Smart Warehouse: US Energy Company's Answer for All Visibility Concerns

Related Articles Contact Wipro Please fill the required details to access the content Smart Warehouse: US Energy Company's Answer for All Visibility Concerns June | 2020 Client background Client: US-based multinational energy company Industry: Oil & Gas Area of Operations: Worldwide Number of Employees: Over 45000 Products & Services: Petroleum, petrochemicals and natural gas Challenge A Fortune 500 organization, driven by the values of responsible operations, execution excellence and technology innovation, was facing challenges in adhering to their vision as their current systems and processes were becoming outdated, and accurate tracking of lubricants was proving to be difficult. They wanted to implement product batch traceability and setup smart warehouse operations to keep up with the ever-evolving demands of their clients. They were looking for a technology partner who could help them in effectively designing and implementing a phase-wise transformation solution addressing their key challenge areas i.e. product batch traceability, supply chain transparency, lubricant tracking, and after-sales service. Solution Wipro stepped in as the preferred partner and initiated smart warehouse operations for the client. MS Azure was chosen for IaaS and PaaS solution deployment. Solution involved integration of multiple systems and hardware like MS Azure, Azure Data factory, local plant server database, hand-held scanners, hand-held computers, mobile application platform, QR code printers, SAP EWM, data collection agent programs, tower lamps, SAP MII, and PCN network. A Lubricant Track and Trace solution was implemented. Its capabilities included: Challenge areas and implementation strategy The engagement involved four key phases: Business Impact The client enabled sustainable transformation by adapting advancements in technology to enhance their market competitiveness, and showed results with the successful deployment of Lubricant Track and Trace solution. Some of the major outcomes of the engagement were: A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. This case study summarizes toolsets and processes adopted to

How a Healthcare Technology Major Moved 3 TB Sensitive Data and

ServiceNow Instance to AWS in Just 8 Weeks

How a Healthcare Technology Major Moved 3 TB Sensitive Data and ServiceNow Instance to AWS in Just 8 Weeks June | 2020 Client background Client: A multinational company based in Europe Industry: Conglomerate Area of operation: Global Products: Health products, electronics Employees: Over 70,000 The Challenge The client had sensitive data residing on the ServiceNow platform that was being decommissioned in accordance with ServiceNow's cloud security policy. They wanted to retain the data stored in ServiceNow for reporting and audit compliance. The client decided to have the complete ServiceNow instance moved to their AWS. However, the decision to migrate the data was made only close to the decommissioning date, leaving just around two months for the mammoth exercise of setting up ServiceNow application, DB schema, and lift and shift of more than 3 TB of data. Additionally, the client wanted to treat the migrated data as a new quality relevant application (QMS), which led to the overall platform being a validated platform with IQ, PQ and complete process of writing multiple documents, test scripts, reviews and approvals. Solution Wipro stepped in as the preferred ServiceNow and data migration partner and leveraged its in-depth understanding of the ServiceNow platform to conduct the exercise of setting up a new ServiceNow instance on client's AWS and migrating large-scale data from ServiceNow instance to AWS in an extremely short span of time. The highlights of the solution include: AWS was treated as any other virtual machine hosting service and all components such as database, DNS, application server and storage had to be configured to ensure the application was for non-SaaS environment. Business Impact Leveraging Wipro's expertise and effective relationship with ServiceNow, the client was able to migrate more than 3 TB of database on ServiceNow cloud to client premises in AWS in a short span of two months. The client was able to: A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident

management improves incident response and enhances end-user satisfaction. This case study summarizes toolsets and processes adopted to

A Global Insurance Group Enabled Agile IT and

Over 68% Cost Savings. Find Out How.

----- Arcticle source ----- https://www.wipro.com/infrastructure/a-global-insurance-group-enabled-agile-it-and-over-68-cost-savings-find-out-how/ ----- Related Articles Contact Wipro Please fill the required details to access the content A Global Insurance Group Enabled Agile IT and Over 68% Cost Savings. Find Out How. June | 2020 Client background Client: A leading multinational insurance group Industry: Insurance Area of operation: Europe Products: Insurance products and services Employees: Over 12,000 The Challenge The client responded to the changing business environment requirements by simplifying end-to-end processes, enabling procurement optimization and product simplification, and transformation of information services. Despite taking these measures, the client realized they were overspending on their IT services and they lacked an agile and automated environment with standardized delivery, which posed challenges in their endeavor to leverage new technology and cloud options. They wanted to move from legacy estate and fixed costs to a consumption-based model. Solution Wipro stepped in as the client's preferred partner to helm their IT transformation journey. We built the solution on six key design principles, together titled 'ASSURE', which stands for: Wipro delivered Infrastructure Services including: services were based on "as-a-service" consumption model. Wipro also executed successful data centre migration. The solution highlights are: Business Impact Leveraging Wipro's solution and delivery expertise, the client achieved measurable benefits across key dimensions: Optimization Consumption Model Innovation & new technology   A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. State of the art infrastructure integrates large, distributed petrochemical complex

----- Arcticle source ----- https://www.wipro.com/infrastructure/state-of-the-art-infrastructure-integrates-large-distributed-petrochemical-complex/ ----- Related Articles Contact Wipro Please fill the required details to access the content State of the art infrastructure integrates large distributed petrochemical complex July | 2020 Client background Client: A large chemical company based in Asia Area of operation: Global Products: Chemicals, Polyethylene, Polyurethanes Employees: Over 4000 The Challenge The petrochemical leader faced major challenges in building a large integrated petrochemical plant in a single phase. The greenfield plant was to go live in five years. The client was looking for a partner who could design the IT infrastructure and provide end-to-end IT lifecycle services. The new petrochemical plant had a large production floor with 26 different subunits distributed across the plant premises. Being a large plant area with multiple shop floors with hazardous material usages, it was a challenge to design passive and active components for automation as well as monitoring from remote locations. Planning an integrated state-of-the-art system with common IT & OT network for the complete plant was a challenge. Solution Wipro stepped in as the preferred IT partner to design the IT & OT infrastructure that would integrate all units of the petrochemical plant and provide a unified monitoring center and health safety Design and program governance – Wipro worked with the client and 30+ Engineering, Procurement, Construction (EPC)units for integrated design and approvals of various systems and subsystems including network, security, public safety and security, public announcement and general alarm, wired and wireless multi-channel communication for IT and OT systems like SCADA, BMS etc. The solutions were designed considering the hazardous nature of the goods. All critical components utilized were explosion-proof with intrinsically safe equipment during power-surge scenario. Integration and commissioning – Wipro installed and integrated various systems across IT and OT for the plant. Wipro delivered end-to-end integration of common systems and core architecture, and carried out integration of subsystems in EPC's subunits. Business Impact By implementing a fully functional IT & OT infrastructure with timely execution, Wipro helped the client accomplish its mission of launching a large integrated petrochemical plant. The client now has a unified monitoring center for its plant's IT & OT equipment, all solutions ensure quality and safety, and it has the capability to add up to 25% of the current capacity. Key outcomes: A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user

satisfaction. This case study summarizes toolsets and processes adopted to

How a Global Company Enabled Smart Logistics & Smart Energy to Enhance Efficiencies

----- Arcticle source ----- https://www.wipro.com/infrastructure/worlds-leading-logistics-company-leverages-iot-to-drive-digital-transformation/ ----- Related Articles Contact Wipro Please fill the required details to access the content How a Global Company Enabled Smart Logistics & Smart Energy to Enhance Efficiencies July | 2020 Client Background Client: A large logistics company Industry: Logistics Area of operation: Worldwide Services: Air mail, Sea mail, parcel Employees: Over 300,000 Challenge The client's Internet of Things (IoT) environment was highly fragmented with different business units undertaking IoT-related research, pilots and implementations in silos. The implementations lacked a common, holistic IoT platform, leading to multiple challenges, including: The client was therefore looking for a common technical platform to underpin its IoT implementations in order to create a single point of ownership and enable robust post-implementation support. Solution Wipro deployed its cloud-based IoT platform and integrated the platform with logistics management systems, corporate data lakes, and real estate management systems of the client. Business impact Wipro's cloud-based IoT solution enabled real time visibility into logistics, energy consumption and customer satisfaction index, resulting in transparency, efficiency and reduced spend. Our support system also helped evaluate the performance indicator for Point of Sale. The holistic solution helped the client better align with its business objectives such as hiring top talent and enabling innovative and sustainable development while ensuring cost-effectiveness, profitable growth and customer retention. The key benefits included: A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. Indian O&G Company HMEL Makes its Refinery Smart and Highly Secure. Find Out How.

----- Arcticle source ----- https://www.wipro.com/infrastructure/indian-og-company-hmel-makes-its-refinery-smart-and-highly-secure/ ----- Related Articles Contact Wipro Please fill the required details to access the content Indian O&G Company HMEL Makes its Refinery Smart and Highly Secure. Find Out How. October | 2020 Client Background Client: HMEL is a public-private partnership joint venture between the Fortune 500 company, Hindustan Petroleum Corporation Limited (HPCL, a Government of India enterprise) and Mittal Energy Investments Pte Ltd., Singapore (MEIL, a Lakshmi N Mittal company). Industry: Oil & Gas Area of operation: India Products: Petroleum products complying with Euro IV specifications Challenge HMEL's production assets represent the single largest investment in any sector in the Indian state of Punjab. It owns and operates the Guru Gobind Singh Refinery, which has 11.3 MMTPA capacity. This Refinery at Bathinda, Punjab, is strategically positioned to respond to India's ever changing energy needs. The energy-efficient, environment-friendly, high distillate yielding complex refinery produces value-added petroleum products catering to a demand-driven market. The oil and gas company wanted to protect and safeguard its assets by setting up a state-of-the-art physical security system through integration of people, process and technology. The intent was to design and implement the system without affecting the ongoing refinery operations and existing data. Major concerns were: Solution Wipro integrated multiple subsystems to a centralized command and control center by deploying its Internet-of-Things based manager-of-managers - Wipro Smart i-ConnectTM. Wipro also provided supply, installation and configuration of advanced integrated physical security solutions consisting of access control system, visitor management system, contract labor management system, CCTV system, high-end video analytics, perimeter intrusion detection system, lighting management, under vehicle scanning system, and GPS-based tracking system to monitor, manage and control incidents across the refinery. Business Impact Wipro's Smart i-Connect platform created great efficiencies for the O&G company in terms of better visibility into incoming movement to the refinery, efficient worker management, and creation of a single point of control. The integration of existing systems streamlined various technologies and applications. The new system with high-end video analytics also enhanced monitoring applications that worked seamlessly with Wipro Smart i-Connect platform. A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user

Helping a Leading Swedish Conglomerate Migrate to a Future-Ready, Software-Defined Data Center

----- Arcticle source ----- https://www.wipro.com/infrastructure/helping-a-leading-swedish-conglomerate-migrate-to-a-future-ready-software-defined-data-center/ ----- Related Articles Contact Wipro Please fill the required details to access the content Helping a Leading Swedish Conglomerate Migrate to a Future-Ready, Software-Defined Data Center October | 2020 Client Background: Client: A global conglomerate offering solutions across locks, doors, gates, entrance automation, and hotel security Industry: Manufacturing Area of operations: Europe, North America, China, and Oceania. Employees: 48,353 (2018) Revenue: 7,613.7 crores SEK (2017) Challenges: For this particular global conglomerate, migrating their legacy data center to a software-defined data center was crucial to accommodating the growth of their newly acquired entities. However, extending network and security policies across heterogeneous hypervisors, clouds, and application frameworks such as VMs, containers, and bare metal presented a challenge. The client was finding it difficult to integrate and monitor physical and cloud data centers across the globe using a single monitoring tool while also ensuring zero-touch provisioning (ZTP). Additionally, they found it difficult to manage network security because their IT infrastructure was equipped with a single-perimeter firewall. However, it was also expensive to manage the large number of physical firewalls as well as the complex matrix of rules. The client wanted to migrate their existing physical network to a new SDDC setup and integrate third-party vendor solutions such as Palo Alto and F5 the with software-defined network (SDN). Solution: Key highlights of the solution include: Business Benefits A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization

solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. This case study summarizes toolsets and processes adopted to =====================

Enhancing network security via a network refresh and NAC deployment for U.S.-based manufacturing company

----- Arrticle source ----- https://www.wipro.com/infrastructure/enhancing-network-security-via-a-network-refresh-and-nac-deployment-for-u-s-based-manufacturing-company/ ----- Related Articles Contact Wipro Please fill the required details to access the content Enhancing network security via a network refresh and NAC deployment for U.S.-based manufacturing company November | 2020 Client Background Client: A USA-based manufacturing company offering a range of services and products across the health and safety, industrial, transportation, electronics, healthcare, and consumer sectors Industry: Manufacturing Area of operations: USA Challenges The client's IT landscape was changing rapidly due to the proliferation of Internet of Things (IoT) devices, the movement of workloads to the cloud, the increasing use of virtualized services, and a surge in the Bring Your Own Device (BYOD) trend. These changes diminished asset viability for end users and devices, increased network vulnerability, and reduced the client's control over network access. In light of these shifts, the client was seeking a single pane of security and management infrastructure to reduce operational costs caused by manual effort and security mitigation. Solution: The key highlights of the solution included: Business Impact This helped the client: A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. How a Leading Telco Got Ready for IoT and 5G

----- Arrticle source ----- https://www.wipro.com/infrastructure/how-a-leading-telco-got-ready-for-iot-and-5g/ ----- Related Articles Contact Wipro Please fill the required details to access the content How a Leading Telco Got Ready for IoT and 5G The Seamless Transition to IPv6 November | 2020 Client

Background Client: A leading communication service provider Products/ Services: Mobile, fixed, and broadband internet services Area of operations: Asia and Africa Employees: Over 15,000 Challenges A secure and efficient network is crucial to boost performance and ensure mobility. However, with an increasing number of devices connecting to the internet, the client felt challenged in meeting the growing network demand and provide native IP security support. They needed to find a way to create efficient and secure packet processing and routing. At the same time, the client also wanted to quickly develop enhanced visibility for data control teams and be compliant with critical regulatory mandates. Improving network for IPv6-only new-age IoT devices and expanding beyond expensive IPv4 network was also crucial to reduce cost and enhance the customer experience. The client, therefore, was looking to implement and launch IPv6 support for the mobile network. Solution Wipro leveraged a dual-stack technology where IPv4 and IPv6 could co-exist during the initial phase deployment. The network was gradually transitioned to native IPv6 to enable a robust and secure IPv6 ready mobile network. Key highlights of the implementation include: Business Impact The implementation of the IPv6 ready mobile network solution helped the telecommunications company become future-ready. It helped build a futuristic, reliable, secure, and faster mobile data experience for new-age devices. It helped the client: A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. A leading airport in the Middle East boosts operational efficiency with Service Lifecycle Management

Related Articles Contact Wipro Please fill the required details to access the content A leading airport in the Middle East boosts operational January | 2021 Client Background Client: A leading airport in the Middle East Industry: Aviation Area of operations: Aviation Customers: 559 Flights, Over 2 million passengers Challenges The airport's IT and OT landscape were fraught with operational challenges, given the siloed operations for various systems. Multiple service desk teams and legacy systems combined with the lack of asset databases impacted inventory management and maintenance process streamlining. In addition, the lack of incident tracking mechanisms and SLA measurement systems made it difficult to transition out of the existing mix of in-house and

local incumbent IT and OT organizations. Other challenges included legacy systems, End of Life (EOL) / End of Support (EOS) for certain systems and poor documentation which impeded the understanding of the system architecture. As airport operations were critical, there was a need to transform the service management process and systems for 24X7X365 SLA based managed services for all IT and OT systems. Besides uptime SLA assurance and adherence at system / sub-systems level, improved response and resolution time were also critical to ensure minimal service outages. Solutions Wipro's comprehensive solution encompassed a wide range of services – from pre-assessment to implementation and support. The solution spanned over 60 systems across 8 terminal buildings and landside areas like parking, mosque, arrival & departure entrances, as well as air-side locations such as fire stations, fuel stations, power grid, water treatment areas, runways, and perimeters. The solution included: Business Impact Wipro's holistic solution enabled the customer to drive digital transformation aligned with its 2020 vision, helping to improve its processes, tools, security, and ultimately the passenger experience. A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. Wipro implemented a centralized accidents and trauma care service solution through ambulance tracking and emergency response in one of the largest cities in India

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-implemented-a-centralized-accidents-and-trauma-care-service-solution/ ----- Related Articles Contact Wipro Please fill the required details to access the content Wipro implemented a centralized accidents and trauma care service solution January | 2021 The solution enables, provisioning of free ambulance Services to victim of accident and trauma on 24x7 basis since 1991 with the fleet of well-equipped ambulances and well trained manpower. The control room is functioning 24 hrs. with a sophisticated ultramodern GPS-GIS enabled computerized system. Calls of accidents and medical emergencies are received through Tel and wireless network connected to the Police, fire Services, Disaster Management Authority, Govt. Hospitals and Govt Secretariat. The organization that runs the application provides the ambulance services to all medical attention needing persons including transportation of pregnant women to the hospital and home after

delivery ,completely free of cost Client Background Client: Autonomous government organization Geography/Area of Operations: India Products/ Services: Health care and trauma care/ Ambulance dispatch Number of Ambulances: 300 Challenges The golden hour is the period of time following a traumatic injury during which there is the highest likelihood that prompt medical and surgical treatment will prevent death. While initially defined as an hour (60 minutes), the exact time period depends on the nature of the injury and can be more than or less than this duration. The proposed solution needed to address the following challenges to ensure that the treatment is provided within the golden hour. Solution Our solution is based on Wipro Smart i-Connect™ IoT platform. The platform has an inbuilt mobile asset management module, basic analytics and big data connectors, with more than 98 inbuilt protocols to directly interface with multiple devices, can be integrated with GIS engines, and has a data ingestion and normalization engine. Wipro Smart i-Connect™ application dashboard is a single / common visualization dashboard for all reporting and a single point of tracking & monitoring. The solution features include: Business Impact Wipro successfully simplified the client's core operation and the resulting benefits were as follows: A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. A leading UK bank enables remote work solution for all contract employees

----- Arcticle source ----- https://www.wipro.com/infrastructure/a-leading-uk-bank-enables-remote-work-solution-for-all-contract-employees/ ----- Related Articles Contact Wipro Please fill the required details to access the content A leading UK bank enables remote work solution for all contract employees Wipro's virtual desktop facilitates secure remote work and ensures excellent user experience February | 2021 Client Background Client: A leading UK based bank Industry: Banking and Financial Services Area of operations: UK Size: Over 1,000 VDI users Revenue: More than GBP 400 million Challenges With the onset of the COVID-19 pandemic and subsequent lockdowns, the client had to quickly set up remote work solutions for all critical users who were part of the offshore testing team. The client did not have VDI solutions and shipping physical laptops to the offshore team was a cumbersome task. In addition, they had to ensure a reliable and secure remote working ecosystem for the vendors. Partnering with a key service provider was the need of the hour. Solutions The client partnered with Wipro to leverage Wipro's Windows Desktop Virtual solution. To address the

challenge, Wipro's team analyzed and evaluated the existing capacity and proposed the Rapid Employee Access Solution. It was a remote, fast and secure solution that enabled Desktop as a Service (DaaS) on cloud using the Azure WVD native environment. Besides, the Wipro team leveraged the Azure environment and set up the VDI service in the cloud - building, creating and publishing the VDI image with Windows 10 multi-session. Business Impact Wipro's intuitive solution enabled seamless business continuity for the client with minimal disruption to services, ensuring superior customer experience. Benefits of the solution included: A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. Multinational financial services firm leverages emerging technologies based automation boost efficiency

----- Arcticle source ----- https://www.wipro.com/infrastructure/multinational-financial-services-firm-leverages-emerging-technologies-based-automation-boost-efficiency/ ----- Related Articles Contact Wipro Please fill the required details to access the content Multinational financial services firm leverages emerging technologies based automation boost efficiency Over 50% reduction in efforts of L2 and L3 skilled resources; risks of business loss minimized. May | 2021 Client Background Client: American multinational financial services Industry: Financial services Products or Services: Credit cards, payment systems Geography: Worldwide Number of customers: Banks and financial institutions Total annual revenue: US$16.88 billion (2019) Challenges The client was expecting more process-based automation. It also wanted to incorporate automation into its operations, so that the company's resources could invest their time and effort in strategic tasks. This would also reduce the probability of business loss due to manual errors. Solutions Wipro leveraged its ServiceTheater team to use emerging technologies: Ansible and Chef to automate and meet the requirements of the customer. Automation assets were defined, developed, and tested within the organization's security and compliance boundaries, through a period of six months. Wipro standardized its automation platform technology tower map across the enterprise. The solutions addressed the customer's automation needs around the following functions: The solution was implemented across the entire IT managed services division of the enterprise. Business Impact The client's business goals and expectations were successfully met. It

contributed towards the enterprise's target of achieving a TCO reduction of 25%. It also helped the customer to significantly improve the efficiencies of the remaining team members. The solution enabled the customer to achieve a standardized delivery and execution methodology, and significantly reduce manual interventions, thereby reducing any threats of business loss due to configuration errors on production systems. Global IT Company Adopts Single Solution Suite to Ensure Smooth Return to Work Post COVID-19

----- Arcticle source ----- https://www.wipro.com/infrastructure/global-it-company-adopts-single-solution-suite-to-ensure-smooth-return-to-work-post-covid-19/ ----- Related Articles Contact Wipro Please fill the required details to access the content Global IT Company Adopts Single Solution Suite to Ensure Smooth Return to Work Post COVID-19 August | 2021 Client

Background Client: Global IT company Area of operations: Worldwide Employees: 160,000+ Challenge Worldwide, COVID-19 has had a detrimental effect on companies' productivity and business continuity. Today, companies are planning and executing strategies to quickly regain equilibrium in the 'new normal' way of working. Remote working has been a big part of this effort. Soon, employees may have to go back to their physical workplaces for various reasons. The challenges here would be: Solution Wipro's "Health COV-ER", the 'Back to Workplace' solution suite, is a one-stop solution offering a single channel for collaboration and communication, including employee transportation and return to work, social distancing, and contact tracing. Health COV-ER offers a comprehensive solution that includes: This cloud solution was enabled for the IT Company in 25+ offices in India for supporting 100K+ employees and two offices in the Philippines to support 10K employees. Contact tracing for employees detected with COVID-19 was used to identify and isolate affected employees Business impact With Wipro's Health COV-ER, the company experienced the following benefits: To know more about the value you will receive with Health COV-ER, contact marketing.cis@wipro.com. A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. Re-Imagine the Datacenter for the Digital Era

----- Arcticle source ----- https://www.wipro.com/infrastructure/re-imagine-the-datacenter-for-the-digital-era/ ----- About the Author Contact Wipro Please fill the required details to access the content Achieve business agility through Cloudification, expansion beyond boundaries, web-scale automation and intelligent self-learning infrastructure As access to virtually unlimited compute resources continues to grow, enterprises and consumers are able to do things that could not be dreamt of until a few years ago. At the core of this shift are Social, Mobility and Analytics trends powered by Cloud technologies. As Public Clouds mature and become more secure, the inhibitions to move to Cloud have begun to disappear. Enterprises want to cloudify their own Datacenters to derive the benefit of agility, elasticity and self-service, learning from Public Cloud providers. The world is going digital at a much faster pace, putting enormous stress on Datacenters. But weighed down by technical debt, Datacenters are unable to change as quickly as the business environment necessitates. This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly and confidently face the change.   Digital and its Impact on Datacenters What

does 'Digital' or 'Digitalization' mean? One of the early examples of large scale digitalization was when we converted mail to e-mail. Communications became digital. Today, everything, from commerce to learning is becoming digital. The spotlight is now on 'Digital' because of the exponential rate at which it is disrupting traditional processes and well-established behaviors. Fuelling this disruption are technologies such as Cloud, Internet of Things (IoT), Mobility, Social platforms and real time Analytics. These technologies have opened fresh opportunities to digitize, triggering a race between enterprises to innovate, increase efficiency and engage with customers. Consumer behavior is changing, new insurance models are being built, the number of steps to complete financial transactions have decreased with even something as deeply entrenched as physical currency threatening to become digital. Paper files are vanishing. Sensors, actuators, microcontrollers and system-on-chip devices are becoming affordable to build cheap robots and drones. Even governments are being overthrown by social media. The next decade will see more technology change than the last 40 years put together. End users will demand Always-On and high-performance experiences of applications and services, data volumes and velocity will multiply, perimeters will have to be broken to expand to newer geographies or enable much tighter B2B integration. There will be more machines talking to each other than humans talking to machines, and machines will continuously learn, identify patterns and predict events in a world where 'Digital' is becoming pervasive. Meanwhile, enterprises are forced into this disruption while most of their IT infrastructure is still legacy At the core of digital is data. A consequence of the accelerated growth in digitalization is the new demands placed on Datacenters. Traditional application architectures are not flexible enough to adapt to the heavy data velocity, volume and variety. In addition, the IoT is driving decentralization of Datacenters and data security in borderless enterprises is taking new forms. Envisioning the New Datacenter The new Datacenter eco-system must respond to the emerging business conditions dictated by a digital world. This means bringing renewed focus to speed of deployment, availability, flexibility, scalability, agility, maintainability, security and affordability. Programmable Infrastructure: Traditionally, when business needed an addition of, say, 10 servers, the process included procurement, installation, configuration, testing and roll out. This could take weeks, if not months. Today, using virtualization, 10 virtual servers can be deployed in minutes. As infrastructure abstraction gets more sophisticated, more and more control is moving to software from hardware. It is not just humans, but software and applications, which will need to provision or deprovision Datacenter components dynamically based on business demand. This can be made possible when components of the infrastructure - such as compute, network, storage and associated services such as backup, archival, DNS, application services, etc.- are programmable. Every Datacenter component must be exposed through APIs that allow various components to talk to each other and that allow administrators to orchestrate and make changes faster. This is a shift from the traditional manual and time consuming process. It forms the basis of a Software Defined Datacenter with configuration and state monitoring programmable. Pervasive Fabric: Future Datacenters will be hybrid and distributed in nature. Such Datacenters necessitate a single pane of glass for provisioning, migrating, managing and monitoring the infrastructure and applications deployed across different Clouds, providing

workload portability and making the network and service location immaterial to the end-user. Web-Scale Agility: Few large companies make over 200 changes per day to their applications. All enterprises will want the same web-scale agility within their Datacenters. A DevOps approach of automated development, testing and release management along with microservices-friendly infrastructure becomes necessary to bring this web-scale agility. DevOps Approaches Cognitive: Datacenters will add intelligence to their systems so that they develop the capability to learn and auto-scale to meet changing business demands, predict failures and self-heal. Pattern recognition and machine learning technologies will enable this development, now possible with the availability of event and performance data and the reduction in data storage costs. Cognitive IT Security: Security concerns have been the biggest inhibitors to expanding Datacenters. Fears around compromised security have grown further as compute perimeters are breaking. But once new virtual boundaries are mapped and enterprise defense-in-depth policies made software defined, security policies can be easily applied to objects irrespective of where the object physically resides in public or private clouds. Security Floating Security Principals and Policy Objects Application Architectures and Development Practices: How long does it take to upgrade a largely monolithic and resource-hungry ERP workload to a newer version? How long does it take to bring up a DR environment in case of a disaster? How long does it take to migrate assets from one Datacenter to other? How much do you worry about redundancy at all levels to keep the infrastructure always on? The new fast-paced world doesn't have time to think about all these things. That is why the trend of tightly coupled applications - into what seems a monolithic black box - is witnessing a reversal. In their place, microservices are evolving. These are a group of tiny and autonomous services with very minimal or no coupling. They are stateless, can be brought up fast, are portable and can be scaled out. This makes DevOps integration easier than in traditional application architectures. Illustration:Monolithic vs Microservices Architec Financial Accountability: Businesses will want to consume Datacenter services on a utility based OpEx model with a swipe of a card. This means creating shared infrastructure with the ability to cross-charge business units based on usage. As a consequence, CIOs will become financially more accountable and need to build business value realization models. Newer KPIs will emerge such as 'Revenue per unit of Compute', 'On-prem vs Off-prem utilization mix' etc. Building Blocks of the New Datacenter Is the IT Pro Dying? Charles Darwin said, "It is not the strongest of the species that survives, nor the most intelligent, but the one most responsive to change." After years of installing and configuring systems and servers, or managing and backing up databases, server/ system/ database administrators will have to face the new reality: systems are being automated and their roles are being redefined. The future of an IT pro is in adding smartness to infrastructure. The new world doesn't want the "learned", it needs "learners". Programming or scripting, necessary for adding smartness to infrastructure, is not difficult. They don't require complicated logic and syntax anymore. And to acquire scripting skills is a necessity to be able to continue as an IT pro of the future. Transformation Approach While it is practically impossible to rip and replace decades of technical debt, enterprises can take a phased, two-step approach to transformation. The Transformation Journey Summary It is time to rethink Datacenters to meet tomorrow's needs. Businesses are changing,

digital technologies are creating fresh opportunities, the perimeters of an enterprise are getting broken and conventionally developed skills are getting extinct. We need to fly, yet remain grounded. It's an interesting inflexion point and the good news is that these changes are bringing CIOs and Datacenter architects back to the forefront to lead their organizations into the digital era. Govindaraj Rangan Govindaraj Rangan (Govind) has 19 years of industry experience across the breadth of the technology spectrum – Application Development to IT Operations, UX Design to IT Security Controls, Presales to Implementation, Converged Systems to Internet of Things, Strategy to Hands-on. With his zeal to remain start-of-the-art, he is quick in developing deep hands-on expertise in emerging technologies and applying in real Customer scenarios. He is currently working on solutions to Cloudify Enterprise Datacenters, expanding their boundaries into Public Clouds, experimenting with IoT and Robotics to build the Datacenter for the Digital Era. He has an M.B.A. from ICFAI University specializing in Finance, M.S. in Software Systems from BITS Pilani and B.E. (EEE) from Madras University. SD-WAN

----- Arcticle source ----- https://www.wipro.com/infrastructure/sd-wan/ ----- About the author Contact Wipro Please fill the required details to access the content SD-WAN - Unbox your branch office Unbox your branch office Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. NFV's success in telecom space and the imagination of a few experts to extend to this enterprise have given birth to the idea of Enterprise Network Functions Virtualization (ENFV). The concept of physical network appliances is going away, leaving only the switch as the lone wolf in the appliances space. Moving every network appliance from a physical world to virtual and packing them in a single x86 appliance is possible now. This Point of View (PoV) document discusses about one such trend of virtualizing important network and security functions and therefore making the branch networks run from a single box. Current approach and its challenges Large corporations of various industry verticals such as retail or banking heavily rely on branches in conducting day-to-day business for one simple reason – they are closer to the consumer of their products or services. While cloudification has successfully moved the applications to a central location, the people who need to access these applications are distributed across the country or globe. However, with the increasing costs and need for consolidation it's no longer possible to have an IT staff member in each branch. Some of these branches may be as small as 5-10 employees. With increasing complexity in technologies, the generic IT administrators no longer can handle highly specialized IT tasks. You need specialized operating system administrators, back-up administrators, IT security staff and somebody to manage them all. Of course, a branch cannot afford an expansive IT department. Management of Head Quarters IT or the data centers are being outsourced to commercial outsourcing & professional

services organizations. Can you manage a branch with no IT staff? Seems unrealistic, but with the branch-in-a-box approach, it's doable. Current approach in connecting the branch is: New approach – Virtualized Branch Networking Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the above shortcomings. This is achieved through virtualization of network functions including routing, wireless LAN controller, firewall, and virtualized servers for running various local applications. Switch may be still required, but a small network switch (supported by few manufacturers now) as a module in the server itself, serves the purpose. Access points cannot be replaced though. The benefits hyper-convergence brings to a branch office network is not only limited to running network functions; with the compute and storage available on these appliances you may run small branch office applications, domain, file and print services, time and attendance applications or CCTV surveillance consoles. All these come with the enterprise grade advantage of centralized back up and management. This single server can be shipped to the branch offices preconfigured waiting to be connected to the Internet (a task which can be achieved by a non-IT staff) and powered, while rest of the configuration, management, policies and control from one central location. In a single click, back up of branch data can be initiated, restored from central location and the branch is up and running in no time. Benefits Resultant benefits are several: Critical success factors Several leading network vendors have recognized the need of customers managing large number of branches and have packaged their hyper-converged branch solutions. However, the following will determine the success factors of such solutions: As the customers adopt more and more branch-in-a-box solutions, feedback exchange with vendors and system integrators these solutions will mature over the period resulting in simplified, secure branch office networking. Be assured, time has come to order your branch networking in a box and unbox your branch.   Mohan Krishnamurthy Madwachar- Mohan has coauthored eight books published by Syngress: He also writes in newspaper columns on various subjects and has contributed to leading content companies as a technical writer and a subject matter expert. SD-WAN:

----- Arcticle source ----- https://www.wipro.com/infrastructure/sd-wan--/ ----- About the author Contact Wipro Please fill the required details to access the content SD-WAN - The next wave in WAN refresh The next wave in WAN refresh The last decade has witnessed a considerable change in the server, applications and end-point device landscape. Transformation in Wide Area Networks (WANs), however, has not kept pace. But the widespread migration of networks and datacenters to Cloud, the growth in end-user wireless devices and bandwidth hungry applications are forcing CTOs to re-examine how they architect, provision and manage their enterprise networks. Traditional MPLS (Multiprotocol Label Switching) used to manage network traffic has become expensive and can't really scale. Fortunately, a solution in the form of Software Defined WANs (SD-WANs) is on the rise,

and about 25% enterprises will use SD-WANs to manage their networks in the next 2 years. Today, only 5% do so. With 55% of IT budgets sucked up by WANs, it is natural that CTOs will want to examine how SD-WANs can solve their problems. Gartner assumes that by 2020, more than 50% of WAN edge infrastructure refresh initiatives would be based on SD WAN versus traditional routers (up from less than 2% today). Currently, enterprises have a complex and expensive infrastructure at branch offices (sites) consisting of terminals/devices, routers, switches, bridges, controllers, firewalls, etc. The individual sites are hauled back to a regional HQ; the regional HQs may be connected between themselves or to a central HQ – which then provides users and applications with Internet/Cloud access. The fact that offices, employees, partners and customers don't directly connect between themselves presents a handicap to real-time applications and collaboration. No enterprise can afford that. To overcome this, smart CTOs have begun to replace or supplement their traditional WANs with secondary links to low-cost business-grade Internet and are leveraging faster rovisioning through 3G/4G/LTE. A shift that is inevitable This shift in strategy takes care of four things: it reduces anxiety of WAN latency and provides users with a great experience; it makes better use of WAN pipes; it brings down costs; and it eliminates the powerful stranglehold of pricing structures that telecom providers have over enterprises. The layer of software over traditional WANs ensures all modes of connectivity are managed for better ROI. With intelligent software and an integrated approach, SD-WANs also make it possible to apply analytics and automation along with new pay-as-you-go models (for a comparison between traditional WANs and SD-WANs, see table "Why SD-WANs are trending"). This makes SD-WANs ready to take on the emerging challenges in enterprise connectivity and takes them from the realm of a technology discussion to the reality of implementation. SD-WAN adoption While SD-WAN adoption is inevitable, it is essential for an enterprise to go through a set of well-defined phases with a technology/ system integration partner: Enterprises must also examine the best-fit cost models that SD-WAN implementations offer (see box "Comparison between commercial SD-WAN models" below). Businesses of the future will depend on SD-WAN The underlying reality of today's business is that infrastructure, networks and capacity must scale and shape dynamically, based on real-time needs. The widely used conference call that forms the bedrock of modern day-to-day enterprise operations, presents us with a classic example. When a team spread across geographies needs to conduct a conference in real-time, it sets up an online call-bridge allowing team members to conduct a discussion using their phone, mobile devices or a desktop. The enterprise and the team doesn't labor over the transport being used; they are not bothered with IT and infrastructure complexities. Their concern is centered around how quickly and effectively the business intent is fulfilled. Before the conference begins, the network does not exist. It is created just in time for the conference and is automatically dismantled as soon as the conference is over. The process is simple and it puts the network back in control of the enterprise. In an era where CTOs cannot imagine a future without Infrastructure as-a-Service (IaaS), Software as-a-Service (SaaS) and mobile work forces, the need to adopt SD-WANs is even more urgent. Enterprises need quick, fast and flexible access to a variety of high-bandwidth services that are within their control. This is where SD-WANs score with cost

savings, simplicity, better user experience and scalability.

Designing a zerodowntime experience

for your end users using

"digital lockers"

----- Arcticle source ----- https://www.wipro.com/infrastructure/designing-a-zerodowntime-experience-for-your-end-users-using-digital-lockers/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content Designing a zero downtime experience for your end users using "digital lockers" A key focus area within the digital workplace today is fostering customer experience and intimacy. Enterprises increasingly realize that a superior end-user experience is a prime driver of operational efficiency, and have tried to provide this through many strategies; BYOD, VDI, or lightweight tablet devices. While these initiatives have helped, they only treat the symptom and not the underlying problem which is that end-user devices and endpoints can and do frequently crash. Moreover, the impact is not just limited to a single employee, but affects the entire enterprise. Due to the hyper-networked nature of work colleagues, partners and customers of the employee must put their interactions on hold until the IT team restores normal operations. This results in a loss of productivity that is estimated to be 4 to 5 times higher. User experience monitoring, can help enterprises identify such events ahead of time, but their effectiveness is minimized if the issue is due to a hardware failure, where the only solution is to provide employees with a replacement endpoint quickly, efficiently and with simplicity. Traditional models do not cut it Enterprises have traditionally used two models to solve this problem. Either they have looked to onsite field engineers to provide replacement endpoints to end users, or they have looked at VDI to eliminate the dependency on the endpoint. However, these models have both failed due to the varied nature of the workplace ecosystem. Having a dedicated field engineer present at smaller sites such as sales offices can be cost prohibitive, while VDI is dependent on excellent network connectivity to ensure day to day functioning and in turn, severely restrict the mobility of road warriors. In this whitepaper, we will explain how a business can drive a better near-zero downtime user experience for their employees through digital lockers. Planning for digital Lockers A digital locker is a digitally access controlled physical locker, with multiple bays that can be utilized by end users to return an endpoint, or pick up a new endpoint, within minutes, without requiring the intervention of on-site field services. Digital lockers thereby enable a zero-downtime experience for end users in a cost-effective manner. However, an essential prerequisite to achieving this is building a seamless mechanism to transfer applications, data, and settings from the existing

endpoint to the new endpoint. Today, multiple models of digital lockers are available with the basic versions providing granular bay-by-bay access, while advanced models offer network interfaces for remotely managing endpoints and, office-in-a-box capabilities on which enterprise IT can run virtual workloads. We believe that digital lockers are not just a tool to provide a better break-fix service, but a chance to rethink and transform your existing support model. Here are a few key aspects to consider when introducing digital lockers: The six fundamental principles to designing a zero-downtime experience for your end users using digital lockers Design for the entire service spectrum and the full estate Business downtime needs to be reduced, irrespective of whether it is because of a failed endpoint or a new employee without one. Design your laptop locker to provide zero-downtime experience across the end user lifecycle, and across your locations. For critical peripherals (keyboards, monitors) use vending machines (like digital lockers, but based on retail vending machines) to provide a seamless integrated zero-downtime experience. Choose an out-of-the-box experience Digital lockers provide the best user experience when users can quickly return to their work. Long lead times required for reengineering or for process approvals destroys the user experience.Eliminate user wait times by opting for an OOB (Out-of-the-box) experience with your endpoints, or ensure that your remote management team reconfigures these machines right after they are installed within the digital lockers, and much before you allocate them to users. Decouple the workspace and the endpoint To allow seamless migration of the workspace (applications, data, and settings) from the old to the new endpoint, look at decoupling the workspace from the rest of the endpoint, through profile virtualization services or EFSS solutions like OneDrive and Dropbox. If you cannot put your data in the Cloud due to regulatory reasons, use the advanced features available on your digital lockers to run fileshare loads. Invest in orchestration Migrating users between endpoints is a non-trivial exercise, with multiple failure points. Invest in orchestration to ensure that your IT management systems can seamlessly support the new model without needing to increase the headcount of your remote engineering team. Revisit your third party service contracts to ensure a seamless IT supply chain Having machines available in the locker is a critical prerequisite to ensuring that your users can pick them up. Revisit your asset management processes to ensure that replenishment orders can seamlessly backfill inventory. Work with your OEM and your field services partner to ensure that they are contractually obligated to maintain accurate asset inventory. Simplify the user experience Doing the above five steps does not ensure success if your end users still need to punch in a 15-digit access code they received on email, or if the nearest digital locker is in another building a mile away. Ensure that you deploy digital lockers in locations that are convenient for end users to access and make sure that you integrate them with existing access control mechanisms like ID cards to simplify the user experience. Summary The uptick in user experience as well as the economics of using these solutions is a winner and can lower the TCO of endpoint management by over 70%, enabling enterprises to focus on improving and maintaining the applications that are the real heartbeat of an organization. It is a great way to ensure that the lights in an organization do not suddenly dim. Going beyond digital lockers and vending machines While the value proposition of digital lockers and vending machines is compelling, far more innovative

models are currently being developed that are poised to disrupt the existing service landscape. Chief amongst these is the VR (virtual reality) kiosk, which provides collaboration and problem resolution capabilities to engineers and end users using remote conferencing and VR interfaces, thereby providing all the advantages of a genius bar, but at hyper-scale and at a fraction of the cost. The world of end user computing is poised to undergo an interesting change fostering employee productivity and significant cost savings Digital lockers are not just a tool to provide a better break-fix service, but a chance to rethink and transform your existing support model. Ramesh Ananthakrisnan - Product Head, Wipro Live WorkspaceTM Ramesh has more than 12 years of experience in developing and deploying the digital workplace to multiple Fortune 100 and 500 customers. He is responsible for the go-to-market for the digital workplace and AI and NLP as it applies to end user services. To know more, reach out to marketing.gis@wipro.com Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.
=====================

Getting Cloud migration right:

----- Arcticle source ----- https://www.wipro.com/infrastructure/getting-cloud-migration-right-faster-simpler-and-safer/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Becoming a Cloud-first organization is no longer a choice for business. The more relevant questions today are 'how soon can we get there' and 'how much do we need to invest'. According to a Forbes article discussing Forrester's Cloud computing predictions for 2018, "Forrester predicts that more than 50% of global enterprises will rely on at least one public Cloud platform to drive digital transformation and delight customers."1 The worldwide public Cloud revenue is expected to grow 21.4% in 2018 alone, according to a recent Gartner2. Clearly, Cloud computing is one of the most disruptive technologies IT has seen since the early days of digital age. Its massive growth comes from its rapid adoption across industries and businesses of all sizes, thanks to its benefits – elasticity, scalability, agility, and pay-as-you go pricing models. Migrating to the Cloud, however, is nt just limited to merely shifting workloads and applications. It requires organizations to reimagine their IT infrastructure and operating philosophies to drive innovation, create new opportunities, and future-proof their success. Tackling the Cloud adoption and migration effectively can maximize the Cloud benefits. 66% of IT decision makers admit to delaying the migrations because "migrating complex apps to the Cloud is perceived more trouble than it's worth". 44% of businesses have experienced some kind of Cloud migration failure3. What makes Cloud migrations such a headache and how can the right planning and execution methodology help

organizations steer clear of the pitfalls? Three key challenges plaguing Cloud migrations While the benefits of migrating to the Cloud are many folds and well proven there are challenges: time factor, costs involved, integration complexity, data risk, people and process, downtimes and so on. Let's discuss in detail three of the biggest challenges in migrating to the Cloud (of any type): #1 Assembling the right ingredients Think of Infrastructure-as-a-service (IaaS) such as AWS, Azure and Google Cloud, as well as people and processes as building blocks – you can assemble them in various ways to get different outcomes. Outcomes to your business are important and to know the need to prioritize them. While the technology challenge is addressed by opting for right platform, which is more prescriptive in nature, getting the right people and devising the right strategies to drive them. #2 Accurately forecasting time, cost, and resource investment Most companies that become frustrated with their Cloud migration often do not do their homework. They miscalculate the time required to migrate to the Cloud, which in turn, affects the cost of service and resources required, ultimately undermining the benefits. The trick to realizing superior cost savings with migration is to begin with migrating in-house services that are least used to the Cloud first, and gradually progress to most-used services. Another factor here is that most organizations' legacy systems (records and transactional processes for instance) are not Cloud-ready and require re-architecting. Enterprises typically calculate Cloud costs by looking at the cost per service unit but fail to multiply this correctly over the length of time required to migrate, say a month or a year. #3 Protecting and securing data in the Cloud Migrating their in-house security posture as-is to the Cloud is one of the biggest challenges any organization can make. While a majority of organizations have made the leap to the Cloud, nearly a quarter are still wary of migrating – primarily due to concerns over security. Gartner's recent report on Cloud security makes an interesting point here – it says most security failures result due to a fault on the users' part, not Cloud providers', as the former fail to manage the controls used to protect corporate data. Gartner predicts that through 2022, at least 95% of Cloud security failures will be the customer's fault4. While public Cloud platform providers have taken note of customer's distrust and are bolstering security through fully integrated and unified security solutions. Managed Cloud migration services: The panacea to the challenges Efficient planning is the most important stage for successful migration. There is no predefined formula for migrations, this can change based on the enterprise needs. Planning for migration could involve: Automation becomes key to build workflows for standard SOPs during migrations; this improves the efficiency and eliminates possibilities of human error during migration. #1 In-depth planning with phased migration: Opt for a Cloud service partner with considerable experience in assessing and migration planning, and well-developed process and capabilities to execute migration in a phased manner: #2 Automation for migration: Reduction in time, cost and risk brings major success in migration projects, enabling large and complex Cloud migrations. This drives faster migrations, improves accuracy by reducing manual errors, tools and process automation for higher availability of service that help in reducing cost of manual actions. Here are the key benefits an expert Cloud managed services provider (MSP) can bring to the table: # Increased agility and scale: While increased agility and scale are the inherent benefits of Cloud computing, realizing these with your in-house

IT team can prove to be daunting. Cloud service partners that bring an industrialized approach to migration, backed by robust infrastructure, SLAs, software-defined policies, and standardized processes can enable up to 90% automation for assessment/data analysis, in addition to the capacity to scale up to 500+ migrations per week. Cloud service partners with access to migration best practices across industries, ready blueprints, proprietary frameworks, tools, and technologies are able to significantly accelerate and streamline migration. # Predictable cost savings: Outsourcing

Cloud migration to the right service partner enables end-to-end visibility and control over costs through automation, and reduces network maintenance costs as well. Flexible pay-per-service or consumption-based payment plans add to the convenience as businesses need not pay for unused capacity. Cloud migration service partners that offer advanced analytics capabilities further facilitate automated intelligent orchestration of workloads to the best-fit Cloud, maximizing ROI and capacity utilization. Some migration service partners also offer converged solutions such as security protection, network monitoring, and disaster recovery that further augment cost savings. The road to successful Cloud migration As businesses increasingly move beyond a single Cloud to adopt a multi-Cloud approach, migration and interoperability challenges loom large. Operational cost, time, effort, and resource savings that can be achieved by partnering with a managed Cloud provider far outweigh the savings of managing the migration in-house. A managed Cloud provider combines automated assessments with industrialized approach to migration, resulting in seamless post-migration digital operations at zero risk. The bottom-line: a combination of careful planning, detailed deliberations, and partnerships with managed Cloud providers can help anticipate and overcome potential roadblocks and ensure migration success. Anantha Rao L - Principal Consultant and Practice Manager for Cloud automation services in Wipro's Cloud & Infrastructure Services He has a total of 19 years of experience with 10 years specifically into developing transformation solutions. He has pioneered complex initiatives to drive automation in consulting, delivery and infrastructure management across various verticals and geographies. He can be reached at anantha.lrao@wipro.com. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.
=====================

The business case for SD-WAN

About the Author Related Articles Contact Wipro Please fill the required details to access the content The business case for SD-WAN Traditional MPLS (Multiprotocol Label Switching), used to manage branch connectivity and network traffic, isn't cutting it any more. In its place, SD-

WAN (Software Define Wide Area Networks) is mainstreaming. Major enterprises are busy examining SD-WAN as a means of dealing with growing network traffic, triggered by the migration of networks and datacenters to Cloud; the proliferation of Internet of Things (IoT); the focus on collaboration; and by the bottomless demand for wireless end-user devices and rich, bandwidth-intensive applications. What is changing with SD-WAN? SD-WAN creates an overlay on the existing network topology. This layer provides enterprises with central control over branch connectivity. They can use this layer to prioritize traffic based on business rules achieving this with greater security using encryption, next generation firewalls, web filtering, and threat management based on location, session, user and application. In addition, a variety of components can be added to SD-WAN implementation such as controllers for device management and, sometimes, an analytics engine for optimizing cloud workloads and monitoring. One study in North America found that by 2017, 74% of respondents had already tried the technology in labsi . Not surprisingly, one leading analyst predicts that worldwide SD-WAN infrastructure and services revenues will see a compound annual growth rate (CAGR) of 69.6% and reach $8.05 billion in 2021ii. Clearly, branch connectivity using traditional WANs - that have not been architected for cloud and have always had security concerns - are primed for retirement. There are compelling reasons for SD-WAN adoption: The technology reduces latency, it optimizes use of WAN infrastructure, brings down costs and gives better management control (for more details see traditional WAN versus SD-WAN). Today, with 55% of IT budgets taken up by WANs, CTOs are being naturally drawn to SD-WAN. Figure 1: Traditional WAN vs SD WAN With SD-WAN trending, every CTO must ask, "In which line of my business can SD-WAN bring value and the highest ROI? And what is the business case for SD-WAN?" Defining the business case Identifying and defining the business case is the first step in SD-WAN adoption. Typically, businesses will want to increase the available bandwidth as they expand. Doing this with MPLS is expensive. SD-WANs make it easy to increase bandwidth without adding to costs. Often, businesses are in the process of retiring old technology. At this point, they would want to consider SD-WAN and upgrade their infrastructure to take advantage of MPLS, broadband and 4G. Finally, SD-WANs provide visibility into applications allowing administrators to prioritize traffic based on application criticality. This has the net effect of improving user experience and ensuring that business is not affected due to poor bandwidth. The other drivers for SD-WAN adoption include agility and security. Automation can speed up configuration and deployments while traffic from data-sensitive applications can be isolated for enhanced security. Analyzing the business case Once the business case is defined and business goals set, effort should be directed to analyzing the business case for appropriate solutions. This involves examining: • Network architecture: This includes understanding the type of routers, links and potential software upgrade required • Utilization: Link utilization and the impact of outbound traffic on inbound and vice versa, along with the type of links (symmetric or asymmetric) which business are constantly trying to optimize • Application landscape: Type of applications, their behavior and SLAs associated with the applications. Special attention needs to be paid to the following category of applications: • Security analysis: This is an important aspect of the analysis, and the solutions implemented must align with compliance requirements of the business. The

analysis must include: •   Cost: Capturing the complete maintenance and management cost of the WAN implementation. This will include: Identifying potential problems During the analysis stage the technical shortcomings of the WAN need to be understood and documented. This will form a major input in determining the specifications of the SD-WAN. This stage requires data from existing network monitoring platforms or from the service provider, and then subjecting the data to analysis. Some of the key areas to be analyzed include: Choosing an SD-WAN By creating a business case, analyzing it and listing problem areas, the most suitable SD-WAN solutions can be identified. At this stage, the business needs the assistance of an experienced system integrator who can evaluate the multiple SD-WAN choices and determine the best fit solution. The SD-WAN market is crowded with vendors. It is difficult for a business to determine the technical features that will meet business requirements, overcome existing problems and deliver a future-proof solution. This should be left to the SI partner. The benefits of SD-WANs are irrefutable. These benefits are technical and commercial in nature. They solve several problems associated with traditional WANs. Going forward, with the increasing adoption of Cloud-based technologies, growing business locations, the need for unified communications and the growth in video-based collaboration a business will be left with no alternative but to capitalize on SD-WAN. Data management in the digital realm

----- Arcticle source ----- https://www.wipro.com/infrastructure/data-management-in-the-digital-realm/ ----- About the Author Contact Wipro

Please fill the required details to access the content Data management in the digital realm NextGen and heterogeneity Introduction The IT landscape of today is defined by two terms, "high velocity" and "consumer experience". In the earlier white papers, data management in the digital realm - trends, challenges, and other constraints and data management in the digital realm breaking dawn-optimizing the usual, we saw the changing trends and challenges faced by IT departments. We also saw the solutions and hygiene that IT must put in place to counter basic challenges and also enable an organization to survive in today's hypercompetitive environment. The proliferation and adoption of application agnostic hybrid infrastructure platforms introduce many new challenges that were never seen before. Hence, looking at advanced mechanisms that facilitate an organization to pursue agile roadmaps will be a key differentiator. These mechanisms are expected to manage and protect data, provide fuel for strategies, and handle heterogeneity, thereby driving innovation within the boundaries of reducing and leveling budgets. Advanced mechanisms Backup and data protection have refined themselves to meet the demands of the usual workloads but are they enough to meet the expectations of modern IT? The basic question that we need to address is Organizations cannot undermine the importance of big data protection and management. Their goal to achieve big data protection and management is facilitated by a few data management software solutions that integrate with common big data platforms. This integration delivers deep insights on the environment and facilitates varied and practical plans of data protection and recovery. Using intelligent approaches provided by big data protection and management vendors and a combination of technologies, big data environment can be extended to the Cloud. This extension enables recovering a big data environment in a public Cloud infrastructure to ensure business continuity and flexibility both during disaster recovery testing or an actual event. Thus, organizations achieve a big data environment that is protected & disaster averse. With the proliferation of PaaS and SaaS methodologies, organizations are given new ways of utilizing the cloud: primary source for hosting applications. Knowing this, we need to think about a few aspects. In reality, very, few SaaS providers offer data recovery but at a heavy price, complex terms and conditions. Additionally, the process of initiation itself takes weeks. In today's world where JIT concepts rule, such timelines are hardly acceptable. The truth is, these activities must or at least should remain the responsibility of each and every organization, regardless of how data is managed, accessed, or stored. Protecting and managing application and data present in the Cloud is just as doable as that for an on-premise scenario. Just like we keep multiple copies of the same data, some on-premise and off-premise likewise we keep multiple copies in the Cloud, either the same Cloud or other Clouds. Another approach for applications running in the Cloud will be to use Cloud file sharing technology with links pointing to a backup server on premise. This helps bring elements of governance, e-discovery, and compliance with the data landscape. Now that we have seen that solutions and methodologies are available to perform efficient backups, organizations will have to find solutions around challenges surrounding methodologies of locating and accessing protected data. The next set of questions which need to be pondered upon are The solution should be such that it ensures data is stored securely in a single, indexed, de-duplicated, storage agnostic virtual repository to enable recovery, retention, access, and search. In addition, it

should be intuitive enough to facilitate employees in performing basic restorations with minimal training. With end-users empowered IT admins no longer have to be part of each and every recovery and restore work. With data management in control, organizations should think around the following The solution architecture should be planned and implemented with the capability of backing data from various sources such as end-user devices, databases, physical servers, virtual servers, and cloud while meeting varied protection expectations.   Figure1 : Any data-any source-any target-anywhere Let us consider an example; files and emails are better being archived & databases backed up. Multiple approaches bring complexities and hence consolidating actions is better. A solution that is deeply integrated with applications and hypervisor, ensures data recoveries are uncorrupted and application aware, enables a single operation to perform backup, archive and reporting will be the most sought after as implementing such a solution will result in reduction in complexity of operations, protection time, infrastructure costs and better administration. We saw above that the software in the solution must have robust functionalities and features that facilitate multiple benefits. But what about the hardware that needs to complement the software. The benefits can be delivered only when the software and hardware are in sync and behave as a single system. Let us question ourselves. Organizations have to focus on software-defined infrastructure solutions that not only provide strong vendor support and services, skill advancement, tightly integrates in an API economy but also contain costs and complement the data management software. Considering another way round, employing software-defined storage as a backup target will bring flexibility and reduce infrastructure costs. Software-defined storage solutions minimize issues like vendor lock-in, especially for hardware procurements from their storage suppliers. According to markets and markets, the software-defined storage market was worth $4.72 billion in 2016, and it could increase to $22.56 billion by 2021. That's a 36.7% compound annual growth rate.[1] Organizations have to harness heterogeneity. Heterogeneity enables capitalizing strengths of individual components be it software or hardware, speeds up returns & improves TCO. However, heterogeneity also invites complexities. To sum up The solution architecture explained here facilitates data protection and management at a pace that matches high-velocity data growth. It is capable of handling and managing complexities associated with heterogeneous data sources, data types and data targets, and innovative platforms such as PaaS and SaaS. It enables efficiencies at multiple levels, ensures data availability and restorability, facilitates monitoring, customizations, and centralization of control through a single pane of glass thereby facilitating monitoring and governance In addition, the solution is programmable and provides necessary touch points that allow seamless integration with intelligent software-defined targets, near-automated deployments, and operations, thereby delivering simplified and rich end user experience. Sauradeep Das Senior Manager, Cloud Infrastructure Services Wipro Ltd. He is a seasoned IT professional with 12 years of industry experience specialized in infrastructure and telecom domains. He has vast experience and played versatile roles during his career including sales, presales, and practice and business development. with masters in management. He is passionate about innovations and adoption of new technologies. He is reachable at sauradeep.das@wipro.com ======================

Software Defined Networking:

Software Defined Networking: Connecting hybrid clouds seamlessly There has been a steep increase in cloud adoption, both by private and public enterprises, for hosting their workloads. Cloud players have made this possible by providing viable solutions to the consumers, who pay only as they use. Hybrid cloud deployments are gaining traction as they deliver the security of private cloud along with the flexibility of public cloud. This computing environment that allows data and applications to be shared between public cloud and private cloud, demands new standards of compliance and standardization of network and security configurations and policies. Traditional ways of connecting the cloud and on-premise datacenter involves various modes like configuring Virtual Private Network (VPN)-native networking constructs. This model though successful, requires skill, effort and involves constant monitoring of the tunnel, which has dependency on firewall/router on the premises. There are cloud networking only solutions which are best suited for multi-cloud networking and help in extending connectivity between various clouds. However, the policy and control remain local to the various clouds and not hybrid for cloud deployments. Software defined networking (SDN), which offers an application-centric approach in data center networking in contrast to a network-centric approach, is looked upon as a game changer in hybrid cloud networks. It enables the elasticity and responsiveness required in hybrid cloud computing. Connecting to cloud: The current models and the challenges Networking for cloud connectivity can be achieved multiple ways. Connectivity via the standard way involves building and operating IPSEC tunnels from cloud to on premises. Figure 1 depicts the standard way of extending reachability from on-premises to public clouds. Figure 1: IPSEC tunnel between on-premises and cloud Several other ways of extending the connectivity involve cloud networking solutions that provide an overlay tunnel between the on-premises and cloud. This method, though effective, cannot extend consistent policy and control and relies on the respective native network constructs. Other ways of extending connectivity include the direct connect/express route from respective cloud providers to the on-premises. Figure 2 depicts connectivity between an on-premises datacenter to public cloud through Cloud Exchange locations. Figure 2: Cloud Connect architecture A cloud service solution extends connectivity between on-premise and corresponding cloud construct by pairing with a Cloud exchange connect location. Though this method provides advantages, the configurations required to extend the reachability is manual with multiple touchpoints and stipulates certain essential skill requirements. Different connectivity types like IPSEC over Internet, Direct Connect, Express route and through Cloud broker, each have segregated control and management

planes which require additional skills over and above the standard networking skills. Figure 3 depicts the typical challenges faced by organizations while adopting various strategies for networking with the hybrid cloud. Figure 3: Current challenges for networking with hybrid cloud SDN for Hybrid Cloud Considering the rate of cloud adoptions and the requirements for standardizing the policy and compliance, the need for extending SDN fabric across various clouds is of paramount importance. The methods described in the previous section aid in networking for cloud, however the policy enforcement is still decentralized and in silos. SDN for hybrid cloud brings in the flexibility of consistent policy push across the clouds, both private and public from a central orchestrator, which is available in both on-premises and cloud model. The network components as part of the innovative solution have greater levels of integrations with cloud native components. This ensures no dependencies exist between the Cloud and Networking teams to achieve business goals. The other important aspect of SDN for Hybrid cloud solution is that the customer can use connectivity mechanisms like Direct connect, Express route etc. for extending the management and control plane reachability beyond the datacenter boundaries. Figure 4 describes the advantages SDN in hybrid cloud brings to the organization. Figure 4: Advantages of SDN in Hybrid Cloud Figure 4: Advantages of SDN in Hybrid Cloud While hybrid cloud with SDN brings in many advantages, there are some associated constraints ranging from hardware dependency, security across diverse platforms, integration with applications, compatibility between on-premises and cloud platforms, and need for planning. Conclusion SDN for hybrid cloud has become the most critical aspect in an organizational digital journey. Precision planning with consulting approach is key to adopting the right SDN in a hybrid cloud environment considering numerous factors like security, application integration, and compatibility. Organizations should embrace hybrid cloud with SDN to achieve speed, flexibility and agility for deploying and migrating applications between on-premises and various public clouds while on the path to achieve digital transformation. Lalit Kameshwar Practice Manager, Cloud & Infrastructure Services, Wipro Limited. Lalit has 13 years of experience in the field of information technology, networking infrastructure architecting, and technical delivery. He specializes in the field of software defined, traditional and Cloud networking. He leads a team of SDN solution architects, Cloud and OpenStack networking professionals, to shape the future of the SDN business for Wipro in global geographies. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.
=====================

Global | Open | Connected

Global | Open | Connected The future of logistics with Physical Internet The future of logistics with Physical Internet November | 2019 The article discusses: Goods efficiently and seamlessly moving across borders in standard-sized, modular containers just like bytes of data... This is the exciting premise of the Physical Internet, which involves application of the digital internet technologies and methodologies to the physical world. While the boundaries between the physical and digital world have been blurring for years, some barriers, such as logistics, remain. For instance, we can select, order, and pay within minutes but it still takes a good amount of time to receive the item. This latency is what the logistics and supply chain industry hopes to minimize with the Physical Internet - the logistics system that is based on global physical, digital, and operational interconnectivity. Physical Internet has the potential to become the next frontier of evolution for the logistics and supply chain industry. Experts expect the Physical Internet to become mainstream by 2030i. Let's deep dive into this new logistics revolution – the Physical Internet – to understand how it is expected to pan out, what technologies will play a key role in its evolution, and how logistics companies can prepare for the upcoming disruption. The driving force behind the revolution Logistics serves as the invisible backbone, powering day-to-day tasks in our increasingly digitized lives. But forward looking organizations worry that the current logistics supply chains are unsustainable from an economic, environmental, and societal perspective. The way we currently transport, store, and handle freight is not only inefficient at every step, but also costly. Digest this - 40% of trucks on the road at any given time are empty, that is, deadheading to pick up their next loads.ii Carriers generally operate with a deadhead rate of 15% of their total miles, which means driving 50-100 empty miles. For every ton mile driven, heavy vehicles emit 161.8 grams of carbon dioxide into the atmosphere. According to combined calculations from several data sources, nearly 67 million metric tons of carbon dioxide are emitted by empty trucks annually.iii To make matters worse – not just trucks, even vast distribution centers are underutilized for days or weeks on end. Clearly, making logistics operations sustainable requires companies to commit to integrating triple bottom line goals that include social goals, environmental goals, and economic goals. Applying the principles of the internet to the physical world can help companies do just that. How? Let's look at an example to understand this. When an image is sent from one location to another over the internet, the data is disassembled into smaller packets that are automatically routed through the most efficient network pathways. When the individual data packets arrive at their destination, they are reassembled to present users with the original image. This process uses standardized protocols that are platform independent. Irrespective of the operating system (Mac, Linux, Microsoft Windows) that users leverage, or the device (smartphone or any other handheld device) they use, they will see the exact same image. Now

let's apply this principle to logistics. Standardized set of boxes (much like the standardized IP protocols) can be bundled together on a single shipment (ensuring greater space utilization) and the most efficient available mode of transport (rail/air/water) can be automatically set. Another attribute added to this is service level committed and charged suitably. If during the travel time, this shipment encounters an issue, the next available node can fill in and take over the process. The result: superior efficiencies, asset utilization, and reduced shipment time (through route and lag optimization). It's easy to see that Physical Internet holds immense promise, but what are the key technologies that will drive it? Blockchain and IoT: The building blocks of Physical Internet Blockchain technology holds immense potential for the logistics industry. In 2019, over 20% of logistics providers tested out the technology while an equal percentage have already implemented it.iv The potential of blockchain combined with the power of IoT will be the game changer – it will turn the entire supply chain into a global connected digital enterprise. Blockchain enables distributed ledgers that records all transaction details like proof of ownership, exchange of assets, and enables secure transfer. This will lead to enhanced efficiencies and value for all parties involved with reduced duplication of data, accelerated transaction time, and zero data errors. On the other hand, IoT sensors embedded in trucks, cargo packages, etc. will enable end-to-end visibility for all parties involved and facilitate real time route optimization, and communication between various disparate parts of the supply chain. In essence, the Physical Internet leverages the powerful combination of blockchain and IoT technologies to enable: Better oversight: Blockchain helps track data transactions taking place between multiple networks owned and administered by various organizations as physical goods pass between points in the supply chain. For all parties connected to the IoT network, blockchain records can reliably track any data leaks/theft, breakages in the network and so on, and help initiate remedial action. Safer contract execution through smart contracts: Consider a Physical Internet powered supply chain wherein payments have to be made by one system only when all the conditions are met by other systems. In such a case, blockchain-enabled smart contracts can prove highly useful. Greater security: Blockchains' robust encryption standards provide an additional layer of security to IoT data, making it difficult for any threat player to bypass. How logistics players can prepare for the disruption While the structure of the logistics marketplace in five or ten years from now is still open to debate, companies are realizing that increased collaboration is the way forward. Preparing for the Physical Internet revolution that is expected to become mainstream in just a decade from now requires collaboration on three key aspects: Though top logistics companies have been partnering with national postal companies and small local players for some years now, succeeding in the Physical Internet era will require them to do so far more extensively. This would mean doing away with standalone distribution centers as well as their owned fleet and resources. Everything will need to be shared and operated collaboratively – in a standardized manner. How then will companies compete? The nature of market dynamics, especially the level of collaboration versus competition, will vary between the scenarios. For instance, when it comes to competing at scale, an established network may become a hindrance rather than an advantage, while locally a larger footprint may translate into better market dominance. The future is here

The race to dominate the Physical Internet space has already begun with Amazon competing with logistics biggies such as UPS and FedEx.v The logistics giants are also prepping to thrive in the new Physical Internet era. DHL Express, for instance, has already started containerized last mile delivery to enable cost-efficient transfer of goods between terminals, motor vehicles and specialized last mile delivery vehicles.vi The time to reimagine logistics is here. The Physical Internet with its ability to move boxes like bytes will usher in a new world of global connected logistics – one that will not only be highly efficient and quick but also transparent and secure. Definitely a clear win for both, companies as well as consumers!

Chaos Engineering: Establishing resilience by embracing chaos

----- Arcticle source ----- https://www.wipro.com/infrastructure/chaos-engineering-establishing-resilience-by-embracing-chaos/ ----- About the Author Contact Wipro Please fill the required details to access the content Chaos Engineering: Establishing resilience by embracing chaos January | 2020 Chaos Engineering as a discipline experiments with the system in production to build confidence in its capability to respond and sustain in turbulent conditions. It helps to identify faults and gaps in the systems. One of the basic principles of chaos engineering is to introduce hypothesis and experiments. The nature and scale of the hypothesis are small while closer to the live systems in terms of functionalities. The primary objective of chaos engineering is to generate new unknown information about a system and its behavior pattern as a whole while reacting to a catastrophe. Why chaos engineering is important Ecosystems are becoming more complex and complicated in the digital age. The service outage in current scenarios is

costly, and the impact is multi-fold. The traditional ways and means of testing are not enough to guarantee service availability with next-gen systems. Hence, there is a need for an innovative approach to verify and validate availability in an automated manner. Chaos engineering addresses these requirements. With the approach of identifying the individual component level failures along with ecosystem-level failures, chaos engineering helps to minimize the impact of outages. Chaos engineering is becoming a norm for disaster recovery testing. The use cases and benefits It is recommended to run chaos engineering continuously in the environment. Some of the key benefits of chaos engineering are: Key resiliency areas addressed by chaos engineering Chaos engineering addresses resiliency of key components in any organization (See Figure 1). Figure 1: Key resiliency areas addressed by chaos engineering How to adopt chaos engineering Chaos engineering should be adopted and implemented in a systematic manner. Key principles to enable adoption of chaos engineering are: How to execute chaos engineering in an automated way The overall process of implementation of chaos engineering in an automated way is described in Figure 2 Figure 2: Chaos engineering implementation process Application of chaos engineering Chaos engineering is not limited to IT/software development. It is widely used across industries cutting across locations such as tech-savvy companies, financial companies, educational institutions, media and communication, service providers etc. Key categories of chaos engineering adoption: Conclusion Chaos engineering is enabling industries to increase service availability and resiliency. This proven approach can be applied to any segment as part of disaster management. Currently, Wipro is using chaos engineering as part of its IPs under the SDx umbrella. One of the use cases is AppAnywhere in which chaos engineering is used to provide resiliency and self-healing capabilities. To know more about AppAnywhere or Wipro's chaos engineering capabilities, connect with us at sdx-cis@wipro.com Rambabu Kata Senior Consultant, Wipro Ram is an IT professional with 25 years of industry experience in IT, delivery, architecture, practice and pre-sales. He has a Bachelor's degree in Electronics and Communication Engineering, and Masters in Marketing Management. He can be reached at Rambabu.Kata@wipro.com.

Tackling the problem of complex request

fulfillment process in ServiceNow

----- Arcticle source ----- https://www.wipro.com/infrastructure/tackling-the-problem-of-complex-request-fulfillment-process-in-servicenow/ ----- About the Authors Related Articles Contact Wipro Please fill the required details to access the content Tackling the problem of complex request fulfillment process in ServiceNow March | 2020 Modern businesses of all sizes, looking to improve productivity, agility and responsiveness, need the support of robust IT service management (ITSM). ITSM is the practice of ensuring that

IT service requests, incidents, issues, changes, assets and other aspects of IT services are managed in a streamlined manner. The ITSM function often receives a wide variety of user requests, given the increasingly important role of enterprise IT in driving competitive differentiation. Efficiently managing the volumes of service requests requires IT teams to follow Information Technology Infrastructure Library (ITIL), an integrated, process-based, best practice framework for managing IT services, which specifies that along with the service desk, service requests must be managed by the request fulfilment process. ServiceNow, a cloud-based ITSM tool, leverages the ITIL v3.0 framework. It is the most preferred tool among enterprises for handling the service management process. While ServiceNow empowers IT users to streamline their workflows, there are certain challenges in leveraging it. In this paper, we propose a method to simplify incident and service request process flow to address ServiceNow related challenges and boost IT as well as user outcomes. Tackling the challenges in ServiceNow request fulfilment process The key to Modern day users demand simplicity and instant gratification while using IT services. The ServiceNow platform is designed to maximize user satisfaction by enabling users to easily contact IT support to report and fix issues. The downside: users must navigate between separate pages and forms to submit incidents and service requests (as illustrated in Figure 1). Figure 1. Incident and Service Request process The manual intervention needed to traverse between different form pages makes the Service Request management process time-consuming and cumbersome for users, thereby defeating the main objective of simplifying request management. Request fulfillment aims to provide employees seamless access to IT services, which enables them to work better. According to Gartner, by 2020, business satisfaction with IT support will decrease by 35% due to an inability of the IT Service Desk to support agile releases in a timely and effective manner . An effective request fulfillment process should help users see available services, understand how to request them, and set expectations for how long requests will take to be addressed - all in a user-friendly and quick manner. The solution: Adopting an 'Intake' approach to ITIL A new Intake approach to ITIL can help reduce the navigation time between multiple forms and provide users a single portal to submit incident and service requests. Here's how it works (Illustrated in Figure 2): The proposed approach promises several advantages over the default approach to request fulfilment that is currently available in ServiceNow. The biggest benefit is the transformation of manual tracking of incidents and requests in the delivery process to automated and streamlined incident and service request management. The other key advantage is reduced navigation between various forms that is currently required to create incident and service requests in ServiceNow. Figure 2. Intake approach to Request Fulfillment Leveraging the proposed approach, a record producer applicable to each user can be created to save time, reduce errors, and boost satisfaction. The intuitive portal enables a single destination for users and teams to submit incident and service requests. The business and IT benefits of the intake approach include: Embrace agility in service request management As customer experience surpasses price and product to become the single most important differentiator for businesses, Gartner predicts that organizations will increasingly redirect their investments towards customer experience innovations . In the corporate IT environment, providing a superior user experience boils down to simplifying

the chaotic and complicated service request process by adopting an intuitive and user-friendly approach. It involves moving request fulfillment to the edge - as close to the users – as possible. The intake approach is a way to gather relevant information and reduce unnecessary steps by customizing request intake forms. Its varied benefits ranging from simplified request submission process and faster time to resolution, to reduced cost of request fulfillment, lead to superior user experience and in turn drive competitive advantage. Find, Lock and Capture

Wipro's Value Creation Framework for Service Delivery

----- Arcticle source ----- https://www.wipro.com/infrastructure/find-lock-and-capture/ ----- Contact Wipro Please fill the required details to access the content Find, Lock and Capture A Whitepaper March | 2020 Wipro's FLoC Framework empowers customers with visibility, innovation and the means to measure and track the value delivered. In this disruptive era and ever-changing dynamics of customer experience, value-add seems to have

emerged as a sole lever to ascertain customer delight. Service providers have always struggled to bring out the right potion of value-add which positions a trusted relationship with customers and addresses individual customer perceptions. FLoC (Find Lock and Capture) addresses modern service provider's dilemma of Value-Add and Customer Engagement. It serves as a structured consistent framework that aligns a sequential process to identify and create, measure and track, and impart visibility for unmatched customer experience. The paper discusses: Read the full paper =======================

The 7-step approach to sustainable and mature 'observability'

The 7-step approach to sustainable and mature 'observability' A guide for I&O leaders March | 2020 The 7-step approach to sustainable and mature 'observability'There is a growing interest in organizations to relate technology events to business outcomes, be it impact correlation or a technology investment's influence on business outcomes. Is our current form of monitoring good enough to address this or is there something beyond we need to look at? The paper decodes this question and provides Infrastructure and Operations (I&O) leaders guidance on the monitoring and observability strategies that would enable them transform their I&O organizations from support functions to strategic business partners. Understanding the current I&O challenges In the last decade, businesses have been rapidly adopting and investing more and more in emerging infrastructure, new technologies and business processes to drive digitization and innovation, reduce their time to market and create new ways of engaging with customers and partners. While the embracement of these new age solutions are happening, it is also irrefutable that legacy environment are counting co-exist. This trend has resulted in organizations having a complex and constantly evolving IT environment. The I&O teams managing these environments are now tasked to maintain a holistic view of the application and infrastructure technology, in a highly synchronized manner, treating the whole system as a single unit rather than as a stack of loosely related individual components. Businesses are also now more focused on outcome based agreements that is driving the I&O leadership to be able to provide an end-to-end service-level agreement (SLAs). At the same time, they have a necessity to drive quality up and cost of operations down. In order to scale up to this demand, the operations teams need a comprehensive 360 degree view of their environment, greater and faster collaboration across silos by sharing real time information about performance and associated risks. They need a better understanding of the dependencies across application code, DevOps-driven tool chains, rapidly changing on-premises infrastructure, complex cloud services, and diverse

mobile, web, and Internet of Things (IoT) end-user experiences and their impact to their core businesses. Traditional workflows, change control programs, monitoring techniques, and root cause analytics are slow and reactive to effectively manage today's rapidly changing environments. Overcoming the challenges with 'observability' I&O organizations have always utilized various monitoring processes to collect system data and report on the state of individual elements. However, monitoring alone is insufficient to address the challenges of complex modern environments. The current environment needs monitoring to be complemented by good 'observability', which is the ability to understand why a system behaves in a certain way. We need solutions that are beyond simple monitoring. Observability solutions will help I&O organizations gain better and deeper insights across the full stack in real time, linking these insights to business outcomes, cost of services, and end-to-end development workflows. The upcoming sections elaborate upon Wipro's approach, solution and guidance to rolling out observability concepts and solutions within an organization. Application of observability Let us examine the following scenario to understand this better. The business operations team of a large retail company suddenly sees a decline in online sales. Concurrently, I&O teams see performance degradations on the application supporting the online portal. The database team has been working on database performance issues for the last 3 hours and have identified some long running queries as the cause. Coincidently, security operations has been on high alert due to an unprecedented stream of attacks on the environment. Is it coincidence that sales is declining at the same time that a security attack is on? Without applying observability, various operations teams, from business to IT to security, would be working in silos and wasting precious time before realizing that the individual issues were interconnected. The monitoring solution worked only because each team realized the stated changes in their respective elements through alerts. But was this sufficient to help the business? The need in such situations is for a solution that can provide a more unified 360 degree relational view of the environment, applying artificial intelligence/machine learning (AI/ML) techniques to filter and correlate data across multiple services. This helps the I&O teams to quickly understand business and end-user impact. Observability platforms allow I&O teams to build and maintain comprehensive views of the full status and performance of entire services, from applications, on-premises infrastructure, cloud services, containers, to Kubernetes, etc. In our scenario, a well designed observability solution would have helped the security team to correlate the impact of the ongoing security incidents with the decline in online sales within minutes. The key capabilities to look for in an observability solution are: Figure 1 details guidance on building a sustainable and mature observability solution. Figure 2: The 7-step approach to a sustainable and mature solution The twin pillars of value realization and sustainability The maturity and success of the observability model is completely reliant on ensuring that the observability process is part of the 'Continuous Improvement Process' of the enterprise. I&O leaders need to align and agree to the maturity model, set up maturity achievement goals to establish a roadmap for increasing levels of maturity and ensure complete buy-in of service partners. The future of observability maturity While the concept of observability is not new, Artificial Intelligence and Machine Learning have given it a new dimension and made observability more

realistic and viable with the promise of good return on investments. Organizations, however, should be cognizant of their own capabilities and limitations and adopt relevant solutions that can be easily implemented while deciding on the application of AI/ML concepts. Since value realization and sustainability are the two foundational pillars ensuring good ROI, I&O leaders should make certain that these are well laid down by observability solution owners or partners implementing it. The future of observability maturity is going to be on the analysis front with 'Prescriptive Analytics' gaining interest and momentum. Application Performance Monitoring products will emerge as the most preferred to enable a fully mature observability solution. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.
========================

Three Challenges to Cloud 2.0 Adoption,

and How to Overcome Them

----- Arcticle source ----- https://www.wipro.com/infrastructure/three-challenges-to-cloud-2-adoption-and-how-to-overcome-them/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Three Challenges to Cloud 2.0 Adoption, and How to Overcome Them March | 2020 This article was featured in Wipro Digital. Leading enterprises have long found value in the cloud. Worldwide, companies have invested in cloud services at a 10.7% compound annual growth rate since 2014, and IDC predicts nearly $500 billion will be spent on public-cloud services alone in 2023. Yet the nature of these investments has begun to change, presenting new challenges for enterprises that seek to develop cloud-native operations and leverage the "Cloud 2.0" opportunities that lie ahead. Much of the first generation of cloud implementations were "lift and shift" migrations, with companies moving on-premise or mainframe services to the cloud for simple efficiency gains and cost reductions. Those cloud-based values still hold true. Increasingly, however, companies have realized that embracing the cloud at a deeper level, leveraging it to drive their larger digital transformation, can yield far greater benefits. At the same time, not all applications are appropriate, necessary or cost efficient to move to the public cloud. Many companies are realizing that hybrid cloud strategies will be the reality to get the best value from their resources. Cloud strategies require thorough application portfolio assessment, which rationalizes the portfolio and targets resources at the applications that drive business value. This is Cloud 2.0. Data from Forrester shows that 86% of

business and IT leaders plan to continue investing in the cloud to contribute to their digital growth. Such cloud-enabled growth has been a revelation. However, driving and scaling cloud native is complicated and introduces unique business and operational challenges. For digital businesses, these challenges often stem from trying to integrate disparate cloud architectures across heterogenous environments. Porting an application or service from a private cloud to a public cloud, or across managed providers, can introduce errors and management challenges. In addition, different parts of the application landscape may be optimized for a specific vendor, making the prospect of portability difficult or, in some cases, unrealistic. No matter how advanced a service or qualified a team, businesses will struggle to realize value and continuity across the cloud if their solution is locked into a single vendor. Cloud 2.0 also requires companies to change the way they think about organizing their technology organizations. Companies have struggled to navigate balancing their investments in infrastructure and applications. These have historically been separate and siloed exercises, but they're starting to converge, a difficult shift for many enterprises to make. Wipro has anticipated this convergence of infrastructure and applications and has been advising clients on it for some time. This foresight has guided our creation of transformation platforms to help businesses build, run and manage their business with a Cloud 2.0 mindset. VMware has a similar vision, culminating in the launch of its new Tanzu platform that integrates infrastructure and applications under a single, open-source roof. To build a cloud-native business, companies must commit to a comprehensive IT renovation, adopt an Agile/DevOps approach, and simplify key processes through automation and containerization. With the infrastructure in place, companies must create a new cloud layer upon which to run the applications. This layer must integrate across a multi-cloud architecture and enable IT to efficiently meet business demands. Finally, the enterprise should seek to manage its Kubernetes clusters from a single, centrally managed platform to maintain visibility. Leveraging the full power of the cloud, businesses can realize far greater benefits than simple cost reductions and efficiency gains. The cloud can deliver so much more – for business as well as customers – if companies understand the challenges that lie ahead and learn how to successfully transition to cloud-native models. This journey can be accelerated if companies find the right partners. Wipro has helped hundreds of global enterprises navigate their transformation and develop cloud-native offerings. We're also the proud system integrator launch partner for VMware's Tanzu platform, an innovative and integrated solution for companies looking to fully embrace the cloud. Together, Wipro and VMware offer a comprehensive system to help companies design, build and achieve their Cloud 2.0 future. Rahul Shah VP and Global Head of Consultative Sales, Partnerships and Solutions, Wipro Digital Rahul Shah is in the business of building partnerships. His approach starts with theme-led thought processes that provide clients with a starting point and an acceleration goal in their digital transformation journeys. He maintains an "always a student" learning philosophy, always exploring different concepts, business models, technologies and industries, with the goal of weaving them into better transformative propositions for clients. Milind Halapeth VP of Global Infrastructure Services and Global Head of Cloud Practice, Wipro Milind Halapeth has more than 20 years of experience in the IT Industry and has represented Wipro in leading industry conferences and events on data

center, cloud and emerging technologies. As leader of the cloud practice of Wipro he has played a key role in developing next-generation transformative offerings and rapidly growing the cloud practice across global geographies. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Harness the Public Cloud Advantage by Controlling Costs

----- Arcticle source ----- https://www.wipro.com/infrastructure/harness-the-public-cloud-advantage-by-controlling-costs/ ----- About the Author Contact Wipro Please fill the required details to access the content Harness the Public Cloud Advantage by Controlling Costs May | 2020 Cloud computing has enabled a radical shift in the way modern enterprises manage their businesses and data. Offering unmatched computing speed, reliable performance, and enhanced productivity, cloud technology also promises organizations the benefits of reduced CapEx. Firms no longer need to invest in bulky and expensive hardware and software that were required to manage onsite data centers in the past. However, there are hidden cost implications of cloud computing in the form of constantly surging OpEx, and this often results in large, unexpected invoices that leave enterprises grappling to optimize their IT budgets. In our earlier paper on Managing Cloud Costs, we discussed the 3 main problem areas including cloud cost visibility and transparency, cloud cost optimization, and cloud cost management. This paper, in continuance, discusses the economics of traditional IT models vs. cloud computing, public cloud in particular. It explores how organizations can optimize their CapEx and OpEx with public cloud to better allocate budgets and stay on course on their IT spends. The prelude - Economics of traditional IT models Traditionally, enterprises have looked at IT as a necessary investment to ensure smooth functioning of organizational systems. Over the last three decades, IT has evolved to play a pivotal role in prioritizing business decisions and investments with the computerization of various business systems including the systems of record, engagement, and finally, systems of insight. These systems have provided a solid foundation for organizations by ensuring maximization of performance and throughput designed for peak loads. However, with constantly evolving technology, CapEx has continued to rise steadily, accumulating a lot of inefficiencies in IT systems hosted in data centers. All this while, OpEx across organizations was driven down drastically with increased automation of IT systems aided by centralized co-ordination and management of virtual machines. However, this also resulted in increased complexity of systems, further fueling automation and more CapEx

investment. While financial engineering did play a major role in converting some of the CapEx into OpEx through various financial models, customers were still locked into multi-year contracts that required significant initial investments and were expensive. About 2010 – 2015, the advent of cloud technology promised enterprises the advantage of on-demand, large scale data storage infrastructure and computing power that was available with no financial lock-in. The biggest advantage of the cloud is that it offers enterprises economies of scale, as they only need to pay for the services they use. This is perceived to lower both CapEx and OpEx and enable better infrastructure management. More organizations than ever before are migrating to the cloud. Consider this: According to IDC, worldwide public cloud services spending will more than double by 2023[1].   Inherent challenges of the cloud model Despite the promise of financial freedom and ability to select IaaS (micro, nano, large, extra-large instances), PaaS, containers or cloud native services (for eg., serverless) based on the enterprise's needs, cloud technology has some inherent limitations in the areas of security, compliance adherence and the organization's ability to control their IT environment. Ironically, all of these issues are silently contributing to yet another challenge –cost management. Let us explore these limitations in more detail: Growth of hyperscale computing Innovation driven by hyperscalers provided cost benefits, but also increased complexity of operations. The benefits of cloud outweighed concerns around outages and increased surface for attacks. Organizations have and continue to invest heavily in strategic and consulting engagements that provide better maturity models, encouraging them to adopt cloud. Increasingly, more and more enterprises are technologically locked into the engagement, with the slow realization that there are unexpected and hidden costs riding on these cloud investments. Lack of control Enterprises end up storing their data with another party, outside of their physical and organizational control, trusting that their data will be secure and maintained well. Many organizations find this lack of in-house control of the data servers unsettling. This cautious approach to the cloud has resulted in shadow IT steadily gaining prominence, silently fueling unforeseen and unplanned expenditure. The problem of plenty Another important challenge that cloud poses is that of choice. Customers continue to be flummoxed by the different cloud options available and the services each entails, including the different sizes, types and reusable components from the providers. The cloud marketplace has evolved exponentially over the last few years - IaaS, PaaS, SaaS, serverless compute functions, cloud native services, readily consumable business services, customizable services/functions. All of these have opened up a plethora of adoption models making the right choice of cloud services a very difficult one for the customer. Containerization Servers, virtual machines and cloud instances have now matured into containers that best utilize underlying resources to run microservices. Running containers on cloud leveraging multi-cloud orchestration delivers cloud agnostic workloads that could scale in an agile manner. Monolithic workloads are being rewritten for cloud – to run on containers and to be able to scale across cloud or move across clouds. However, the complexity of estimating the cost of running these microservices is probably the toughest challenge for technologists. Containers can scale infinitely depending on the load – running only parts of the code that is relevant as a microservice and scaling back when done. However, what organizations do not realize, and service

provides often fail to stress upon is this - this architecture has multiple moving parts that doesn't seem to be contained in a predictable cost model. Spiraling OpEx One of the biggest advantages of the cloud is the shift from CapEx to a pay-as-you-go model. Much like utilities billing, customers pay only for what they use, when they use it. However, while this proposition is an easy call to make for start-ups, it merits considerable thought and careful planning for large enterprises in the long run. Often, the overall price tag of cloud services ends up being much higher than anticipated for large scale enterprises. 50% of enterprises spend more than $1.2 million on cloud services annually [2]. Most large organizations, because of the amount of data and processes they run, end up overprovisioning for their services, and maintain a hybrid cloud model, incurring large OpEx costs that were unplanned for in their budgets. If they are not careful, these costs can spin out of control, doing away with the biggest advantage of the cloud. Balancing costs with technology innovation Despite the challenges, cloud is driving innovation heavily across industries. The public cloud service market is expected to reach $623.3 billion by 2023 worldwide.[3] Boundaries are blurring and technology is enabling new avenues of growth for traditional businesses. Data is now seamlessly leveraged across domains, and services are hyper-customized to users resulting in empowered end users. The growing importance of digitization is now reflected in new organizational roles such as 'Chief Digital Officer'. The ability to deliver custom content, lean and agile processes enabled by DevOps, microservices on containers, PaaS, and other cloud native services will determine next gen digital business. Efficient cloud systems of the future will be driven by the ability to predict the need, availability of efficient levers to scale quickly, and agility to deliver appropriately. However, as IT management models evolve, cost imperatives are being significantly impacted. Organizations, particularly the larger ones, must ensure that they continuously monitor and improve their OpEx even as upfront CapEx seems to be under control. As mentioned in How to Manage Cloud Costs, organizations must have a thorough understanding of their CSP's billing and invoice structure. This is particularly crucial for organizations operating on hybrid platforms, as hidden and unforeseen costs can significantly impact overall budgeting. Efficiency is guaranteed when performance and throughput are maximized while costs are kept under control. Enterprises must make a conscious effort to correlate business impact with ongoing spends to measure efficiency and take corrective action where required. Best practices to continuously monitor OpEx costs on cloud include: Businesses must make use of available information that pinpoints the inefficiencies in the systems and continuously work to improve their OpEx margins. IT must be chartered with the task of maximizing output and reducing inefficiencies in the system even as innovation continues to multiply the speed at which business happens. Seamless migration to cloud-native state Cloud service providers and hyperscalers must enable organizations to better estimate their consumption with a proactive quota and budget management system. Wipro's holistic extensible platform 'BoundaryLess Enterprise (BLE)' enables enterprises to rapidly adapt to the cloud-native digital world by seamlessly integrating and operating multi-cloud services. BLE provides organizations with a ready-to-use, plug and play platform that delivers cloud services for multiple stakeholders customized to their needs. The solution manages hybrid cloud-native applications lifecycle on CI-CD through DevOps

extending to edge services. Most interestingly, BLE offers automation of workflows to rapidly provision, control, secure and terminate cloud services. It ties in the subscription to the user and the service – so that enterprises can meter their cloud consumption needs and stay on top of their costs. The optimization module in BLE helps organizations estimate their bill of IT, monitor real time consumption and correlate billing data. It further provides organizations with recommendations on optimization, enabling them to operate on the cloud efficiently by improving performance and reducing costs. The Case for a New Approach to Cloud Operations

----- Arcticle source ----- https://www.wipro.com/infrastructure/the-case-for-a-new-approach-to-cloud-operations/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content The Case for a New Approach to Cloud Operations   June | 2020 Imagine you are the IT manager responsible for managing your customer's on-demand video service. The application has module for purchasing various subscriptions, authentication, content catalogs, user data and the content files. Users may use a multitude of devices to access this content from anywhere in the world once the authentication is established. The application uses the standard three-tier architecture that has been running fine in IaaS mode on cloud. A recent event that led to a sudden spike in demand for VOD services has made the customer rethink the whole application architecture. The application designers propose a true cloud-native architecture with components that utilize Platform-as-a-Service (PaaS) in public cloud. The customer likes the idea since it gives them the opportunity to add rich features to their application, enhance the user experience by providing custom recommendations enabled by analytics, and align their capacity and spend with the demand. The proposed architecture will have services like Containers, API gateway, NoSQL DB's, Cognito, Lambda functions, RDS, Mobile Analytics, SQS, SNS and Elasticache. You still have to manage the

service, however, instead of well-established server-centric parameters, you now have event logs, file data and process information to create a map of your application health. This is now a common problem service providers face when customers opt for application transformation in serverless and microservices architectures. The distributed, message-driven and loosely coupled application architecture of cloud services means the way we look at service management needs to move beyond the server-centric approach. How is cloud monitoring different The cloud-native transformation of an application could enable it to scale from few container or Lambda instances to few thousand and back within a short time, generate data that is a mix of structured and unstructured, and provide customers the power to use true pay-per-use model. The platform services themselves are highly available and data backed up in multiple places by default, so the up/down status monitoring or traditional redundant architecture is not required. For the IT manager, this poses problems of choosing which services and parameters to monitor, which tools to use, how to bring it all together in a unified application view and, measurement and charging for services delivered. Some of the challenges in implementing this approach are: Service operations need to make some fundamental changes in the approach to provide the true and integrated picture of the entire IT estate. This requires rethink of our traditional ideas of application architecture and the functional value of each of its components. Service model for the future The traditional service delivery model needs to change to reflect the new reality of on-demand and fluctuating consumption, spread over multiple independent services. The changes required are not limited to a new set of shiny tools the managers should acquire, rather, cover the entire service management lifecycle. People: The composition and skillset of the operations team needs to reflect the blurring boundaries between application and infrastructure in the Infrastructure-as-a-code (IaaC) world by Tools: The arsenal of tools needs to expand to cover services beyond servers and storage. Some examples are Pricing: Aligning the service delivery price with the service consumption is perhaps the biggest challenge for the service providers. While the underlying management tool cost can be managed since these work on volume of data generated and processed, the resource deployment cannot move linearly up or down with the service consumption. The services landscape in the cloud especially around PaaS, is still evolving. The rapid pace of innovation and launch of new services makes it even more complicated to track, evaluate and integrate the management methods into the existing operations framework. To stay ahead, we need to bring the learnings of CI/CD model into our operations framework to quickly adapt our service offerings and delivery model in line with the market demand. Wipro's Office in a Box (OIB) Framework –

3 simple steps to edge IT infrastructure

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipros-office-in-a-box-oib-framework/ ----- Related Articles Contact Wipro Please fill the required details to access the content Wipros Office in a Box (OIB) Framework July | 2020 Almost all organizations, across industries and sizes, need to have geographically dispersed employee bases. The extent of dispersion varies from multiple locations in a single metro area (for smaller organizations) to hundreds of locations across multiple countries (for larger, multinational organizations). All of these geographically dispersed locations (factories, remote offices, warehouses, service centers, and so on) need to have local backend IT infrastructure to deliver services to the local staff. Examples of these services include local file storage, local applications, network connectivity, and more. One common design question that CIOs and IT teams of these organizations face is how to strike an optimal balance between "Standardization" and "Customization" – which have divergent objectives. On one hand, "Standardization" hopes to achieve (a) ease of management (b) reduction in costs and (c) consistent services for all staff; and on the other hand, "Customization" hopes to achieve (a) local needs catering (b) best-fit solutions (c) specialized services. Wipro's OIB (Office in a box) framework aims to bridge this gap with a structured approach. 1. Services Needed The first step is to list out all services that are required to be delivered at your remote sites. This should be an all-encompassing list covering all possible services (not all services maybe required at all sites). Having this list helps to create a good starting point for identifying the right solutions that can cater to all the requirements. It also helps to arrange these services in a ladder fashion to identify the various technology components needed. An example of this ladder is shown below. As you look at the figure on your left, the questions that you need to ask yourself are which services to include and exclude. For example, if you come from a manufacturing background, a   good question to ask will be "Should we include OT security in this list?" Another example, if you are a user of Raspberry PI or you are thinking about sensors to collect IoT data from windmills, it may be relevant to ask if these services should be included. These decisions are often driven by organization design, separation between IT/OT teams and responsibilities, gaps in current services, and a vision for future services. The output of Step 1 will be an exhaustive list of services required across the various sites. 2. Categorization of Sites The next step is to categorize the sites in a particular fashion. The objective of categorization is to group sites with similar requirements together, which can likely be

supported by a single solution. The rationale used for categorization, as well as the factors considered to arrive at a categorization, may be different for each customer. However, the objective remains the same: each site should not have its own unique "Christmas tree." For example, sites could be categorized based on number of staff members at each site, or they could be categorized by the nature of business conducted at each site. They could also be categorized by distinct IT needs at each site. Take a look at the picture below to see how sites are categorized on three dimensions: criticality, size, and type. Looking at the picture above, you might ask yourself, "Why don't I categorize sites as factories, warehouses, and so on?" Or you may wonder, "Why don't I have four types of sites by criticality and five types of sites by size?" The output of Step 2 will be a defined list of site types or site categorizes where all sites within a single type or category have homogenous IT requirements (the services identified in Step 1). 3. Design Principles At this stage, we have a matrix consisting of lists of services and services needed per site category (as shown below). The final step is to lay out the design principles, which will be used as a basis for creating the solutions that will be deployed at each site. The intent is to develop design principles at a tactical and operational level, which will help make critical decisions around costs, choice of technology/OEM, and so on. Take a look at the design principles listed below. These could be generic or specific to your situation. For example – if you have already invested in a particular brand of hyper-converged infrastructure it maybe worthwhile to take a decision to either continue or change. Or it maybe on your mind to reduce remote site infra by moving to cloud Based on the design principles, the final decision on the OEM and technology solutions will be made. In parallel the service delivery mechanism will be defined to be used to deliver services to customers/staff/business. From a pricing standpoint it will be an objective to convert the services into a simple intuitive catalog. The final output of the entire framework will be a catalog as depicted below comprised of a service catalog and a price catalog. And so on. To conclude, Wipro's OIB framework takes a simple yet customizable approach to converting IT requirements into a simple, reusable catalog. IOT and Ambient Computing

----- Arcticle source ----- https://www.wipro.com/infrastructure/iot-and-ambient-computing/ ----- Ambient computing at the workplace Five characteristics of ambient computing What drives ambient computing? The future of ambient computing About the Author(s) Related Articles Contact

Wipro Please fill the required details to access the content IOT AND AMBIENT COMPUTING THE ERA OF THE SMART AMBIENT WORKPLACE BEGINS July | 2020 Ambient computing – the combination of end point hardware, software, user experience and machines/human machine interaction and learning is the fabric of everyday life. It is about using a computer or far field communication–enabled device or internet-enabled device, without necessarily consciously using it. For instance, we no longer have to use a desktop to be operating a computer. That is the effect of ambient computing – the accumulation of collective devices we use in our homes and workplaces become extensions of each other; they're invisible to us, work in sync with us, and offer us an overall seamless experience. The Internet of Things (IoT) and ambient computing are directly related. IoT describes the smart home and how the devices connect. Ambient computing is what happens when these devices are connected, and more so, what they learn from each other. Think of smart dwellings; you enter the building with your ID card, and it automatically remembers your preferred lighting and ambient temperature, knows how you like your coffee, can recall when your first meeting of the day is due to start, and more. From smart phones and TVs, watches, and voice-activated digital assistants to intelligent coffee machines, smart lighting, and daylight-imitating alarm clocks, the ambient computing experience is all around us. But what are the capabilities of ambient computing and IoT in our workplaces? Ambient computing can help a business function to its full potential, eliminate unnecessary steps in processes, and collect, analyze, and actively learn from data. Ambient computing in the workplace turns the traditional computer-employee relationship on its head. Instead of the employee utilizing the computer to gather information, the computer (or rather, collection of internet-enabled devices) gathers the information for us when we indicate we need it or perhaps even before. Ambient computing already provides some of the intelligent services that are becoming commonplace in the modern work environment, such as voice-driven speakers, smart thermostats, virtual agents, and chatbots. In striking contrast to traditional computing platforms, ambient computing moves the focus away from the physical device. As we move toward fully-integrated smart workplaces, ambient computing will become the norm and provide multiple benefits including cost savings for business leaders and decision makers, and increased collaboration among employees. Among several characteristics of ambient computing, here are five to note. Invisible: Foremost, ambient computing is behind the scenes. For instance, in a business conference room environment, an AI system can gather information and take notes on a conversation without employees realizing. At the same time, the camera and speaker system can adjust to improve image quality, focus on the person talking in the discussion, and block unnecessary noise. Data-centric: Data centers are at the heart of ambient computing. The more data-intelligent systems, the better their ability is to use context to understand certain situations. In remote contact centers, customer data can support virtual assistants as they make suggestions on how to improve a conversation. Embedded: Ambient computing embeds technology into the workplace environment. For instance, in the communication environment, intelligent assistants embedded into collaboration tools can help users find information and set reminders that enhance productivity. Familiar: Ambient computing is simple and easy to adopt. In the communication environment, intelligent tools are

becoming more natural. Now that users can communicate via voice or text, they can choose the experience that works best for them. Inclusive: Ambient computing integrates tools seamlessly. For instance, an AI bot can bring information from CRM systems and help desks into collaboration tools, which is far more useful than nonintegrated systems. A cluster of technologies is enabling the move toward ambient intelligence. Zero UI (user interface) – The replacement of a computer screen and keyboard with machines that respond to voice, touch, movement, and biometrics (for instance, fingerprint and retina recognition). Artificial intelligence – The emergence of computer systems that can perform tasks that a human would generally do, such as reading documents, data analysis, decision-making, and language translation. Machine learning – The ability of computerized devices to build skills and improve performance of various tasks without being explicitly programmed to do so. Natural language processing – Enables computers to listen to people asking questions, understand their words, and reply. Edge computing – Improves responsiveness and turnaround time by moving processing from a "centralized" processing center (most likely in the cloud) to smaller processing centers close to where the information is being created or delivered. Mesh networks – Provide continuous connectivity as computerized device users move from space to space. Mesh networks can encompass seamless movement among a multitude of devices, applications, locations, and individual networks. Ambient computing will continue to leverage machine learning and other forms of artificial intelligence to create a digital workplace environment in which companies will integrate technology seamlessly and invisibly into every business process, thereby maximizing usefulness while minimizing distractions. As technologies in the ambient computing-IoT ecosystems of homes and workspaces become embedded into retail stores, hospitals, and transportation services, IoT sensors will feed people's movements and routines into the cloud. AI systems will absorb this data and refine the directions they give to the smart devices to execute ambient computing scenarios. The result: A future of radically better experiences in which nearly everything is integrated, interconnected, and intelligent – without the mess of applications and actions that are necessary today. Poorna Rajesh D Senior Practice Manager – IoT & Smart Cities, Wipro Limited Poorna has more than 15 years' experience in consulting, pre-sales, technical delivery, business development in IoT, IoT platforms, solution engineering network operations, datacenter infrastructure management, remote infrastructure management solutions, solution design, and solution architecture. =====================

Are Today's Data Centers Less Relevant?

Are Todays Data Centers Less Relevant? July | 2020 Are data centers dying? In my opinion – no, but they are undoubtedly undergoing a transformation. Today's data centers are being repurposed to deliver the right services at the right time, and at the right cost: making an evolution journey from hardware-centric to service-centric. Traditional data centers provided limited and restricted functionality owing to the inefficient processes and layers of complexity associated with deploying and managing multiple layers of the infrastructure. Today, organizations are under immense pressure to keep pace with the demands of rapidly changing business models and innovate at a much faster pace than ever before; the delivery modes of IT infrastructure and services are adapting to meet these demands The growth in data has forced most organizations to revisit their data center strategies by developing new operational capabilities such as software-defined infrastructure, analytics, and the increased adoption of cloud platforms. A greater amount of effort within data center transformation is being directed towards reducing complexity and providing more streamlined operational models for the core and edge of IT infrastructure. With these new edge and modern data centers, organizations aim to accelerate the deployment of resources for better-optimized workloads. The journey to cloud Adoption of cloud - private, public, and hybrid - is rapidly increasing. Analysts predict that even conservative organizations, which formerly subscribed to a "no-cloud" policy, will get there soon. Gartner predicts that by 2022, the market size and growth of the cloud services industry will proceed at a pace nearly three times the growth of overall IT services. Corporations with 'no-cloud' policies will be as rare as those with a 'no-internet' policy. Niche Cloud Service Providers (CSPs) entered the cloud market promoting the efficacy of a "pure cloud" play. On the other hand, key technology veterans enjoyed a huge legacy software installed base and positioned their respective hybrid cloud while trying to strike a balance between cloud and on-premises systems. It has worked well for both of them to be positioned as leaders in this new era of transformation. The transformation challenges IT executives face a complex set of competing priorities to balance "Run to Change", when considering how to transform their data centers. The first of these is to determine how to modernize the legacy footprint and monetize the cost of operations. A key initiative in this transformation journey involves identifying potential workloads that are better serviced on public cloud platforms, and workloads that are good to be kept within the data centers and continue to leverage existing investments on infrastructure. The second set of priorities are to ensure that internal business units have easy access to the IT resources that allow them to transform core services. It should help them enable new digital experience for their end-users, identify how IT can contribute to generate new revenue streams, and help them mark distinction

in the market. This includes bracing new cloud-native applications development, enabling easy or ready to use platform for developers, whether they develop on/off-premise. In addition to this, as new cloud-based applications development mature or demand increases or it becomes more strategic for business, then, that's the time for organizations to decide if it makes more business and commercial sense to bring them back to data centers. To make transformation work successfully at both fronts, organizations are collaborating closely with internal stakeholders to formulate a plan to undergo transformation across the whole organization. This includes reevaluating on / off-premise infrastructure investments, enabling a platform to help the staff to develop new skills, developing a resource pool to support transformation journey working hand in hand with lines of business to ensure business continuity and competitiveness. In most of these scenarios, organizations are looking for experts to guide them to navigate these changes as effectively as possible, because this is indeed a new and bold territory for many of them. Enabling a true hybrid experience In essence, what we are describing here is the adoption of a hybrid-cloud environment, which provides organizations the flexibility to run workloads on/off-premise, platforms that are well-integrated to enable seamless movement of workloads between on /off-premise, a single pane of glass to manage seamless operations, and provide a truly hybrid-experience. Having said that, the true hybrid experience cannot be realized by using conventional platforms alone. A true hybrid experience requires a transformation of technology and operations, i.e. people and processes that deliver value to the business must adapt to the model. Enriching skills, redefining processes, resetting priorities are typically the most difficult steps to data center transformation and modernization. While some choose to take a step ahead and transform themselves, others choose to redirect human capital towards driving new business innovation. As part of this journey, many decide to move conventional applications onto enterprise-class public clouds that can guarantee enterprise SLAs. They shift the human capital investment that was used to manage those applications—the people and skill-sets within IT—toward more innovative projects that directly promote business value. Whether organizations decide to modernize their data centers, adapt managed provider platforms, or both, they need a trusted partner who can help them navigate best-in-class solutions and services in their transformation journey. Many organizations approach this transformation in a phased manner: they begin by modernizing infrastructure, then automate IT services, and incrementally transform people and processes to support the business.Others may want to jump-start the process all at once to transform as quickly as possible. To facilitate the jump-start approach, many vendors have created the best of the breed, ready-to-consume hybrid-cloud solutions. Organizations are also discovering that this combination of tools, built on best-in-class services and proven IT strategies, may best deliver for data center transformation. Next-gen data centers Next-gen data centers constitute evolution of merging IT where resources are abstracted, hardware complexities are zeroed-down, workloads run seamlessly on most appropriate set of resources, and static infrastructure transform into dynamic, workload-aware, pattern-driven methodology that can proactively forecast demand and respond with utmost speed. This journey requires a two-fold change – organizational and cultural. Those who succeed will witness the new way of working, drive innovation,

and make use of rapidly evolving technologies to speed-up their go-to-market strategies. This will be the beginning of the Next-Generation Data Center. Vasudha Mishra Senior Practice Manager – Cloud Infrastructure Services, Data Center and Hybrid Cloud Practice, Wipro Vasudha is an IT Professional with over 15 years of work experience in Information Technology (Service and System Integration), with a blend of IT Infrastructure solutions consulting and pre-sales expertise. Cloud Cost Optimization is a day-1 exercise

----- Arcticle source ----- https://www.wipro.com/infrastructure/cloud-cost-optimization-is-a-day-1-exercise/ ----- About the Author(s) Related Articles Contact Wipro Please fill the required details to access the content Cloud Cost Optimization is a day-1 exercise August | 2020 Optimization on the cloud can be different than in a traditional data center environment. A key reason can be because site reliability engineers put automated and decision-point processes in place from implementation day-one and continue this onward with existing and new hybrid workloads. At the same time, customers desire a proactive vs. reactive approach. To become a cloud clairvoyant, the optimization process in the cloud environment must factor in a design (or a re-design) of resources, processes and tools. Optimization best practices must be planned while leaders map requirements to solutions, design migration steps, and make target foundations enterprise-ready. Customers and vendors (e.g., Systems Integrators SIs) jointly agree on optimization best practices. It's essential to start with the information you know (for example, contract agreements, business requirements, resource plans) and then determine the resources needed to optimize and integrate the right skills and optimization processes/tools into cloud operations, including CI/CD pipelines. From there, tracking and measuring the results, and actioning on a feedback loop brings agility to the continuous cloud cost optimisation. Here are some questions and/or discussion points that can be used during Agile cloud optimization sessions: Optimization is a continuous process, and you may have many agile sessions with your customers until your process matures and is well established. Manish Garg Vice President & Business Head – Cloud & Infrastructure Services, UKI, Africa and Strategic Accounts Europe. During his 28 years with Wipro, Manish has worked across UK & India playing strategic roles. He has been instrumental in building the Wipro's Cloud & Infrastructure business while serving clients with distinction and living Wipro's culture and values. Manish is deeply

engaged in the marketplace, having worked across industries and has direct experience of helping customers with large IT transformations, small advisory projects and global engagements. Wipro wins the 2020 Global Systems Integrator of the Year by Nutanix

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-wins-the-2020-global-systems-integrator-of-the-year-by-nutanix/ ----- Contact Wipro Please fill the required details to access the content Wipro wins the 2020 Global Systems Integrator of the Year by Nutanix September | 2020 Wipro Technologies was awarded the 2020 Global Systems Integrator of the Year award by Nutanix. The award was presented to Wipro during the Partner Xchange Keynote session of the Nutanix .Next Conference. Nutanix awards the Global System Integrator (GSI) of the Year award based on several factors including financial performance of the alliance, executive relationship level, momentum in the global go-to-market between the firms, and the market release of joint industry solutions. Wipro is very excited by the momentum we have seen during the 2020 fiscal year including global market uptake of both the VirtuaDesk™ VDI service powered by Nutanix and the Digital Database Platform Service which we offer based on Nutanix ERA platform. The ecosystem of Wipro's leadership, technical engineering experts and client facing field force have embraced the full stack of Nutanix software and have been important evangelists for us in the joint base of global clients. Over the past 3 years, Wipro and Nutanix have released and continued to enhance the Wipro VirtuaDesk™ solution which is a managed VDI service built on a foundation of Nutanix AHV, Prism Pro and Calm. Wipro's VDI management fabric allows IT leaders to monitor enterprise user experience in real time, automatically and proactively scale resources where they are needed and manage the operations and financial performance of their workplace services through a cadre of reports and dashboards. In 2019, Wipro and Nutanix launched the Digital Database Platform Service (DDPS), a service designed to manage enterprise databases including Oracle, SQL, MongoDB, and Postgres for day to day management, copy data management and intelligent automation of routine DBA tasks. DDPS is built on Nutanix ERA and Calm and has been received positively by analysts as well as the joint client base of Nutanix and Wipro. Wipro is excited to be recognized by Nutanix for this joint work we have undertaken with Nutanix

over the past 5 years. Nutanix has been an incredible partner for us with results that have grown from year to year across our regions and industry verticals. This award is a great barometer and motivator for Wipro and we fully expect exciting growth globally in this relationship.

Results-Oriented Leadership Practices for Today's New Normal

----- Arcticle source ----- https://www.wipro.com/infrastructure/results-oriented-leadership-practices-for-todays-new-normal/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Results-Oriented Leadership Practices for Today's New Normal September | 2020 Keeping employees focused and engaged is no easy task on a typical day. But doing so during a global pandemic like COVID-19 is an altogether different ball game. Not only were employees forced to adapt to remote work almost overnight – away from the usual channels of collaboration – but the gnawing uncertainty of tomorrow is also making them anxious and prone to depression. So, what does effective leadership look like in the post-COVID world? There's no playbook for effective leadership, but the golden rule of thumb -- aptly illustrated in the widely acclaimed book What Happens Now? -- remains unchanged, even in the face of the current pandemic.[i] It says that all leaders, even highly successful ones, must constantly reinvent and change themselves or risk being outrun by their businesses. In this article, we'll explore the leadership styles best suited for today and list proven best practices regarding what leaders should do to successfully navigate disruptions. COVID-19: A Litmus Test for Leadership A recently launched Leadership Confidence Index revealed that the confidence level among the current leadership of corporations is very low. Only 15% of global business executives have confidence in their current leadership to successfully manage disruption.[ii] This statistic is disturbing -- even for the most seasoned leaders who have weathered many a storm. Today's situation calls for a radical shift in leadership with a greater focus on agility and adaptability and a shift away from top-down or command-and-control styles of leadership. There's an old adage by Theodore M. Hesburgh that says, "The very essence of leadership is that you have to have a vision. You can't blow an uncertain trumpet," which aptly describes the kind of leadership we need today. Even though the COVID crisis has emerged as a test for good and bad leadership, crisis does not build character -- it reveals it. Existing leaders, who are agile, visionary, and courageous enough to take bold steps will emerge as leaders who will make a difference in the post COVID world. With workplaces evolving into a new category of Work from Anywhere (WFA) -- which could be a home, office, café or even the beach -- a new dimension in leadership strategy and approaches has emerged. A leadership style developed by Kenneth Blanchard and Paul Hersey, known as Situational Leadership, is emerging as one of the best ways to lead teams forward today. Situational Leadership refers to leadership that's tailored to a situation and serves as an effective tool helping leaders align their behaviors with the needs of the individual or groups they are responsible for.

With situational leadership, it is up to the leader to change their style, versus followers adapting to the leader's style. The key aspect about Situational Leadership that makes it relevant for today's new normal is flexibility. It adapts its style and behaviors depending on the needs a situation brings to the table. Adapting to the New Normal: What it Takes While there are no silver bullet solutions to lead amid this crisis, our seven proven best practices can help leaders navigate their way to finding the right solutions to their specific problems. #1 Lead and Transform: Leadership is all about constantly striving to transform oneself, others, organizations, and society at large. When faced with crisis, leaders should not be unwilling to step forward, because even a wrong step forward is better than not taking a step at all. #2 Influence: Leaders should aim to create a positive influence that fosters acceptance and, in turn, positive actions. The goal should be to inspire others through one's actions. For instance, if members from the IT team worked through the night to set up a VPN system to enable remote work for hundreds of employees, leaders should highlight their story for others to hear about and feel inspired. #3 Motivate: One key characteristic is how a leader can motivate and lead a team to success. Leaders should empower their teams to make decisions, even if they're wrong. This is important because making a mistake is rarely a matter of 'if' and almost always a matter of 'when' in terms of business. In the face of wrong decisions, good leaders motivate their teams to take the right learnings and apply them in future. #4 Engage: COVID-19 has created more stress than ever to the workplace. Not only are people feeling isolated due to remote work and not being able to venture out, but many are also feeling anxious and depressed. In this new normal, leaders need to create strategies, innovate platforms, and develop environments to create and foster constant engagement with employees. #5 Collaborate: Creating a culture of virtual collaboration among all stakeholders is emerging as a new leadership priority in the post-COVID world. Audio-visual collaboration tools can come in handy for leaders to conduct fun team sessions, virtual games, online meditation, and more. For instance, Goldman Sachs offers cooking classes via Zoom.[iii] Other firms have launched virtual choir workshops, drinks and lunch sessions, story time for children, and even online challenges to boost employee morale.[iv] #6 Flexible: We live in a VUCA world – volatile, uncertain, complex, and ambiguous. Therefore, leadership agility -- the ability to take rapid and effective action amid complexity -- is a key attribute today. In today's fluid and dynamic environment, leaders need to be flexible and willing to amend business strategies and plans quickly when necessary. Those who fail to take note of changing consumer preferences and course-correct early on will end up perishing. For instance, consider Blockbuster's failure and Netflix's subsequent growth to a billion-dollar media giant.[v] Blockbuster's CEO John Antioco, though renowned for his operational acumen, failed to see how media consumption was changing with the emergence of digital technology. #7 Focus on Results: Good leaders must shift their focus activities to outcome-based measurement for success in today. To achieve results, leaders should focus on reskilling and upskilling themselves as well as their teams to prepare for the current and future challenges in the post-COVID world. Finding Opportunity in the Face of Adversity Amid a prolonged crisis like COVID-19, good leadership can be the silver lining the world needs thanks to its potential to turn a crisis into an opportunity for innovation. For instance, if leaders adopt a non-binary,

creative approach to solving the rash of problems that typically emerges in any crisis, so will the others in the organization. This is the time for leaders to seize the moment. Because, once the crisis abates, everyone is likely to remember how leaders acted during the pandemic. Are leaders equipped well to pass their toughest leadership test? Only time will tell. ----- Arcticle source ----- https://www.wipro.com/infrastructure/modern-workspaces-for-finserv-with-vdi/ ----- Optimize Your Remote Working Experience with VDI Services for Finserv Wipro virtuadesk™: Flexible workplaces for Finserv Benefits of VDI overview Wipro's Virtuadesk benefits for Finserv CIOs A Global Swiss Bank Case Study Contact Wipro Please fill the required details to access the content Modern Workspaces for Finserv with VDI The pandemic has changed the fabric of business as we know it. With partial lockdowns, mandatory quarantines, and constantly evolving situations, banks today require more flexibility to meet the challenges and opportunities created by the new way of working. To keep operations and customer engagement throughout the pandemic, many banks adopted stop-gap solutions like Virtual Desktop Infrastructure (VDI) services that enabled them to extend their businesses from in-store to digital to stay productive and continue serving their customers. As the world enters recovery and explores new paths to prosperity, banks looking to improve the resiliency of the workspace, enhance the security posture to mitigate ever increasing security threats and modernize must reassess their workspace strategy. To achieve long-term transformation and realize the benefits of VDI, banks need immediate IT-business alignment and a resilient roadmap focused on security, productivity, agility, and value optimization. A Swiss bank shifts to flexible workplaces with Wipro's virtual desktop infrastructure services at the peak of the pandemic As a leading financial institution in Europe, a

Swiss bank with a global presence needed to pivot quickly during an unprecedented crisis. Like many businesses, the bank was in completely new territory but needed to act quickly and decisively to realize their long-term digital ambitions and effortlessly support their remote workforce. Learn why the financial institution went to Wipro for their VDI services. Our VDI expertise extends beyond COVID-19. We launched Wipro's virtuadesk in 2013 and are pioneering desktop as a service with a bank in the Middle East.   Ready to explore the benefits of VDI?
=======================

Want to see VDI for financial services in action?

----- Arcticle source ----- https://www.wipro.com/infrastructure/secure-scalable-workspaces-for-finserv-with-vdi/ ----- Have a clear objective Simplify and centralize workspace management Adopt VDI with a Gartner Recognized Magic Quadrant Leader Contact Wipro Please fill the required details to access the content Secure, Scalable Workspaces for Finserv with VDI January | 2022 In traditional server setups, an operating system is installed right on top of the hardware of a physical server. With virtualization, an additional layer is created between the hardware and an operating system, enabling the operating system to run inside each virtual machine. VDI hosts desktops that allow users to securely access company data using their personal desktops, laptops, tablets and smartphones as access terminals while the entire applications and data securely reside in the enterprise public or private cloud infrastructure. Changes on a master desktop image can be quickly mirrored to virtual desktops in a desktop pool to create flexible workspaces at scale to make it easy to monitor and operate. Though not impossible, it is difficult to provide secure, scalable, and productive remote workspaces without the right desktop virtualization service. Wipro's virtuadesk™ answers the call. VDI for remote access and mobile workforce Wipro's virtuadesk, a VDI solution for banking, enhances the remote working experience and makes it easier for CIOs, CTOs and CISOs to meet their business objectives across cost optimization, employee engagement, security, compliance and operational excellence. Not all VDI solutions or workspaces are created equal Some solutions fail to focus on subtle elements like personalization, configurability and user experience, which are critical in ensuring productivity. These elements also do not address the inherent network-related challenges, multi-location availability and security while employees work remotely. Few other solutions cannot scale existing enterprise investments in virtualization or offer the commercial flexibility of a pay-as-you-go model. What differentiates Wipro's virtuadesk™ is its hybrid/multi-cloud capabilities that ensure any device, anywhere, anytime availability, plus the full benefits of VDI and desktop as a service: With Wipro's virtuadesk, banks and other financial institutions can enable a simplified, secure, intelligent and high-performing workspace for a remote and mobile workforce today and in the future too. If you want to increase collaboration, move at the speed of business in an uncertain environment and scale as your needs change, explore the benefits of

adopting flexible workplaces. Here are 3 simple steps to leverage the benefits of VDI and desktop as a service. These are the strategies we had used to help a top Swiss bank achieve business continuity and keep their employees engaged and productive. Similar steps will work for you too. What's the purpose of your business? How does that translate to new ways of working? Have a clear vision of what you want to accomplish with desktop virtualization. Asking these questions will help you gain a deeper understanding of what VDI is and how to create flexible workspaces. The right infrastructure can prepare you for whatever lies ahead, enabling your enterprise to pivot quickly and keep things going during trying times. If a user has an issue that they cannot solve with the VDI platform's powerful desktop as a service feature, there is a 'support' tab that is integrated with customer service. Wipro's virtuadesk eliminates device dependence, giving users and administrators greater digital dexterity to pivot forward as things change quickly. The platform's threat intelligence proactively monitors and manages issues and helps create secure flexible workplaces.   Schedule a live demo with us.   =======================

Pragmatic approach for supplier onboarding

----- Arcticle source ----- https://www.wipro.com/infrastructure/pragmatic-approach-for-supplier-onboarding/ ----- About the author(s) Related Articles Contact Wipro Please fill the required details to access the content Pragmatic approach for supplier onboarding Progress, Not Perfection September | 2020 1. INTRODUCTION The increase in complexity of today's IT environments managed by various suppliers requires a structured and robust supporting model that can be provided to customers toward delivering services in an effective and collaborative manner. The SIAM (service integration and management) capability provides valuable insights and acts as a guide in setting up a SIAM organizational structure. Through this whitepaper, we would like to share our practical experiences of the approach taken to onboard suppliers in an SIAM ecosystem. Effective onboarding can improve collaboration between the customer, service integrator, and suppliers. It will also ensure that suppliers feel welcome and prepared, in turn giving them the confidence to deploy the right level of resources to make a positive impact within the SIAM model. 2. KEY STAKEHOLDERS Stakeholders are those who may be impacted by or influence supplier onboarding. Identifying the right stakeholders is an important element in this approach. We suggest identifying stakeholders based on the degree of influence they would have on the entire supplier-onboarding process vis-à-vis the impact it would have. The following outlines the pragmatic approach for onboarding suppliers: 3.1 SEQUENCING THE APPOINTMENT OF SUPPLIERS Suppliers are broadly classified into three types: Prioritizing the onboarding of core SIAM suppliers first, followed by non-core SIAM suppliers, and finally the commodity suppliers is the recommended approach. This sequence is based on the below matrix of 'Business Value Contribution' versus 'Overall Risk on the Systems/Business' and is helpful in minimizing the risks associated with the transition of such

an activity. In addition, here is a short list of recommendations to consider while evaluating the onboarding of suppliers: 3.2. STANDARDIZED ONBOARDING PLAN An onboarding plan aims at making new suppliers familiar with the overall strategy formulated to onboard suppliers and get them acquainted with processes and tools. It also acts as a reference document to track the progress of the supplier's onboarding. The owner of this plan is the service integrator. The details below should be captured in the plan: 3.3. SUPPLIER CONTRACTUAL PROCESSES AND TOOL ALIGNMENT As a prerequisite, the service integrator should work with suppliers to understand their contractual processes and tools agreement with the customer. The objective is to design an integrated process supported by tools that will ensure all suppliers are engaged properly in the service-delivery model and are able to provide value. Before the planned supplier onboarding workshop, a draft version of the process documents and tool integration plan should be ready. 3.4. SUPPLIER ONBOARDING WORKSHOP The objective of the workshop is to introduce new approaches and working models and resolve operational details of the implementation. These workshops require extensive preparation. The retained customer organization, service integrator, and suppliers should all have a clear, mutual understanding of the contractual commitments. The service integrator is responsible for driving the workshop. The below-mentioned actions should be carried out during the workshop: 3.5. FORMAL AGREEMENT BETWEEN SERVICE INTEGRATOR AND SUPPLIERS Post conclusion of the workshop and after agreement of the onboarding plan, a formal agreement between the service integrator and the suppliers should be facilitated by the retained IT. There are various names for such agreements, including Joint Way of Working (J-WOW), Memorandum of Understanding (MOU), Information Sharing Document (ISD), etc. The agreement should cover details on agreed processes, tools, governance, service levels, and reporting. 3.6. ONBOARDING SIGN-OFF The service integrator should be responsible to get a sign-off from the customer and the suppliers on completion of the onboarding exercise. The below verification should be performed at the final stage: References Scopism. (n.d.). www.scopism.com. Why Modernize Legacy Applications with Microsoft Azure?

----- Arcticle source ----- https://www.wipro.com/infrastructure/why-modernize-legacy-applications-with-microsoft-azure/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Why Modernize Legacy Applications with Microsoft Azure? September | 2020 Advancements in technology and digital innovation in the last decade are fundamentally altering business processes, products, services, and relationships. In turn, organizations are restructuring to adapt themselves to this trend. This restructuring, in other words, digital transformation, forms the foundation for organizations looking to deliver value to their customers. It is expected that worldwide spending on digital transformation enabling technology and services will cross USD 2.3 Trillion by 2023[i]. This paper explores the growing role of application modernization in facilitating digital transformation. It further delves into the inherent challenges in application modernization and explores how Microsoft Azure solutions offer cutting-edge features and benefits to help organizations effectively modernize their applications and win the battle for transformation success. Application transformation in the era of the cloud With enterprises embracing digital transformation and adopting Infrastructure as a Service (IaaS) and Software as a Service (SaaS) models to build cloud-native digital capabilities, the application modernization ecosystem is gaining momentum, playing a key role in accelerating the enterprise's digital journey. Many organizations using legacy systems spend huge resources on maintaining existing applications – this stymies innovation while consuming resource bandwidth. Additionally, existing systems are equally hard to replace as they carry vital organizational information and are central to business process operations. Enterprises that realize this are gradually adopting legacy modernization, investing in innovative approaches to upgrade their applications, and reducing maintenance costs. Application modernization is also helping organizations develop agility, improve operational efficiency, align to IT investments, and stay on top of their business imperatives by delivering a superlative customer experience. The global application modernization market is expected to grow to USD 16.67 Billion by 2022[ii]. The case for application modernization and inherent challenges Why modernize legacy applications? Most legacy applications are monolithic, making them difficult to update and

expensive to scale. Modernization supports a microservices architecture where the components are smaller, loosely coupled, and can be deployed and scaled independently of each other. This gives businesses the freedom and flexibility to customize the application modernization processes to meet their individual business requirements and challenges. Application modernization involves redefining, upgrading, and aligning existing applications to meet evolving business needs and accommodate future requirements. It leverages emerging technologies including Machine Learning (ML) and Artificial Intelligence (AI), Cloud, DevOps, Microservices, Containers, IoT, and Serverless Computing amongst others to develop an agile portfolio of solutions tailored to meet new age business requirements. However, selecting the right technology platform that is aligned to their specific business requirements is critical in ensuring successful application modernization. This requires a detailed understanding of technology options available in the market and complete alignment with business objectives. For instance, is the modernization project a business centric one or a technology-led requirement? Application modernization is a complex, multi-layered process with many related factors. Some of the challenges in application modernization include: Given the above challenges, investing in the right tools and platforms is key to successfully transition from legacy applications to the digital world. There are many tools and platform options available including microservices, containers, agile dev processes and the likes. Future forward with Microsoft Azure – 5 reasons to modernize now One of the more popular solutions is Microsoft Azure, fast becoming the leader in the cloud infrastructure race with cutting-edge features and developer-friendly offerings. Q2 2020 earnings reveal that Azure has grown 47% in revenue over the previous quarter, and Microsoft's Intelligent Cloud Business grew 17% to USD 13.4 billion.[iii] Whether your data is on-premises or on the cloud, tools and platforms from Microsoft, specifically the Microsoft Azure Cloud offering promises solutions for almost every possible business modernization scenario. Its microservices offering enables organizations to build, deploy, and operate applications independently at scale, and at speed. With 30-40% of all bespoke applications running on .NET, it is easy to see why Microsoft Azure is gaining in popularity. Microsoft Azure is enterprise ready, with the ability to run all existing ASP.NET apps, allowing organizations to leverage existing knowledge and technology. It is a fully managed services offering with built-in autoscaling, CI/CD, load balancing and more. It delivers strong platform benefits by providing a stable yet flexible foundation for existing and new app development. Its full-stack cloud offering entails frontend, backend, data, intelligence, and DevOps solutions. The solution is also highly secure, providing built-in security services and unique intelligence to protect workloads across infrastructure and applications. It offers a plethora of applications and tools to choose from for advanced development, monitoring, debugging and telemetry. We list a few apps from the Azure family: Azure Web App is a fully managed Platform as a Service (PaaS) that provides various tools and services to create reliable, secure, and scalable mission-critical web apps, mobile apps, API apps, and logic apps – all in a single instance. It provides a multi-lingual and versatile framework, supports visual studio integration, and secure integration with other SaaS apps. Azure Mobile App connects with customers wherever they are with Mobile Backend as a Service (MBaaS), delivering tailored experiences based on

their interests and behavior. Azure Logic App helps schedule, automate, and orchestrate tasks, business processes and workflows required to integrate apps, data, systems, and services across organizations. Azure Function allows you to run small pieces of code or "functions" without the worry of application infrastructure, enabling the cloud infrastructure to provide all the up-to-date servers you need to keep your application running at scale. WebJobs is also a feature of Azure App Service that enables you to run a program or script in the same instance as a web app, API app, or mobile app, with no additional cost. Here are five ways in which application modernization using Microsoft Azure delivers a competitive edge: Apart from the above, Azure offers enhanced security by building in better security protocols against phishing and threat attacks. Azure also offers greater compliance by constantly introducing new compliance updates and guidelines. Toward resilience with Microsoft Azure Microsoft Azure can deliver immense value to an enterprise's digital transformation strategy. However, it is important for organizations to partner with Application Transformation Service Providers who have the requisite knowhow and skills, can align to the business vision, and be futuristic in their approach. A scalable partnership will ideally involve application modernization, Azure Microservices, APIs, Azure Container Services, Azure Automation and DevOps in a scalable, robust, and iterative manner. Wipro's cloud Services works at the intersection of cloud, mobility and analytics to create simple, effective and future-ready digital solutions, firmly planting your business into the future. Reach out to us at marketing.cis@wipro.com to understand how you can leverage Wipro's Application Modernization Services to future-ready your business, today. Why IT Operations Need Artificial Intelligence?

Related Articles Contact Wipro Please fill the required details to access the content Why IT Operations Need Artificial Intelligence? Performance and Cost Optimization with AIOps October | 2020 The key driver for continuous technological advancements has always been the intent to increase human efficiencies and enhance quality of life. This ultimately results in cost optimization, rapid production, and enhanced quality. Information Technology (IT) is no different. It is the core enabler for every business, driving overall technological advancement for modernization and cost optimization. Wipro has been enabling the transformation of physical data center based infrastructure to cloud-based SaaS and containerization for multiple customers. Our experts leverage Docker & Kubernetes for a channelized DevOps pipeline to transform everything in IT as an application or a software service – be it infrastructure, network or an end application. AIOps plays a crucial role in implementing DevOps pipeline on containers (See Figure 1). This helps allocate the required capacity to the right resources at the right time in an agile manner. At Wipro, we leverage AIOps to understand available capacity and determine where and when it is required. Figure 1: Moving to cloud based SaaS and containerization   AIOps: Enabling true capacity optimization on cloud and containers Digital Cockpit, designed by Wipro's Business Service Management (BSM) team leveraging machine learning (ML) and application of data sciences, helps us develop solutions for true capacity optimization on cloud and containers. We treat monitoring as the insight intelligence providing the trigger points for: With our business-focused solution, we take a proactive approach to performance analysis based on application environment data and AIOps platform connected performance insights. This helps treat each IT component as an application and use everything as a software service. Table 1: Applying Wipro's AIOps solutions to real world problems   Building a new paradigm for next gen DevOps At Wipro, we provide visibility and clarity to the most complex multi-cloud environments by bringing together data from disparate sources so that IT teams can analyze and understand data in context. This also stops applications from failing or running slowly by isolating the probable cause, while linking patterns or anomalies to events. Our AIOps story in DevOps is aligned to: To provide an application like experience as an AIOps service, Wipro makes the DevOps journey free of resourcing efforts. This helps DevOps focus on real development operations. The key to a flawless DevOps pipeline is knowing what resources are required when, and from where they can be allocated. While containerization is the natural answer for this, it can work in perfect sync only when the system is intelligent enough to continuously run environmental scans to report on availability and optimize capacity. Table 2: Adopting futuristic DevOps with AIOps   Becoming operational ready with AIOps Figure 2: DevOps with AIOps   AIOps is becoming an inevitable component in EaaS-driven DevOps due to the concept of continuously

training machines from machines within and applying the ML techniques on ever-evolving data from multiple operations channels. As agility is dependent on mutating demand, it makes business sense to move from current DevOps to futuristic DevOps with AIOps to drive insights for optimization. Ankur Jalpota Global Practice & Business Head for BSM & AIOps, Wipro Ankur works with technology partners in advancing and modernizing the tooling space and aligning the overall offering with the ongoing evolution journey. He is an evangelist for humanizing technology that focuses on end customer usability and ground level business impact. Ankur has played key roles in developing next-generation transformative offerings and executing growth strategies at Wipro in AI & Cloud. You can reach Ankur at ankur.jalpota@wipro.com   Click here to download your copy of State of IT infrastructure report 2020 Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. The Future of IT Field Services

----- Arcticle source ----- https://www.wipro.com/infrastructure/the-future-of-it-field-services/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content The Future of IT Field Services Digital Delivery Model for Cost Optimization and Great User Experience October | 2020 Workplace services, today, focus on access from anywhere, end user experience, automation, security and cost optimization. This is supported with different technologies like modern device management, evergreen IT etc. However, one of the areas that is still unexplored is end user field services, which is still traditional, and has high turnaround time as well as cost. The crucial questions The answers to these questions lead to the evolution of new age end user field services, which focuses on technology-driven cost-optimized field services. Better user experience In the digital world, user experience is core. Organizations want to provide to the end users a better experience as they work from anywhere, anytime. The key to better user experience is to proactively identify the issues and solve it affects the end user. User experience analytics tool like Wipro UxM combined with proactive problem management helps in providing a better user experience. UxM tool provides the analytical data, which includes historical as well as real time analytics. The power of UxM is optimal when it blends with ITIL best practices. Wipro's UxM framework is one of the UxM tools that blends with ITIL best practices to enable proactive identification and resolution of flaws in end user environment. Automation Automation is another key component that enables a better user experience as well as reduction in mean time to resolve. The experience will be excellent if the UxM identifies the issue in the environment and resolves it automatically. Most automation tools focus on automatic resolution of software or

configuration related issues. Hardware related automation is minimal and is one of the unexplored areas. The users prefer to sort issues on their own and only reach out to the IT department when they are not able to solve the problem. The IT departments or IT service providers need to enable solution for the IT end users irrespective of whether it is a software problem or a hardware problem. There are solutions that can automate hardware related issues as simple as getting a soft drink in a vending machine or doing a transaction in ATM machine. Wipro's Digilocker solution is one among the same, wherein a user can drop his machine and take a new machine and start working. As todays cloud option enable the user data in cloud and profile settings can be pushed automatically, the user can start using the device in no time. Traditionally, getting an accessory like mouse, headphone etc. involved a cumbersome process of raising the request, getting it approved, IT department delivering the device etc. This can be automated by the combination of the workflows in the ITSM tool and vending machine. Access to the Digilocker and vending machine can be enabled through employee access card, which makes it simple for the user to get the device. Hardware remote diagnosis Application that runs over the operating system. Any other issues, like BIOS level issues, cannot be diagnosed with remote support tools. So, remote diagnosis of hardware was an unexplored area for ages. A few solutions like Intel VPro technology helps in remote diagnosis using the chipset technology. These tools along with their hardware monitoring solution help in remotely identifying the hardware related issues irrespective of anywhere, anytime working. Effective resource utilization The number of end user field services IT staff deployed is usually very high in the traditional model, which increases the cost of maintaining end user devices. Lack of automation and absence of remote diagnostics for hardware were the major reasons for the same. IT staff had to be onsite to diagnose hardware-related issues. The IT staff member then has to log a call with the warranty vendor to replace the concerned part and wait for the warranty OEM vendor to dispatch the part and get it replaced. This used to take a long cycle time. With the arrival of automation and remote diagnosis tools, it is a matter of leveraging the OEM support for warranty replacement, which reduces the overall mean time to resolve and ensures a better user experience. Near zero physical field support New age field services shifts from people-intensive delivery model to technology-enabled delivery model that harness the power of automation, remote support tools, OEM warranty support and user experience analytics for a near zero physical field support. Distributed Cloud - Connecting Edge and Core

Distributed Cloud - Connecting Edge and Core November | 2020 Introduction With the advancement of technology transformation, cloudification has become democratized. Cloud and Cloud Computing have become essential commodities for everyone everywhere today. Currently, cloud could be on-prem or public, and the next wave in this transformation is Edge Cloud, which seems to be gathering momentum. In the near future, both edge cloud and central cloud will definitely share equal amounts of the pie. Is this enough though? Have we reached the end state for multi-cloud or hybrid cloud with simply transitioning to central cloud and edge cloud? The answer is an emphatic NO. So what represents the next wave in this multi-cloud transformation journey? Distributed cloud could hold all the answers. This document aims to define and socialize key aspects of distributed cloud, its importance, trajectory, benefits of adoption, and challenges. Definition of Distributed Cloud Distributed cloud is defined as the distribution of public cloud services to different locations outside the cloud providers' data centers, while the originating public cloud provider assumes responsibility for the operation, governance, maintenance, and updates. In other words, distributed cloud is one of the multi-cloud computing platforms that connects the edge with core / central clouds. This connectivity is established from a distributed set of machines in multiple locations, connecting one of the services hub or service. One of the salient differentiators of distributed cloud is that it leverages the features and benefits of Fog computing while bridging, interconnecting Core and Edge clouds. Distributed Cloud and its Importance Today's multi-cloud operandi are experiencing different levels of complexities and challenges. With the increased usage of intelligent devices such as smartphones, sensors, etc., data generation is growing exponentially. All of these new dimensions are adding more complexities, and making it harder to manage, organize, and optimize to get the best outcome from each of these devices. This is adding new challenges as well as opportunities for organizations. As a result, there is a new, evolving set of business opportunities and complexities in a true hybrid, multi-cloud model. These edge and core clouds alone do not fulfill the requirements on a larger scale with the current modus operandi, wherein most of the core services are delivered primarily from central clouds (be it hyper-scaler or On-Prem clouds). This leads to the creation of a new set of delivery models and innovations to deliver efficient, integrated services. In order to address and offer a new mode of services in an efficient but cloudified model (without losing the control), Distributed Cloud explores and consumes core central services efficiently. Key drivers for focus on distributed cloud are due to its uniqueness and the value proposition it brings in addition to advancements

in the industry at large. Some of the drivers and developments are listed below: Thus, Distributed Cloud brings value to cloud service providers by seamlessly leveraging the central services in a distributed manner, without compromising on control and efficiency. Transformation Approach Distributed cloud is going to evolve from the current set of cloud models to both Core and Edge clouds. The journey to transform the current models to meet and suit distributed cloud requirements will be long. Central Cloud Adoption: In this model, the current hyper-scalers will redefine and tailor current services and models to become light, but retain the overall governance and control functionalities. Service Providers Adoption: The other approach is where the service providers such as Telecommunications or hosting or system integrators or hosting providers or a combination, wherein the services are tailored and expanded to adopt a distributed model of services delivery. Edge Cloud Providers Adoption: Since the nature of distributed cloud is closer to edge cloud providers, the latter is naturally a suitable fit to expand the portfolio of services by adopting the governance and control layer functionality to meet and align for distributed cloud. This could be achieved through a large edge cloud, be it near edge or far edge cloud sites of the current edge cloud models. Figure 1 : Cloud Transformation Models   Execution Models With reference the execution models, the distributed cloud are delivered in one of the two ways – Commercial or Community centric. However, it is expected additional models might emerge in due course of time with the advancement of technology and consumption pattern. Figure 2 : Multi-Cloud Architecture Delivery Models   Key Benefits Distributed cloud will add value across organizations with these salient benefits: Key Challenges The trajectory and journey for distributed cloud when compared to other cloud evolutions isn't simple by any stretch of the imagination. This is due to the prevalence of various complexities, multiple ecosystems' involvement, and varied levels of approval entities involved. Location is going to be the key in distributed cloud unlike other clouds. The law of the land defines some of the characteristics for distributed cloud. Some of the key dependencies for this distributed cloud evolution and maturity would be the feasibility and compatibility of hardware abstraction layer sharing capabilities. These components include but are not limited to processors sharing, (DRAM) Dynamic Random Access Memory, and add-on components such as SSDs, GPUs, and FPUs. Conclusion Distributed cloud will definitely evolve over a period of time, bringing enhancements to user experience while simultaneously proving to be economical. Its evolution is based on various socio-economic and political dependencies in addition to technological advancements. This buzz around the concept of distributed cloud will be an integral part of CXO in the long run. Distributed cloud connects the dots of edge cloud and central cloud to make the ecosystem a true multi, hybrid cloud in the future. The Innovation Imperative: How to Stay Ahead

----- Arcticle source ----- https://www.wipro.com/infrastructure/the-innovation-imperative-how-to-stay-ahead/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content The Innovation Imperative: How to Stay Ahead November | 2020 Anyone in the tech circles would have heard (and used) the term 'disruptive innovation' more times than they can remember. The tech world is fascinated with overnight success - moral stories and lore abound on how leading companies, at the peak of their powers, missed the ominous signals of disruption that finally delivered the killer blow. Blockbuster's demise and Netflix's meteoric rise is stuff that digital history is proud of.i However, as is the case with most other popular concepts, the disruption theory is unfortunately becoming a victim of its own popular success. Politicians to boardroom CXOs, shop-floor managers to consultants, and pretty much everyone else in between in piggybacking on the term 'disruptive innovation' without realizing what it actually is. Innovation and the consequent disruption are part of a process, not a product. This paper discusses what disruptive innovation really is, how it differs from incremental innovation, and what it takes to get innovation right.   Decoding Disruptive Innovation "Disruptive Innovation" refers to the evolution of a product or service over time, which means that almost every innovation — disruptive or not - starts as a small-scale experiment. What differentiates successful disrupters from the not-so-

successful ones is that the former primarily focus on getting the business model right, more than the product. For instance, take the iPhone – its success is not just due to awesome product quality, but due to the fact that it gave users a convenient way of using internet-centric applications and created an ecosystem of application developers. When such small innovations are applied at scale, they start eroding the incumbents' market share and their profitability. Because disruptive innovations typically take hold at the bottom of the market, addressing the same needs as high-market solutions in a simple and relatively cheap way. Often in all small-scale experiments that go on to become big disruptions, financial rewards are not the driving force for the innovation - they are the outcome. Let's take the example of Google that began as an academic experiment by two PhD students to understand how web pages link to each other.ii The search results in their experiment were simply a by-product of the index they created. Their goal was small and simple - providing a big positive change to the experience of users. Similarly, Uber started with the goal of providing a better service than taxis and had just three cars registered on its app back then. Airbnb, the world's most revered vacation rental company, began when its founders rented out their own loft with an air mattress and free breakfast to make extra money. All of these examples reiterate a simple fact – disruptive innovation in most cases may not be the product or service itself but the process and business model behind it. Most companies make the mistake of thinking of innovation only in terms of new features and products, while real success hinges on two other key factors: a) Business model innovation, and b) User adoption and retention. Let us illustrate this with an example. In 1886, Carl Benz applied for a patent for his "vehicle powered by a gas engine." This was a big invention, but did not qualify as a disruptive innovation. Because the early automobiles were expensive luxury items that could not disrupt the transportation market for horse-drawn vehicles that were used by the larger population. Disruptive innovation in the automotive industry happened only when the lower-priced and mass-produced Ford Model T debuted. In 1913, the Ford Model T became the first automobile to be mass-produced on a moving assembly line. By 1927, Ford had produced over 15,000,000 Model T automobiles. The lesson: the disruption was not the automobile itself but the assembly line approach (business model innovation) that built the automobiles at affordable rates, enabling greater uptake (user adoption innovation). At this point, let's take a step back and come to the story of Uber again. Would it qualify as an example of disruptive innovation or a service improvement? Industry pundits often exclude Uber from the list of true disruptive innovations because of three important factors: The Disruptor or the Disrupted: What Separates Incumbents From Start-ups While the definition of disruptive innovation is clear, the bankruptcy of Kodak in 2012 shook incumbents across industries. The term "disruptive innovation" became a buzzword and began to be linked to the ability to use new digital technologies and business models to disrupt entire industries. The start-ups came to be symbolized with this kind of innovation due to their agility and nimble ways of working that give them the ability to challenge long-held business models. Why do leading incumbents of industries fail to be the innovative disrupter themselves, despite the fact that they have the customer and financial base to maneuver? The answer lies in how most big companies think about innovation. Many large organizations are good at "incremental" innovation

given their existing customer base, and easy access to market research and innovation trend consultants who support these initiatives. More importantly, there is a significant difference between disruptive and incremental innovation. The goal of incremental innovation is primarily to signal that the company is keeping up with trends—it is retaining relevance, and driving continual service improvements to stay competitive. Incremental innovation is also relatively easy to plan, resource, and measure – mostly because it doesn't disrupt anything. In fact it's fun and exciting, like a new feature or a new flavor. Incremental innovation has a feel-good factor attached to it that makes it easier to implement as the typical change management hurdles on the employee side don't stand in the way. Securing management buy-in is easier too in the case of incremental innovation as it doesn't require reinventing the wheel - rather it enables companies to sail better, cheaper, and faster. Fortunately, most big, established companies are good at this kind of innovation. However, when it comes to disruptive innovation, incumbents' main challenges stem from an excess of institutional control and an inability to scale up innovations. In a recent McKinsey survey, many respondents from established companies said that parent companies had hindered the development of their start-ups and limited entrepreneurs' freedom to make independent decisions.iii Viewing Innovation From the 'Experience' Lens Regardless of start-ups or incumbents, a winning formula for innovation in any company should focus on how it will impact user experience – whether they are internal employees or external customers. Identify the opportunities that can improve the experience – even in a small way – and then tie that thought back to product features and/or services to see where disruptive or incremental innovation fits best. Taking an experience-focused approach can help companies marry the methods and pace of start-ups, with the scale of large enterprises – making for a win-win. As businesses navigate turbulent times amid global market uncertainties, innovation will be a key source of current and long-term competitive advantage and getting it right will be a critical differentiating factor for success. The SD-WAN Advantage – Case Study Wipro, with its consulting framework for network, InsightixTM, and its extensive experience in large-scale project management, global logistics, and vendor management, has realized WAN transformation for customers across industries. Read this case study to find out how Wipro enabled a global electronics manufacturing company to take control of its complex legacy network by bringing down WAN operations cost by over 30% through vendor consolidation and Cisco SD-WAN implementation in client sites across 40+ countries. Explains SDWAN business case Watch how our trusted partnership of 25 years delivers end-to-end innovative business transformation solutions #WANFreedom, Wipro's SD-WAN managed-services offering, helps organizations take control of their WAN (Wide-Area Network) investments and optimize performance across cloud networks. Powered by Cisco's industry-leading SD-WAN technology, #WANFreedom delivers superior monitoring, maintenance, and managed services, flexibly, and at a lower cost. =======================

The Advent of New-Age Tools for the Hybrid-Cloud Operating Model

About The Author Related Articles Contact Wipro Please fill the required details to access the content The Advent of New-Age Tools for the Hybrid-Cloud Operating Model November | 2020 In the last decade, organizations have shifted from largely dedicated, private, on-site data centers to a pool of on-demand compute capability – a.k.a. the cloud. Interest in cloud computing is growing at an unprecedented pace. Enterprises have embraced the cloud in their quest to drive innovation, enhance agility, and cut costs. According to Gartner, 90% of all organizations will be using cloud services in some form by 2022[i]. Hybrid-cloud computing: Furthering public cloud growth Data from the IDC (International Data Corporation) Worldwide Semiannual Public Cloud

Services Tracker suggests that the worldwide public cloud services market grew 26.0% year over year in 2019 with revenues totaling $233.4 billion.[ii] This includes infrastructure as a service (IaaS), platform as a service (PaaS), and software as a service (SaaS). The IDC goes on to note: "The public cloud services market has more than doubled since 2016," suggesting public cloud is becoming the preferred cloud model. Why is public cloud so popular? From a financial perspective, its multi-tenant environment makes splitting infrastructure costs easy. It also offers flexible pay-as-you-go pricing models, and is easy to deploy and configure, even remotely. There are no hardware maintenance costs and no long-term contracts. Instead, public cloud boasts optimized staffing budgets and massive economies of scale. These advantages, combined with reduced redundancy, maximized uptime, and almost no risk of failure, ensure speedy adoption of public cloud across large, medium, and small enterprises alike. However, not everything belongs on the public cloud. Most organizations still keep some of their data in captive or hosted data centers on private clouds for various reasons, the most important being control and security. Regulations and compliance laws like HIPAA, GDPR, and PCI require financial services and energy companies to retain some workload and customer data on private clouds. As a result, even as an organization moves the bulk of its data to public cloud, it's likely to retain some core data in a captive or hosted data center. To simultaneously address demands for cost efficiency, scalability, agility, and security, many organizations partner with multiple public and private cloud services providers, a balance that poses new challenges while resolving others. With hybrid cloud, data moves seamlessly between private and public clouds, giving businesses complete control of the way their data is stored, deployed, and managed. Hybrid cloud can be a catalyst for digital transformation – transforming legacy systems and applications with new capabilities and speed, connecting organizations to different cloud models, delivering flexible IT resources efficiently and at lower costs. Nutanix's most recent Enterprise Cloud Index shows more than 85% of 2,650 respondents cite hybrid cloud as their ideal IT operating model.[iii] "Enterprises plan to aggressively shift investments to hybrid-cloud architectures," the report continues, with plans for steady and substantial hybrid deployment in the next five years. Common challenges to hybrid cloud adoption Cost management IT and management teams sometimes struggle to manage costs with hybrid-cloud models because of unexpected differences between hybrid and on-site resources. Teams often overestimate public cloud usage, for example, adding unnecessary capacity expenses. Because public cloud offers on-demand resource consumption, managing and balancing costs across cloud platforms is important for sustaining the hybrid-cloud model. Compliance From penalties to lawsuits to lowered reputation, the cost of non-compliance is high, so organizations are constantly working to meet various global and regional regulations governing the storage and usage of sensitive business data. On site, compliance is typically handled by the IT operations team and is not an area that the developers are experienced with because of diversified range of tools usage to automate task. Hence, additional training and tooling in hybrid computing is essential to ensure compliance. Security As hybrid environments become more complex, they also become more vulnerable to cyberattacks. The intricate network of infrastructure and related operations means more to monitor and therefore more to potentially overlook, increasing the risk of data breaches.

Provisioning, configuration, monitoring, and governance functions These are perhaps the most complicated and tricky of all challenges to hybrid computing. Traditionally, governance aims to provide oversight and direction for IT, standardize operations, and improve quality. It also tends to slow development because of the process-driven, standardized approach. Before the advent of hybrid-cloud computing, operations and development were two separate silos. In the new era of hybrid, however, flexibility, agility, and on-demand services are key. Hybrid-cloud migration and management are complicated and demanding. As organizations embrace hybrid cloud, they are operating multiple dynamic infrastructures, including containers, VMs, and bare-metal servers. One of the most important elements of successful cloud migration is automating the infrastructure configuration. Setting up automated processes for provisioning, configuration, management, and governance can save time and resources which would otherwise be spent on routine maintenance. The proliferation of cloud automation tools and the survival of the fittest The popularity of hybrid cloud has led to the proliferation of various open-source tools and technologies that can be added to existing programs to improve capabilities like provisioning, configuration management, cost management, self-service, monitoring, reporting. Cloud technology companies offer their own suite of applications and management software. Each cloud management platform comes with its unique strengths and advantages, and integration between platforms and tools can be a huge task, dependent on: Based on the evolution of the cloud computing environment, the automation tools available can be divided into three categories[iv]: Hybrid-cloud computing demands new ways of operation. Enterprises considering long-term adoption will need to consider all the tools and applications, as well as all new and legacy systems involved, to manage a smooth transition and superior performance. Increasingly, enterprises want to choose tools and applications from different vendors, and this trend is likely to continue. Agility and flexibility will be key – qualities to which cloud-native and open-source tools lend themselves. These newer offerings currently dominate the open-source and cloud-native tool stack scenario for automation tasks, suggesting their rising popularity over the old standards of the cloud services market. Partnering your way through transformation Enterprises can increase the success of their cloud transformation journeys and the reliability and of their infrastructure by partnering with experienced global system integrators (GSIs). As specialists who can understand and support converged infrastructure solutions, and offer applications and tools tailored to those solutions, GSIs are well positioned to help businesses embrace the hybrid-cloud model and scale their IT infrastructures. To support consumption-based pricing models, GSIs can team up with their infrastructure partners to offer the optimal cloud model for each organization. Extensive domain experience also helps GSIs deliver industry-specific consulting and implementation expertise. Organizations must remember that complete migration is not the end of the enterprise's journey to the cloud. On the contrary, it is just the start. Managing cloud services is an ongoing effort, crucial to the success of the organization's digital transformation strategy.

Can Your Network Meet Digital Needs?

----- Arcticle source ----- https://www.wipro.com/infrastructure/can-your-network-meet-digital-needs/ ----- About The Author(s) Related Articles Contact Wipro Please fill the required details to access the content Can Your Network Meet Digital Needs? Smart Network Automation for Business Transformation January | 2021 Networks are the lifeline of all modern enterprises. As organizations embrace digitalization and transformation, the focus shifts to a differentiated approach to strategy, operations, and execution, both from a technology and process perspective. Alongside the evolution of application architectures from monolithic to microservices and cloud native, there has also been increased traction in the automation of network operations. This paper explores the gaining prominence of network automation in enterprise business processes, with special emphasis on Day 2 operations. The paper elaborates on the Wipro-NetBrain partnership in enabling new automation goals and objectives for enterprise networking and also delves on some of the key attributes and benefits of the joint offering in optimizing Day 2 operations. Networking in the era of digital transformation There was a time when network operations were outside the purview of business operations and not considered to be of much strategic value. The advent of SMAC (Social, Mobility, Analytics & Cloud) technologies rendered that belief obsolete more than a decade ago. With the recent global developments ushered in by the new normal, users are now connecting from home and remote locations, off the traditional/corporate network. This transition has driven businesses to reimagine service models that necessitate digital transformation, and aligning of underlying IT modules. In other words, this implies that the network infrastructure has a direct impact on the success or failure of digital transformation initiatives. Enhancing efficiency and effectiveness of Day 2 network operations Network

automation has gained immense traction in the recent past in the all-digital, ever-connected world of people and processes. Network automation is increasingly becoming the cornerstone strategy to enable secure, reliable, responsive, agile, and easily managed networks while maintaining costs and ensuring security. The introduction of DevOps practices has ushered in security and reliability in the software development arena, leading to the development of mature methodologies such as DevSecOps, site reliability engineering, etc. Similarly, in the world of infrastructure operations, the advent of automation has led to steady progress with orchestration, intent-based networks, and even autonomous networks. However, it is crucial to understand well the distinction between hype and reality as these new practices gain momentum. Architecting, building and operationalizing networks whether greenfield or brownfield environments involve Day Zero, Day One and Day Two activities: A key imperative in Day 2 network operations is the blast radius associated with any change carried out on the infrastructure. Hence, many enterprises have 'zero' tolerance for errors arising in the network, as the minutest of changes in the network infrastructure can have dire consequences. In such scenarios, automation plays a significant role. Holistically speaking, network automation has touchpoints through the complete lifecycle of IT systems, right from service design through transition and operations. As such, there are a plethora of solutions available that cater to the different aspects of provisioning, configuration, operations, etc. The next-gen networks deliver significant cost and productivity benefits, accelerating business goals and outcomes. Wipro & NetBrain: A partnership to transform networks Under the umbrella of Wipro Cloud and Infrastructure Services, MNS 2.0 (Managed Network Services 2.0) & NetOps 2.0 are offerings that provide additional impetus and focus on network automation. With the intent of delivering a superior network experience to end-users and improved business service availability, Wipro has infused automation across the spectrum of network services. The NetOps 2.0 approach drives high network efficiency in IT operations and enhances business effectiveness. Partnering with NetBrain, the market leader in network automation, and leveraging Wipro's industry-leading AI-Platform HOLMES™, Wipro has delivered significant ROI for customers across the globe. Figure 1 shows the interface of Wipro AI platform HOLMES. Key attributes of NetBrain automation NetBrain's automaton solutions drive documentation automation, troubleshooting automation, change management automation, and audit and compliance reporting. Coupled with the NetOps 2.0 approach and Wipro's AI-Platform HOLMES™, the solution offers significant advantages. We extensively leverage NetBrain in most Wipro Insightix network solution-led network assessments. Salient attributes of NetBrain: Driving efficiencies for a global manufacturing entity Let us look at how Wipro partnered with NetBrain to enable new efficiencies for a global manufacturing entity. The client was a leading manufacturer of key components for the Telecom industry with world-wide operations. The client has made significant investments to modernize their network infrastructure to enable access, transport and hosting (on-premise and cloud) and also on monitoring and management platforms. However, in the absence of operational automation, they continued to face challenges in analyzing the reasons for slow application response. Other concern areas included, drawing contextual and relevant network diagrams for troubleshooting, the lack of a common set of guiding principles for

managing a multi-vendor network, and the rigid mindset of network engineers to switch to an automated environment. Troubleshooting is both an art and a science, and many times, success becomes a factor of the troubleshooter's ingenuity and expertise. Key aspects of troubleshooting, whether it is for availability or performance-related aspects, include tracing the network path end-to-end, determining the necessary conditions for packet flow through the network (Access control lists, Firewall rules, NAT rules, Policy based routing, and so on), and verifying suitable route paths, link utilization, and device parameters to determine if end users can access applications seamlessly. Wipro leveraged NetBrain automation tool to simplify the process of deploying run books with Qapp (Quick apps) based Scriptless visual programming. Automating the standard operating procedures augmented troubleshooting, and enabled a single pane of glass management. A salient attribute of the solution offering was the ability to integrate with multiple ecosystem partners across service desk, monitoring, management, and log analytics space. Bringing in automation capabilities and experience led to several improvements in the client's network environment. Benefits included availability of on-demand contextual network maps, empowerment of L1 network engineers for easy troubleshooting, significant reduction of cycle time (Mean time to resolve) for incident resolution and a comprehensive view of the entire network, enabled by quick and easy ecosystem integration. Building resilience and responsiveness in networks of the future Amidst the uncertainty posed by COVID-19, the workplace has evolved beyond the four walls of the office to accommodate the flexible space/time requirements of organizations. Reliable, secure networks are at the forefront of every transformation initiative, and this mandates networks to be more resilient, adding in elements of automation, personalization, and configurable services. Effective network automation must break free of traditional silos to bring together all network infrastructure elements, operations, and support systems. The Wipro-NetBrain collaboration aims to reimagine solutions, bringing in strong complementary capabilities around automation tools, processes, and solutions to excel Day 2 operations, empower key stakeholders, and accelerate business outcomes Schedule a discussion with our experts to understand how Wipro-NetBrain partnership can support your organization in enabling automation in networking. Shyam Sundar Venkat Managing Consultant, Cloud & Infrastructure Services, Wipro Shyam Venkat is an IT professional with more than two decades of experience around Cloud Infrastructure, Network Transformation, IT Strategy, Service Management, Site Reliability Engineering, Cybersecurity etc. Settled in Dallas TX, Shyam has led several successful engagements with clients across Industry verticals in technology management, consulting, service delivery and operations. He is also a trained Indian classical vocalist with few performances to his credit. Shyam can be reached at shyam.venkat@wipro.com Satyaki Hosmane Senior Solution Architect, Network Practice Wipro Satyaki Hosmane has over 18 years of experience in the field of information technology, networking infrastructure architecture, and technical delivery. He is an expert in the field of software defined, and traditional and wireless networking. He leads projects on Insightix Network, a framework for network consulting that enables quick and easy transformation to a digital network. Satyaki holds a number of certifications in leading technologies and products like CCNA, CCNP, CCIE (W) and (VCA).

Satyaki can be reached at satyaki.hosmane@wipro.com Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Designing IT operations to deliver incremental business outcome improvements

----- Arcticle source ----- https://www.wipro.com/infrastructure/designing-it-operations-to-deliver-incremental-business-outcom-improvements/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Designing IT operations to deliver incremental business outcome improvements December | 2020 And using the state of current maturity to "redesign operations" that can provide a "singular quality of service". This redesigned operational framework known as Managed Integration Services Framework will use several techniques from structured data analytics to textual analytics, from several different sources, like ticket data, application support data, QA and Testing data, architecture documents to derive the "AS IS ISM (integrated services maturity) of the environment". Some of the areas to look for would be: The gaps in the above areas, combined with the organizational change appetite are then used to define a set of "Integrated transformation programs" combined with an application or business unit specific approach for incremental business service outcomes defined at the beginning, through structured as well as simultaneous changes in the machine, method, and model. This is illustrated in the diagram below. Murthy Malapaka CTO Cloud and Infrastructure Services, North Americas Murthy Malapaka is CTO of Cloud and Infrastructure Services, North America, at Wipro Ltd. Malapaka has nearly three decades of experience in the technology space and has held various technology leadership positions across application and infrastructure architecture domains, specializing in service availability and reliability. In his current role, Malapaka helps enterprises digitally re-architect their operations to run on multi-cloud IT environments Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Predictive Maintenance in Manufacturing using Azure Serverless Architecture

About The Author Related Articles Contact Wipro Please fill the required details to access the content Predictive Maintenance in Manufacturing using Azure Serverless Architecture February | 2021 To have an edge in the fiercely competitive world of manufacturing, manufacturers must shift production to higher values and advanced technology support and offer a new product-as-a-service model. A 2020 Forbes report states that 47% of all the manufactured products will become smart, connected, and capable of providing a product-as-a-service model. Top 5 challenges faced by the manufacturing industry Despite a plethora of opportunities that are integral to the manufacturing industry, specific pain areas need to be addressed soon. Some of them are: Predictive Maintenance It is common among businesses to rely on corrective maintenance. Parts are replaced as and when they fail, which causes the factory to shut down. It also impacts product manufacturing, resulting in unhappy customers. At the next level, businesses practice preventive maintenance, determining a part's lifespan and maintaining or replacing it before a failure. It may cause unnecessary maintenance of machines leading to wastage of money. Predictive maintenance optimizes the balance between corrective and preventative maintenance by enabling just-in-time replacement of components The Benefits of Predictive Maintenance Predictive Maintenance using Azure Serverless Components: Reference Architecture Devices: Devices can be connected to the cloud directly or indirectly. It is done directly using IP-capable devices that establish secure connections via the internet. In the indirect method, devices connect via a field gateway. This enables aggregation and reduced raw device data before transporting the back-end and local decision-making capability. IoT Hub: Azure IoT Hub offers built-in, high-scale, secure connectivity, data, and event ingestion. It also establishes bi-directional communication with devices, including device management with command and control capabilities. Azure IoT Hub can securely connect millions of devices to the cloud from various devices and protocols. Stream Analytics: To process the massive amount of data generated by the field devices in real-time and process this live stream, Azure Stream Analytics is used. Event Hub: Azure Stream Analytics generates an event and sends it to the Event Hub, which triggers background jobs for further analysis. Event Processor: Web Job is used to process the event data received from Event Hub, and a portion of this data is used to train in the ML model. Storage: Storage is divided into warm and cold path stores. Warm path data is required to be available for reporting and immediate visualization from devices. Cold path data is stored for the long term and used for batch processing. We use Azure Cosmos DB for warm path storage and Azure Blob for cold path stores. Dashboard and UI- Web App or Power BI is used to

create and show the dashboard to the end-user to engage in interactive browsing. Machine Learning: It enables systems to learn from historical data and to act without being explicitly programmed. Scenarios such as predictive maintenance are enabled through ML. We use Azure Machine Learning for ML needs. References: Alok Bhatnagar Principal Consultant Cloud and infrastructure Services Alok has more than 16 years' experience in software design, architecture, and development with expertise in cloud-native and cloud-agnostic architecture. He has rich experience working on various cloud platforms like Azure, AWS, and IBM and has leading certifications, including Azure Certified Solution Architect, AWS Certified Solution Architect Associate, and MCSD. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.

Hospitality Gets Smart and Safe. Thanks to IoT.

----- Arcticle source ----- https://www.wipro.com/infrastructure/hospitality-gets-smart-and-safe-thanks-to-iot/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Hospitality Gets Smart and Safe. Thanks to IoT. February | 2021 IoT in hospitality is not seen just as a supporting technology any more. It is becoming mainstream in enhancing hotel businesses by inculcating safety and improving overall business operations. Major pillars for any hospitality business are customer experience, operational efficiency, and health and safety. Health and safety is emerging as the #1 trend as people adjust to life with the Coronavirus and hotels consider health of their customers the utmost priority. During this pandemic, hotels have started to reimagine the processes and are adopting new technologies to provide a safer environment to their guests. Some of the IoT and analytics-based safety initiatives include The IoT advantage in the hospitality industry Apart from health and safety, IoT is also changing the way products and services deliver value and redefining the guest experience by providing self-check-ins, personalized recommendations, and solving real-time queries in no time. IoT is enabling reduction in operational expenses and improvement in staff efficiency by providing smarter facilities, which includes smart bin monitoring, smart parking, and smart restrooms and utilities management. It even enables tracking of worker staff efficiency. Integrated energy management, which includes smart lighting, intelligent HVAC controls, and smart equipment with health monitoring and predictive maintenance capabilities along with usage analytics and insights, helps tackle the issue of huge energy consumption. Reimagining customer experience with IoT Besides providing customer experience through faster reservations, and quicker check-in-

check-outs, personalized services and better room experience are equally important. Customer experience is being enhanced through IoT by enabling multiple use cases such as Figure 1: Customer journey inside a smart hotel With the tremendous benefits of IoT, big hotels are lowering their labor costs while redefining guest satisfaction in an entirely new way. Making a guest feel safe and special is the biggest achievement in the hospitality sector. Interested in knowing more about how IoT can help transform your business to meet the new requirements in the new normal? Want to know how we can help empower you for a resilient future? Connect with our IoT experts Tanuj Chawla Pre Sales Consultant and SME - IoT, Cloud & Infrastructure Services, Wipro Tanuj plays a key role in consulting for IoT in the US and APAC Geos. He has expertise across multiple industries including Retail, and Oil & Gas. You can reach Tanuj at tanuj.chawla1@wipro.com Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Leveraging Digitization to Drive Customer Experiences in BFSI in the New Normal

----- Arcticle source ----- https://www.wipro.com/infrastructure/leveraging-digitization-to-drive-customer-experiences-in-bfsi-in-the-new-normal/ ----- About The Author(s) Related Articles Contact Wipro Please fill the required details to access the content Leveraging Digitization to Drive Customer Experiences in BFSI in the New Normal COVID-19: A catalyst in the Digital Journey February | 2021 Abstract Banking and Financial Institutions (BFSIs) have been at the forefront of digital transformation initiatives with data at the epicenter of banking innovation, in an attempt to fuel performance and improve customer experiences. Competition from a variety of segments including fintech startups, alternate credit companies, retail giants and internet behemoths, complemented by globalization are accelerating digitization at banks. Ever evolving and tightening regulatory restrictions are further fueling this transformation which has been propelled to the next level with the pandemic. This paper studies the impact of next-gen technologies and digitization including IoT, Cloud, and 5G on productivity and modernization of operations at banks and financial institutions. It further delves into how these technologies can be leveraged to offer solutions that enable banking in the new normal. Reimagining banking in the new normal Even as banks in the last decade have been embracing digitalization and moving to a client service model that requires minimal contact with their customers, COVID-19 has brought with it huge challenges to the BFSI sector, triggering changes in both customer behavior and

banking operations in the long run. Consider this: consumer usage of digital banking surged with 68% of Indian consumers using online or mobile banking to conduct financial transactions. 48% of respondents expect to use contactless payments instead of cash or card in the post-COVID worldi. The new normal is forcing BFSIs to implement digitization beyond the customer-facing layer, and develop an integrated architecture encompassing all aspects of banking. Financial organizations are focusing on priorities in four key areas in order to overcome the challenges brought on by COVID-19: Optimizing processes to meet evolved customer expectations: While digital banking has been on the rise globally, a country like India is still driven heavily by physical transactions at the bank. BFSIs need to quickly implement technology-enabled processes to adapt to the new normal to deliver customer satisfaction across branches and retail outlets. Customers have become increasingly health conscious and COVID-aware, and are looking for ways to transact while prioritizing their health and safety. Banks need to leverage technology, AI, machine learning, data, and human resources to innovate and digitize the delivery of products and services providing for seamless, contactless experiences. Connectivity: While some largescale BFSIs have started leveraging the cloud, others still need to ensure connectivity across all their operations and transactions for a seamless experience in the new normal. The pandemic has led to an increase in online banking activity, nudging financial organizations to embrace digitization and a hybrid multi-cloud model to enable an array of services including payment gateways, online fund transfers and transactions, digital wallets and more, all aimed at driving a unified customer experience. This connectivity needs to be extended on the ground to banking experiences, identifying, aiding, and mapping the customer journey within the bank through kiosks, facial recognition systems, thermal scanners, digitized ledgers and more for a safe banking experience. Security: As banks embrace technology at speed and scale, ensuring data security is another key concern. The dependence on digital banking in recent times and the ensuing tech upgrades on premises have left the industry vulnerable to security threats, heightening the need for tighter security, both for physical devices and data. Regulatory compliance: For BFSIs operating across boundaries, ensuring compliance to evolving regulatory requirements is another huge concern. Regulators increasingly want to make sure that boards are engaged, and capital and liquidity standards are maintained per norms, and effective risk management practices are in place even as BFSIs pull out all the stops to ensure uninterrupted customer service and deal with wildly fluctuating and unprecedented economic and market conditions. Riding the digitization wave for positive customer experiences As BFSIs embrace large-scale technology upgradation and digitization in an attempt to limp back to normalcy, IoT - along with 5G and the cloud - is transforming the way banks are operating post COVID. Seamless customer experiences and transactions while ensuring employee safety and maintaining productivity, renewing operating models to support customers, leveraging technology to minimize operational disruption to processes and mitigating risk will be key. Banks are buying out legacy assets and shared services carve-outs and entering into long-term integrated technologies and managed services support engagements that will further their digital transformation strategy. IoT is bringing the banking world closer than ever before, offering clients a

completely connected and integrated experience by servicing all their financial needs across devices including tablets and mobiles. Enabling digitized transactions and pay-from-anywhere models, every IoT-enabled device has the ability to become a Point of Sale (POS) device. Banking transactions and queries can now be carried out from the comfort of the customer's home or within the safety of the bank with the increased use of connected devices including voice activated and facial recognition software that require minimal touch. IoT also enables device tracking and spend analysis on-the-fly, offering better protection from cyber-fraud. The growth in 5G adoption will further increase productivity levels with connected devices and help optimize the digital banking experience. Cloud is the core technology at the forefront of digital transformation in BFSIs. It provides an infrastructure fabric for other technologies such as mobile, automation, artificial intelligence, social computing, Internet of Things (IoT), analytics, and blockchain, to name a few. Cloud technologies such as virtualization, Infrastructure-as-a-Service (IaaS), and Platform-as-a-Service (PaaS) can help banks improve cash flow by moving from a Capital Expenditure (CapEx) to an Operational Expenditure (OpEx) model. Risk Profiling Systems, Early Warning Systems using Predictive Analytics, Non-Performing Assets (NPAs) monitoring are applications which can be built on a cloud technology infrastructure. The banking industry has been an early adopter of cloud and these new technologies will drive domain transformation in the future. Leveraging transformative technology solutions Even as the banking industry adapts to work-from-home, it will require an active workspace for routine business operations with employees present to service customers. How then can banks ensure people safety and well-being in the new normal? Wipro's 'Health COV-ER' solution leverages the power of IoT, cloud and analytics, helping BFSIs manage their employees returning to work with a system driven, thoroughly designed process aimed at ensuring workplace safety and compliance. Health COV-ER is truly comprehensive with a hassle-free work employee schedule and attendance management, health assessments, and integrated contact tracing solutions. This is a SaaS product designed to help BFSIs fortify and strengthen their business, while ensuring customer and employee safety on-premises. The 'Health COV-ER' solution features applications for seamless management of all people at the bank including employees, contractors and vendors, and customers by supporting visit/ work scheduling and detailed health assessment and monitoring. The solution helps banks resume branch operations easily in the new normal with integrated mobile communications, easy-to-fill digital forms and social distancing mechanisms that can be tracked with the latest technology. Some of the salient Health COV-ER features that drive workplace transformation and productivity include: Smart workplace solutions for employees: These include an integrated, interlinked set of solutions designed for workplace safety. Features comprise detailed health assessment of employees and self-declaration via the app for COVID testing and other critical ailments, QR code generation based on the health declaration form, and staggered time-based entry with automatic notification. Other features include a touchless attendance system integrated with an active global directory, online seat booking for employees with a track on occupancy ratios, energy management, dashboard reporting, and secure admin approvals. Customer solutions: These include thermal scanning for temperature entrance before approval of entry, video analytics

and BLE-based social distance alerts, crowd sensing and heat map generation, facemask detection and social distance violation detection measures to maintain customer safety and health while at the branch. The app supports touchless customer onboarding. Alarms are auto-generated on violation of any of the pre-set norms and thresholds. Real-time data on customer footfall at the branch can be leveraged for multiple business cases to help drive superior customer experiences. Customers who are in the queue or waiting to be served can also leverage the app to check on nearby branches with lesser wait times. The data also helps management analyze the volume of business against the number of customers. Virtual Queue Management and Reservations for customers, and in a pandemic situation, the use of touchless and a more hygienic way of communication with BFSI employees. Reservations in the form of pre-booking of available slots 24 hours prior to arrival at the location, where customers can plan their journey way ahead of time. Integration with government apps and data bodies: Data on COVID infected customers or employees who are restricted access to the campus will be further integrated with government health / COVID monitoring data, including apps such as Aarogya Setu of India. This will help facilitate contact tracing efforts to identify COVID positive cases and control the probable spread of infection, thereby complying with government norms and regulations per specific geographies and adhering to local laws while protecting personal information of individuals. Data center maintenance: Given the volume of sensitive information banks process, data centers are sacred and core to the successful working of banks. The Health COV-ER solution helps monitor data centers effectively and maintain workplace hygiene and safety. These new-normal solutions in the current pandemic scenarios could benefit from: Remote device management and asset management: Mobile and remote devices have been around for a while now and have become an inseparable part of our lives. There was a time when desktops were considered primary IT assets and were managed. However, today, mobile devices have overpowered desktops. This means they also need to be managed and maintained as they fall under IT asset management. The solution offering includes provisions for remote monitoring and maintenance of devices and bank assets securing the organization from physical asset thefts and data loss. Few questions that need attention, considering the excessive use of remote devices in organizations nowadays: Here are some core functions of remote device management: Seizing the moment to go the extra mile to serve individuals with integrity and sensitivity Technology and skill upgradation – imperative to the new normal Providing restricted banking hours, flexibility, security, and safety while ensuring availability of omni-channel customer service and banking transactions is the way forward through COVID-19 and beyond. BFSIs will have to adapt in more ways than one, with the use of technology and skill upgradations to thrive in the new normal and build a resilient operating model, as blockchain, AI, and open banking become more popular. The focus must be equally on employee re-skilling and up-skilling as it is on technology upgradation. Digitization must enable new value creation for customers, delivering on expectations across the value chain. Digital transformation will enable agility, security, and enhanced productivity for BFSIs if harnessed well and right, paving the way for a new decade of banking experiences. The overall business landscape has essentially been redefined, as the COVID-19 pandemic is likely to considerably fast-track the

shift to digital. Customer behavior and desired communications are radically changing, and while customers continue to progress digitally, simultaneous digital transformation will continue rapidly. In addition, as a catalyst, COVID-19 also presents a unique chance to gear up and take stock of digitalization with the help of technology interventions such as IoT, ICT, AI, AR-VR. They can also build or create value in the emerging ecosystem. References Vaishali Deshmukh Managing Consultant Wipro Vaishali has 15+ years of experience as a trusted advisor. Network on Autopilot Mode

----- Arcticle source ----- https://www.wipro.com/infrastructure/network-on-autopilot-mode/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Network on Autopilot Mode AI-Trained Intelligent Networks Cut Through Complexity February | 2021 Networks are becoming increasingly complex, making effective and efficient network management a challenge. With new and emerging technologies and the increasing adoption of cloud, users expect faster network speeds and seamless network availability. In addition, security threats are more advanced and agile. As the network incorporates several devices, tools, applications, systems, and now, work from home users, the complexity escalates. A larger scale of network amplifies the potential for failure. Networks now need to be intelligent. Artificial intelligence (AI) and machine learning (ML) will be critical in automating network operations and optimizing end user experience. This paper looks at how AI, ML, and automation can change the existing network operations and simplify the life of network engineers. It explores how businesses can leverage AI/ML to make a true self-healing autonomous network, going beyond automation and work done by bots. Effective network operations in a new age technology world With millions of applications developed every day, the 'networking' stack plays a vital role in ensuring secure and any time access, regardless of where the applications are hosted - on premise or on the cloud. The pressure on the network to quickly adapt to new and emerging technologies while ensuring seamless user experience only amplifies the network's complexity

and the efforts it takes to manage it. There are myriad issues that can come up on a daily basis, based on the size of the infrastructure and the design complexity. A wrong VLAN on a port or misconfiguration of a VLAN can cause multiple ports and circuits to go down as the ports may get blocked due to spanning tree. A small change, misconfiguration or incident can have a significant impact on the business. Robust change management and incident management systems help in avoiding such issues. However, network complexity gives rise to many such scenarios, and solution doesn't come easy as one size does not fit all. For instance, checking a layer 2 issue when there are 10 switches to manage is radically different from a landscape with 100 switches in a domain. There is no efficient solution that can help in simulating such issues, as replication of the existing configuration and the device sets adds to complexity and additional requirements. Simplifying configuration with software-defined networking Software-defined networking (SDN) has eased the configuration part by segregating the network control plane from the forwarding plane. It has enabled a 'single plane of glass', wherein all the nodes can be managed and controlled from a single controller and management dashboard. The traditional configuration is abstracted with user-friendly graphical user interface. The time spent on configuring routing policies by logging into individual routers/switches command-line interface is dramatically reduced by pushing the same from the single user interface, which, in turn pushes to all the respective nodes where the policies need to be configured. However, even though the configuration part is simplified, the alarms or events have increased and have become more complex. Consider this - the connectivity from the user to an application as a single entity has multiple components like LAN (either wired/Wi-Fi), WAN (either traditional or software defined) plus where it is hosted -- in the data center or the cloud. Each of this is monitored by its own respective controllers, and each logs the alerts/ incidents to the organization's IT Service Management desk. An application can slow down due to network latency or high response time from the application server itself. Earlier, these were marked as network issues. Now, leveraging new gen solutions, we are able to garner better insights into these issues and classify these in two different domains – network and applications – thereby, ensuring issues are assigned to the appropriate teams for resolution. Similarly, an overlay tunnel would have gone down because of the underlay device's port which is either flapping or has gone down. In such scenarios, each endpoint logs its own events - the SD-WAN controller would log an incident for the tunnel going down and the underlay device would log an event for the port going down. With multiple incidents being logged from multiple controllers and the underlay devices, ITOps find it very difficult to correlate each of them. With separate teams handling issues from different components, the correlation becomes even more difficult. The focus of the operations teams is on configuration and troubleshooting. The configuration part is now simplified with next-gen solutions, but troubleshooting has become more complex. Is there a solution that can ease the troubleshooting or issue resolution process as well? The answer is a resounding 'yes'. Intelligent network with AI and ML Networks need to be intelligent to meet the dynamic needs of the digital age. AI and ML play a critical role in enabling this by automating and infusing intelligence in network operations.   Figure 1 highlights a solution that listens to all alerts/events generated by different endpoints (network

devices, SDN controllers, SDWAN edge devices, Wi-Fi controllers, etc.). The ML model is trained to learn from these events and then correlate them to the project as a single issue, which the operations team can look into. This helps all the teams find the root cause faster, enabling quicker resolutions, while reducing the MTTR (mean time to resolve) significantly. In addition to this, the AI/ML-based solution can also help in predicting issues in the system. For example, the interface utilization is monitored by the solution and it learns the pattern of the traffic - the time stamp at which the traffic surges/dips. Over a period of time, the solution will predict the utilization at a given time in the future. This helps in capacity planning which was previously fraught with human errors over spreadsheets and multiple logics. Wipro is developing a bot that listens to the incidents and follows a defined standard operating procedure for that particular incident. This approach helps in reducing the time taken by an L1 engineer to perform basic troubleshooting. Automating the L1 task enabled Wipro to reduce 110 person-hours for managing 60 sites of a customer. With the robust power of AI and ML, solutions that learn the types of issues and their resolutions can be developed. Once the model is trained, it will provide the fixes for the issues raised. Eventually, issues will reduce by virtue of co-relation and the solutions as autosuggestions. If there are more matches with the fixes that are suggested by the solution, then the solution can provide the fix with data modeling. Putting networks on autopilot mode A network that can fix and optimize itself without human intervention will revolutionize network management. AI and ML can train software-defined networks to learn to help with network management using operational data. Automation, AI, and ML will drive network management into the autopilot mode and the future. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Get more out of your public cloud investments with SD-WAN

Get more out of your public cloud investments with SD-WAN March | 2021 The massive wave of public cloud adoption has placed SD-WANs, or Software Defined Wide Area Networks, firmly in the spotlight. The advances made in cloud technology by leaders like Microsoft, Google, and Amazon have made it easy and cost-effective for enterprises to move away from their traditional datacenters and adopt cloud. While cloudification is moving applications to a central location, users are now distributed across geos. A recent analyst study shows that 32% of IT budgets will be allocated to cloud within the next 12 months1. An imperative of public cloud is to have a secure, application-aware, intent-based network. And SD-WAN is the answer. As investments in public cloud grow, we expect to see a proportionate increase of interest in SD-WAN. Traditional WANs worked using one or two gateways and expensive Multiprotocol Label Switching (MPLS) networks and complex security policies to keep the enterprise connected. This made connecting branch offices an expensive exercise—more hardware had to be added, more security processes monitored, and more infrastructure maintenance to be provisioned. Besides, traditional WANs demand long lead times to set up new branches and they require traffic to be backhauled through a datacenter which often became bottlenecks. For the last decade, service providers like British Telecom, Telstra, Deutsche Telekom, Movistar, Vodafone, AT&T, and Jio provided the services needed for these WAN networks. But because MPLS is expensive, it became one of the reasons for enterprises to move away and look for more reliable Internet-based networks. SD-WANs for geographically spread-out businesses SD-WANs take the pain out of network configuration and operations while reducing capital and operational expenditure. They make use of high-speed busines class Internet and local Internet breakout to send traffic toward cloud. This also means it has a major impact on the network business of traditional providers. Their customers increase bandwidth usage because they have access to bigger pipes at lower costs on the Internet. This also has the effect of reducing the costs associated with MPLS. Overall, it is a major win for enterprises. There are deeper problems associated with using traditional provides. As businesses expand across geos, providers with a limited footprint may not be able to support their customers. For example, a provider may have strong operations across the US but none in Europe. To overcome this, providers partner with each other across geographies. There is a downside to this. It makes client contracts, processes, and provisioning complex, messy, and expensive. Take the case of Europe. Each country has its own dominant network provider. They know their region, understand the underlying business nuances, and are very aggressive. An engineering, manufacturing or pharma company with operations spread across Europe will typically want to realize the cost benefits offered by

network providers in each region. As an example, they will want to pick the best provider at the best price point. Having multiple and diversified providers across countries can quickly add to technological complexity, management overheads, and developmental blind spots. These developments have led to a clear outcome: Unable to compete with local providers, the behemoths of telecom find that bandwidth consumption is down, and they cannot modernize services to retain customers. They have no incentive left to continue providing network services. This has opened the doors to System Integrators (SIs). The importance of SIs in the world of SD-WAN SI can break the barriers to a single provider while ensuring that the advantage of lower pricing provided by multiple geo-specific providers is not lost. SIs can tie together the best-of-breed providers, manage contracts, drive technological enhancements, and ensure that network experience remains world-class while costs are managed in line with customer expectations. Given the pressure brought about by the COVID-19 pandemic, businesses across Europe – as is true for businesses across the world – have become cost conscious. There is significant pressure on them to reduce run budgets. A quick and effective way to do this is by moving to a well thought out and carefully strategized SD-WAN paradigm. On paper SD-WAN appears perfect and has appeal. But enterprises are hesitant to take the leap. There is an inherent fear that their users may not have access to the same experience they have become accustomed to. Unlike a datacenter, that could be in one or two locations and are easy to monitor, an SD-WAN may affect users. This fear prevents enterprises from discussing SD-WANs with SIs. For effective implementation of SD-WAN, CTOs across enterprises must identify business uses cases that bring value and have the highest/ fastest ROI. Does it reduce costs? Does it provide visibility into applications? Does it allow administrators to prioritize traffic based on application criticality? Does it improve user experience? Does it have lower maintenance costs? Does it enhance agility and security? Does it permit automation to be used to speed up configuration, deployments and reporting? The answers to these questions will determine the exact solution. Learning from adjacent industries The experience of large, diversified customers who have made the call (for SD-WAN) shows that the technology provides robust and reliable solutions to resolve these questions. One customer, a manufacturing major in over 1500 locations, has modernized its network using SD-WAN. We need to examine industry segments like Retail and Consumer Packaged Goods leading the way with public cloud adoption. They are successfully choosing SD-WAN. The Banking industry too has identified significant opportunities in public cloud and will soon shift to SD-WANs. Typically, businesses with a large multi-geo e-business component are more enthusiastic about public cloud – these are the businesses to look up to for best practices and methodologies that lead to successful SD-WAN adoption. With large technology providers like Microsoft, Amazon, and Google making it simpler to adopt public cloud, SD-WAN is unavoidable. And for businesses in Europe, characterized by a variety of network providers, getting an experienced SI onboard to implement the SD-WAN strategy is an immediate imperative. Containers are growing in popularity. Have you considered secure containers though?

----- Arcticle source ----- https://www.wipro.com/infrastructure/containers-are-growing-in-popularity-have-you-considered-secure-containers-though/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Containers are growing in popularity. Have you considered secure containers though? March | 2021 In an increasingly interconnected environment, information is exposed to a growing number and wider variety of risks. Threats such as malicious code, computer hacking, and denial-of-service attacks have become more common. Implementing, maintaining, and updating information security in an organization is more of a challenge. The number of cyberattacks is increasing alarmingly. Ransomware is leading the way in modern cybersecurity events. Cybercrime damages will cost the world $6 trillion annually by 20221. For many organizations, information is their most important asset, so protecting it is crucial. Also, with the increased popularity of microservices and containers, many organizations are moving more and more toward containerized environments due to the unparalleled agility, and cost and time savings that containers offer. In this paper, we will explore some of the security threats for containers and how organizations are mitigating them. However, like all other software, containers and containerized applications too can fall prey to security vulnerabilities of various kinds, including bugs, inadequate authentication and authorization, and misconfiguration. The first of these challenges stems from an obvious fact: breaking your application up into containerized services (and perhaps microservices) requires some way for those services to communicate. And even though they're all potentially running on the same Kubernetes cluster, you still need to worry about controlling access between them. After all, you might be sharing that Kubernetes cluster with other applications, and you can't leave your containers open to these other apps. Controlling access to a container requires authenticating its callers, then determining what requests these other containers are authorized to make. It's typical today to solve this problem by using a service mesh Like Istio. Just like VMs, containers can still be compromised through various attacks, or left vulnerable through misconfigurations or unpatched components that can

lead to unauthorized access to your workloads and your compute resources, and even the potential to recreate your application (and its data) somewhere else. Perhaps the other most obvious source of security issues in a containerized environment is problems lurking within application images themselves. Flawed or malicious software isn't the only threat. Poorly configured images can also be a source of vulnerabilities. For example, an image might launch an extraneous daemon or service that allows unwanted access from the network, or it might be configured to run with more user privileges than are necessary. Secrets stored within images, such as authentication keys or certificates, are another danger to watch out for. Pulling images only from trusted sources, such as private container registries, but a poorly configured registry can also be a security issue. Access to the registry should require encrypted and authenticated connections, preferably using credentials that are federated with existing network security controls. Any efforts to secure container images can be rendered meaningless if the registry can be easily compromised. Also, the registry should undergo frequent maintenance to ensure that it doesn't contain stale images with lingering vulnerabilities. But in the last couple of years, a great deal of effort has been devoted to developing software to enhance the security of containers. Fortunately, best practices for securing containerized infrastructure are emerging. The National Institute of Standards and Technology (NIST) has published "NIST Special Publication 800-190: Application Container Security Guide": a set of guidelines that can serve as a useful starting point and a baseline for security audits which is worth referring. How to mitigate security risks in containers Some ways to mitigate the risk in containers are by locking it down, especially the management layer of multi-container orchestration platforms needs to be tightened with two-factor authentication, data encryption at rest, configuring the orchestrators in separate networks, i.e. low sensitive workloads must be separated from High sensitivity workloads. In addition, workloads should be distributed such that each host runs containers only of a given security level, include end-to-end encryption of all network traffic between cluster nodes and mutually authenticated network connections between cluster members. One of the more serious concerns arises when the container runtimes that launch and manage containers—software such as containers, CRI-O, and rkt—themselves contain vulnerabilities. These flaws can lead to "container escape" scenarios where an attacker could potentially gain access to other containers or the host operating system itself, so admins should make installing runtime security patches a high priority. The host OS represents the most critical target for attacks, if compromised, it can expose all of the containers running on it. For this reason, running a pared-down, container-specific OS that limits the number of installed components to the bare minimum of software required to create and manage containers. Fewer components means fewer potential vulnerabilities that can be exploited. Google has some renowned in-built security standards to mitigate the risks for containers as follows: Infrastructure Security: Container infrastructure security is about ensuring that your developers have the tools they need to securely build containerized services. Identity and authorization On Google Kubernetes Engine, use Cloud IAM to manage access to your projects and role-based access control (RBAC) to manage access to your clusters and namespaces. Audit logging: On Google Kubernetes Engine, Cloud Audit Logs records API

audit logs automatically for you. Networking One can create a network policy to manage pod-to-pod communications in your cluster. Use private clusters for private IPs and include Google Kubernetes Engine resources in a shared VPC. Compliance Google Kubernetes Engine features many compliance certifications including ISO 27001, ISO 27017, ISO 27108, HIPAA, and PCI-DSS. Google Kubernetes Engine uses Container-Optimized OS (COS) by default, an OS purpose-built and optimized for running containers. COS is maintained by Google in open source. Automatically upgraded components On GKE, masters are automatically patched to the latest Kubernetes version, and you can use node auto-upgrade to keep your security up to date by automatically applying the latest patches for your nodes. Customer-managed encryption keys Users in regulated industries may need to be in control of the keys used to encrypt data stored in GKE. With customer-managed encryption keys, one can pick a key from Cloud KMS to protect your GKE persistent disk. Application layer secrets encryption By default, Kubernetes secrets are stored in plaintext which are encrypted by GKE. Workload Identity Your containerized application probably needs to connect to other services. Workload Identity uses a Google-managed service account to share credentials for authentication, following the principles of least privilege for application authentication. Managed SSL certs In GKE, HTTPS load balancers need to be associated with an SSL certificate. You can obtain, manage, and renew these certificates yourself, or have Google automatically obtain, manage, and renew those certificates for you. Latest Trends & Players in Container Security: Security will continue to be a key issue because of shared operating systems. Significant vulnerabilities impacted Kubernetes, causing IT operations to reconsider their deployments. This is another reason why Google will continue to attract more users with their secure and scalable offerings. Google is delivering ease of use, reliability, and less risk around containers. Having the market presence and global reach, infrastructure partners with the scale of Google will provide the necessary resources for containers and orchestration to truly reach the next level of market performance. More specialized container security software has also been developed. For example, while Twistlock offers software that profiles a container's expected behavior and "whitelists" processes, networking activities, and even certain storage practices, so that any malicious or unexpected behaviour can be flagged. Polyverse takes advantage of the fact that containers can be started in a fraction of a second to relaunch containerized applications in a known good state every few seconds to minimize the time that a hacker must exploit an application running in a container. Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. ===================== ----- Arcticle source ----- https://www.wipro.com/infrastructure/how-to-build-the-enterprise-of-the-future/ ----- Contact Wipro Please fill the required details to access the content How to build the enterprise of the future April | 2021 Cloud adoption is getting tricky. With so many choices, it's easy to make a decision that could set you back months. But with some insider knowledge, you can chart a clear path to success. "Building the Enterprise of the Future," a new report from Wipro, highlights what enterprises need to know to break free from traditional operational perimeters and access the boundaryless world of partnerships and accelerated growth. You'll learn simple ways to evaluate your cloud needs and build business resilience by examining essential trends, platforms, and services for 2021. With all the disruptions caused by COVID-19, businesses need solutions that will outlast the pandemic. If you're looking for a long-term strategy, one that will balance business change with operational stability, then this is for you. =====================

Augmented Reality is No Longer Only about Field Service

----- Arcticle source ----- https://www.wipro.com/infrastructure/augmented-reality-is-no-longer-only-about-field-service/ ----- About the Author Contact Wipro Please fill the required details to access the content Augmented Reality is No Longer Only about Field Service April | 2021 In a highly competitive environment, customer service is the key to success in any business. Uninterrupted and efficient services, particularly in the case of industries like manufacturing, telecom or energy, are critical. The maintenance of assets and critical equipment has a direct correlation to the provision of these services. And these two synergistic aspects of service and maintenance further impact the performance, productivity, product quality, and eventually, customer satisfaction. However, service and maintenance are also resource, time and cost intensive. Today, cutting edge, innovative and disruptive technologies such as automation technologies, Internet of Things (IoT) and augmented reality (AR)/virtual reality (VR) have enabled a paradigm shift in visibility, efficiency and profitability while maximizing uptime of critical devices and machinery. The potential for augmented reality According to research by Grand View Research, Inc., the global augmented reality market size was USD 17.67 billion in 2020. It is estimated to reach USD 340.16 billion by 2028, with a CAGR of 43.8% from 2021 to 2028[1]. PwC estimates that AR and VR have the potential to boost global GDP by USD 1.5 trillion by 2030[2]. With the new normal setting in after the COVID-19 pandemic, the demand for remote assistance and collaboration to improve workflow management is increasing. AR-based applications can help in tracking, identifying and resolving technical issues. In addition, the growth of smart phones, wearables, smart glasses etc. is enabling the adoption of AR for technical teams as well as customers. AR and VR in field

services Imagine a scenario where a technician is responding to a customer complaint about a specific equipment. The L1 or L2 technician assigned is not necessarily the expert. They may have to refer to a manual, check with an expert or return for another visit after consulting with an expert in the organization. The expert may also need to be called upon to provide services if the problem is not resolved. All this takes up time and cost. With the help of an AR headset, the technician seeks the help of the expert. The expert, present at a remote location, visualizes the overlay of the equipment and guides the technician in real time to resolve the problem. The overlay can be made up of video or audio recordings, manuals or other information that can be made readily available to the technician on the job. AR has created a perceptual reality that the expert is able to visualize. This saves cost and time of multiple visits or employing higher number of experts. In turn, it also boosts customer satisfaction as the issue is resolved quickly with minimal interventions. AR/VR platforms transform field services by enabling hands-free, offline/online viewing of workflow instructions for training, maintenance, and inspection. These applications enable novice workers to connect with a remote expert who can guide them in performing the workflow better. In addition, they can: For industries with high requirement of field services, the use of AR-based solutions offer several benefits – increasing worker efficiency, accelerating issue resolution time, reducing travel expenses and minimizing costs, and increasing the number of tickets handled. Post the pandemic, the potential for AR has increased manifold. Social distancing and lockdowns have severely hampered field services. AR-based applications can help prevent physical interaction for service calls and training. They enable companies to diagnose issues remotely and deploy expert resources with AR-based applications only for complex in-person jobs, thus reducing the risk to the employees and customers. Companies can diagnose issues remotely to prioritize operations and reserve their expert resources for AR-assisted service to new technicians and more complex in-person repairs. Research has indicated that with an average of around 84,000 service incidents per month[3], over 40% require an in-person, on-site dispatch to resolve. Augmented reality has reduced human errors and unnecessary calls significantly, for better and faster task performance. Yet, the adoption of AR remains untapped. The Strategies For Growth℠ 2019 Field Service Management (FSM) Tracking Survey[4] revealed that only 13% respondents were using AR or VR in their field service operations, while about 34% were likely to incorporate the use of AR and VR in the next five years. Benefits of AR applications across industries With an evolving business landscape, shifting customer preferences and high competition, it's easy to imagine how AR/VR technologies have found a place across several industries. And the use of AR is not just limited to field services. It has expanded to various other operations, reducing downtimes, improving services, reducing costs, and enhancing productivity. Let's take a look at some use cases. In the manufacturing industry, AR can ensure efficient operations by reducing production downtime, quickly identifying the problems and keeping all processes functional. A classic example is the aircraft manufacturer, Boeing, which has deployed AR to enhance productivity and reduce errors in their operations. The company uses several devices from tablets to Microsoft's HoloLens to Google Glass, which help to keep workers hands-free with their eyes on the job. They have also leveraged Upskill's Skylight software to reduce wiring time in some aircrafts

by 30%[5]. In addition, AR is a valuable asset in training of employees in the manufacturing industry. While in person training is challenging in these times, there is also the element of safety while training for critical machinery. Deploying the use of wearables or tablets can easily help in training. Telecom companies typically have towers and other equipment in remote areas. The use of AR can help in planning equipment inspections, which require highly skilled and expensive professionals. With the help of AR, the inspection can be carried out remotely, thus saving time and costs. In addition, AR-based applications can also be deployed to improve overall equipment performance with regular pre-determined inspections. Telecom giant, Vodafone's Dutch arm, VodafoneZiggo, first piloted remote customer assistance technology powered by artificial intelligence (AI) and AR. Following this, Vodafone UK replicated the use of the AR platform, resulting in a 12% improvement in first call resolution (FCR) and a 68% improvement in customer satisfaction[6]. Field support is a critical service criterion for the utilities sector. However, there are several diverse use cases for AR across the utilities process value chain. These include: assessment and restoration during storms/outages, visual inspection of vegetation on their transmission and distribution lines, construction or new connection of underground gas pipeline, and seeking expert help or collaboration with other crew members during maintenance onsite. AR can significantly help in training novice technicians and help utilities overcome the challenge of an ageing and retiring workforce. AR devices have come a long way and now meet the intrinsic site requirements related to safety and environment - a critical need for utilities. AR has the capability to completely transform the way healthcare is rendered. It can dramatically improve the quality of patient treatment, and enhance the performance of medical professionals. AR is not only changing the way doctors learn about the human anatomy, but also helping them diagnose patients more effectively by overlaying CT scans and other imagery onto a patient's body. AR glasses allow surgeons to perform complex surgeries that once required monitors and endoscopic cameras. Mayo Clinic, the global leader in medical care has recognized the growth of new and disruptive technologies in the world of medicine. To address the unmet needs of patients, providers and the health care system, Mayo Clinic Cardiovascular Medicine formed the Virtual Reality Innovations Group. Researchers in this group explore the application of these innovative technologies to improve patient care. Augmented reality has proven to be significantly beneficial in several industries. AR technologies in education have helped redefine learning methods, especially those for differently abled children. Museums are using AR-based applications to make the experience more informative and enjoyable at the same time. The automotive industry has long been using AR. Back in 2015, Hyundai launched the augmented reality owner's manual app[7]. It was their version of the traditional owner's manual, allowing consumers to use their smartphone or tablet to get information on repairs, maintenance and other vehicle features. The use of AR for military training and combat exercises is well known. It is being frequently used to enhance training, provide situation awareness, and ensure safety. AR and VR: The technology of the future With COVID-19 and the limitations imposed by it, the adoption of AR and VR is accelerating. These technologies are rapidly changing the way we live and the environment around us. Their rapid evolution also means that they will perhaps be something completely different even 5 years down the road.

Research has indicated that there will be approximately 2.5 billion AR-capable devices (smartphones and smart glasses) -- by 2023, and around 30 million VR devices (including mobile, standalone, console and PC-based). The growth in AR is expected to be higher, with its applicability across a wide spectrum of industries. Moreover, AR provides an overlay of features onto the real world, compared to VR, which simulates the environment. Nevertheless, the specific use cases for these two technologies have tremendous potential to enhance customer satisfaction, improve training quality, reduce manpower costs, and ensure safety of service providers. We build augmented reality solutions that have the potential to redefine your business and improve efficiency, accuracy and user experience. 2G/3G is Shutting Down. You Need an Effective Strategy to Migrate IoT Devices to New Network

----- Arcticle source ----- https://www.wipro.com/infrastructure/2g-3g-is-shutting-down-you-need-an-effective-strategy-to-migrate-iot-devices-to-new-network/ ----- About the Author Contact Wipro Please fill the required details to access the content 2G/3G is Shutting Down. You Need an Effective Strategy to Migrate IoT Devices to New Network April | 2021 Change is inevitable. Mobile Network Operators face the constant need of upgrading the network to support the rise in global mobile data usage and increasing traffic enabled by emerging IoT applications.   Many operators across the globe have already announced shutdowns of 2G and 3G networks and some of them have stopped supporting 2G networks. The entire landscape of cellular connectivity is changing with the sunset of cellular networks and the continuous growth of 5G networks. Enterprises worldwide still use 2G and 3G for various IoT use cases and applications. For these businesses, the questions today are around the life expectancy of those networks, how long 4G LTE networks will be viable, and if 5G will mature soon enough for their needs. Impact of 2G and 3G sunsetting on existing IoT deployments More than 50% of cellular connected IoT deployments today are 2G or 3G. Changing the communication module of IoT devices due to network sunset is challenging, and requires investment in people, cost and time as it may force hardware modifications or revisions. If an organization's existing IoT deployment is based on communication modules that is designed to use 2G or 3G, then sunsetting can cause many device compatibility problems. The IoT deployment has to be reconfigured to support newer cellular based technologies. Transitioning to new networks Before making tough decisions, enterprises must do a detailed and thorough review of the inventory of their connected device offerings. They need to consider these factors for

transitioning the existing IoT deployment based on 2G/3G network: After evaluating these factors, enterprises must prepare a comprehensive plan for phased migration of devices in the existing IoT deployment to new network. The approach has to be based on minimizing the cost of migration with minimal disruption to existing operations and long-term implications as cellular networks continue to evolve. Making the change with the right migration strategy No matter what approach is considered in transitioning to the new network, it is important to consider deploying eSIM technology based SIM. This will ensure your solution has connectivity for the entire lifecycle and will also provide you the capability to change connectivity provider without needing to physically swap SIM cards for always-on connectivity through a carrier-independent over-the-air platform. It is also important to consider implementing a solution that supports remote configuration and firmware updates of devices. The aim is to minimize the need for costly site visit, truck rolls and professional services that can have a huge implication on cost of migration and maintenance activities. Are you prepared for the 2G/3G sunset in order to avoid blackout and business disruption? Wipro will help make your transition seamless. For more details, connect with us on ask.cis@wipro.com Aravind Sorake, Senior Architect - Cloud & Infrastructure Services, Wipro Aravind has industry experience in the areas of Consulting, Business Development, Pre-sales, Solution Design and Software Development. As an experienced IoT and Smart Cities professional, Aravind has worked extensively with companies around the globe in providing innovative and cutting-edge solutions. Aravind has special interest in cellular communication technology trends and IoT. You can reach him at aravind.sorake@wipro.com =====================

Adaptive Governance to Thrive in an Ever-Changing Digital Ecosystem

----- Arcticle source ----- https://www.wipro.com/infrastructure/adaptive-governance-to-thrive-in-an-ever-canging-digital-ecosystem/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Adaptive Governance to Thrive in an Ever-Changing Digital Ecosystem April | 2021 Abstract: In the 1990s, the third industrial revolution (sometimes referred to as the Digital Revolution) gained prominence, with telecommunications, automation, and digital electronics providing significant breakthroughs. The growing power of the internet, information, and computing made it a pivotal decade for the years ahead. However, IT was still a spectator to the business strategy due to limited contributions to business value. Times have since changed. Today, IT, once an auxiliary behind-the-scenes function for the business, has catapulted to the center of every company's transformation goals, driving business disruption and innovation. Add the Cloud to the mix, and you have a protagonist in this transformation story. Not only does the Cloud convert buzzwords like agility, customer experience, scale, and cost efficiencies into action, it also ties in very closely to business objectives as an able partner

for success. Consider Volkswagen who, through its partnership with AWS, is implementing the Industrial Cloud to bring its production and logistics platforms into the Cloud. The platform will aggregate data from all machines, plants, and systems in all factories to integrate more than 30,000 locations1 In recent times, cloud transformations have been structured and delivered by the Cloud Center of Excellence (CCoE), which leverages the governance function to ensure that the cross-functional organizational staff can drive adoption of the Cloud guiding principles through the overarching framework. A key area where the CCoE needs more power to wield the Cloud baton is countering the ever-changing market dynamics, which nascent Cloud organizations cannot decipher. The first of this two-part point-of-view series looks at ways to address this issue. Adaptive governance: What does it entail? Adaptive governance provides a flexible and responsive governance framework that helps align with fluctuating external environments – with seamless business and IT interconnections, processes, risks, structures, and stakeholders woven in. The focus is on the current and evolving view of the industry, competition, and external market forces. This governance model keeps the CCoE transformation unaffected by dynamic environments and enhances the Cloud adoption rigor. It is time for elevated conversations around sustained business improvements and growth. Governance needs not just to be fit for use and fit for purpose but also be fit for the future. It needs a dynamic outlook to survive and thrive amidst the uncertainty, complexity, and interconnectivity of the global business environment. Organizations must improve resilience and prepare for disruption if they want to remain relevant and deliver value for shareholders and stakeholders. While a standard governance model can bring awareness and service adoption, adaptive governance drives competitive advantage. Evolution of governance Historically, IT governance traces its genesis to the early 1990s. It was spun off as a derivative of corporate governance and was positioned primarily to link an organization's strategic objectives, business goals, and IT management. It has broad connotations and interpretations across the business space2 Primarily, IT governance is a framework that provides a structure for organizations to ensure that IT investments support business objectives. A set of policies, procedures, and guidelines keeps the business and IT spaces aligned and informed of the best use of investments (in processes, people, and technology) to further organizational goals. In the business technology landscape, multiple interests need to be factored in: shareholders, customers, competitive interests, government, and advisors. If set up and executed correctly, governance leads to increased agility in deploying solutions, better business value, and a tight cost structure. Often, one of the most noticeable areas where governance execution fails is the explosion of costs through overruns and penalties. Consider the case of Facebook, which incurred $5 billion in penalties for privacy violations from its partnership with Cambridge Analytica3. A well-defined corporate and IT governance strategy offers a better understanding of risks, regulatory policies, and requirement adherence. How a Cloud Center of Excellence helps customers on their Cloud journey A Cloud Center of Excellence (CCoE) helps an organization adopt a Cloud-first and Cloud-native approach. It ties into the organization's vision and provides the direction to the Cloud. The CCoE provides the structure and governance across different customer landscapes, complexities, expectations, and maturities. It also helps uncover deeper issues and challenges that need comprehensive thinking and

execution, like advocacy, building a Cloud-aligned culture, promoting innovation, scanning for opportunities, threats, and remediations. Building a CCoE and advocating the Cloud agenda across an organization is not easy. Strong sponsorship from the leaders – not just from IT but from Finance and each business line – is needed. Typically, many transformations do not take off or meander because the value delivered is not clearly outlined to the organization, making the transformation a leap of faith. What can make this leap of faith a leap of conviction is leveraging a governance model that can define and refine the cloud objectives, setting the appropriate metrics that align to outcomes, and rigorous tracking and course corrections to achieve them. Discrete and adaptive governance Discrete governance centers around static and siloed elements and has an internal focus on an organization's interconnected functions. It manages to work well with smaller-scoped Cloud engagements that are either just starting or are localized in the organization. Their impact on Cloud transformation journeys is limited because the cloud journey has many moving parts: the internal workings of the organization, the external market forces that demand a quick and scalable move to the Cloud, competition trying to seize an early mover's advantage, and customers needing features quicker than the changing seasons. Table 1 outlines the differentiating parameters between discrete and adaptive governance.   Parameters   Discrete Governance   Adaptive Governance Synergy Builds the governance function in silos. Has limited synergies. Provides a tactical perspective. Builds synergy between multiple Cloud initiatives and has a well-rounded view to scale effectively. Has a strategic perspective. Suitability Suits transformation programs that have standard processes, delivery mechanisms, and smaller groups. Struggles to provide optimum results when overlaid with many external groups, themes, and objectives. Suits large Cloud functions and company-wide initiatives.   Better suited to navigate ambiguity and complexity. Agility and Efficiency More efficiency-focused than agility-focused; less agility to change tracks. Efficiency and agility focused. Able to move faster and change tracks as needed. Advocacy Advocacy is limited to granular objectives and, in many cases, is limited to tech with tools and platforms. Advocacy is better with key, quick wins in a dynamic environment. Also helps recover faster from failures. Business Outcomes and Value Delivery Measures and delivers against existing metrics and objectives. Can define and refine business objectives based on expected outcomes. Empowers business for decision-making; investments with value-added solution enablement. Continual Improvement Based on after-the-fact feedback. Reactive to changes. Anticipative and proactive, based on continual re-scoping of CCoE needs. Provides a governance for governance model that is intended for continual improvement. Better suited for auditing compliance and performance. Cloud Maturity Progression Formalizes standards and functions and provides Cloud value. Matures and grows the Cloud organization; sustains and enriches cloud value. Innovation Centricity Less innovation-centric and needs significant effort and investment to innovate; risks adding inefficiencies. Closely ties into tech innovation themes to deliver, measure, and enhance Cloud value. Demand Management Limited and ineffective demand to opportunity translation. More cohesive; utilizes enterprise architecture-led business demand and tech enablement. KPIs and Metrics Measurement using static key performance indicator (KPI) scorecards have less traceability to the expected outcomes. Effective,

clutter-free key performance indicator (KPI) scorecards with actionable data points suited for current and evolving business outcomes. Table 1: Differences between adaptive and discrete governance Our next paper will further explore how to align with an emergent strategy to drive better business outcomes, empowering the Cloud Center of Excellence (CCoE) to drive digital transformation. We will also talk further about the adaptive governance model and how integrating adaptive governance can deliver results. Aligning with an emergent strategy to drive better business outcomes, empowering the Cloud Center of Excellence to drive digital transformation

----- Arcticle source ----- https://www.wipro.com/infrastructure/aligning-with-an-emergent-strategy-to-drive-better-business-outcomes-empowering-the-cloud-center-of-excellence-to-drive-digital-transformation/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Aligning with an emergent strategy to drive better business outcomes,empowering the Cloud Center of Excellence to drive digital transformation April | 2021 Setting up Cloud transformation initiatives in an organization takes work. It is even tougher to get it going and growing. Delivering a successful Cloud transformation needs to focus on value. There is a need for standardized value delivery with quicker prioritization (and de-prioritization) of Cloud workstreams. Often, some workstreams begin in multiple pockets and in different orders of magnitude, all of which need to be transparent to each other and must orchestrate together. Employee and customer experiences through incremental and consumable changes in action become crucial to building on the momentum. The progress serves to propagate value and awareness across the larger organization. Throughout the adoption path, an alignment to business and IT objectives is required for better benchmarking, traceability, and value

realization This paper delves into how an organization can increase Cloud maturity, scale, and responsiveness to the expected business objectives. A key element of adaptive governance is a scaled agile framework (SAFe) that helps the CCoE scale the organization's cloud transformation journey. A CCoE aligned to an adaptive governance model needs an underlying agile framework to transform the Cloud agenda from the individual team level to portfolio and then to the program level. SAFe combines agile and lean system thinking practices, delivers enterprise Cloud programs of value, helps align business and customer context, and widens the scope of functional planning and value delivery1.   The Adaptive governance operating model The operating model for adaptive governance is structured around quickly understanding and navigating through decisions that impact business outcomes. Business environments undergo constant changes due to external forces, which include newer industry regulations, competition entering newer markets at a faster pace, advisors with newer projections for the overall industry, and some industries taking a bigger hit than others during a crisis (the travel and hospitality industry, for instance, during a pandemic). Organizations need to be open to changes, able to strategize and modify directions, and accelerate on demand to ensure that their market advantage is sustained. Adaptive governance provides the framework and the models that can align to internal and external changes. It can also identify areas needing a change in strategy and execution to ensure that business outcomes are met and exceeded and modify the transformation charter accordingly for the future. Some governing elements of the framework are listed below: The scaled agile framework provides stability and structure. Another critical constituent is the availability of current and accurate organizational data – interconnected with business and IT – in the form of business and IT dashboards. The data's recency and accuracy are paramount to ensuring that every milestone is measured, captured, and understood. There is a need for robust data architecture to convert data into information and then to insights. The four types of analytical categories listed below provide details: The next part of the model is the information correlation plane. Data from the business processes, applications, infrastructure, security, and cost dimensions are captured using automated tools and systems and correlated further. The integrated information feeds into the adaptive governance maturity assessment model and helps provide recommendations to revise the business and technology charter as needed. This process helps in driving business outcomes and ensures that the required business value is provided. Adaptive governance maturity assessment and the journey toward actionable results Evolving and driving business values and outcomes need synergies across businesses and the application-infrastructure layers. These synergies need to manifest across both the strategy and operations phases. Defining the expected business value helps determine the proper business outcomes for the organization. These business outcomes then translate into organization-wide metrics that track and measure the outcomes and position them for success. The metrics / key performance indicators (KPIs) that are thus created are more aligned to the business and help measure vital factors impacting the business. It is important to note that metrics are not outputs and are only a means to an end. The validity of the metrics is vital, and they must be made actionable, leveraging the adaptive governance maturity assessment. Adaptive governance maturity assessment The adaptive governance

maturity assessment helps drive the metrics into action. Across the entire cloud organization, through a series of contextualized questionnaire responses, the maturity of the organization is classified into the following maturity levels: Each level determines a step toward keeping up with and ahead of changes. As the organization's maturity improves, it becomes more adept at navigating the change. The first two levels – Aligned and Optimized – constitute a discrete governance maturity for the organization, where it is competent to tackle standard scoped deliveries. The next three levels – Integrated, Enterprise, and Ecosystem – bring in the adaptive color to the organization to scale and grow with the Cloud. The Cloud Center of Excellence is typically in a nascent/rudimentary stage during the Aligned and Optimized governance levels. The measurement model also includes tool-led insights and qualitative assessments through comprehensive questions and ratings to deliver scorecards that check for hits and misses. Ratings and predictive analytics help tune the metrics from the bottom up. The operating and assessment models help the organization scale seamlessly between discrete and adaptive governance and encourage further steps to tune and redefine the Cloud charter when needed. Measurement to action Through the metrics-based assessment, there is a clear baseline indicating where the organization stands, and the recommended actions are based on the measurement-to-action principles: Delivering the actions The Cloud Center of Excellence owns the actions prescribed by the maturity assessment model. The group orchestrates the actions through its core and extended functions across the business and tech realms. These could be around a Cloud cost optimization exercise from the cost and economics function, driving business ideation to tech translation through the enterprise architecture group, or moving batches of mission-critical workloads to the Cloud by the migration and transformation office. Scaling Cloud adoption with the adaptive governance framework Scalable Cloud delivery is understandably a huge mountain to climb. However, with adaptive governance by its side, a CCoE can help align and refine its Cloud vision and implement an agile strategy that achieves optimum business outcomes. It is essential to keep the governance function always staffed and not look at it like a SWAT team in a crisis. Retaining an active focus on integrating objectives, metrics, and actions brings a higher chance of success in Cloud transformations. An Experience-Centric Digital Workplace: Why It Matters and How to Build It

An Experience-Centric Digital Workplace: Why It Matters and How to Build It May | 2021 A digital workplace experience has gone from being a nice-to-have to an absolute imperative in just a few years. According to Gartner, by 2020, the most critical competitive differentiator for 30% of organizations will come from the workforce's ability to creatively exploit digital technologies1. While the traditional workplace was already in a state of evolution, thanks to widespread digitalization and changing workforce dynamics, the outbreak of the COVID-19 pandemic has pushed the accelerator. Forced to adapt almost overnight to 100% remote working model, most organizations are struggling to ensure consistent network performance, robust security, and employee productivity while simultaneously building business resiliency. Most organizations have a laser-sharp focus on their customer experience but fail to replicate the commitment when it comes to their employees – the starting point of all business outcomes – from efficiency and productivity to profitability, innovation and growth. As organizations prepare to operate in the new post-COVID reality, the employee experience and digital workplace culture will prove to be critical enablers for business resilience, adaptability and agility. This paper discusses why a digital workplace is critical for organizations of all sizes today and how to build one quickly at scale. The workplace experience isn't about technology; employees matter most Contrary to perception, a digital workplace has less to do with technology or architecture and is more drawn towards the employee experience (EX) that drives the workplace experience (WX). Digest this – 66% of employees feel overwhelmed due to difficult and restrictive technology at work. While most employees love their personal tech (mobile apps, smart home devices, etc.), few can say the same about workplace tech. That's because enterprise tech solutions are mostly deployed in silos, have fixed capacity, limited choice (of access, device, etc.), and basically lack the efficiency and convenience that modern users as well as business needs demand. Modern users need integrated solutions that let them work flexibly anywhere, anytime, and on any device of their choice. They do not wish to concern themselves with the backend complexity of corporate IT and that's exactly what IT's aim should be too. This expectation is driving a much-needed change in how enterprises think about the workplace experience. While Technology Thinking dominated the period around year 2007 (tech silos and pipeline-driven tech focus), the rise of Industrialization around 2014 gave way to Services Thinking driven by industrialization of services with the primary goal of optimizing costs. Cut to today and the enterprise scenario is dominated by Platform Thinking with a sharp focus on product and innovation, and

leveraging platform interconnections to deliver superior customer and employee experience. However, the capabilities of an IT management framework designed for an era of desktop computing are not able to keep up with these new demands for convergence of end-user computing activities. CIOs need to embrace a modern IT infrastructure, with more agility than ever today, given that remote working is also adding steam to demands for a converged workplace experience that supports not just Work from Home (WFH) but Work from Anywhere (WFX). Technology experts believe that industry convergence will be the primary trend in the immediate future. Mobile solutions, cloud computing and the Internet of Things [IoT] will gain prominence over the next five years as the workplace is no more confined to a brick and mortar structure Creating a digital workplace is one of IT's biggest challenges: Here's what you can do Creating a workplace experience sans borders requires IT to empower end users to work independently as well as collaboratively from anywhere. This means tailoring the workplace experience to the specific needs of each user group and ensuring that the right information is available to the right users at the right time – quickly and securely. This is a formidable challenge for IT as three key roadblocks stand in the way: #1 Ensuring cyber and information security across the digital workplace: A digital workplace introduces more end points and devices (BYOD), making it difficult for corporate IT to enforce security policies and control access. Most companies let their employees use their own device to access business applications. That's because employees expect a frictionless experience irrespective of whether they use their own or corporate devices. This leads to increased risk of data breaches, theft and phishing scams, causing organizations heavy legal, financial and reputational losses. Clearly, perimeter-based security systems are insufficient in a digital workplace environment that extends beyond borders. 83% of CIOs believe mobile security threats are a major problem2. What to do: Digital enterprises must employ a zero-trust security approach that verifies all aspects of a connection — including the device, its applications, users and networks — before granting access. #2 Making the workplace experience seamless: This requires creating and maintaining the infrastructure and networks to deliver data, applications and connectivity across devices in a frictionless manner. With new-age digital technologies such as IoT, 5G, and AI making significant impact on the way we work, the need for modern infrastructure, high-speed, and reliable network connectivity is soaring. What to do: Digital enterprises must embrace network modernization through Software-Defined Networking (SD-WAN) to drive intelligent bandwidth allocation depending on prioritization of application criticality, and other key factors. This will help pool/virtualize WAN resources, enforce app security, and reduce hardware footprint. Adopting a bi-modal IT operating model also ensures greater underlying flexibility in infrastructure and services. Enterprises must align network to user needs, define performance for apps and users, and enable datacenter grade robust security at the edge of the enterprise.   #3 Driving effective change management: Workforce transformation is one of the biggest factors that can make or break the success of a digital workplace. While effective change management is about getting all functions to support and embrace workplace changes, three departments in particular i.e. Facilities, IT and HR, should be in sync. What to do: Organizations should articulate clearly to employees what the digital workplace will do for them, how it will impact

their day-to-day activities, and how it can help them be more productive, collaborative, and give greater control over how they use enterprise IT services. Share frequent updates on implementation, ask for feedback, and motivate employees to drive greater uptake and adoption of digital workplace tools.   How Wipro's digital workplace solutions are leading the change   Wipro's suite of Digital Workplace solutions extend across the entire employee lifecycle (Pre-hire support, onboarding, employee assistance, productivity & security, as well as offboarding assistance). We deliver persona-driven services with a laser-sharp focus on employee experience and service design. As enterprises adapt to the new normal, our Wipro Live Workspace services backed by solid consulting experience will help define the most logical roadmap for workspace maturity. References Wipro will help you transition seamlessly from a physical to digital workplace environment leveraging our ready-to-use accelerators and frameworks. For details, connect with us at ask.cis@wipro.com. Srinivas Kollur Practice Director, Cloud & Infrastructure Services, Wipro Srinivas has 22 years of industry experience on various facets of infrastructure management services and global work experience. As a subject matter expert on Digital Workplace Services, Srinivas represents Wipro in various internal and external forums to discuss the challenges and opportunities, and help our customers design and drive the transformation roadmap. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =======================

How Airports Can Create Contactless Passenger Experience

----- Arcticle source ----- https://www.wipro.com/infrastructure/how-airports-can-create-contactless-passenger-experience/ ----- Related Articles Contact Wipro Please fill the required details to access the content How Airports Can Create Contactless Passenger Experience May | 2021 COVID-19 has clearly accelerated awareness for safety, healthcare and increased hygiene. It has unfolded new consumer expectations while traveling and created the demand for safer air travel. Airports now need to maneuver through the crisis and come up with solutions to understand passengers' new requirements and manage them effectively. The concept of touchless/ contactless passenger experience has gained traction to ensure adherence to COVID-related restrictions and health concerns. Innovative technologies like touchless body temperature detections, and facial recognition are becoming the new norm. Innovative ideas and technologies are critical to creating tech-savvy airports that deliver exceptional passenger experience

in the new normal. Technologies such as artificial intelligence (AI), machine learning (ML), Internet of Things (IoT) and the convergence of 5G with cloud capabilities are bringing significant transformation to the travel experience. Challenges at the airport Travel bans, partial lockdown and restrictive quarantine measures continue to impede travel industry recovery. Human interactions and inadequate staff at screening checkpoints, baggage handling and security often lead to long queues. These long queues could compromise social distancing norms and lead to health risk. Additionally, most airport infrastructures have maximum capacity utilization, which weren't designed to adapt to social distancing regulations. Inconsistencies in flight schedules due to country-specific restrictions lead to significant delays at the airports. Overcoming these challenges requires operational flexibility, collaboration, and technological readiness. Redefining the airport experience with innovation Touchless technology innovations have become critical in supporting airport recovery. These are enabling a move from manual processes to digital services. Automation and touchless technologies have increased the efficiency of airport management at various passenger touchpoints. New age passenger experience Touchless technology means no manual input of data or in other words, low or no direct contact with systems. Although sanitization measures are implemented, the systems do not need constant monitoring due to lack of direct contact. Passengers are assured of sanitized restroom with robots disinfecting within regular intervals. User-friendly mobile applications help airport visitors to navigate the premises. Many airlines now use mobile apps to communicate with customers on flight details, alerts and status reports. Customizable apps such as Wipro Health CO-VER can be used at airports to track, educate, and alert visitors about social distancing measures. In the context of the current pandemic, the use of immunity passport can prove convenient to passengers. Similar to a paper-based certificate, the digital health passport can be applied to enable human mobility. Passenger time optimization Biometrics and digital identification could become new travel passports to eliminate manually-intensive operations. Facial identification using biometric device could replace a physical passport. You could go straight through the boarding gate with the facial recognition access, allowing time optimization. Applying biometric devices can eliminate long waiting time at immigration checkpoints. With the introduction of biometrics in airports, passengers can benefit from fast-track services. Recently, Dubai Airport1 implemented a new biometric system that uses AI technology at smart gates to prevent passenger clusters, improve passenger time optimization, and to enhance touchless experience. A passenger with machine-readable passport can access the smart gate and proceed. Smart baggage kiosks Self-service bag drop (SSBD) is an automated technology designed to give control to the traveler. Implementing self-service baggage drop-offs can exponentially enhance passengers' experience. This will result in reduced queuing and check-in time and enable stress-free journey. It will allow the passenger to print bag tags, boarding passes and drop-off baggage by using customer-friendly interface. Built-in sensors, cameras, and smart kiosks at the airport will promote substantial benefits to the passenger as well as the airport management. It will enable fewer manual workforce, time optimization, and convenient check-in. With the steady increase of passenger footprint per year, the need for space optimization is a priority. Enhanced lounge experience The use of AI at

airports has the ability to convert data into usable intelligence for improvement in operations and passenger experience. Sanitizing robots and self-service automated stations at the airport-lounge can further promote touchless solutions. It can potentially enhance premium, tailored experience for travelers looking for comfort. Turkish Airlines has recently applied Apple's iBeacon technology that connects with other iOS devices to enable lounge users to access popular books[1]. Similar concepts can be configured to bring about more intelligent and innovative technology to foster user experience across the lounge. Grab, a mobile ordering device used by airports is another example. Passengers can order meals through their own devices with a scan of a QR code without downloading the app and without any human interaction. Smart airports with touchless technology The events of 2020 have plummeted traveler confidence. Technological innovation has lifted some pressure off and restored assurance. Although these innovations enhance safer travel, they do raise questions on personal data security and privacy protection. Stakeholders in the travel industry are finding ways to address these challenges while investing in innovative platforms to enable better customer service. Implementing cloud-based digital transformation in the travel industry has provided a breakthrough in contactless passenger experience. Investing in cutting-edge technologies at the airports can promote sustainability, resilience and efficiency and mitigate future disruptions. Wipro is helping leading airports adapt to the new normal. To know how we can support your transformation journey, contact us at ask.cis@wipro.com. Modern Businesses Need Next-Gen SD-WAN

----- Arcticle source ----- https://www.wipro.com/infrastructure/modern-businesses-need-next-gen-sd-wan/ ----- Contact Wipro Please fill the required details to access the content Modern Businesses Need Next-Gen SD-WAN May | 2021 Without a dependable, agile, secure, efficient, and ubiquitous network, it is impossible to succeed in the pandemic-altered world With the emergence of virtual digital infrastructures and hybrid work styles becoming the norm, organizations must have an advanced and secure SD-WAN platform to deliver the wide-area connectivity necessary to operate. Next-generation SD-WAN is becoming a priority with rising demands for supporting the dynamism and flexibility a modern business needs. The most important and impactful characteristic of an advanced SD-WAN is a design that utilizes orchestration, which delivers a single point of control for all aspects of the SD-WAN. Wipro's joint thought leadership paper with Cisco - Upgrading to a New Digital Network that Empowers Hybrid and Multi-Cloud Applications – explores the growing relevance and demand for secure SD-WAN platforms and delves into critical aspects like Wipro has teamed up with Cisco to offer an improved approach to modern SD-WAN deployments. Wipro's #WANFreedom integrates the company's comprehensive lifecycle services for SD-WAN and the highly regarded Viptela SD-WAN solution from Cisco to deliver improved agility, speed, security, employee experiences, and network dependability. What Can Design Thinking Do for IT Operations Automation?

----- Arcticle source ----- https://www.wipro.com/infrastructure/what-can-design-thinking-do-for-it-operation-automation/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content What Can Design Thinking Do for IT Operations Automation May | 2021 Think about your best-in-class experiences as a consumer. From renting an apartment through Airbnb for your vacation to streaming a video on Netflix, it is certain that design thinking techniques contributed to those superior experiences. There is no single definition for design thinking. At its core, design thinking represents a deep understanding of customer's goal, envisaging various possibilities to meet the goal and finally creating innovative solutions to prototype and test. The most widely accepted process of design thinking is from the Stanford d.school which comprises five iterative processes in design thinking including - Empathize, Define, Ideate, Prototype, and Test. How can we apply Design Thinking to IT operations automation? Today, we find that most organizations that have implemented automation are dissatisfied with the outcome and are looking to enhance the impact of automation to gear towards large-scale transformation. Such a

problem statement requires a systematic approach to identify, assess and deploy automation while tracking the value of realization in parallel. Large-scale transformation will not be fully realized unless a scalable approach to IT operations automation is defined. Let us map design thinking process to required automation activities and understand if it helps in quicker realization of value from automation. From the above table, it is evident that Design Thinking principles vastly contribute to facilitate planning of IT operations automation. This human-centric design process helps in shifting focus from individual task automation to end-to-end process automation resulting in large-scale transformation, higher returns and superior customer experience. To know more about how you can start scaling automation projects with design thinking, reach out to us here Priyank Jain Automation Practice Manager – Cloud & Infrastructure Services, Wipro Priyank is an Automation evangelist who is passionate about applying technology to solve enterprise IT problems and helping clients transform their automation journey. He has 12+ years of experience in the IT industry across various domains including Strategy, Business Planning, Automation, GTM, & sales enablement. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.

How to build a boundaryless data-driven enterprise

----- Arcticle source ----- https://www.wipro.com/infrastructure/how-to-build-a-boundaryless-data-driven-enterprise/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content How to build a boundaryless data-driven enterprise June | 2021 Introduction Enterprises today face new and ever-growing challenges as unprecedented change drives the critical need for agility and resilience. This change is not only forcing organizations to re-think their whole business strategy; it's fast-tracking digital transformation and the adoption of more agile, secure, and intelligent infrastructures.   IDC recently predicted that in 2022, enterprises focused on digital resilience will adapt to disruption 50% faster than those fixated on restoring existing business/IT resilience practices[1]. So, for any forward-thinking enterprise, building resilience is essential to enabling competitive advantage, which is only achievable with real-time, data-driven insight. By 2023, 60% of organizations will have started to implement DataOps programs to reduce the number of data and analytics errors by 80%, increasing trust in analytic outcomes and the efficiency of Gen D workers. Additionally, 50% of organizations will adopt a "data supermarket" strategy to unify data storage, access, and governance capabilities to deliver a consistent data experience and maximize data value.2 We've explored how

boundaryless data storage and autonomous operation in digital transformation are now the driving force behind the data-centric approach enterprises need to take. Preparing for exponential data growth The COVID-19 pandemic has accelerated data growth globally, leading to a rapid increase in data consumption and fuelling the continued evolution of the Global DataSphere that's dominating the 21st-century enterprise. According to IDC: Monetize and modernize: Data storage ecosystem Enterprises have an opportunity to harness the power of data; it is now crucial to their success. But an old solution can't be integrated into a single server room – data isn't something that can easily be packed in a box. That's where the data storage ecosystem plays a significant role. To harness the true potential, the underlying storage should: Many businesses are on the path to digital transformation to enable agility and flexibility while reducing complexity and time to market. Cloud is increasingly becoming the preferred route for embarking on this journey, but CIOs need the ability to select the cloud that meets specific workload requirements related to data storage performance and services. Wipro's autonomous storage operation powered by Pure Storage accelerates digital transformation with a multi-cloud infrastructure that supports enterprise objectives. It's creating transformational impact with the ability to offer full-scale autonomy, enhanced SLAs, and efficiency: Wipro and Pure Storage®: Driving business outcomes According to IDC, by 2022, strategic partnerships will be formed between 40% of market-leading IT and OT vendors to deliver a holistic solution. For customers, this is set to reduce integration and deployment costs by 20%6. Wipro and Pure are already achieving this strategic partnership to offer compelling, cost-effective, managed environments. Wipro brings leading knowledge and experience in driving outcome-based transformation, from consulting to end-to-end strategy execution with a technology infrastructure engineered as a service in a hybrid cloud ecosystem. Pure brings the simplicity, flexibility, and efficiency to maximize results for enterprise and cloud-native web-scale applications on-premises and in the public cloud. Together, Wipro and Pure give organizations the capability to transform digitally and drive outcomes: improving time to market, achieving the "first time right" approach, improving flexibility and agility, and driving cost optimization. The joint solution provides: Benefits include: Autonomous storage operation simplified with Service Theatre Wipro's Service Theatre is a fully programmable platform that extracts complex technologies and delivers outcome-driven automation assets, which are discoverable and used as managed API. Service Theatre radically simplifies and centralizes automation asset creation with its theatre concept and balances it with an efficient consumption and reuse model that provides new services aligned to changing business demands. This element ensures it performs Day 2 tasks (lifecycle management). Code Orange: Evergreen storage and Wipro - Pure as-a-Service™ The service is built on Pure's flexible consumption models, combined with added solutions to minimize or eliminate the financial impact of change. In this model, customers only pay for the storage they need when they need it, whether on-premises or in the cloud. So as business needs change, budgets can be flexed up, down, or out - with no upfront investments, over-provisioning, and complicated leasing requirements. The simple, agile, and Evergreen platform enables any organization to turn data into intelligence and advantage. Everything's included in the price, so there's no additional capital for refresh in future

years. It's the smartest way for enterprise customers to combine the best of a traditional on-premises storage solution with a subscription to continuous innovation. The advantages Conclusion: Deliver data-driven transformation By 2023, 60% of leaders in G2000 organizations will have shifted their management orientation from processes to outcomes, establishing more agile, innovative, and empathetic operating models[7]. With its comprehensive data management capabilities, Wipro's unique proposition, powered by Pure Storage, enables enterprises to leverage an outcome-driven cloud-native architecture and deliver the following use cases: Multi-hybrid cloud Pure Cloud Block Store™ combined with FlashArray™ allows workloads to be replicated and extended across multiple on-premises, hosted, and AWS or Microsoft Azure public clouds, providing a true hybrid cloud experience. The service is managed centrally with Pure1® and Service Theatre, which offers the flexibility to move data seamlessly. It enables applications to be built and run quickly and easily from anywhere, driving innovation and reducing time to market. Pure as-a-Service complements the service further by offering a single data storage subscription. The 100% OPEX model also means customers only pay for the storage they use. High availability and resilience ActiveCluster™ delivers a proven 6x9s of availability on a single array, so in addition to being extremely reliable, it's also fully integrated with no additional license costs. The Pure-hosted Pure1 is the first-ever Software as a Service replication mediator, enabling disaster recovery without the need for a third data center. Container storage Portworx®, the #1 Kubernetes data storage platform, guarantees that data and next-generation microservices-based applications are secure and available 24/7, without disruption. Enterprises can run any cloud-native data service in any cloud, using any Kubernetes platform for built-in data protection and hybrid-cloud mobility. The combined strength gives customers a simplified, cost-effective, and efficient unified system where data can be managed from anywhere. Reference Imran Ahmed Practice Head Wipro leads the storage and backup domain within Wipro as Practice Head. He was instrumental in industrializing cloud-based vertical-specific solution models for highly regulated environments, focusing on compliances required in multi-hybrid cloud deployments. Imran is a key influencer, addressing challenges and de-risking roadblocks in the client transformation journey, which has led him to introduce Zero Friction Transformation Services for industries to tide over the challenges of implementing a frictionless experience from idea to operations. He has successfully addressed data security, privacy, and localization concerns alongside the overall cyber-defence strategies of enterprises. As a thought leader within the cloud and data center industry, he has presented in various CXO-level forums and events. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.

A New Era of Connectivity and Sustainability with IoT

----- Arcticle source ----- https://www.wipro.com/infrastructure/a-new-era-of-connectivity-and-sustainability-with-iot/ ----- Contact Wipro Please fill the required details to access the content A New Era of Connectivity and Sustainability with IoT July | 2021 As global economies chart the course to reverse the fiscal downturn caused by pandemic, a massive shift in consumer behaviour such as rapid adoption of digital outlay and a collective overdrive into conscious and ethical buying decisions, will place sustainability at the center of all global recovery plans. Adoption of emerging technologies such as IoT, AI, ML, and 3D Printing to synchronize business cycles with larger sustainability goals will drive the recovery plan forward for both, governments and businesses. This paper explores how smart and futuristic technology solutions have a pivotal role in ushering in the new normal without compromising the environmental benefits generated during the pandemic, such as improved air quality and ecological restoration. Early adoption of these technologies has produced evidence to support tangible business value as well as quantifiable environmental benefits.   =====================

Is Your IT Strategy Delivering the Best Employee Experience?

----- Arcticle source ----- https://www.wipro.com/infrastructure/is-your-it-strategy-delivering-the-best-employee-experience/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Is Your IT Strategy Delivering the Best Employee Experience? Wipro's Device as a Service solution – WaaS360 – focuses on experience to drive right decisions August | 2021 Before one understands WaaS360, Wipro's Device as a Service solution, one would need to know the insights that led us to build this device-focused service from the ground up. In our experience, we have observed that while our clients' endpoints landscape is growing or changing fast, the traditional services around that landscape have not kept up to speed and in fact, have not seen much change in a long time. The number of endpoint options to be managed in a highly complex global ecosystem is increasing rapidly, but there is little to no accountability to ensure good customer experience on these devices. This gets further complicated by the fact that the market is rapidly evolving, bringing with it a whole lot of challenges that are getting more pronounced by the day. This is making an already-uphill task of maintaining good employee experience using legacy services a perpendicular climb. Let us highlight some of the major concerns that plague this arena to understand the gravity of the situation we are dealing with: The state of employee experience When the going gets tough, the tough get going. But concerns have been going on for so long now that the second part of that popular phrase now seems to read

differently. We have been observing that companies are faced with very difficult choices nowadays. Decision-makers are not debating which option is better but rather which option is the lesser of two evils. For example, whether to make upfront capital expenditure and do a big-bang hardware refresh every few years, leaving little cheese for core business activities or to bleed due to a thousand cuts, incurring cost of finance, leasing out hardware, and managing it all (and trying to look happy while at it). Somewhere in all of these concerns and sub-optimal elements, the employee experience went out of focus. Clients earnestly do try various glasses on every now and then to make that picture less blurry, but they are often left wanting for more. Reimagining choice and experience with WaaS360 Wipro's WaaS360 is a genuine attempt to address precisely this fundamental disconnect – how to provide the best choices of the time to our clients while elevating employee experience in a way that makes good business sense. We manage the whole arena under WaaS360 for our clients, providing maximum benefits at an optimized TCO (and succeeding while at it). Customer experience need not necessarily be lost in translation anymore. WaaS360 is not just a bunch of hardware packaged together with some services and it's not just financial re-engineering. With WaaS360, Wipro has built a proposition from the ground up that is greater than the sum of its parts. We understand that the devil usually lies in the details and we are tackling the details head-on when building this custom (which, thankfully, is easy given its modular and flexible nature) solution for our clients. If you were to ask me why Wipro WaaS360, I would answer the following: I'm not claiming that we've solved the 'event X' problem but I can assure you that your company will have more resources for its core business activities while you have a great experience on the devices and services we provide. If you are interested in learning how Wipro is helping our clients achieve their vision of transformation through DaaS, we should talk. Connect with us at ask.cis@wipro.com. Vikram Singh Product Manager – WaaS360 (Worldwide), iCORE–CIS, Wipro Vikram has 8 years' experience in software & Android app development, consulting, business development & product management. Currently, he manages WaaS360 offering globally while helping customers across industries address challenges of workplace & enhance their employee experience. He's an alumnus of IIM Kozhikode and has strong interest in gadgets and latest tech trends. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

The Future of Edge Services Delivery

The Future of Edge Services Delivery Secure Access Service Edge August | 2021 Figure 1: The 3Cs model SASE at a glance A cloud native architecture, SASE is used to deliver connectivity and security services in a complaint manner to an edge estate. Initially coined by Gartner, it was widely accepted within the information technology (IT) and telecom industries. Backhaul connectivity constraints, including latency, are addressed in a controlled manner to ensure the distributed data is secure. SDWAN and SASE are both edge centric solutions, though SDWAN focuses on connectivity while SASE refers to security and compliance. It is essential for both the technologies to work together to make the ecosystem more secure, robust, and seamless to access and consume services from anywhere in the world. Figure 2: SASE core components and characteristics SASE landscape and current market dynamics The SASE model, its end-to-end integrated ecosystem landscape, and its key components and elements are depicted in Figure 3. Figure 3: SASE – End to end landscape view Currently, the SASE market is a crowded space with various technologies and vendors bringing their own points of view. In the near future, great convergence and consolidation is expected. Here are the three types of solution providers and their focus areas: Some of the vendors providing SASE technologies as a whole, in addition to the major players mentioned earlier are Versa Networks, Cato Networks, Fortinet, Aruba, Cloudflare, Perimeter 81. The vendors in this category are emerging technology companies that can offer differentiated value propositions. Analysts' predictions SASE adoption models1 As SASE evolves as a model and framework, and the transformation models require time to mature, the existing models have some advantages before becoming full-fledged matured models. Key approaches for SASE adoption include process, people, measurement, technologies, and strategy. The strategy will be a combination of short, medium, and long term. Parameter Current Models Future Models Benefits Use cases Challenges Currently, there are no industry wide frameworks and standards for SASE because it is evolving and there is a long way to go before we have a SASE with widely accepted, recognized frameworks and standards, measurements, and KPIs. Wipro's role and value proposition Wipro plays multiple roles with respect to SASE, including that of a system integrator, a consumer, and a solutions or strategic partner. Wrapping up SASE is fast becoming an essential model that every company will have to adopt and maintain, as well as follow the maturity curve, until the overall industry governance, framework, and standards are apparent. Working from anywhere without compromising security and compliance is a necessity, so SASE is integral to the ecosystem. Wipro is poised to deliver differentiated offerings through joint solutions created in partnership with established and startup technology vendors. To learn more about how Wipro's solutions and

unique capabilities can help your company achieve a seamless digital transformation, please contact us at sdx-cis@wipro.com Rambabu Kata Senior Consultant, Wipro Rambabu Kata (Ram) is an IT professional with 26 years of industry experience in IT, delivery, architecture, practice, and pre-sales. He has a Bachelor's degree in electronics and communication engineering and a Master's in marketing management. Govindan Kutty Practice Director – Data center & Hybrid Cloud Practice at Wipro Govindan is an IT professional with 25 years of industry experience in IT delivery, solution engineering, and practice development. Govindan currently heads the solution engineering and innovation center. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.

Wipro Partners with Palo Alto Networks to Deliver Managed SASE

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-partners-with-palo-alto-networks-to-deliver-sase-key-to-enterprise-networks-for-effective-digital-acceleration/ ----- Efficient and effective networks - The bloodline of digital acceleration SD WAN – Accelerate the journey, but don't neglect security Secure access service edge (SASE) – The future of SD WAN and security Wipro's managed SASE in partnership with Palo Alto Networks Connecting safer and better Related Articles Contact Wipro Please fill the required details to access the content Wipro Partners with Palo Alto Networks to Deliver Managed SASE August | 2021 The COVID-19 pandemic has compelled companies to rethink and realign their business strategies. Digital adoption and transformation are not new concepts; companies have been trying to adopt digital technologies in order to scale their businesses for nearly two decades now. However, the pandemic has brought into focus the critical need for companies to be resilient, agile, and secure. 2020, hence, became the year of accelerated digital transformation, with companies now reevaluating their strategies for an end-to-end digital overhaul. A survey by the Boston Consulting Group (BCG) among more than 5,000 respondents indicated that over 80% felt digital was helping them get through the economic slowdown resulting from the COVID-19 pandemic. In addition, the survey also pointed that 65% of the companies expected to increase their investments in digital transformation in the future. The key learning from the pandemic is that digitally mature companies demonstrate growth and resilience by focusing on technological investments. The 2021, Deloitte Digital Transformation Executive Survey revealed that the digitally mature ones (50% of the survey respondents) were able to improve

profit margins and annual revenues as compared to companies lower on the digital maturity curve. Less mature companies were restrained by legacy systems and the resultant inability to enhance their customer offerings. At the crux of this digital transformation is the cloud. Cloud offers the flexibility, speed, and the ability to experiment with reduced risk, in an attempt to make digital transformation more successful. However, simply moving legacy applications to the cloud will not enable digital transformation. Cloud adoption has to be an integral part of the overall digital transformation strategy and journey. A company's digital transformation journey traverses different phases including goal setting, planning, executing, and managing risks, with the cloud playing a key role in anchoring this journey. The increase in remote working necessitated by the pandemic puts tremendous stress on companies to ensure robust networking technologies, including adequate security measures. It is estimated that nearly a quarter of the global workforce will be working from home at least for some days in the week by the end of 2021 alone, and these numbers are expected to increase further in the next few years. To meet these growing demands of companies, networks must cater to both multicloud and digital strategies. Resilient networks are, therefore, the bloodlines of the digital transformation initiatives across companies today, and network modernization is a critical element in accelerating the transformation efforts. Agility remains a key criterion for the network's capability to rise to the challenges of the new normal. In this scenario, legacy networks are just not up to the task. Companies need to identify areas of automation, underpinned by software defined networks and better security. While cloud adoption entails moving applications to single or multiple cloud platforms, users are distributed across the globe. It is therefore imperative for the public cloud to have a secure, application aware, intent-based network. The growing adoption of the public cloud has placed software defined wide area network (SD WAN) firmly in the spotlight. SD WAN is the integration of multiple wide area network (WAN) tools and products bundled with a single pane of glass management. It is a software-based approach to building and managing networks that connect geographically dispersed offices with software defined networking (SDN) principle of separating the control plane and data plane for the WAN. Companies leverage SD WAN to securely connect branch offices to their corporate networks using the internet or technologies like 4G/5G that connect from anywhere. This replaces the need for traditional and expensive multiprotocol label switching (MPLS) connections, dedicated firewalls physically at the branch, or proprietary hardware. However, the challenge is that SD WAN uses a networking overlay or an SD WAN fabric that doesn't include complete security and access control that companies need to protect and defend their network in a cloud environment. The security still relies on the legacy model of packet routing, forcing it to fit the cloud ready enterprise. This results in manual intensive security operations, which create substantial administrative overhead for networking and security operations teams. In addition, delivery of essential branch services such as security is inconsistent, further adding to cost and complexity across a company, making SD WAN a less than compelling proposition. Cloud adoption, infrastructure automation, and the availability of cost-effective, high performance WAN connectivity, such as broadband and 4G/5G are the three key pillars fundamental to transformation. As companies deploy cloud

and other new age technologies, they gather vast amounts of data, all of which is stored across data centers, public and private clouds, software as a service (SaaS) applications, mobile devices, and many more. However, placing the right security controls for their data, the right access controls for their applications, and configuring the right tools is a challenge. To combat these concerns, companies often use multiple point products to secure web gateways, support application firewalls, and secure virtual private network (VPN) remote access. However, since these products have their own policy management protocols, interfaces, and logs, administrative challenges, in addition to increased costs and complexity, threaten the companies' security posture. Traditional network approaches and technologies can no longer provide the levels of security and access control required by modern digital companies. This is where secure access service edge (SASE) comes in. A SASE solution provides mobile users, branch offices, and other locations with secure connectivity and consistent security across the globe. It offers companies a single, centralized view of their entire network, enabling them to easily identify and track users, devices, and endpoints, applying their networking access and security policies. SASE ensures multi branch and multi cloud network security while connecting users to their applications and data in a cloud environment securely. The shift to migrating data and applications to the cloud provides clear organizational benefits such as lower costs, improved performance, and enhanced agility, but it also presents a set of unique challenges. Legacy architectures with complex and costly security ecosystems limit the visibility of threats and slow down the business. SASE is a model that provides the right path for companies to modernize their enterprise for security, speed, growth, and cost reductions. Wipro's SD WAN managed offering, #WANFreedom, is powered by Palo Alto Networks Prisma® SD-WAN. Prisma SD WAN is the industry's first next generation SD WAN solution that makes the secure cloud delivered branch possible, delivering a return on investment (ROI) of up to 243%. It ensures exceptional user experience with app defined policies, simplifying network, and security operations using machine learning and automation. Palo Alto Networks Prisma Access, a complete cloud delivered security platform that protects all application traffic for companies to safely facilitate secure remote workforces, is seamlessly integrated with Prisma SD WAN. This integration enables companies to transform their networking and security infrastructure while realizing market-leading ROI. This SASE solution combines a global high performance network with the next gen SD WAN to simplify the delivery of consistent security at scale while ensuring optimal work from anywhere experience. Wipro and Palo Alto Networks have combined forces to define a managed service delivered through #WANFreedom and secure Internet access services, to enable companies to embrace digital transformation and deliver cybersecurity success with SASE. Digital transformation, fueled by the cloud and new disruptive technologies, has forever transformed the way companies work. Networks and network security must evolve at the same pace. SASE has brought about the convergence between network and security capabilities, simplifying the adoption of the cloud and the next normal of remote working. Solutions such as SASE become a powerful tool for companies moving forward as workers and networks will be widely distributed, ensuring both agility and security for the company. To know more about Wipro's partnership with Palo Alto Networks in delivering SASE,

please click here About the Author Apurba Dutta General Manager and Global Head for Wipro Network and Infra Security Practice Apurba has over two decades of IT experience, helping customers across the globe in transformation solutions. He has managed business units – P&L, Sales, Delivery -- working with ecosystem partners to modernize the core and help enterprises create digital foundations. In his current role, he works closely with internal and external stakeholders, advisors and analysts, and helps customers fast-track to future by adopting different commercial models (As a Service), innovative solutions, IPs, and network /security platforms. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.
======================

Sustainability: A Race to Achieve Net Zero with IoT-led Digital Solutions

----- Arcticle source ----- https://www.wipro.com/infrastructure/sustainability-a-race-to-achieve-net-zero-with-iot-led-digital-solutions/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Sustainability: A Race to Achieve Net Zero with IoT-led Digital Solutions August | 2021 Global enterprises are realigning their corporate objectives to reconcile the gap between sustainable operations and their financial goals across the value chain. The drastic shift in attitude recorded in the past decade is an encouraging indicator of the changes that lie ahead. Global enterprises are setting up sustainability goals as an integral part of their corporate strategy and not just as an ad hoc activity to generate a positive brand image. Carbon neutrality and net-zero emission targets are critical milestones that many companies aim to achieve within specified timelines. Striking the right balance between the total contributed emission against the amount removed from the atmosphere is at the core of the net-zero principle. However, approaching this as an abstract concept will not take companies any closer to achieving these goals. Energy consumption and usage distributions largely remain unpredictable due to the complexity of operations and the size of an enterprise. Corporates lack a unified view of their energy footprint across the value chain and often fail to predict an opportunity to conserve energy and reduce emissions. This paper explores the ways smart technologies, including IoT and AI analytics, can enable enterprises to identify untapped potential in reducing their global carbon footprints for a sustainable future. Unified picture of global emissions Scientists and climate experts endorse a rapid and simultaneous adoption of technology-led solutions across different sectors and sub-sectors to

accelerate the drive towards net-zero emissions. A unified view of existing energy consumption and proportional emissions is critical to decarbonize on a global scale. The combined energy consumption of industries, electricity and heat, buildings, and transportation sectors alone contribute towards three-quarters of global emission. This is closely followed by agriculture and cement, and chemical industries through direct and indirect use of fossil fuels. Although the pandemic induced lock downs and restrictions temporarily reduced emission levels, the predicted upward trajectory remains unchanged. [1] At the brink of a climate catastrophe The core reasons for adopting any new technology have always focused on generating business value and augmenting financial outcomes. Decades of such a myopic approach to climate change have brought us to the brink of an unavoidable climate crisis without collective and conscious efforts. The scope for action involves a range of proactive and preventive measures with every stakeholder involved, from individuals, corporate organizations to governments across the world. A mere 1.5-degree Celsius increase in temperature triggers rapid desertification in some parts of the world while drastically altering weather patterns in other regions. In 2019, weather-related disasters started a mass displacement of 24.9 million people in Southeast Asia and some parts of Africa[2]. If the current emission levels continue, over 200 million people living in climatic hotspots will become climate refugees by 2050 due to cataclysmic environmental disasters[3]. Holistic transformation for sustainable growth The UN-mandated integrated approach towards SDG 2030 calls for building a holistic outlook towards several critical issues affecting the planet. The synergy of individuals, academia, corporates, technology, and financial resources is required to reach these ambitious targets. A paradigm shift in the corporate brand perceptions of consumers is pushing enterprises to adopt a well-rounded transformation strategy to position themselves as 'social partners' and not just as another corporate entity operating for profit. This shift in approach is driving critical changes in society's environmental, economic, and social fabric. The focus on climate protection drives, including crucial initiatives such as reducing resource consumption, responsible waste disposal, restoration of biodiversity, and water neutrality, has a cascading effect on the entire value chain of companies for sustainable and environmentally responsible growth. Corporates can leverage smart technologies such as IoT and AI analytics to devise a customized plan that fits their operational needs for a successful net-zero journey. "Net zero Emissions Must Be Met by 2050 or COVID-19 Impact on Global Economies Will Pale Beside Climate Crisis, Science is clear: if we fail to meet these goals, the disruption to economies, societies and people caused by COVID-19 will pale in comparison to what the climate crisis holds in store. And so, our shared responsibility is equally clear: redouble our efforts to recover from the economic and social crisis and get on track to achieve the SDGs [Sustainable Development Goals] and build a sustainable, inclusive and resilient future." – Antonio Guterres, UN Secretary – General Challenges in adopting effective sustainability strategies A responsible corporate citizenship model must go beyond the ceremonial sustainability report publications or half-hearted measures that come with no follow-up actions. Enterprises must demonstrate a clear, comprehensive, measurable action plan that is transparent to all stakeholders, including the customers, employees, and investors. Clearly defined goals within a specified time frame with periodical access to data

and performance metrics should be integral to enterprises operating across different sectors. Initiatives like "Transform to Net Zero" set a clear target to cut GHG emissions by 50% by 2030. The governing principles convert commitments to action plans with focused efforts on data-led innovation, policy engagement, transparency, and accountability. This cross-sector initiative aims to accelerate the transition and encourage collaboration to achieve a net-zero global economy.[4] As one of the founding members of this climate leadership initiative, Wipro is at the forefront of catalyzing the transformation by working closely with policymakers, business partners, and other stakeholders. Digital technologies under the IoT umbrella are predicted to reduce global emissions by up to 15 percent in the next decade – or one-third of the 50% reduction [1]required by 2030 through its customizable solutions and versatile applications. Corporates operating in 'high emission' industries such as manufacturing and oil and gas are leveraging data-led analytics to compose a comprehensive action plan to reduce their carbon emission and related costs. By synchronizing assets, people, and products, cloud -based connected devices can streamline data flow to assess asset performance and product quality with crucial information on equipment health and maintenance status[2]. Digital twin technology can predict malfunction and significantly reduce unplanned downtimes. Deployment of intelligent technologies such as IoT sensors can also communicate and store data in the cloud for an in-depth analysis to develop models to predict any malfunction before it occurs or forewarn the crew of possible repair work. This significantly reduces the costs associated with repairs, production disruptions, or possible workplace accidents due to equipment damage and positively impacts the surrounding environment. IoT and AI solutions have a range of applications that can maximize renewable energy distribution models. Smart grid technologies combined with real-time data inputs can disrupt the production of electricity and distribution to domestic and commercial consumers with an accurate estimation of power usage to predict supply and demand. IoT technology with machine learning capability and AI-backed analytics can make renewable energy solutions like solar panels and wind turbines more efficient and cost-effective. The energy wasted in transmission lines can be drastically cut down with reduced dependence on fossil fuels.[3] Smart farming based on IoT technologies enables farmers to reduce waste and enhance productivity ranging from the quantity of fertilizer utilized to the number of journeys farm vehicles make. This enables efficient utilization of resources such as water and electricity. IoT smart farming solutions are a system built for monitoring crop fields with the help of sensors (light, humidity, temperature, soil moisture, crop health, etc.) and automating the irrigation system. Farmers can monitor the field conditions from anywhere.[4] Policymakers and governments around the world are embracing smart technologies to leverage data insights and cost efficiencies. Building smart cities and special environmental zones using IoT technology could be a game changer for city corporation authorities. Cities consume 78% of the world's primary energy and account for over 70% of carbon emissions.[5] Smart technology will be a key lever in enabling cities to achieve important zero-carbon goals using technologies for effective management of street lighting, waste disposal, parking data, crowd control, public transportation, and utility services. Many multistory buildings and shared workspaces implement smart building management systems such as IoT sensors to control HVAC (Heating, Ventilation, and Air

Conditioning) for better occupant experiences and effective resource management for reduced maintenance costs. The facilities management team often has access to multi-site visibility on occupancy and deep insights into HVAC and energy consumption. Building management technology enables automatic monitoring, managing, and proactively controlling systems to maintain key parameters such as air quality, temperature control, etc. with remote access to buildings. Powerful AI-backed data analysis tools give deep insights and provide real-time data to detect patterns in the energy consumption of an entire facility for customized occupant experiences and higher cost efficiency. A careful step in the right direction The true potential of IoT technology lies in its power to give real-time data from multiple sources with powerful AI-backed analytics that presents enterprise-wide data in a single pane view for an accurate prediction model. If enterprises can predict their contribution to global emission and view the costs associated with it, both financial and environmental, the action plan to offset the emissions can be fine-tuned to meet the combined goal of sustainability and business value generation. Powerful AI-backed data analytics can empower governments and enterprises with critical information to plan a circular economy that focuses on end-to-end activities from production to consumption to achieve optimized output in the most environmentally responsible way. Global economies, industries, corporates, and individuals are at a crossroad to take decisive action. With smart and futuristic technology, net-zero is not an abstract or improbable task, but rather an achievable target that can be reached with systematic actions and long-term plans. Corporations like Wipro are committed to achieving net-zero carbon emission before 2040 by positioning sustainability at the core of their business model. Many global corporates are emerging as influential climate leaders to enable business transformation to accomplish the net-zero targets[6]. The action plan consists of business transformation, collective actions, and systemic change in the way the value chain of each industry operates to create business value. A successful transition from sustainability commitment to implementation relies on the adoption of smart technologies that have the capacity to generate incremental value with deeper insights. Technology will be a key enabler in the race to meet net zero and its versatile application across different industries will help generate positive and promising results with measurable performance metrics in reducing emissions either directly or indirectly. These technology enabled solutions must be used ethically and with total transparency and accountability by governments and corporates around the world in the race to win net zero targets and for a sustainable future. If you are interested in learning how Wipro can help you achieve your sustainability goals, connect with us. OT and IT Convergence: Why You Need IoT Managed Services

OT and IT Convergence: Why You Need IoT Managed Services August | 2021 Over the past decade, information technology service management (ITSM) using the information technology infrastructure library (ITIL) and other standards has become a widely used, proven approach in most large companies. This helps IT teams to take a structured approach to service management — enhance service quality, increase transparency, boost accountability of IT teams, enable compliance, and most importantly, drive customer satisfaction. Unfortunately, in most companies, operational technology (OT) systems like supervisory control and data acquisition (SCADA), building management system (BMS), human machine interface (HMIs), servers, programmable logic controllers (PLCs), relays, real time automation controllers (RTACs), and other intelligent electronic devices are excluded from the ITSM processes. There are many reasons for this, including lack of skills, tools, and change management. Figure 1: IT and OT systems The processes, policies, and service management agreements for IT systems are not always applied to the OT systems. This poses a challenge for the holistic management of IT and OT functions. Why OTSM is critical for business success Forward thinking global companies are now converging their IT and business processes with a focus on service, enabled by the technology and operations side of the business. This holistic and seamless approach to OTSM is more critical than ever before. To reap the real benefits of IT/OT convergence, people, systems, and processes related to IT and OT need to work in tandem as part of the strategy. The emergence of new technologies and the proliferation of networked OT systems have made it easier today to predict and manage errors, faults, and challenges. IT/OT convergence enables real time decision making, reduction of unplanned downtime, and the most efficient use of equipment and staff in response to changes and problems. Aligning IT and OT systems can also eliminate unneeded hardware and software, reduce capital, and operational expenses. While IT-OT convergence is imperative, policies, processes, tools, and the teams for OT need to be customized to ensure sensitivity to the OT environment. Figure 2: Benefits of operational technology service management IT-OT convergence simplified with IoT Device connectivity through IoT has allowed companies to provide better customer convenience and increase operational efficiency, and this feature can be further leveraged to improve OTSM by the convergence of IT and OT. IT-OT convergence is a step-by-step journey that requires integration of existing silo systems, applications, and end-point devices/controllers for a holistic view, correlating and coordinating incidents, and defining the actions to rectify incidents in an efficient way. Estimates indicate that the total

installed base of IoT devices is 13.8 billion in 2021, and expected to grow to 30.9 billion by 2025. To have an intelligent system, IT and OT information must be converged. Let's consider the example of a utility company. In the event a tower is faulty, OT will take note and notify the monitoring team. The monitoring team may have to visit the tower, without prior knowledge of the nature of the fault. By using IoT and other emergent technologies, the utility company will be able to come up with a list of possible reasons for the failure and the remedy. It's likely that the fault can be repaired remotely without dispatching a team to the site. Integration of the IT and OT systems makes this possible. Further, predictive analytics has a critical role in maintenance activities. Major benefits include reduced time to resolution, increased efficiency of service to customers, and enhanced productivity and life of the device. Additionally, companies can save maintenance costs and reduce management resources. Connecting the dots with Wipro's OTNxT solution OTNxT built on Wipro Smart i-Connect (WSiC™) IoT platform, acts as a bridge and enables IT-OT convergence. The framework helps in building the specific elements needed for each OT environment. WSiC™ OTNxT provides the required protocols, drives, and application programming interfaces (APIs) for integrating OT systems and applications for monitoring the health parameters of OT assets and associated applications. WSIC's inherent ITSM tool can be integrated with existing ITSM tools and alerts identified in the OT estate can be converted into incident tickets, which can be shared with onsite technicians using the workforce management tool with a clear description of the fault identified. There are plenty of ways that your enterprise can benefit from Wipro's OTNxT solution. To learn more, connect with us at ask.cis@wipro.com. Announcement Blog : Wipro and Palo Alto Networks: Committed to Digital Acceleration with Secure Networking

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-and-palo-alto-networks-committed-to-digital-acceleration-with-secure-

networking/ ----- Related Articles Contact Wipro Please fill the required details to access the content Wipro and Palo Alto Networks: Committed to Digital Acceleration with Secure Networking September | 2021 The COVID-19 pandemic and its implications have accelerated the digital transformation journey for many organizations. In the last decade, organizations across the globe have been undergoing a radical shift in the way they operate, thanks to rapid adoption of cloud and online collaboration, infrastructure automation and the availability of cost effective, high performance wide area network (WAN) connectivity, such as broadband and 4G/5G. As enterprises move their workloads to the cloud and cloud-based architectures, they expect lower cost, higher performance, improved agility, and enhanced user experience as well as security. The pandemic simply sped up this process for organizations. While 2020 became the year of accelerated digital transformation, it also underscored the need for organizations to be both secure and agile. The sudden shift in work dynamics like work-from-home or hybrid work models put the spotlight on managing and securing networks. The shifting of devices, services, users, applications and data beyond the enterprise perimeter have reinforced the need for secure access for employees working from home. Enabling this secure remote workforce is the key to support business continuity. And as the cloud becomes essential to run businesses, organizations are now re-working their network to cope with complexities of legacy wide area networks (WAN) and enable connectivity between users, data, and applications residing in the cloud. Secure access service edge (SASE): On the right path to networking Traditional network approaches and technologies no longer provide the levels of security and access control that digital organizations need. The growing adoption of public cloud has placed software-defined wide area network (SD-WAN) in the spotlight. Simply put, SD-WAN is a software-based approach to building and managing networks that connect geographically dispersed offices with the software-defined networking (SDN) principle of separating the control plane and data plane for the WAN. Organizations leverage SD-WAN to securely connect branch offices to their corporate networks using Internet or technologies like 4G/5G that connect from anywhere. This replaces the need for traditional and expensive Multiprotocol Label Switching (MPLS) connections, dedicated firewalls physically at the branch, or proprietary hardware. However, the challenge is that SD-WAN leverages a networking overlay or an SD-WAN fabric that doesn't include a complete security and access control solution that organizations need to protect and defend their networks in a cloud environment. This is where secure access service edge (SASE) comes in; a service model that provides the right path for organizations to modernize their enterprise for security, enabling speed, growth, while reducing their costs. SASE is the convergence of WAN with network security services like secure web gateway (SWG), cloud access security broker (CASB), firewall as a service (FWaaS), and Zero Trust Network Access (ZTNA) into a single, cloud-delivered service model. Wipro's Managed SASE with #WANFreedom SD-WAN, powered by Palo Alto Networks Wipro has been relentlessly pursuing the delivery of managed next gen SD-WAN transformation services. Wipro helps customers secure their connectivity to multiple clouds, optimize their application experiences and accelerate their digital transformation journeys. Wipro's managed Network services solution, #WANFreedom, provides comprehensive lifecycle services, spanning consulting, planning

and design, implementation, and managed services. Wipro's as-a-service model powered by an integrated automation platform creates a cognitive digital networking infrastructure, which is secure and dynamic and has the flexibility to access multi-cloud services. It also supports new applications in its digital transformation journey with reduced overhead. The managed services model allows Wipro to deliver optimal cost-effectiveness and reliability to its customers by re-architecting their WAN, enabling support across distributed applications in a hybrid multi-cloud environment, monitoring, maintaining, and managing services continuously. This drastically improves application performance resulting in increased business productivity, agility and reduced costs for IT. Wipro Managed SASE delivered with #WANFreedom SD-WAN, is powered by Palo Alto Networks Prisma® SD-WAN the industry's first next-generation SD-WAN solution, seamlessly integrated with Prisma® Access, the most comprehensive cloud-delivered security platform that protects the security organization's traffic, applications, and users across all locations. This integration enables organizations to transform their networking and security infrastructure while realizing unprecedented ROI. This SASE solution consolidates all of the networking and security capabilities organizations need into a single cloud-delivered platform, transforming network security and allowing organizations to enable flexible remote workforces. It provides complete security for all application traffic while ensuring an exceptional user experience. SD-WAN coupled with security services are essential for today's digital enterprises to accelerate their transformation journey and stay ahead of the competition. Secure networking solution by Wipro and Palo Alto as Managed SASE Platform is critical for remote work and multi cloud adoption. Wipro's services and Palo Alto's technology innovation are the right fit for purpose platform for customer IT Landscape to enhance application experience for users." Said Apurba Dutta , General Manager and Global Head for Wipro Network and Infra Security Practice. Paving the way for a secure future Through our partnership with Palo Alto Networks, we will continue to enable organizations to embrace digital and network transformation with SASE. We aim to offer a clear strategy and bring the capabilities to help our mutual customers overcome their challenges in the wake of the current pandemic and a radically changed digital landscape. Wipro can help you drive digital transformation with security optimization. Looking for more information? How to Realize the Potential of IoT

How to Realize the Potential of IoT The Need for a Programmatic Integrated Platform-Based Approach September | 2021 The all-pervasive and ubiquitous Internet of Things (IoT) has made an indelible impact on our lives and businesses. The internet connected the world and the emergence of the IoT further consolidated these connections. Gartner's definition succinctly encapsulates its essence – "The Internet of Things (IoT) is the network of physical objects that contain embedded technology to communicate and sense or interact with their internal states or the external environment." The IoT connects billions of devices, giving businesses an opportunity to enhance productivity, efficiency, and innovation. According to Statista, there were 13.8 billion installed and connected devices globally in 2021, and they are estimated to increase to 30.9 billion by 2025, creating a deeply connected web of devices. IoT enables seamless access to unprecedented amounts of data. Even in its nascent stage of evolution, the potential to impact business outcomes is tremendous, and is poised to bring in the next evolution in connectivity. The global market for IoT end user solutions is expected to reach $1.6 trillion by 2025. Today, IoT is no longer just an emerging technology, but a game changer propelled by the pandemic. The IoT is enabling global businesses to build on the foundations of artificial intelligence, machine learning, big data, and the cloud to unlock new possibilities for the future. The Vodafone 2020 IoT Spotlight report, based on a survey of over 1,600 businesses, has revealed that 84% of businesses credit IoT technology for maintaining business continuity during the pandemic. In addition, about three fourths of the respondents now indicate an accelerated adoption plan. Leveraging IoT use cases for business transformation As companies across industries embark on digital transformation programs to engage with the digital economy, they are looking to connect physical assets with the IT ecosystem to increase operational efficiency, optimize usage, and improve the reliability of assets to generate new business opportunities. With sensors connected to the equipment, machinery, and various other assets, the IoT has found its place in use cases across industries. These connected assets are enhancing the potential to generate and utilize data, to leverage analytics, and to provide key business insights across operations and customers. In recent years, companies have also realized the benefits of cost efficiency, security, agility, and collaboration through integration with cloud platforms and edge computing. The manufacturing, energy, retail, logistics, and transportation industries have been the most prolific users of IoT for business transformation. However, to realize the full potential of digital transformation, integration with the operational systems is critical. Let's take the example of a manufacturing unit, where a faulty part has been

detected. The operations teams will resolve the problem based on the current assessment. However, several factors need to be considered – when was the last time the part failed, how was it repaired, what spares were used, was the material available in the inventory, what skills were required, and so on. Also, it is unclear if these were mapped against how critical the part was to the operation and its potential future state. To ensure such predictability, the convergence between IT and operational technology (OT) is paramount. The quintessential IT-OT convergence Device connectivity with the IoT enables companies to offer better customer experience, improve operational efficiency, and reduce time and effort. How can this be made possible? As mentioned before, the answer lies in the convergence of IT and OT, which bridges IT and OT data and platforms in near real time so that information can be harnessed as a virtual single system, enabling visibility and business process rigor across the organization. Today, the data flow between IT and OT has increased significantly, enabled by IoT technologies and other methods such as in memory databases, advanced integration methods, artificial intelligence, machine learning, and analytics. In Wipro's conversations with several customers, we found that IoT decisions were still taken by the business. In theory, this is an ideal approach, given that business owners must focus on solving their specific business problems. However, there are several challenges underpinning this problem-solving approach. Siloed approaches do little to foster organizational development and growth. Each department has access to an incredible amount of data that can be managed, utilized, and controlled much better to increase overall business functions. Siloed working results in a lack of holistic view. Take the example of a retail store. A store manager's focus is on layout planning, increasing footfalls, enhancing customer retention, and so on. The warehouse manager has different priorities – ensuring products are retrieved and stored properly, supply is adequate, etc. Each of these units may have its own legacy platforms, point solutions, or varied solutions built on standard platforms, disparate databases, etc. What's lacking is a holistic approach to ensure that the store runs smoothly in all aspects.   In manufacturing, this becomes even more complex. There are several systems deployed that could include – supervisory control and data acquisition (SCADA), manufacturing execution systems (MES), logistics and supply chains, warehousing systems, among others. Large manufacturing companies are likely to have even 50 or more different vendors for different technologies and databases. Managing these suppliers and ensuring return on investment is a challenge for chief information officers (CIOs). CIO and CDO initiative – A strategic and programmatic approach to IoT Today, CIO and Chief Digital Officer (CDO) organizations are increasingly looking at IoT as a bigger initiative across the organization. A survey by IDG indicated that 67% of CIOs are moving towards a strategic role in the organization, focused on revenue generation and customer centric initiatives. Most organizations have made significant investments in IoT based technologies, but the lack of an organization wide IoT strategy prevents the realization of their full potential. There is a need for a strategic and programmatic approach in IoT initiatives, which means that organizations must take stock of the actions already undertaken and craft a future roadmap for better business efficiency. Here, a platform-based approach plays an important role. This is not to imply a radical change, but rather a consolidation is recommended. Most vendors offer seamless

integration across platforms. For instance, Wipro Smart i-Connect™, our multi-domain, ready to deploy IoT solution can be seamlessly integrated with Azure or Amazon Web Services (AWS), or any other platform. For a CIO, better control constitutes a strong technical roadmap, an effective strategy, and therefore larger benefits from use cases with cross references, cross linkages, and analytics. There are several benefits in adopting this approach. Vendor consolidation can simplify operations and therefore, vendor management. Technology costs will reduce. In addition, technology consolidation of infrastructure with the option of choosing the right base technology will benefit the organization in the long run. Last, but not the least, it will improve the ability to drive outcomes. Today, we estimate that only 30% of IoT pilots see production. This does not imply that the balance 70% have failed; rather they have not been able to realize the envisaged benefits. An integrated approach offers the capability to cut across service components, including systems, processes, data, and applications. While this ecosystem can deliver unprecedented efficiencies and innovation, no single platform can encompass the length and breadth of IoT. While there are a variety of platforms that can handle device integration, aggregation, presentation, monitoring, controls, artificial intelligence, and analytics, what is needed is a holistic and integrated approach to IoT implementation. An integrated programmatic approach is not a one-time event. Nor is it an inexpensive, quick fix solution. Organizations must conduct a thorough cost benefit analysis of their current use cases. Then, they can decide which initiatives to migrate to the new environment. At some point, there may still be a smorgasbord of technologies, databases, and point solutions. The idea is to have a long-term view of the expected benefits that is aligned to the strategic roadmap of the organization. Linkages must be established and integration must take place. Take stock, make your strategies, and move in a programmatic integrated platform based approach. If you are interested in learning how Wipro is helping our clients achieve their vision of IoT-led transformation, we should talk. Connect us About the Author Ashish Khare General Manager,.Cloud & Infrastructure Services, Wipro Ashish heads the Smart City and IoT initiatives at Wipro and plays a key role in consulting for IoT and smart city, covering integration, management, and business operations. With over 25 years of experience, his current focus is on new technologies and solutions, especially around IT-OT convergence. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

AI is Driving a Big Change in Change Management

----- Arcticle source ----- https://www.wipro.com/infrastructure/ai-is-driving-a-big-change-in-change-management/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content AI is Driving a Big Change in Change Management September | 2021 Traditional ITIL-based method of change management is no longer effective. The rapid expansion of application and infrastructure is making manual change management increasingly stressful. Maintaining change records of every object of configuration items is challenging. In a complex IT environment, it is usual to keep manual documentation of planned and approved changes at a very high level. A complete list of the bits and bytes that will be changed is not feasible. Due to the interdependencies between applications, even a minor change can affect the entire business process. Cloud-based changes are even more rapid and difficult to manage round the clock, and around the globe. The current approach: Incident management after change execution Gartner estimates that 85% of performance and availability incidents are the result of change. The incident management process, mostly, starts as soon as the incident is recorded in the information technology service management (ITSM) tool. Technical support teams begin troubleshooting and use logs, performance metrics, and application traces to try and restore service as soon as possible. The support team faces tremendous pressure to restore business service as quickly as possible. The typical approach is to restart the service, restore the last known good configuration, spin a new cloud instance, etc., thus creating a lot of panic, pressure, and business loss. While this approach may restore the business service, it takes considerable time and expertise to root out the problem. If the root cause of the problem is not identified quickly, one is only treating its symptoms. Also, the issue will eventually recur unless a permanent solution is determined and implemented. What is the challenge? The key question is — "what, when, where, who, and why changed?" Tracking and tracing each change at the granular level is difficult. There is no practical way for companies to keep track of all unauthorized changes, which keep unfolding behind the scenes. Every second, thousands of IT specialists modify the system. Manual documentation of planned and approved changes is kept at a very high level since it is not feasible to list every bit and byte that will be changed. What if a machine could track all object changes based on both the previous and modified attributes? This would enable IT specialists to view which specific configuration parameters were modified, which files updated, and which attributes of the database schema object altered. AI for tracking and analyzing changes Currently, only a few artificial intelligence for IT operations (AIOps) tools provide root cause analysis. Most tools are useful only for pinpointing the problem or partially finding the cause, but a human touch is essential. With Wipro business service management (BSM), customers have access to state-of-the-art change analytics solution. AI-based prediction is used to detect risky changes and outages, as well as identify the root cause of incidents. Change analytics offers one of the best ways to

leverage artificial intelligence and machine learning (ML) capabilities, and is your in-house AI-based auditor that keeps track of granular changes. Based on 10 years of research and development, this product comes with many prebuilt algorithms that detect unauthorized changes with risk measures attached. With change analytics, you will experience less incidents, avoid outages, speed up mean time to recovery or mean time to restore (MTTR), and improve productivity. Figure 1 includes a number of key practical applications of Wipro's change analytics solution. Figure 1: Wipro's BSM AIOps solution — Key practical applications The future of change analytics Change analytics will redefine the IT Operations space. Breaking data silos is important to get insights and draw intelligent correlations. Knowing what actually changed in your environment reveals powerful insights for delivering and operating critical business applications. To reduce root cause turnaround time from weeks to hours AI based analytic approach is the demand of every business. To reduce IT pain points Wipro change analytics is the solution. Wipro's BSM AIOps will deliver immense value to your business. For more details, connect with us. BSM practice team Co Author:Sachin Gujar, Senior Architect, Wipro Ltd. Sachin Gujar is a Senior Solution Architect with Wipro's Business Service Management and AIOps tools practice team. He has over 18 years of experience in enterprise end-to-end infrastructure monitoring solutions, tools architecture solution designing, transformation, transitions, and automation. His core vertical clients include financial services, manufacturing, hi-tech, retail, healthcare and services, and energy and utilities. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.

Reimagining Remote Field Support in the Hybrid Work Era

----- Arcticle source ----- https://www.wipro.com/infrastructure/reimagining-
remote-field-support-in-the-hybrid-work-era/ ----- Related Articles Contact
Wipro Please fill the required details to access the content Reimagining
Remote Field Support in the Hybrid Work Era September | 2021 The
COVID-19 pandemic brought in many changes and established a new
normal. New age remote working, or the 'hybrid work era' is one of the
markers of the new order. Today, organizations are offering their employees
the flexibility of working from the location of their choice — office or home,
or even a location of their personal preference. This huge shift calls for
digital workspace providers to take the workspace to where the users are,
while maintaining the basic principles of operations which is "system
stability, performance and agility" without compromising its security
perimeters and ease of operations. The ongoing crisis is proving to be a
critical time for field service organizations. To ensure business continuity,
many are turning to innovative technologies to overcome these new and
unforeseen challenges. Challenges in meeting remote system support
requirements With a drastic surge in the number of employees engaged in
remote work, an obvious outcome is the increase in the number of issues
faced by them and need for more support. The safety of employees and
customers, while ensuring business continuity, is top priority for digital
service providers across industries.   Disruption in field-support and device
dispatches: The abrupt shift to remote work combined with zero change to
responsibilities to deliver on time has altered user expectations. For field
services, balancing user expectations of seamless experience sans any
device failure or interruption is a challenge. With stringent restrictions in
place in view of safety, IT enterprises are constrained to rethink the legacy
service systems approach of 'hands and feet support' and 'device
dispatches'. Adverse user experience: Due to the prevailing restrictions,
inordinate delays in dispatches of devices are inevitable. The prolonged
downtime for mean time to resolve (MTTR) adversely impacts the user
productivity, in turn affecting user experience and the organization's
bottom-line. This leaves some pertinent questions to be answered. Is there a
solution available that can minimize hardware breakdowns that contribute
to system's stability and system performance? Even if there is a device
break-down preventing boot-up / start-up, can a solution help fix it remotely?
Can a solution isolate a virus-infected machine from the corporate network
and still troubleshoot it remotely at the Bios level? Lack of preparedness and
dearth of solutions – especially remote-control ones: Most businesses were
not ready for the pandemic-level disruptions, with only 2% believing that
their businesses could run at 'normal' levels, according to a survey by Help
Net Security. The hybrid work era has also brought in a huge demand for
more devices as people work from home. This is quite evident from the 8%
CAGR expected in the global computers market by 2025, which will be a

$500 billion industry. These numbers are indicative of the potential risks and challenges in end user device management. It is widely accepted that end user devices are at the core of workplace technology. However, the non-availability of a remote management solution which can help administrators to remotely troubleshoot / isolate problems that lie beneath the operating system (OS) layer only exacerbate the problem. Leveraging technology for adaptability There is a strong need for enabling innovative ways to provide remote field support in the new normal. The IT enterprises focus should be on providing an integrated and stable workplace with cost effective out-of-band (OOB) remote management capability. Obviously, all these should be provided without compromising the system security and performance that can contribute to enhanced digital employee experience. Leveraging a combination of in-band and out-of-band management holds the key towards effective remote field support. With in-band management, the remote session can be established over the OS layer. However, a prerequisite is that the device needs to be powered on and the user to be signed-in to the device. In contrast, OOB management establishes a remote session at the bios level leveraging Transport Layer Security (TLS) communication. Since this OOB management is provided below the OS layer and runs on the hardware level, it does not require the device to be powered on. Table 1 provides a high-level comparison between in-band versus out-of-band remote management: In-band remote management Out-of-band remote management Devices need to be powered on and connected to a network source (Internet/Intranet) Need active OS running on the device   More features as software controlled   Completely agent based and dependent on active service running under service section of OS   Devices need to be connected to a power source with an active Wi-Fi/LAN   Device need not be running on the OS   Chipset + SW Agent controlled   KVM is in-built at the chip level, so bios level mouse and keyboard remote control is possible   It complements and enhances the traditional remote management tool Table 1: Comparison between in-band and out-of-band remote management Wipro recommends an integrated and stable platform that minimizes system disruptions at the thermal, electrical, and mechanical levels contributing to system uptime and user productivity. This platform benefit users by: Transformative technology with Wipro + Intel® Collaborating closely with Intel®, Wipro has leveraged amalgamated integration via the Intel vPro® platform to enhance its remote field support services, in response to the paradigm shift to remote working at scale and other pandemic challenges. The result is TruRemote, part of Wipro's LiveWorkspaceTM offering. Being a part of the Out of Band remote management services, it allows administrators to remotely take control of devices at the chipset/bios level, as needed. TruRemote leverages OOB remote management to connect to home or office devices from anywhere in the world through wired or wireless connections. This offering is powered by a collection of computer hardware technologies from Intel®, including: The hardware based Intel AMT allows Wipro to provide continual out-of-band connectivity independent of the OS allowing flexibility to fix a broader range of system issues across multiple devices including personal computers (PC) and laptops based on the Intel vPro platform. Used in combination with Intel processors and network controllers, it is a key component in the hardware-enhanced manageability and security strategy. Intel End Point Management Assistant software as part of Intel AMT allows Wipro to remotely and securely manage

devices on known Wi-Fi networks beyond the firewall too. Table 2 illustrates various use cases where Wipro's TruRemote can provide remote field services for devices: Use cases / Sample scenarios resolved using TruRemote Blue Screen on Death Login issues / Laptop booting issues Any ticket that involves Restart, Reboot, Format, Re-Image and Patching Troubleshooting of unattended machines – Sales Kiosks, Stores PCs or Factory PCs Bios password issues – Resolved without sharing the admin password with the users Encryption password issues – Resolved without sharing the admin password with the users Trust relationship error / Domain related issues Isolate virus infected machines from the corporate network and remotely troubleshoot over the internet Table 2: Various errors that can be remediated by TruRemote While the novelty of remote work can be refreshing, it can pale just as quickly when user device issues that require immediate remediation crop up. For example, the blue screen of death or the inability to boot the device due to various reasons. It is observed that 8% to 12% of the overall tickets that are escalated to and resolved by field support Services, at least 25% to 30% can be resolved with TruRemote. In a sample space of 1000 relevant field service tickets, it is a direct cost saving of $ 200K annually. In addition, assuming a productivity downtime of at least 24 hours for a next business day support, this is at least a million dollars in potential savings. User experience and customer satisfaction are realized additionally as intangible benefits. Sheer numbers for the total productive downtime due to varying field services resolution times is staggering. In this hybrid work era, obviously, innovative solutions that minimize device downtime and maximize productivity are the need of the hour. Recognizing these needs, Wipro has created customized and amalgamated integrations for Intel vPro™ Platform with other software components that allow remote support teams to achieve: Seamless remote working COVID-19 has necessitated changes that are here to stay. Barring some industries or services such as healthcare, aviation, manufacturing, etc., remote working is possible. Regardless of when the pandemic subsides, we are likely to witness significant increase in remote working than ever before. The new ways of working have given rise to new technologies that ensure the availability of devices and the flexibility to the remote worker, while ensuring device security. Wipro's TruRemote is a definitive step in that direction. Such technologies will remain relevant for the new way of working besides spurring future innovations. If you are interested in learning how Wipro is helping our clients empower their field support teams, connect with us About the Author Lakshmi Narasimhan Practice Director – Digital Workplace services, iCORE–CIS, Wipro Lakshmi has two decades of experience in Business development, pre-sales, Consulting and Program Management in the IT Infrastructure services domain where he leads engagements with existing client relationships. His role focuses ensuring that Wipro's clients get the value of the larger DWP practice. Lakshmi also manages the Wipro TruRemote offering while helping customers across industries with out of band remote management solutions. This offering is also integrated as part of the larger DWP offerings – Live WorkSpace™ and WaaS360. Strategy to Build Secure Multi-cloud Networking

----- Arcticle source ----- https://www.wipro.com/infrastructure/the-strategy-to-build-secure-multi-cloud-networking/ ----- Related Articles Contact Wipro Please fill the required details to access the content The Strategy to Build Secure Multi-cloud Networking October | 2021 The data center is no longer the center of gravity. Today, applications are distributed across data centers, multiple public clouds, and Edge. The current network architecture cannot meet the related performance and reliability expectations. Cloud adoption continues to expand as agile development, swift deployment, and unrestricted scale become the new normal for customers across industries, sizes, and geographies. Distributed hybrid multi-cloud deployment, decoupled cloud services from a centralized physical location can potentially address client concerns around operational control, performance, and geographical location of the services, providing fuel for a new growth engine. This paper discusses how to approach conventional network design, including security and operations, as organizations transform to hybrid multi-cloud environments. Multi-cloud: An effective cloud strategy A Gartner survey revealed that 81% of organizations using the public cloud were currently working with two or more external providers. Further, if you have anything on-premises or at a co-location, this means you need at least 3 networking consoles for configuration, troubleshooting, reporting, analytics, etc. And the improper and inefficient network connectivity would lead to poor cloud application performance and major productivity challenges. The networking world continues to evolve to meet the high cloud and as-a-service demands. Enterprises are searching for better programmability, automation, orchestration, and data center interoperability to build private clouds or cloud-based data centers. By the end of 2022, the number of enterprise network teams using a SaaS-based console to manage data center networks will increase by more than 10 times to over 1,500, according to Gartner's new 2020 Magic Quadrant for Data Center and Cloud Networking. Organizations have entered a new era of application centric computing where they are quickly adopting multi-cloud architectures. They are choosing more than one public cloud service provider, and empowering end users with a choice of the best components for their use cases. It is also helping organizations avoid circumstances such as a single point of failure and vendor lock-in. Not leveraging a multi-cloud approach makes organizations fully reliant on one public cloud service provider for all their cloud-related services, and in such cases, there is a possibility that some of the services may not offer the best value to address specific use cases. Key reasons for adoption of Multi-cloud architecture Choice of service No single cloud service provider poses the best set of services to meet all the requirements of an organization. However, a multi-cloud environment allows

enterprises to select the best service from multiple vendors for their specific use cases. Reduced vendor lock-in A multi-cloud environment allows enterprises to choose the best service from different cloud service providers delivering to their specific requirements. Empowering organizations to choose services from multiple vendors will eventually help them not only to distribute workloads across multiple providers but also reduce vendor-specific dependency. Low latency Latency plays a crucial role while deciding the cloud strategy. Choosing a service and infrastructure closer to users will offer better performance. When an organization plans for multi-region deployment of an application to provide a uniform and seamless user experience, a multi-cloud strategy empowers them to choose the closest services and infrastructure from multiple providers. Improved disaster recovery Multi-cloud environments help organizations to improve the management of their disaster recovery by adding the flexibility to choose redundant servers from different cloud providers. A multi-cloud arrangement allows replicas of applications in two or more clouds. In case of downtime in one cloud, all relevant requests can be redirected to the applications hosted in the other cloud. This arrangement can also be extended to multiple regions to achieve greater resiliency. Challenges of Multi-cloud While multi-cloud deployment becomes the new normal, there are some challenges that organizations face at the beginning of their journey - Figure 1: Top five network challenges in modern multi-cloud environments Network requirements for evolving multi-cloud environments Organizations need to recognize that in order to successfully migrate and optimize applications and workloads across on-premises locations and public clouds, new network architectures will be required. Specifically, a network architecture, that facilitates distribution of applications while maintaining security, configuration policies and ensuring performance, will be essential. To be successful, organizations should partner with providers who deliver: Ideal multi-cloud network architecture Organizations adopt different public cloud and hybrid cloud environments to build their IT infrastructure to leverage larger benefits such as flexibility, performance, agility, and cost savings. However, the major bottleneck occurs while interconnecting workloads scattered across on-premises data center and multiple public clouds. The need of today is an application-aware architecture that offers consistent network services across all technology silos and specifies service details that are fundamentally decoupled from the underlying infrastructure, allowing them to be applied through policy translation administered dynamically by the centralized controller with complete visibility of business applications. The key components of an application-aware cloud-ready network architecture are: Figure2: Software defined Multi-Cloud Network architecture Software-defined multi-cloud network solution benefits The software defined multicloud network solution enables flexibility to address changing needs by adopting "cloud-aware" network architecture with following benefits: Wipro's multi-cloud network services Wipro's highly skilled team of network experts helps customers in their cloud journey with consulting, planning and designing, transformation and management services covering the end-to-end lifecycle. The right path to multi-cloud networking At the heart of the network paradigm is software-defined networking that helps automate network workflows and consistently maintain a healthy information security posture. The other aspects of network transformation include increasing network bandwidth utilization

and establishing flexible but security-conscious controls that support both on-premises and public cloud workloads. Wipro's Software Defined Multi-Cloud Network Solution can deliver secure and simplified cloud connectivity with single pane of glass network management and visibility. There are plenty of ways that your enterprise can benefit from adopting an ideal multi-cloud network. To learn more about how Wipro can help in your transformation journey, connect with us. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Stepping towards near-zero field support assignments with Wipro's Virtual Walk-In

----- Arcticle source ----- https://www.wipro.com/infrastructure/stepping-towards-nearzero-field-support-assignments-with-wipros-virtual-walkin/ ----- About The Author(s) Related Articles Contact Wipro Please fill the required details to access the content Stepping towards near-zero field support assignments with Wipro's Virtual Walk-In October | 2021 The ongoing global pandemic has irreversibly entrenched work-from-home and hybrid working models into the work environment for the foreseeable future. This has also transformed the way in which the digital workplace managed services are offered to enterprises. Organizations are now gearing up to meet the challenges of these new models and in parallel striving to maintain service delivery standards toward sustaining employee experience. Continued and uncertain lockdowns and the newly introduced social distancing norms have had a lasting impact on field support services resulting in longer resolution times on reported issues as well as support requests. This in turn, has had an adverse effect on user experience. Single window for 100% ticket resolution While remote field support can resolve and remediate several issues, hardware issues and device replacement requests need in-person support. In our experience, 90% of the tickets can be resolved by service desk with in-band remote support capability, while 10% tickets are escalated

to field services. Traditional remote support models can assist in resolving issues related to installation, configuration, updates / upgrades and other operating system related tickets. Other issues that require field support services cause an end-user down time leading to cost overruns and productivity loss and subsequent delays to business outcomes. In addition to coping with these issues, enterprises are hard pressed to manage asset warehousing, shipment and tracking. While a request for in-person support is expensive in terms of cost and time, it cannot be completely avoided. If a request or an issue cannot be resolved by the traditional remote support model, the next step is to request for field services. In a typical scenario, this resolution which could result in a field engineer dispatch or new device shipment can invariably contribute to a downtime of 24-48 hours. This is where the Virtual Walk-In eliminates the need for on-demand field support services. Benefits beyond ticket resolution 'Near-Zero Field Support' for escalation of tickets is the key objective of Wipro's Virtual Walk-In solution, there are several other advantages clients can gain from Virtual Walk-In The various benefits include: Wipro's Virtual Walk-in – a win-win story The Virtual Walk-in is a combination of a range of cutting-edge technologies that has made our promise of near-zero remote resolution of IT issues and requests a reality. The key value propositions of Virtual Walk-In are: Apart from the 4 traditional support channels such as phone, chat, web and email, Wipro's Virtual Walk-In is the digitized touch service support for employees to experience human support virtually. This offering is vastly beneficial to enterprises which are spread across a large geographical area or a cluster with smaller groups of employees or even branches across small towns, retail stores, large campuses with multiple blocks and research facilities where downtime can prove expensive.   The support comprises the following elements: As a result of the integrated solution of Virtual Walk-In the customer can seek to achieve: Would you like to explore how Wipro's Virtual Walk-In can benefit your organization? Deepa Raghavan Solution architect, Cloud & Infrastructure service, Wipro Deepa is a certified change practitioner with nearly 2 decades' industry experience in pre-sales, practice, consulting and transformation in the digital workplace domain. She performs a techno-business role, currently leads the key alliances for LiveWorkspace™ and various product and practice development initiatives. His role focuses on ensuring that Wipro's clients get the value of the larger DWP practice. Lakshmi also manages the Wipro TruRemote offering while helping customers across industries with out of band remote management solutions. This offering is also integrated as part of the larger DWP offerings – Live WorkSpace™ and WaaS360 Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

A Green Future with Smart Energy Management

A Green Future with Smart Energy Management October | 2021 Energy management is crucial to conserve ecosystems and natural resources for enhancing energy efficiency, optimizing energy usage, and leveraging renewable resources for energy generation. This helps reduce energy consumption, mitigate wastage and losses, and improve overall carbon footprint resulting in improved operation and maintenance. In order to achieve energy management, it is crucial for engineering operations and facility management teams to identify its main objective, which can be either reducing cost of energy or minimizing environmental impact while ensuring production and quality. However, reducing overall operational cost requires effective utilization of energy across infrastructure systems for large and distributed footprints. Figure 1: Energy management challenges and opportunities Taking a 7-step approach to energy management Effective energy management means getting a holistic view of energy consumption across procurement, usage, operations, and monitoring. Also, energy performance management is not a one-time activity, but a continuous process for improvement which requires establishing effective energy management practices and processes to guide the energy management program based on the type of business, size and industry (see Figure 2). The 7-step energy management approach includes: Figure 2: Energy management approach Build a dedicated energy team, institute an energy policy, and implement steps for energy efficiency based on regular assessment of energy performance. Conduct technical assessments and audits for existing infrastructure through data gathering, analysis and evaluation. This helps establish the baseline matrix, benchmark past performance and conduct comparison between facilities, industry average and best practices for measuring future results of efficiency. This also helps conduct periodic evaluation of energy usage for all major facilities and functions in the organizations. Set performance goals to drive energy management activities and promote continuous improvement. For intended results, develop effective strategies for financial gains. Develop a roadmap to improve energy performance with a detailed action plan to ensure a systematic process to implement energy performance measures. However, it is crucial to regularly update the action plan and reflect on recent achievements, changes in performance and shifting priorities. This requires defining technical steps, targets, and determining roles and resources. Implement a phase-wise plan to cater to different measurement levels within the overall energy ecosystem. This is crucial to continuously assess the action plan to monitor KPIs and make modifications for achieving larger set goals based on the awareness, commitment, and capability of the people. This requires creating a communication plan for key audience, raising awareness in the organization, building capacity, and tracking and

monitoring progress regularly. Evaluate progress by reviewing energy usage data and compare activities of the action plan to your performance goals. This helps create new action plans, identify best practices and set new performance goals. This in turn helps measure the effectiveness of projects and programs implemented, make informed decisions about future energy projects, reward individuals and teams for accomplishments. In addition, this helps document additional savings opportunities as well as non-quantifiable benefits that can leveraged for future initiatives. Provide and seek recognition for energy management achievements for sustaining momentum and supporting the energy management program. This helps validate importance of the energy management program for internal and external stakeholders. Smart energy management for real time tracking and energy monitoring Organizations can collect real time energy consumption data by connecting equipment through SDKs and industrial protocols over the network or by adding smart sensors that can collect data and share it over the IoT network with centralized IoT application and tools (see Figure 3). IoT based solutions can help organizations not only connect various data points through smart connected things but also collect and analyze real time energy consumption data by constantly monitoring equipment. This is crucial to improve maintenance and downtimes. At the same time, smart energy management solutions can help understand real-time status of electrical equipment based on availability of data points for humidity, ventilation, and air-conditioning systems. This helps optimize the energy usage. *ECM – Energy Conservation Measures, ECC – Energy Command Center Figure 3: Energy management solution architecture Additionally, a smart energy management solution can also provide early warning about potential faults that may degrade the overall performance of the assets resulting in increased energy consumption (see Figure 4). Figure 4: Tracking and analysis with smart energy management solution Energy consumption optimization through actionable intelligence By designing and implementing an energy management plan and system, organizations can monitor load consuming elements and provide actionable intelligence to optimize site energy consumption. This also helps get access to key data including energy data, fuel data and temperature data for enabling potential savings of the O&M and OpEx. An enterprise level view of the total energy consumption across the network, as well as proactive monitoring, availability management and performance reporting of the energy asset helps create well defined Energy Performance Index for all relevant stakeholders. The end result: increased visibility into energy usage due to timely availability of data leads to improved asset lifecycle, winning CSR strategy, and reduced carbon footprint. If you are interested in learning how Wipro is helping our clients achieve transformed energy management system, connect with us. Pradeepsingh Bhangu Senior Consultant - Cloud & Infrastructure Services, Wipro Pradeep has extensive experience in data centers and IoT solutions, with a focus on energy monitoring and management solutions. His specializations include consultancy, project management, audit & benchmarking, and operations & maintenance. Pradeep has worked with various customers around the globe, delivering innovative and cutting-edge solutions. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes

- to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.

Modernizing the Workspace with VDI to Run your Business in the New Normal

----- Arcticle source ----- https://www.wipro.com/infrastructure/modernizing-the-workspace-with-vdi-to-run-your-business-in-the-new-normal/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Modernizing the Workspace with VDI to Run your Business in the New Normal October | 2021 Business environments today have irrevocably been altered. To reduce the impact of the pandemic on business continuity, improve operational resilience, and enhance employee productivity, organizations across the globe deployed work-from-home initiatives. Over the last one year, as businesses slowly resumed with some level of normalcy, organizations sought ways to empower employees with tools to return to work. The hybrid or flexible working models have become a preferred option for organizations across industries. Research by PwC indicates that among nearly 1,500 executives and office workers, 55% expected to be back in office about 3 days in the week, and work from home the rest of the week. With the trend expected to continue over the next few years, desktop virtualization technologies have assumed importance for the flexibility, convenience, and security they offer to the business. Virtual desktop infrastructure (VDI) technologies can enable and simplify the process of adapting to the hybrid or flexi models of working to ensure data security, business continuity and enhance employee productivity. Transforming desktop infrastructure VDI is not a new technology, adopted by organizations across the globe to outsource application development and infrastructure management. Over 2 decades, the technology has offered significant value to companies. To overcome the constraints imposed by regulations and data security norms, organizations adopted VDI technologies to gain cost advantages offered by the offshore locations. Today, enterprises are moving to virtualized desktops due to the immense value of rapidly and securely provisioning apps, workspaces, and data to mobile, distributed, and global workforce. Access to enterprise technology services means more collaboration, higher productivity, and less unproductive time due to end point hardware issues. VDI and its impact on business continuity and growth VDI enables a virtual desktop environment, where business applications and other data are available to end-user devices from centralized data center locations, either on-premise or on the cloud. In traditional server setups, an operating system is installed on top of the hardware of a physical server. With virtualization, an additional layer is created between the hardware and operating system, enabling the operating system to run inside each virtual machine. Broadly, VDI hosts desktops that

enables users to securely access enterprise data on their personal desktops, laptops, tablets, and smartphones. Changes on a parent desktop image can be quickly mirrored to virtual desktops in a desktop pool to create flexible workspaces at scale. Today, the VDI technologies offer several advantages to organizations beyond enabling the hybrid or flexible work models. With partial lockdowns, mandatory quarantines, and constantly evolving situations, organizations are offering employees the flexibility to meet the challenges and opportunities created by the new way of working. First, users can access the organization's data only through virtualized desktop and the VDI is managed through central servers. Hence, centralized image deployment, policy management and patch management, and application portability can be managed seamlessly. Second, it offers users the flexibility to access their desktops from anywhere. Organizations can provide the desktop or the laptop to the employee. Some organizations even offer the 'bring-your-own-device' policy to their employees, further enhancing the employee experience. The onboarding time for a new employee is reduced when the employee uses their own device. A company procured device would typically take about 24 – 48 hours or even more to be shipped to the employee. Third, human resources (HR) and recruitment teams have the choice of a global base to hire from. With the employee working from anywhere in the world, they are able to attract and retain the best talent for the job. Companies are also able to save on expensive real estate costs. In addition, with zero or reduced commuting time, stress levels is reduced, resulting in improved productivity. Particularly in the service industry, which is concentrated in large metro areas, real estate can be optimized. Also, organizations can leverage desktop virtualization and other next gen technologies to modernize the offices and set up collaborative centers in the space available. Challenges in adopting VDI While VDI technology has greatly facilitated the flexible working models, there are some inherent challenges in adopting this technology. VDI is not a single technology, but a complex amalgamation of several complex technologies including networking, computing, storage, and so on. Organizations need to evaluate and choose right technology components that meet their business needs, assess the applicability of the VDI for different business units to maximize its value. Second challenge is ensuring consistent user experience. Any issues in the network or the data center can impact the VDI performance. Any modifications or challenges in the firewalls, active directory, or DNS will impact the VDI, thereby slowing down the device at the end user. In addition, bandwidth requirements will vary as per the applications used, type of work performed, and so on. Audio-video collaboration, screen sharing, and other collaborative platforms require higher bandwidth. Many organizations address this challenge by providing the appropriate broadband or other connectivity to their employees. Third challenge is user expectations and organizational change management. There are some fundamental differences between physical laptops/desktops and virtual desktops. Users expected complete control of their environment; however, with virtual desktops running in the data center users will be given selective control on desktops to change desktop settings, configurations based on user persona. It is critical to communicate the difference between physical and virtual desktop environments to end users and manage the expectations. Is VDI adoption commonplace? Despite its vast benefits, the adoption of VDI has been slow. However, the pandemic has accelerated adoption. The key

challenge to rapid adoption is that VDI is not a one-size-fits-all technology. Organizations need to assess their application landscape, feasibility, TCO, and several other factors before adopting these set of technologies. In 2020, a survey among 500+ companies by Spice Works indicated that the VDI adoption rate was 32%. The survey also indicated that nearly two-thirds of the companies were expected to leverage desktop virtualization by 2021. Research by Global Market Insights, Inc., has estimated that the VDI market will reach $30 billion by 2026, growing at a CAGR of 17%. Wipro's approach to VDI Wipro's approach to VDI is a holistic solution, addressing the challenges of customers today. Right from the technology stack, implementation, architecture, delivery of the services is done in the 'as a service' model. Wipro virtuadesk™ approach provides an enterprise-grade virtual workplace, enabling access to remote desktops, laptops, and operating systems anywhere, anytime. As previously mentioned, there are several factors at play. Hence, based on the best of breed components, Wipro offers a variety of reference architectures. Moreover, the requirements across industries need to be addressed. Industries such as finance, healthcare etc. are heavily regulated. To integrate the platforms in the VDI network, compliances need to be considered. Retail operations will have multiple geographic locations where VDI needs to be implemented. Wipro virtuadesk™ is a transformative application and desktop delivery platform, powered by artificial intelligence, analytics, automation led managed services. With a simplified operating model, this complete desktop virtualization solution is designed to deliver the best performance and user experience, with agility. Wipro's packaged solutions combine leading cloud and hyper converged infrastructure technologies, to deliver workplace transformation and seamless user experiences. Wipro virtuadesk™ offers an as-a-service model that leverages simplified and integrated architecture for a cloud-hosted desktop, to deliver an unconstrained experience. It includes critical features such as service monitoring, service management, service automation, service visualization, enterprise marketplace, application performance monitoring to enable a modernized and consumption-based framework. The solution also helps optimize costs and scale quickly. It enables businesses to update enterprise software tools and allows employees to run multiple operating systems on the same machine. They can also use their own devices to enhance productivity while ensuring data and application security. Key differentiators of Wipro's VDI solution Consulting & assessment framework: At Wipro, we recognize that not all roles and employee profiles are fit for VDI. We leverage a scientific approach to analyze the applications and users, identify the applications fit for delivery, and create a mapping of the applications used by users. Wipro's VDI implementation starts with a comprehensive user profile and application assessment. Leveraging our patented tool to conduct the assessment, we gather data from our clients that includes - types of users, applications used, location of the applications, how are they governed by the regulations, and so on. Based on the assessments, we create different personas and recommend the VDI application to deliver the right level of compute memory and storage systems depending on the needs of the job profile. To ensure continuous benefits from the VDI environment, we monitor the usage over a period of time to optimize the desktop configuration. This helps us to ensure that 100% engagements are successful. Standard reference architectures & deployment automations: Wipro created reference architecture and

deployment automations for all leading technology stacks that can bring in standardization and improve time to market. With customer locations across the globe, the deployment automation platform ensures that all environments are managed in a consistent manner to reduce deployment cycles. Standardized processes enable us to deploy on-premise VDI environment in 50% lesser time. User migrations & change management: When migrating to the VDI environment, effective change management is critical. Wipro deploys a comprehensive platform to plan and execute user migrations. The users that will be migrated, phases of migration, communication modules, number of changes in one instance, and other critical details are communicated to the users in an efficient manner. The platform also offers hyper care once the migration is completed. Users are provided with self-service links and a remote help desk is enabled. Application life cycle management: Wipro implemented a comprehensive application delivery and life cycle management platform integrated to VDI platform to streamline application management. One of the challenges in desktop environments is application lifecycle management, application updates, patch management, license management on end points. To reduce these risks, the applications are moved to centralized delivery wherever possible, using application layering technologies. The application updates are streamlined and managed by the back-end team in a centralized manner. The framework also identifies which applications can be delivered through the centralized model. User experience management: Another key differentiator is the desktop monitoring and analytics. Wipro has implemented a comprehensive monitoring framework to monitor user experience, behavior and their productivity by leveraging AI and Machine Learning (ML) technologies. Any challenges faced in the end-user device are investigated and fixed proactively. Performance issues and the root cause of the application performance are highlighted through the platform. There are several solutions available today. However, many of them fail to focus on more subtle elements like personalization, configurability, and user experience, which are critical in ensuring productivity. These elements also address the inherent network-related challenges, multi-location availability, and security while employees work remotely. Solutions that cannot scale existing enterprise investments in virtualization or offer the commercial flexibility of a pay-as-you-go model will not be beneficial to organizations in the long term. What separates Wipro virtuadesk™ is its hybrid/multi-cloud capabilities that ensure any device, anywhere, anytime availability, including the full benefits of VDI and desktop as a service. VDI is here to stay As the adoption of VDI continues to grow, a holistic approach to improve user experience and ease of user onboarding will ensure success. There is no cookie-cutter approach. Organizations must re-visit their business strategies with out-of-the-box thinking. New technologies are transforming industries across the world. Take the example of the automotive industry. A domain for hard-core engineering, the automotive industry today recruits talent with design, IT, AI, and automation skills. Similarly in retail & consumer care industry, with the rising popularity of digital channels and e-commerce, the retail market scenario has changed. Online payments, evolving supply chains, AR/VR for better user experience, etc. are trends that necessitate an employee base with a completely different set of skills for the industry. Interestingly, there are close to 11 million job openings in the US alone, with lesser number of job applicants today. Organizations can take advantage of

flexible workspace platforms like VDI to tap talent with next gen technologies skills and knowledge to hire and retain talent from anywhere in the world. Security of applications and end-user accessibility can also be addressed using desktop, application virtualization technologies. Organizations have a plethora of technologies to ensure that the data and the applications are secure. In addition, with Bring Your Own Device (BYOD) policies, employee satisfaction can be enhanced. A critical aspect in the success of the VDI environment is the cloud. At Wipro, we recommend a hybrid, multicloud strategy to optimize disaster recovery. Applications can rest on the cloud, whether public or private or a combination of the models. Complemented with the right end point policy, the appropriate tools and technologies to identify the right set of applications and users, preparing the applications optimized for the VDI environment, proactively addressing migration challenges and efficient user experience management will ensure successful adoption with minimal impact to the business. Instead of DIY, VDI platforms enterprises can take advantage of productized DaaS offerings like Wipro virtuadesk™ to improve the time to market and optimize total cost of ownership (TCO) as well as avail ever green service offering to deliver great user experience to employees.   To know more, please write to ask.cis@wipro.com Seshu GVK General Manager, Cloud & Infrastructure Services, Wipro Limited. Seshu has two decades of IT industry experience across multiple domains—Telecom, Energy, High-tech, Healthcare, Consumer, Banking & Financial Services—covering product development, enterprise application development, infrastructure management. Currently, he heads Wipro virtuadesk™ practice globally in Wipro. Wipro virtuadesk™ is a complete desktop virtualization solution that enables customers to easily secure, provision, and share applications and data, for a collaborative and mobile workforce. Designed for fast and secure deployment, Wipro virtuadesk™ minimizes the risk in desktop virtualization implementation Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.

Discover the Digital Workplace

----- Arcticle source ----- https://www.wipro.com/infrastructure/discover-the-digital-workplace/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Discover the Digital Workplace October | 2021 In the ever-competitive war for talent, digital workplace savvy companies are winning the war in attracting and retaining talent. The workplaces of today are altering every aspect of business operations and performance. As the distinction between the employees' professional and personal life dissolves, the workplace of today demands unprecedented digital ways of communication, collaboration, and support.

The industry today acknowledges digital workplace experience as a key to innovation; implying that organizations that have fully implemented technologies like the smart workplace, mobility, automation, artificial intelligence, analytics, and connected employee tools are leading business transformation journeys. The speed of adopting a digital workplace has never been so fast paced. The corporate world has started measuring the CxOs workplace on digital maturity. This contemporary approach is maturing rapidly as generation Y workers are moving into leadership and decision-making roles, and they tend to be almost fully digital and focused on driving adoption. With this profound change, the CIO organization is looked upon as a business partner to enable rapid progress. Today, IT organizations are taking all possible initiatives to create the workplace for tomorrow. So, the real question is, though all of the technologies we talk about are already here – albeit still in uncommon usage, what is the successful transition to a digital workplace and how can we better deliver innovation in the working environment? What is digital workplace experience? Before we jump to a conclusive definition, it is essential to understand the meaning of the personal digital experience. Let's answer this question: what do Google, Amazon, Facebook, YouTube, and Netflix have in common? The simple answer is a 'consistent and intuitive personalized experience' that is accessible anytime and anywhere and using any device. The digital workplace experience is the spectrum of technology touchpoints for work that is based on the employees' individual persona and removes the barriers of collaboration with the organization. These technologies are designed and delivered in a coherent way that is mobile, smart, instant, and intuitive. Why adopt a digital workplace strategy? Experience today is more important than the technology, and the gap between the organization and the personal digital environments can hinder the organization's ability to succeed. There is an immediate need to evolve the current workplace from a technology-centric approach to a user-centric approach. IT and HR leaders focused on the digital workplace should together strengthen the technology planning, as a poor employee experience fuels employee disengagement and dissatisfaction, in turn limiting their interactions with customers and the internal organization. How to design the ideal digital workplace roadmap? The employee is the new customer. Organizations are formally adopting strategies which have leadership support, aligned with expert execution through change management specialists, to design their modern workplace services. Let's look at a few examples of how organizations have invested in technology to create a modernized workplace. The path for implementing a digital workplace starts with taking a user-centric approach of studying employee technology, human needs, and the use cases for business. This design-led approach is a specialized study to understand what matters to people and business. The study is performed by a group of craftsmen specialized in design, strategy, technology, and marketing. They work closely with corporate employees to plan, write and produce the most needed and best-fit technology and non-technology solutions. Personas are an excellent tool for the understanding of who your employees are and what they really want from the organization. With personas, it becomes quickly apparent that the digital workplace is not an out-of-the-box, one-type-fits-all product that can be implemented in any organization. Instead, it is an interwoven set of tools and applications published as per the users' needs. Persona journey maps give great insights into different groups of employees, their

motivations, digital needs, business requirements, and what they need from the organization to perform better. The employee digital experience score card recently made its debut in the workplace technology environment. These smart tools can immediately extract valuable actionable insights from any device, process or software used by the employee. The metrics that matter most to the business are the ones that measure the intelligence of IT, and the ones that increase the speed and agility of understanding the business and employee needs. Machine algorithms and cognitive platforms are allowing us to proactively fix issues even before the users report them. One of the hallmarks of employee experience design is the creation of an enterprise-level marketplace that delivers personalized software, tools, and content across the arc of the employee journey. The key here is integrating the backend systems and processes for service rendering automation. The touchpoints of these catalogs are persona-based, and the services can include everything from virtual machine images, mobility, facility, or the HR services. Mobile apps are central to the omni-channel experience. Organizations are now embracing IoT and location-based services and applications to improve workforce engagement and experience. From smart workplace to smart parking and smart conference rooms, the future of the workplace will be defined by the seamless connections of networks, sensors, and mobile apps that will overcome all physical barriers. Tech-enabled smart pre-boarding is a new way to impress employees. Onboarding service catalogs and VDI route new hires to an online pre-boarding process that includes payroll, compliance, policies, benefits, etc. Today, corporations based on personas give options to employees to choose their own devices and accessories during the pre-boarding process. Organizations believe effective onboarding sets the tone for a great employee experience and forms a critical component for new talent attraction. AI and cognitive platforms are playing a key role in transforming the modern workplace. The chatbot performs far more complex tasks and instantly provides employees with data and information as opposed to just doing low-value repeatable tasks like password resets or printer setup. The bots are trained to perform guided actions to fix problems and execute service requests like booking conference rooms, travel, hotels, etc. These bots can easily be accessed over mobile devices, or PCs to provide instant support to the end-user community. The digital workplace is adding new dimensions to businesses globally allowing companies to grow and compete. This pace of this change is only going to accelerate; the global CxOs have already placed digital workplace transformation at the heart of their corporate strategies to drive growth. Innovation today is not something that happens only in the board room; it is clear that people and innovation in the workplace are equivalently essential assets. In a world where new-age technologies are disrupting industries, there's an opportunity for organizations to reinvent their culture of innovation and create a modern workplace that engages and empowers people to do their best work. Redesigning the traditional workplace is about changing your approach to technology, social networks, and leadership practices. Digital workplace showcases the energy and flexibility of the modern organization, and it has proved to be more productive, responsive, and creative. So, are you ready?   To know more, please write to ask.cis@wipro.com Ankur Sachdeva Ankur Sachdeva leads the Digital Workplace Practice at Wipro. Transforming Finserv Workspaces for Millennial Workforces

----- Arcticle source ----- https://www.wipro.com/infrastructure/transforming-finserv-workspaces-for-millennial-workforces/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Transforming Finserv Workspaces for Millennial Workforces October | 2021 Technology has transformed the face of the banking industry. It is now an enabler of modernization, innovation, and the digital economy through real time actionable analytics and insights driving informed decisions, creating competitive advantage, and enhancing the customer experience. Banks are now a one stop shop for all financial products and services round the clock. Technology enabled products and channels have opened up new market opportunities and delivery channels leading to increased productivity, efficiency, flexibility, and scalability of banking transactions making even the smallest of transactions virtually viable. Evolution of the banking industry: Retail banking to mobile banking Traditionally, banking was confined to the functions of accepting deposits, providing loans, carrying out financial transactions, and offering wealth management with a suitable set of workforce trained to carry out these day to day functions efficiently and securely. The tediousness involved in using these services through physical bank offices paved the way for the evolution of internet banking, e-banking and fintech startups equipped with modern workspaces and best of the breed workforces. In the recent years, fintechs have evolved into well-established financial institutions and are proving to be a huge competition to the traditional banks. To remain competitive and relevant for customers, banks have to embrace the culture and service model of the fintechs either through partnerships, acquisitions, or by building in-house startups to transform themselves into future ready financial services organizations. They need to revolutionize the way they offer products and services to the end customers through branchless banking, hire new talent for building next gen banking solutions, and explore new channels of service delivery and modern workspaces. Significance of talent management in the banking industry In the ever-evolving financial services sector, acquiring, training, retaining and developing workforces can be one of the major factors in

deciding the success of any organization. The talent management practices in this sector are experiencing a transformational shift due to rise of millennial workforces. Employers are now trying to better comprehend the motivations, needs, and expectations of the millennials and aligning their policies and practices to create working environments which can nurture multi-generational workforces alike. To keep up with the trends shaping the future of the financial services sector, organizations are required to onboard new talent trained in next gen technologies such as digital currency, biometric security, mobile applications, user experience, artificial intelligence and machine learning, and analytics in order to implement sophisticated financial services like branchless banking, mobile app based services, remote KYC authorization with biometrics, integration with ecommerce platforms, next gen customer acquisition, loyalty management solutions etc. While these skills are essential, they are not easily available in the market due to huge demand across industry verticals like consumer, automotive, manufacturing etc. which are developing next gen offerings like autonomous vehicles, virtual retail stores, on demand manufacturing etc. With organizations across industries looking for similar skills, it is imperative to attract and retain the best talent. Organizations need to have the HR and workspace policies that support the hiring of the talent irrespective of their location and provide them with necessary tools and applications to make them productive without compromising on the aspects of intellectual property and data security. It calls for a flexible and hybrid workplace which is resilient and secure, and enables employees to work from 'anywhere, anytime, and on any device.' Need for workplace transformation Due to the ever evolving ways of working, organizations have reconfigured themselves in a mode that strikes a vital balance between physical as well as virtual workforces enabling greater connection and collaboration. Organizations are now leveraging technology for enhancing human connection and building social capital while the culture of distributed working continues to evolve. Bankers and advisors are leveraging digital capabilities and channels for building customer relationships, financial advisory, and executing sale of financial products and services. Technology is creating workplaces and workspaces that aren't only equipping teams with better tools and accelerators of service delivery but also empowering them. Technology has enabled both remote as well as flexible ways of working. Remote ways of working refer to the location where work takes place - office or home. On the other hand, flexible ways of working refer to the working schedule - when and how often the work is taking place, the extent to which work responsibilities are held individually or shared, the working hours/ shifts, and the type of employment model. Remote working is the enabler of flexible ways of working and eventually leads to long term savings on operating expenditure by the organization, increase in job attractiveness, efficiency and productivity as well as overall employee wellbeing. Organizations need to adopt good virtual practices to encourage engagement within and among their teams, ensure adoption of digital ways of working, fostering informal interactions within the teams to maintain a sense of belongingness and connection while ensuring security and resiliency of the infrastructure and applications connecting them. Transforming employee experience and empowering workforces Millennial employees are becoming main consumers of the workplace environment given the increase in demand for next gen skills. Based on the gamut of

available employment options, they are driven to search for suitable roles and organizations which can enable better performance and career growth. The workforce today demands flexible work location, hours, and the choice of devices they would like to use to get the work done. In some cases, flexibility in work location and hours takes precedence over the pay and other aspects of the job. This trend is driving HR and IT leaders of the enterprises to reinvent the workplace services with flexibility and employee experience at the core. At the same time, it is critical to maintain the security and compliance requirements that need to be considered as an integral part of the solution rather than as an afterthought to avoid user experience issues. Virtual desktop infrastructure (VDI) as a technology helps organizations to enable seamless working experience across devices with different form factors, operating systems, enterprise managed, and unmanaged devices with enhanced security and controls. With the use of virtual desktop infrastructure services, organizations can create irresistible working experience for their employees during the employee's journey through: Handling these aspects with the use of VDI services will not only help financial organizations in attracting and retaining the best talent in the market but also will eventually lead to development of better products and services to ensure customer delight. The way forward The future of the banks lies in their ability to innovatively reimagine their user experience journeys, enhance and personalize the employee experience, the way they utilize tools and technologies for ideation, innovation, collaboration and finding new ways of solving customer challenges and enhancing customer experience. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Why Your IT Service Desk Won't Be There Tomorrow

----- Arcticle source ----- https://www.wipro.com/infrastructure/why-your-it-service-desk-wont-be-there-tomorrow/ ----- About the Author(s) Related Articles Contact Wipro Please fill the required details to access the content Why Your IT Service Desk Won't Be There Tomorrow December | 2021 Service desk as a concept has evolved over time and has embraced technological advancements to address the needs of the modern workforce. In today's world, with employees having the flexibility to work from anywhere, anytime, the IT service desk has gradually emerged as a crucial enabler in implementing an effective strategy for digital workplace transformations. It now becomes imperative to transition from a reactive, manual intervention-based service model to an intuitive, digitally enabled model to reprioritize the service desk objectives and support employees effectively and efficiently to ensure business continuity and their productivity irrespective of the location, devices, or channels. Considering the millennial workforce's affinity for personal digital touch points with the likes of Amazon and Uber, organizations are now envisioning their service desks to offer consumer-like experiences to their employees, leveraging smart technologies such as AI, analytics, and automation. Research indicates that millennials are more open to using a variety of emerging means to get the IT support they need. Instant messaging (71%), video chat (54%), and the use of mobile apps to resolve IT issues (54%) are most popular. To achieve the envisioned service desk, the transactional first level IT support in the workplace will moderately be substituted by zero-touch service desk - an intelligent, automated approach to resolving trouble tickets without any active involvement of the service desk agents. It promotes self-healing, knowledge base portals, and self-service actions routing the service agents' skills towards high priority issues. This transformation of the traditional service management was imminent as over-burdened service desk agents were resolving improperly assigned incident, problem, and request tickets in an untimely manner. Ineffective resolutions resulted in negative employee experiences and reduced productivity levels. The pandemic acted as a catalyst in driving this further due to the surge in the ticket volumes accounting for the remote working employees. Challenges such as limited visibility of service experience levels, lack of intelligence in the system, emerging trend of BYOD, and aggravated pressure on the agents, compelled organizations to reduce costs and enhance productivity while optimizing the service desks. Hence, there is a need for organizations to reimagine and build an effective support system which is all- predictive, proactive, and pre-emptive. The future-ready service desk must have a foundation of intelligent employee-centric integrations that will lead to the evolution of the service desk to an enterprise desk that can sense employee sentiments, seek feedback, and pre-empt issues. Persona-driven approach The service desk of the future will not adopt a one-size fits all model but will incorporate persona-driven methodology that will help in creating user profiles of the employees basis the role, devices, workload, etc. The desk will

then use these profiles to offer hyper-personalized resolutions aligned to the business, by identifying the devices and ascertaining the criticality of the issues as per the profile. Experience management The service desk will evolve into experience desks that will map the employee journey to identify "moments of truth" in the service levels. The employee's experiences will be quantified with data to understand their sentiments and ensure that their expectations are being met. The outcome and value-based service desk with an XLA based approach will continuously move towards improvement to build customized knowledgebase by taking feedbacks for all digital touchpoints in the journey. Automation integration Evolution of the service desk with minimal human intervention will happen with zero-touch and automation capabilities. This will help in reducing the volume of service desk tickets and simplifying the process of ticket creation and resolution with automated ticket routing, to the appropriate agent skilled for that issue and intelligent swarming for end-to-end agent accountability for that ticket. The service desk is also becoming leaner with shift-left initiatives, wherein the level 1 tickets will be shifted to self-help and the other requests will be resolved through automation. The IT teams are maturing, wherein they now look at unreported issues or the ones with the potential to disrupt the employee's work continuity, rather than just addressing the raised tickets. The changing workforces are placing emphasis on having proactive maintenance to address issues before problems arise, and the modern service desk must have the capability to meet these demands. Hence, the network and the device performance are proactively measured and monitored consistently to identify, diagnose, and remediate anomalies and issues using self-healing AI-driven automated capabilities. This approach prevents the issues from happening in the first place, reducing the tickets and improving employee productivity. It is observed that millennials attempt to fix workplace issues themselves as they do in their personal lives. According to Gartner, "end users require an IT self-service portal where knowledge is readily available, where passwords are easy to reset, and that is very intuitive to use". Hence, an effective portal, accessible from multiple channels with a cognitive virtual assistant will allow the employees to find the answers easily around how-to requests, technical support, IT equipment ordering, and password reset requests. Resolving the latter issue with self-service information on automated password reset tools, for example, can save organizations the costs of supporting this type of request via more expensive channels. The employees should also be able to access service desk support from any device, anytime, anywhere. Analytical metrics The real-time data retrieval for conducting analysis of the data can help the agents in monitoring the employees' ecosystem and identify potential issues to proactively resolve them in an automated manner. The analytics and reporting will capture the historical data and the feedback data which can be beneficial in visualizing a trend to create a hyper-personalized strategy. Service desk has come a long way in terms of transformation. There is no doubt that the service desk of 2030 will look completely different from what it looks like today. For an evolved service desk equipped with advanced capabilities and focused on employee experience, organizations will have to aggressively invest in its transformation to enhance productivity and satisfaction levels. To envision these digital workplace transformations with the futuristic service desk, Wipro offers a user-enablement platform, myUnihub which is integrated with cognitive virtual assistants and real-time

digital experience monitoring capabilities and stages consumerized experience enabled through harmonized multichannel interfaces supported by smart automation and data insights. With Wipro's design-led process backed by data accelerators, organizations can experience agility and flexibility in their service model while enabling next-gen employee experiences. Riya Bansal Product and Practice Development Manager, Digital Workplace Services, iCORE–CIS, Wipro Riya has work experience in Communication Networks, Business Development, Product Marketing and Management. Currently she is developing and managing digital workplace offerings that help Wipro's clients in enhancing the experiences and productivity of their modern workforce.   Lalit Mehar Presales Consultant, Digital Workplace Services, iCORE-CIS Wipro Lalit has work experience of solution designing in the field of service desk and device management. Currently he is designing solution for clients in end user services offering. He brings in a cross functional business acumen and has strong interest in new-age technologies. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.

Bringing about IT-OT Convergence: Leveraging IoT Ecosystems to Manage Infrastructure Better

----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Bringing about IT-OT Convergence: Leveraging IoT Ecosystems to Manage Infrastructure Better February | 2022 With fast-evolving technological capabilities and customer expectations, there is increased dependence on operational technology (OT) today. However, as IT and OT converge, OT systems are becoming highly complex to manage, and increasingly vulnerable to malicious attacks. To navigate the new paradigm, businesses must apply IT best practices in OT services management. Increased customer expectations, evolving capabilities in IT and data analytics, and continuous disruption in an increasingly competitive business landscape is accelerating the dependence on operational technology (OT). However, due to the isolated nature of OT environments and lack of transparency and standardization, centralized process improvements and efficiencies of scale are not possible in OT domains unlike their IT counterparts. Moreover, as IT and OT converge, OT systems are

becoming highly complex to manage, generating more data than organizations are able to process meaningfully, and are increasingly vulnerable to malicious attacks. To navigate the new paradigm, businesses must draw from the best practices in IT and embrace the shift towards OT services management. Navigating the current operational technology landscape Operational technology (OT) is an integral aspect of the world economy, driving factories, energy generation, transportation, and utilities. These technology systems combine hardware and software components, and physical devices to monitor infrastructure and manage changes over time. The rapid advancements and developments in technology have also transformed operational technology, further driving the convergence of OT and IT systems. While OT systems were isolated from the internet in the past, they increasingly require data and analytics to function optimally. sales for OT hardware and software have increased due to IT-OT convergence and are projected to reach $33 billion by 2028. Operational technology today spans across different technology systems such as programmable logic controllers (PLC), distributed control systems (DCS), supervisory control, data acquisition (SCADA), Integrated Building Management Systems (IBMS), POS, cameras and handhelds. It combines hardware and software components to monitor and control physical assets in industries as diverse as telecommunications and retail. With each passing day, the dependence of enterprises on operational technology is increasing. The increasing adoption of automation across sectors has resulted in wide swathes of areas being integrated with OT. However, such massive adoption also means increasing exposure to the risk of OT systems failure or malicious attacks, and increases the need for enhanced systems to manage the technology. Only 8% of OT leaders reported no intrusions over a 1 year period, according to a 2020 report by Fortinet. The continuous and optimal functioning of OT systems is critical for the bottom lines of organizations. As OT systems become more complex and sophisticated, companies need to devise carefully framed strategies and frameworks to manage them, with enhanced monitoring and control capabilities. Islanded OT systems and the need to manage them more effectively A clear difference can be observed in the way IT and OT environments are managed, monitored, and integrated with larger technology ecosystems within an organization. Devices such as PCs and laptops and cloud-based servers are managed systematically within a clearly defined framework but once one enters the realm of power grids and building controls, things start to become more loosely defined. Differences in underlying architecture have kept IT and OT separate or 'islanded' even as data flows between the two fields have increased over the years. A degree of separation between the two has traditionally been maintained for operational integrity and security, and due to lack of support. OT systems often feature embedded devices operating on specialized technology developed by OEMs without open management interfaces, requiring specific and compatible tools to reconfigure them. Centralized management and remote execution of tasks is a key component of IT management that allows for scalable solutions and optimization of processes. However, in an OT environment, specialized and local resources need to be present to oversee or manage the actioning of various processes. Often, OT systems are managed by manufacturing engineers, process control engineers, or controls technicians. When sophisticated manufacturing machinery is involved, centralized software updates could, in the event of an error, knock

the entire production line out of action. From patching to configuration, training processes need to be developed for OT resources to better manage their systems. While this is a sufficiently sophisticated and evolved area in the field of IT, it is lacking when it comes to OT. The IT-OT convergence has given rise to the Industrial Internet of Things (IIoT) which provides businesses with the ability to collect vast amounts of data and leverage analytics to gain business insights in unprecedented levels. This means that data is growing exponentially in OT, necessitating better systems for managing this increasingly lucrative and vulnerable information. IT/OT convergence is an increasing aspect of the evolving enterprise world. As digital technologies pervade the physical systems and machines on plant floors, it gives rise to the question of applying IT methods to managing OT environments. There are concerns that IT processes don't take into consideration the intricacies and specialized details typical of industrial situations. However, industrial environments often run on unsupported technologies and are not optimized for how systems interact. This calls for change. While IT processes cannot translate into OT environments directly, it is a useful approach. OT cannot be isolated from IT and IT methods cannot be directly applied in an OT environment. A balanced approach is key. Leveraging best practices and management frameworks from IT As business processes became increasingly integrated with technology and IT, IT services management (ITSM) emerged as a structured methodology for organizations to streamline and manage IT services. ITSM encompasses the designing, planning, operating and controlling aspects of IT management. In the realm of IT, ITSM empowered businesses to enhance value to customers, improve quality of service and increase transparency, accountability, and compliance. In the realm of OT, operational technology systems management (OTSM) must emerge as an approach that mirrors ITSM and draws from its best practices to drive efficiencies. Information Technology Infrastructure Library (ITIL) is a framework that brings together the best practices in IT support for delivering consistent and continual results for organizations. It helps organizations deploy service management in cost-effective ways and drive business outcomes through clearly defined processes. Resource optimization is central to ITIL and involves regular reviews of processes for identifying areas for possible improvement. Businesses are not pressured to accept all practices defined under ITIL but only those that are meaningful and practical to them. ITIL processes must drive desired business results. If this is not achieved, then corrective actions are initiated and the processes are modified to drive the desired outcomes. ITIL process owners ensure that individuals in relevant roles action these processes. Process owners list and monitor KPIs, ensure synergy and collaboration across the system, drive effectiveness of processes, ensure targets are met, conduct reviews, and ensure training of personnel. OT systems management must be aligned with the different stages of the ITIL lifecycle. Initially, the strategy stage ensures that the OT strategy is aligned with the overarching organizational strategy. It is crucial for this stage to be implemented perfectly for future stages to be effective, as they are built upon the strategy as a foundational layer. Next, the planning and design activities for the OT strategy are executed. This ranges from service level management to information security management and availability management and draws from the plans formulated during the strategy stage. During the transition stage, the updated or new services are built and tested and transferred into operations. It involves various

aspects such as configuration management, change management (in case of an altered process), service validation, and deployment. After the transition stage, the services are operationalized in a live environment. This stage encompasses aspects such as incident management and problem management. The final stage is continual service improvement which leverages processes from across the previous stages to ensure that improvement areas are always worked on to offer ongoing optimization. This involves service reporting and measurement, service level management processes, ROI optimization, and improvement in processes. IoT ecosystems as a way of managing OT systems An IoT managed service framework such as Wipro's IoT NXT can act as a bridge between IT and OT, and offer flexible and reliable solutions for managing infrastructure. With such a solution, organizations can monitor their OT infrastructure on a 24x7 basis, ranging from sensors, gateways, controllers and equipment. They can ensure effective asset monitoring and management. A solution such as IoT NXT allows for integration with IT services management (ITSM) tools, and drives enhanced results across service automation, incidence management, and contract management. Businesses can take advantage of service management and automation, integration with BSM tools, and device management. Additionally, IoT NXT paves the way for effective management of IoT networks, cloud environments, and data centers. The administrative processes for databases can be streamlined and enhanced. The increased convergence of IT and OT leaves buildings, plants and factory floors incredibly vulnerable to a wide range of cyber security threats that are constantly evolving, from ransomware to data theft. With an IoT management framework, organizations can adopt the best practices from IT to counter threats of this nature and avoid potential damage to their bottom lines. OT managed services solutions allow organizations to leverage the power of analytics in areas such as predictive maintenance. Smart analytics allows organizations to implement corrective measures ahead of time by conducting simulations of real-world situations and by implementing impact analyses. Constant monitoring and superior management capabilities unlock possibilities for continuous improvements in enhancing use-case efficiency and driving business results. Stakeholders can measure asset failure probability reliably. Meanwhile, operational analytics boosts the success rates of health and maintenance efforts for equipment. It leads to cost savings by preventing the need to deploy personnel for maintenance when fixes can be implemented through remote means. It helps to avoid elaborate and inefficient practices in traditional scheduled maintenance efforts and identify the areas that actually require attention, thereby avoiding wastage of productivity and costs. It helps optimize the usage of machinery to extract the most value out of them, prolong their life span, and minimize downtime. IoT NXT combines efficiencies that are achieved in facility management, workforce management, process management, and tools. Process standardization is ensured to drive consistent outcomes, and programs such as Lean and Six Sigma help to translate this into a reality. Proactive communication with stakeholders and a strong governance model further enhance the effectiveness of OT service management. Wipro's IoT NxT GCC, enabled by Wipro Smart i-Connect™ along with ServiceNXT, allows for a highly efficient operating and governance template for OT management, with the organic platform enabling businesses to navigate complexities seamlessly while offering modularity, scalability and security. This empowers

organizations with the flexibility and customizability they need to drive non-linear business growth. They can proactively update systems to fortify them against potential threats, and deploy automation capabilities to streamline key operational tasks. Organizations can improve their process documentation through consistent reporting and monitoring. Security controls can be embedded into systems with improved endpoint visibility. OT agility is enterprise agility Leveraging the best practices from IT in OT environments can help organizations harness data more effectively and manage change successfully using standardized processes, protocols, and unified interfaces. Businesses can make proactive decisions that are guided by data-driven insights and leverage scalability and flexibility. People and processes across IT and OT domains can collaborate seamlessly to drive the organization forward. Customers, partners, suppliers, and other stakeholders can engage in more effective ways. Lifecycle maintenance costs can be reduced and support enhanced, and stand-alone projects can be replaced by an overarching platform that offers scalable solutions to the entire OT and IT fields. To navigate the new paradigm, enterprises must embrace the change and become more agile through efficiencies. The timeframe from ideation to innovation can finally decrease as information becomes more easily available and actionable. Saravanan Palanisamy Lead Solution Architect - IoT, UK – Cloud & Infrastructure Services, Wipro Saravanan has industry experience in the areas of solution design, pre-sales, consulting and software development. As an experienced IoT and Smart Cities professional, Saravanan has worked extensively with companies around the globe in providing innovative and cutting-edge solutions. Saravanan has special interest in smart buildings and retail technology trends and IoT. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.

Internet of Vehicles (IoV): Revolutionizing Transportation of Tomorrow Riding on 5G and Edge AI

----- Arccticle source ----- https://www.wipro.com/infrastructure/internet-of-vehicles-iov-revolutionizing-transportation-of-tomorrow-riding-on-5g-and-edge-ai/ ----- How 5G and IoT are changing the automotive and transport industries Benefits of IoV About the Author Raj B.R – Practice Director – 5G IoT & Smart City Related Articles Contact Wipro Please fill the required details to access the content Internet of Vehicles (IoV): Revolutionizing

Transportation of Tomorrow Riding on 5G and Edge AI March | 2022 Increasing digitalization has led to the proliferation of data. The Internet of Things (IoT) is a technological evolution that has thrived on the availability of this limitless data. Despite the business impact of the pandemic, enterprise spending on IoT was expected to grow 24% by the end of 2021. By 2030, it is estimated that there will be 25.4 billion IoT devices across the globe. IoT is no longer a nascent technology, but a game changer that is enabling global businesses to build on the foundations of artificial intelligence, machine learning, big data, and the cloud to unlock new possibilities for the future. The transformational phase in IoT led technology revitalization has greatly benefited two sectors: automotive and transport. 5G wireless communication has been a catalyst in this transformation. The advancement in Industry 4.0 and IoT has given a significant impetus to the market for connected and autonomous vehicles. The premise of 5G technology is essentially based on the assurance of ultra-high speed data transfer and low latency, which means quicker response times and better reliability. Today, several vehicle manufacturers leverage IoT to connect to cellular networks for real-time navigation, driver assistance features, connected infotainment, and emergency services. With the advent of 5G, applications such as autonomous driving, Vehicle-2-Vehicle (V2V), Vehicle-2-Infrastructure (V2I), Vehicle-2-Network (V2N), and Vehicle-2-Pedestrian (V2P) communications will receive great impetus. The reliability, availability, speed, and lower latency of 5G has the potential to enable a Vehicle-to-Everything (V2X) environment. Gartner estimates that the share of 5G-enabled cars that are actively connected to a 5G service will grow from 15% in 2020 to 74% in 2023, reaching 94% in 2028. By 2023, the automotive industry will become the largest market opportunity for 5G IoT solutions. Gartner further estimates that it will represent 53% of the overall 5G IoT endpoint opportunity in that year. The 5G era is expected to bring in network and service capabilities that previously were not available. The combination of 5G, IoT and Edge AI will facilitate the change to smart transportation or mobility. In this paper, we explore the different dimensions of mobility and the critical role of 5G wireless in bridging the gap and creating innovative services that can leverage the connectivity options for vehicles in the near future. The next step for the automotive industry: Internet of Vehicles (IoV) In simple terms, Internet of Vehicles (IoV) can be described as a network that utilizes sensors, software, and technology to connect vehicles to their relative environment (entities such as pedestrians, traffic management equipment, other vehicles, pedestrians, parking lots, and so on) and exchange data. At the base is the IoT domain which has changed the face of the transportation and traffic management systems to a more advanced and interconnected system which will allow vehicles to communicate with each other as well as with road side infrastructure. IoV has originated from an older technology called Vehicular Ad Hoc Networks (VANETs). In its conventional form, VANET enabled cars to form spontaneous wireless connections with other vehicles and devices. Today's technology enabled and modern cars have approximately 100 million lines of software codes. IoV combines this with smart devices to access and communicate information with the ecosystem. The connected vehicles in future will have a large number of connected end-points and a high volume of data exchanged. In the future, any vehicle will have the capability to connect anything at any time in an entirely flexible, reliable and secure way.

5G communication will be key for this network connectivity requirements to deliver the required services. With its incredibly low latency, high speed of communication, and availability of high volume of data communication, 5G is most suited for vehicle to infrastructure connectivity. 5G and Edge: Two key technologies to facilitate IoV The crux of this technology is communication and the speed at which the communication takes place. This is enabled by a variety of interconnected entities – hardware, software, network, and the communications service providers. The ultimate aim of IoV is to ensure safety of the vehicle and its environment in addition to enhancing the vehicle maintenance. Hence, within the IoV infrastructure, there are 5 key connections that need to be established: Vehicle-to-Vehicle (V2V), Vehicle-to-Human (V2H), Vehicle-to-Infrastructure (V2I), Vehicle-to-Roadside Unit (V2R), and Vehicle-to-Sensors (V2S). Conventional wireless communication methods are incapable of providing the latency and availability required for the IoV infrastructure. IoV requires real-time insights on the vehicular movement, road traffic and other factors, make predictive analytics, and initiate the corrective actions for better vehicular movement and traffic management. Edge computing is a critical part of IoV, enabling moving vehicles to connect to the surrounding environment and communicate to the compute infrastructure for data analytics and inferencing with very low latency. Complex analytics and calculations can be performed in the Edge servers to meet the requirement of low latency and bandwidth efficiency thereby reducing the cloud burden and delay. 5G and Edge computing are inextricably linked, with their combined ability to deliver such complex and low latency requirements. IoV draws support from 5G communication technology which is capable of ultra-reliable low latency communications (uRLLC), enhanced mobile broadband (eMBB), and massive machine type communications (mMTC) by incorporating techniques such as massive MIMO (multiple-input multiple-output), network virtualization and Edge computing. Mobile edge computing has proven to be an enabling technology for IoV, providing the potential solutions for sharing the computation capabilities among vehicles, in addition to other accessible resources. Edge AI and analytics, another important aspect in IoV, basically entails the collection and analysis of data at the sensor or device level. It enables the decision making at the edge, further enhancing the agility of the vehicular sensors and reducing risks. Another noteworthy technology is 'beamforming', an enabling technology within 5G. This technology is used with phased array antennae systems to help focus a wireless signal on a specific device, rather than spreading the signal in all directions, thereby resulting in direct communication. Beamforming transceivers are integrated into massive MIMO arrays at both the device as well as the cell-site ends. These technologies hold the promise of bringing down the IoT connectivity speeds to almost instant data delivery with less than a millisecond of delay, thereby enhancing the reliability of the communication. Given the complexity of communications in this technology, artificial intelligence (AI) is deployed in the antenna, which directs the beams to the receiving devices. In addition, beamforming technology also allows radio waves to bounce off buildings to enhance the reliability of signals that are not directly in the line of sight. It is estimated that every year, approximately 1.3 million people lose their lives in road accidents, while 20 to 50 million people are injured, many resulting in permanent disability. It's also widely accepted that a large majority of these accidents occur due to human errors. Considering these

statistics, the importance of IoV in elevating road safety and reducing road accidents cannot be undermined. The purpose of the IoV technology is to ensure safety, in addition to faster travel, reduced energy consumption, and better vehicle maintenance. It also results in higher vehicle lifecycle. The most important contribution that IoV can make is in road and traffic management, with real-time assessment of the situation. Over a period of time, with the increasing use of autonomous vehicles, the number of sensors and software available to provide the data will increase. This, in turn, will provide better data points to the technology to make the split-second decisions, reducing road accidents and other untoward incidents. Key benefits that IoV provides in enhancing the overall transportation infrastructure include: The use cases for IoV are not just limited to vehicles, but to the traffic and transport ecosystem as well. Fuel and electricity resources can be optimized through smart signals and lights that assess the conditions of the traffic on the road and operate accordingly. IoV technology can also have a deep impact on the environment, resulting in reduced carbon emissions with better vehicle management and maintenance. Connected vehicles are an important step in reducing the carbon footprint and improving the overall environment. Raj heads the new-age-solutions team with the charter to develop IoT solutions for the 5G era and is also part of the global Smart City team as Practice Director at Wipro. Embracing Business Growth with Azure VMware Cloud

----- Arcticle source ----- https://www.wipro.com/infrastructure/embracing-business-growth-with-azure-vmware-cloud/ ----- About the Authors Related Articles Contact Wipro Please fill the required details to access the content Embracing Business Growth with Azure VMware Cloud March | 2022 Building your business in the cloud is no longer a question; it is a necessity. Freeing yourself of legacy systems, inflexibility, and the need for agility in an increasingly volatile marketplace requires platforms that allow you to meet customer demands and the need for digital interaction. Enterprises need to have the courage to rise beyond the daunting migration complexity and push forward with effectively moving existing workloads from on-premises environments into the cloud, refactoring applications, finding appropriate skills so you can embrace new innovative technologies to unlock new

opportunities and growth. The Microsoft Azure VMware Solution, a jointly engineered offering from Microsoft and VMware, can streamline your shift to the Azure VMware cloud and power up the transition while reducing customers' long-term costs. Azure VMware Solution is a private cloud infrastructure-as-a-service that runs natively on dedicated bare-metal Azure infrastructure. Jointly engineered by Microsoft and VMware, the Azure VMware solution offers the ability to quickly and seamlessly migrate or extend existing VMware workloads from on-premises environments to global Azure infrastructure, and modernize the applications using Azure native services. Customers get to protect their VMware investment by leveraging the existing tools and skillsets while ensuring operational agility, innovation, and stability that Azure native services offer. While customers can capitalize on great price benefits for Microsoft applications, they can modernize their existing applications running on VMware by integrating with the Azure native services management and security. The organizational benefits of extending on-premises workloads to the Azure VMware cloud go beyond upgrading to more relevant technology. Some of the significant advantages include the ability to use VMware's enterprise applications and tools powered by the flexibility and velocity of Azure, reduction in time and cost of migration, and better cloud economics due to lower TCO compared to traditional native on-premises cloud environments. While other players in the market help organizations with their cloud journey, the Azure VMware solution offers a unique set of features that sets it apart. These include- Let us explore the use cases for customers to drive benefits from a migration to the Azure VMware solution. For enterprises with an extensive application landscape on VMware, transitioning to the Azure VMware cloud can yield positive cost reduction, improved agility, or capability to adopt high value-chain services, leveraging the existing VMware licenses. Customers can also reduce TCO in the long-term by a shift to the Azure VMware cloud instead of renewing their on-premises VMware contract. Another compulsive reason for embracing the Azure VMware solution is accelerating automation, as VMware provides an excellent array of automation tools for managing day-to-day operations. Wipro FullStride Cloud Services strong Microsoft and VMware competencies, has ensured that we are the trusted partner of choice for leading enterprises looking to create a strategic roadmap for risk-free migration to to Azure VMware cloud, and if required managed services. Wipro is a Microsoft Gold Partner and a Managed Service Provider (MSP) expert partner for Azure. With a Leader positioning by Everest PEAK Matrix® 2021 for Microsoft Azure capabilities and a robust talent ecosystem of experienced cloud professionals, Wipro FullStride Cloud Services' business profile includes seven Microsoft advanced specializations with 3,800+ Microsoft Azure certified professionals.. Wipro FullStride Cloud Services possess an extensive portfolio of industry-leading cloud-related capabilities and experience. Our promises include: With its extensive partner ecosystem and deployable, ready skills, Wipro provides a single-pane-of-glass experience for seamless multi-cloud management. When you choose Wipro to accelerate your Azure VMware cloud journey, you can also leverage our ITIL framework service management, continuous process improvements, Cloud Center of Excellence, and the promise of Wipro best practices and quality. Azure VMWare Service: Leverage the power of best of worlds Azure VMWare services enable you to retain your native attributes while integrating native services from Azure, and at the same time, extend

the entire automation built with VMware workload in the data center to Azure. With Azure and VMware shaking hands to bring best-in-the-class benefits to customers, you can now have the best of both worlds to transform and run your workload without any compromise. To know more, contact Azure-Marketing@wipro.com.   Rajiv Kumar GM. Practice & Presales Head - Cloud, Cloud & Infrastructure Services, Wipro Rajiv has about 23 years of experience in the IT Industry. He has played a crucial role in developing next-generation transformative offerings like Azure Stack and rapidly growing the cloud practice across geographies. He is a member of the Association of Enterprise Architects and has many leading certifications like TOGAF, Azure Cloud architect Expert, Google Professional architect, and AWS Solution Architect. Site Reliability Engineering: Making Your IT Systems More Scalable, Reliable, and Efficient

----- Arcticle source ----- https://www.wipro.com/infrastructure/site-reliability-engineering-making-your-it-systems-more-scalable-reliable-and-efficient/ ----- About the Authors Related Articles Contact Wipro Please fill the required details to access the content Site Reliability Engineering: Making Your IT Systems More Scalable, Reliable, and Efficient April | 2022 A holistic approach to reliability should incorporate reliability principles in the DevOps pipeline to form 'DevRelOps'. An evolving business landscape, increasing customer expectations and the 'new normal' created by the COVID-19 pandemic make time-to-market a critical parameter for business success today. While IT has always been business-critical, it is also mission-critical and life-critical in some industry contexts. With that in mind, the DevOps mindset has focused on feature velocity to bring in new features in shorter cycle times. However, while organizations need to improve the resiliency and security of their IT systems, the focus on reliability cannot be diminished.. In more recent times, instances of high cost of downtime are evident. For instance, in March 2019, a 14 hour outage for a social media company cost $90 M. The past decade has seen a tremendous transformation in the IT landscape with the evolution of application and infrastructure technologies leveraging cloud, Internet of Things (IoT), artificial intelligence (AI) and so on. This has given rise to a situation where distributed systems have become the norm. While every organization strives

to provide the best possible services to its customers, many a time, the misalignment between business and IT results in a disconnect on the specific service level objectives. With digital as the core for every business, service reliability plays a crucial part in meeting the expected business outcomes. While the aspiration may be to achieve 100% reliability, it is almost an impossible feat, as the cost of providing five-nines reliability (99.999) is humungous, if not impossible. SRE: An enhanced approach to meeting reliability requirements   How this is addressed by SRE Trust is the bedrock of businesses. Unreliable services can leave a permanent dent in the minds of the customer and specific actions need to be taken to improve reliability. Improved user experience with SLO driven methodology. Defining the right SLOs is extremely critical to establish benchmarks and set the right expectations of the stakeholders.   Reduce mean time to detect (MTTD) and mean time to respond (MTTR) with observability. Observability helps in enabling the right logs, traces and metrics as a feedback loop instrumentation of the systems is carried out on an ongoing basis by developers. Wipro's SRE Portfolio Wipro's Cloud Infrastructure Services focus on providing end-to-end services encompassing consulting, transformation, migration, and operational services across cloud environments in several industry verticals. Wipro envisaged the need for SRE in the context of next gen IT ops early on and has created a portfolio in this area. We have seen tremendous uptick in the pilots around SRE across many of our clients with different levels of adoption maturity. In 2019, Wipro created an SRE team. The team was chartered to deliver SRE services across all life cycle phases (consulting, design, build, and operations) and resource domains (people, process, and technology). The portfolio includes consulting and technical services to help customers define, plan, prepare the organization, implement, and operate an SRE practice that meets their specific needs. What benefits customers most is the fact that Wipro is an end-to-end player in the enterprise IT space and has extensive capabilities in incorporating SRE practices at the business, development and operations levels. To have a strong and focused approach, Wipro brings in a multi-work stream engagement model comprising a multitude of major service lines - cloud and infrastructure services, digital application services, cybersecurity risk services, and analytics; working in tandem with our business verticals such as healthcare, telecom, and utilities. Wipro has around 20 different services in the SRE Service catalog. While some of them enable clients to jumpstart SRE, the others focus on specific dimensions of SRE such as automation, user experience, architectural design patterns, service level objectives, and others. Illustrative set of SRE services a) The Wipro Jumpstart SRE enables customers to put an SRE practice, Center of Excellence (CoE), mindset, and culture in place with reliability at the core. It starts with understanding the overall business context and criticality, establishing the right priorities, conducting a maturity assessment, and creating a high level plan for establishing an envisioned target state operating model. Depending on the specific needs of the customer, the focus areas would encompass understanding the service criticality for the overall business, establishing the right service level objectives with value stream mapping, arriving at the right governance model, and inculcating the SRE spirit across the organization and the SRE way of working. To build this further, we collaborate with client stakeholders to evaluate the progress and chalk out the next steps in terms of identifying the specific value streams to

be taken up to arrive at the target state operating model. b) SRE observability and monitoring: Wipro's approach for SRE services is built on an ecosystem supported by two operating models: Wipro's strategy is to have a top down and grassroots approach to establish the effectiveness of IT system operations to business outcomes. Towards that end, we establish the right KPIs and SLIs to be monitored from a user experience standpoint. The right kind of observability setup helps us in monitoring the required SLOs and also helps in reducing the MTTD and MTTR. Key outcomes Jumpstart SRE Monitoring & observability Achieve critical business insights and improve IT operations in incident management and blameless post mortem Review critical design patterns such as load shedding Enterprise digital operations center Let's take a look at how two organizations benefited from engaging with Wipro for SRE: If you are interested in learning how Wipro is helping our clients to achieve their vision with a strong and focused approach to site reliability engineering, we should talk. Expanding the transformative potential of IoT with blockchain

----- Arcticle source ----- https://www.wipro.com/infrastructure/expanding-the-transformative-potential-of-iot-with-blockchain/ ----- Exploring the current IoT landscape The benefits of blockchain IoT About the Author Related Articles Contact Wipro Secure updating capabilities Organizations can efficiently address outdated IoT issues as the safety of blockchain allows for the secure transfer of code on IoT devices. Testing this capability has yielded satisfactory results, with an open-source blockchain utilized for firmware updates over a wi-fi connection. Enhanced privacy Enhanced data management Improved scalability Better authentication Automatic connection IoT-IoT IoT blockchain Hybrid IoT blockchain — adoption and challenges There are technical and operational limitations to the widespread adoption of IoT blockchain technology. Foremost among them are the challenges in scalability and storage in blockchain networks that maintain centralized ledgers. This issue happens when storage on edge nodes is inefficient as intelligent devices at the edge are ill-equipped to handle high-volume data or high computational demands. But even though IoT blockchain is an emerging technology in its nascent stage, it is seeing adoption from significant technology organizations, including the IBM blockchain platform, which allows businesses to leverage IoT blockchain and cognitive computing. Organizations have implemented blockchain across industries spanning from BFSI to agriculture and smart homes, supply chains, and smart contracts. Unleashing new efficiencies with IoT blockchain While the application of blockchain in IoT may not be a mature field yet, it will have a considerable impact shortly. Blockchain today suffers from a lack of regulation and consistency across geographies. Improvements in the standardization and regulation of blockchain technology will increase IoT blockchain's commercial practicality and feasibility for enterprises and businesses everywhere. With its transparency and peer-to-peer communication, blockchain has the potential to drive security improvements across industries. It will pave the way for a new kind of interconnectedness and efficiency for businesses everywhere. Please fill the required details to access the content Expanding the transformative potential of IoT with blockchain April | 2022 Internet of things (IoT) technology is witnessing rapid adoption across industries. However, the architecture of these networks, combined with their centralized compute and storage resource needs, present significant security risks. With applications across a broad spectrum of industries, the internet of things (IoT) is enabling businesses to harness valuable data, analyze it, and make informed data-driven decisions. While this data provides tremendous value, the introduction of blockchain ensures the maintenance of data authenticity and immutableness without any compromises. Integrating blockchain technology into IoT networks addresses security concerns (end-to-end traceability, data privacy & anonymity, identity verification & authentication, confidentiality, data integrity, and availability) while increasing transaction speed, data management, and processing efficiency. While there are limitations currently holding back blockchain IoT in its current form, its application and impact in the field of IoT are inevitable. However, enterprises are leveraging

blockchain technology for its unique range of features, equipped to enhance the functioning of IoT networks and usher in a new paradigm for intelligent, data-driven organizations. In 2021, there were 13.8 billion units of installed and connected IoT devices, which can grow nearly three times to reach 30.9 billion units by 2025. With rapid developments in IoT technology and its accelerated adoption, industries can now capture data from various sources, glean insights, and leverage them to guide their business decisions. However, can businesses completely trust IoT data and operate confidently based upon the authenticity of the information contained across these devices? The vulnerabilities of IoT devices and their traditional centralized architecture drive home the impracticality of placing complete trust in IoT information in the current scenario. But, blockchain can ensure confidence in the data captured by IoT networks by designating each device its unique identity at the time of creation and allowing the validation and verification of that identity across its lifecycle by leveraging its distributed ledger technology. Device identity protocols enable each device to have a public blockchain key for control over its identity and the ability to maintain an immutable history of events that organizations can track over time. Impact of blockchain on IoT: Key differences in IoT implementation with and without blockchain Blockchain is a distributed ledger technology that combines with IoT to make machine-to-machine transactions possible. The technology records transactions in a database, verify them from multiple sources, and enters them into a shared ledger distributed across each node. Thus, the impact of blockchain on IoT presents several benefits, wherein an intelligent device can function autonomously without depending on a centralized authority. The technology can also track the communication between devices. The synergy between blockchain and IoT creates a path to address critical IoT issues. Some significant benefits include secure communications, peer-to-peer architecture, database redundancy, privacy in data exchange, and automatic additions of new IoT devices. Table 1 offers an example of data exchange in IoT with and without blockchain. IoT + Blockchain Centralized Low Openness Low High High Blockchain technology circumvents the need for central deployment of servers and databases. It ensures IoT-related operations in a distributed, secure manner with little opportunity for faults. Blockchain consolidates the capability of IoT devices to scale up security and transparency in the ecosystem. While blockchain ensures scale and decentralized infrastructure, IoT enables intelligent operations. There are several use cases across industries. For instance, the pandemic saw different initiatives proposed to implement COVID-19 certificates so that individuals with such credentials could be exempt from the physical restrictions to carry out certain activities. The blockchain-based platform can be a promising approach due to its decentralized and transparent features for securely sharing COVID-19 vaccination certificates. The focus on privacy proposes a hashing algorithm that enables users to store the information on the blockchain anonymously using an ID created from their iris. In this case, the blockchain can store vaccination certificate data and a hash of the user ID. Let's consider a use case in another industry. IoT sensors provide details through sensors, GPS, shipping details, etc., in supply chain functions across organizations and industries. Combining blockchain enhances reliability and traceability, storing the gathered data securely in the blockchain. Blockchain can benefit this business nexus across data management and financial and operational

functions in the automotive industry. The convergence of blockchain and IoT technologies   Figure 1: Blockchain IoT networks Integrating blockchain technology into IoT networks enables device-to-device transactions. These transactions get recorded and stored in the blockchain's distributed network across many nodes. Multiple sources then verify this record. By leveraging the capabilities of blockchain technology in IoT networks, smart contracts automatically trigger transactions among IoT devices when they meet pre-determined conditions. This technology creates the perfect environment for the autonomous functioning of smart devices by removing the need for a centralized authority while enhancing the security and tracking of device-to-device communication facilitated by smart contracts. While blockchain's architecture offers a range of benefits due to its decentralized nature, some challenges exist. IoT platforms have a client-server model with a centralized authority. Organizations should develop IoT platforms in a decentralized manner to ensure compatibility with blockchain, necessitating the IoT sensors to handle their storage and compute resources instead of utilizing centralized resources. Data decentralization and security IoT device data is often stored and managed by centralized servers, leaving vulnerabilities that malicious actors can exploit. With a central storage location, the risk of network failure is high. With data computation and storage spread across a vast range of devices numbering in the millions, the network becomes invulnerable to the loss of a single device, server, or central network. This capability contributes to the resiliency of IoT networks with blockchain technology. The network has high fault tolerance and can operate even with multiple offline nodes. High-level security is ensured by authenticating and authorizing encrypted device data with distributed ledgers. Blockchain can validate transactions by concealing the connections between devices while preceding third-party implementation options. Organizations can avoid data leaks and hacking incidents with blockchain's ability to optimize IoT protocols and supply encryption. Blockchain streamlines data management significantly by allowing devices to transfer data directly among them instead of transmitting data via a centralized server, reducing the number of transactions. The absence of IoT gateways and intermediate devices optimizes data processing time. Furthermore, blockchain-enabled intelligent contracts can convert much of the traditional IoT processes into automated processes. By driving efficiencies in data management across edge devices, organizations benefit from reduced costs for IoT device maintenance and data transfer. The decentralized nature of blockchain IoT networks allows for improvements in transaction speed and coordination between connected IoT devices, which, combined with the ability to share data, paves the way for better scalability. Decentralized PKIs, used by blockchain networks, are superior to centralized PKIs since only the user has access to the personality identification hidden key. In contrast, the network provider accesses the open key. These keys are cryptographically generated, making them invulnerable to hacking attempts. With blockchain technology and smart contracts, automatic commands and messages are possible in IoT networks, enabling data analysis and scenarios such as automatic filling of custom documents.   Different approaches for implementing IoT blockchain This method makes blockchain integration into IoT networks relatively straightforward, using only a sharing register for data storage. Routing mechanisms ensure that data transfers take place out of the blockchain, driving higher transaction speed and reducing lags. Moreover, this approach

enables offline capabilities for IoT devices. With the IoT-IoT approach not requiring significant workflow changes for devices on the network, it is relatively a simple solution. It only needs replacing a cloud/server with a blockchain for the transfer, storage, and data extraction. Here, IoT devices interact through the blockchain, which serves as a kind of cloud for the traditional IoT network, leading to tracing improvements, communication security, workflow automation, and capacity. However, the increased complexity of this mechanism can also lead to delays. It is an approach that requires significant modifications to the workflows of IoT devices and blockchain development. Additionally, it will require a blockchain with high speed, capacity, and zero fees. Here, the blockchain stores some types of information while sharing most of the data and communication across IoT devices. While it offers a range of advantages, the low delays and high working speeds required of the IoT devices are not practical. Notably, this approach enables fog computing to overcome the limitations of IoT devices and blockchain. Organizations can use this method to store, extract, and analyze private data. Using edge devices instead of a centralized cloud translates into savings in operating costs. Virendra Singh Delivery Head-IoT, iCORE-CIS Virendra heads the global IoT new-age solutions delivery team. He plays a crucial role in providing next-gen IoT solutions to clients worldwide and developing innovative support capabilities for the global IoT practice. With 24 years of experience and expertise across multiple domains, Virendra has a proven track record for complex solutions delivery, customer-centricity, and a passion for excellence. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.
=======================

Intelligent buildings to smart buildings with IoT

----- Arcticle source ----- https://www.wipro.com/infrastructure/intelligent-buildings-to-smart-buildings-with-iot/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Intelligent buildings to smart buildings with IoT April | 2022 The Building Management Systems (BMS) we see today serve the same purpose they did when first introduced in the late 1800s in the European countries and the 1990s in India: While there has been much technical evolution, such as the shift from pneumatic systems to computer-based control systems, from simple ACAD drawings to BIM models, most buildings remain energy inefficient and difficult to maintain, and often don't fully serve the occupants' needs. By disrupting long-established BMS models with IoT systems, there are significant opportunities to improve building efficiency in a variety of ways, which in turn will lead to cost savings and the

development of innovative services. Building planning and construction methods are also changing by leveraging IoT technology to reduce power consumption, increase energy savings, and create more sustainable buildings. The world is now reimagining commercial and public buildings, emphasizing health, safety, and energy efficiency. Today, technology plays a critical role in creating dynamic smart buildings that streamline maintenance, offer better experiences for occupants, and improve ROI. Intelligent building solutions integrate smart technologies to transform how a building performs. The B-IoT provides end-to-end smart solutions, from smart building consulting to controls contracting, master systems integration, integration platforms, command and control user interface, and digital engineering services. IoT systems connect various sensors and smart devices to a local or cloud-based controller from an architectural perspective. Sensors often collect and transmit real-time data about their environment that the controllers can then use to offer both immediate and long-term responses. Predictive and adaptive algorithms can help controllers execute simple and complex operational responses. IoT systems are somewhat reliable in their architecture and consist of three primary layers: The size and scope of today's IoT systems also differ; they can range from a small number of sensors in a residential building to millions of gadgets on complex factory floors and within large commercial buildings. Customer privacy and security are critical and are sensitive factors that developers should consider to make an IoT system sustainable in the long term and on a large scale. Building management system offers a specific series of distinctive constraints and possible solutions in energy. The notion of a "smart building" is getting progressively more widespread. A smart building is equipped with modern technologies to automate procedures, particularly HVAC controls, and contain energy consumption. A smart city includes various IoT systems dedicated to parking availability, traffic optimization, weather preparedness, public transit, and building sensors. IoT architecture comprises four components: There five most common application types of IoT are: Schematic of the system arrangement of IoT architecture Here are critical areas where building automation with IoT can significantly impact. Traditionally, these were all standalone with no integration. However, these are seamlessly integrated into a smart building today, enabling control, data flow, and energy optimization. 1. Facility management & operations We can do a lot about maintenance in the IoT world, specifically predictive maintenance. Having equipment out of commission or in disrepair can translate to potential health and safety concerns on the premises. Unexpected issues are bound to arise, often not visible to the naked eye. Sensors can detect potential problems before anyone in the office or home becomes aware and will send alerts and information to building managers so that they can act immediately, staving off what could be a costly breakdown of a system or piece of equipment. This feature also reduces tenant disruption and saves money in the long run. Facility managers need to oversee many different aspects and measurements of their buildings, such as humidity and carbon dioxide levels. These measurements ensure the safety of the building occupants, minimum operational costs, and consistent conformity to regulatory restrictions. By taking advantage of predesigned building automation IoT solutions, facility managers can begin monitoring their buildings in real-time and repurpose the resources previously tasked with taking manual readings.

With pre-packaged dashboards, hierarchical data privacy rules, alerts, and triggers, facilities managers will be well on their way to supporting an IoT-enabled HVAC solution. 2. Sustainability The current sustainability goals and environmental restrictions play a significant role in designing intelligent buildings of the future. Effective power management, integration of IoT systems for green energy, and self-sustainability capabilities are integral parts of most smart buildings today. There is not necessarily a "best" application for the IoT applied to building energy reduction because each application has custom goals based on the building characteristics and location. For this reason, it is difficult to compare the cost and installation difficulty of an IoT application.   2a. Energy efficiency Energy efficiency has long been at the core of BMS implementation. IoT technology can identify critical areas of energy wastage and cost minimization, creating smart energy. One can use the sensor-generated data at the building level to optimize and regulate HVAC equipment. By making relevant adjustments, you can save on both energy and costs. New builds are already introducing building automation systems widely, but you can also retrofit them to existing buildings to give you the energy-saving benefits of a smart building.
      2b. Water management The average person spends about 90% of their time indoors, and the average family uses around 300 liters of water each day, while the average office worker uses up to 30 liters per day while at work. With water resources becoming scarce, monitoring and saving water is imperative. Embedding IoT-enabled sensors in water supply channels give the data we need to monitor and control. These IoT sensors can alert facility managers to initiate temporary measures and store data historically.
3. Security & safety Access control is a fundamental security aspect for every building and organization where restricted access is necessary, including schools, hospitals, offices, warehouses, data centers, and even hotels. The primary driver of access control is safeguarding people and protecting physical and intellectual property. Most of us probably already use key cards, but IoT adds another layer. With key cards and connected 'checkpoints,' remote access control is possible, with remotely lockable doors and the ability to track and program door access. 4. Occupant comfort A smoothly run building or facility keeps the occupants comfortable. Smart buildings with IoT sensors & cloud technologies can support this. Many of the above areas contribute to occupant comfort, with indoor temperatures, air quality, lighting, and humidity playing into occupants' well-being and productivity. IoT sensors monitor all of these and allow you to fine-tune them as you go, helping you to maintain an optimal and healthy indoor environment. Data from sensors can also help you accurately assess traffic and usage in different parts of the building to prioritize things like cleaning activities, ensuring good sanitation and well-maintained amenities. There are various ways to detect user comfort using IoT systems and otherwise. User comfort is essential to measure as this must be maintained or improved when implementing an energy consumption-reducing IoT application. The addition of occupancy and comfort-sensing allows the system to perform what users desire instead of overheating, cooling, lighting, etc. Additionally, you can use the occupancy and activity details to tailor energy systems only to regions that require it, in either the long or the short term. This adjustment could be as simple as automatically turning on and off lights or allowing predictive HVAC control based on long-term occupancy patterns. Conclusion Building IoT offers the promise to transform one of the largest

business markets. Over a third of all energy is consumed in buildings, making them a critical component of any global sustainability response. At the same time, buildings, by nature of their high occupancy densities, are central to security considerations, including health securities that the pandemic has further brought into sharp focus. We believe that the next 5–7 years will see a massive transformation of buildings, with IoT solutions likely being one of the key enablers. N.J.Abraham Project Delivery - IoT & Smart Campus NJ is a part of the Delivery Team of IoT & Smart Campus with CIS Wipro. He handles key Global Projects. He has 23 years of experience in the IBMS & IoT Industry and has worked in multiple technical domains. He has worked in Global Organisations handling various mid & leadership roles. He has a proven track of handling mission critical projects, complex technologies, customer centric and a zeal for excellence. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

The buzz around SASE.

Is it worth all the hype?

----- Arcticle source ----- https://www.wipro.com/infrastructure/the-buzz-around-sase-is-it-worth-all-the-hype/ ----- About the Author(s) Related Articles Contact Wipro Please fill the required details to access the content The buzz around SASE. Is it worth all the hype? April | 2022 The paradigm shift in the IT infrastructure Digital transformation has created a massive wave across every line of business, be it healthcare, banking & finance, manufacturing, or telecom. The advent of new-age technologies like cloud, AI, analytics, software-defined networks, automation, and blockchain has propelled seeking possible IT transformations that are cost-effective with minimum human intervention. The demand & supply model has raised the bar of consumer expectations that further triggered us to align our business initiatives to consumer needs, and guess what? The outcome is a win-win for both the consumers and the suppliers. It began with storage virtualization (vSAN), giving rise to server consolidation to fit into the new architecture model. The progression in storage and compute virtualization won't solely suffice to accommodate the shifting IT landscape. Organizations must transform the underlying network infrastructure and elevate it to realize a full-fledged IT modernization. The advent of virtualization and adoption of multi-cloud & hybrid cloud technology coupled with anywhere-workspace has been the early drivers for software-defined technology, be it compute, server, or network space. The software-centric approach can achieve scalability, flexibility, and adaptability that helps optimize both CapEx and OpEx savings. Evolution of Networks over the years Let's take a look at the

evolution of wired networks. Legacy infra was a hardware-based siloed architecture that failed to achieve customers' dynamic business needs, rendering the overall design obsolete. It started with OTN (Optical Transport Networks) carrying voice signals giving rise to ethernet and MPLS networks carrying data and video frames. With the exponential increase in data, IoT, and adoption of edge and cloud computing techniques, we gradually transitioned to cost-effective, scalable & vendor-agnostic software-defined networks to address the challenges witnessed by legacy infrastructure. SD-WAN has essentially revolutionized the WAN virtualization space by decoupling the network functions from the underlying physical infrastructure. The overlay model helps establish direct connectivity to on-premises or cloud devices, unlike the traditional MPLS link connectivity that traverses through the hub site first, adding to latency and backhauling of traffic. However, SD-WAN primarily focuses on covering wide-area connectivity with limited security functionality built on a box that fails to deliver the security aspects of Edge at the micro-level, diving deep into users, devices, and applications. This is where the concept of SASE kicks in. Introduction to SASE Traditionally, organizations bound security to premises with perimeter firewalls, which is no longer relevant after introducing VM & distributed workforce. A granular level of protection attached to workloads with intrinsic security at every layer of infrastructure induces the need for unified networking and security as the envisioned design approach. Endpoint & last mile security and easy accessibility to the cloud are imperative to today's distributed/disjointed workforce. One can define SASE, i.e., Secure Access Service Edge, as the convergence of WAN and security, consumed as a cloud service model. With the SASE approach, a secured experience for every user on-prem, cloud, branch/ DC, or remote is possible with direct onramp connectivity to the cloud. The local secured internet breakout for users to access SaaS applications/generic internet services is possible with the SASE framework, which would otherwise require complex firewall HW implementation at all sites. SASE and the SD-WAN overlay model cater to a complete end-to-end portfolio of services, including virtual WAN link connectivity, secure internet access, cloud web security, and ZTNA (Zero trust network access). One can enable security features on service edges called PoP-over-cloud or proximity to public cloud gateways. This approach helps overcome multiple VPN mesh inter-connectivity, adding cost and network complexity. The overlay model is carrier-neutral and supports any underlying infrastructure like ethernet, MPLS, LTE, and internet. The SASE Pitch A potential SASE solution pitch could be any of the following: Kudos to all SASE players like VMware, Palo Alto Networks, Fortinet, Cisco, and Zscaler, for anticipating the need for top-notch security and extending their offerings during the COVID pandemic when most of the resources worked remotely. They have played a significant role in driving the business growth with minimum security breaches ensuring a hassle-free, safe environment. SASE-The future Network security features cannot be compromised and will continue to be the driving force to protect the overall infra, edges, and workloads. Convergence of networks & security becomes an integral scope for end-to-end secured connectivity. SASE enhances the security capabilities manifold, ensuring a safe and protective edge. Solutions going forward must be centered around SASE to stay relevant in today's growing distributive set-ups. If SDN is the new norm, SASE is the future. I can't possibly think of any potential disrupters

for SASE today, so I will wait and watch to see what the future unfolds after SASE. Apurba Dutta General Manager and Global Head for Wipro Network and Infra Security Practice, Cloud and Infrastructure Services – iCORE, Wipro Limited Apurba has over two decades of IT experience in helping customers across the globe in transformation solutions. He has managed large business units– P&L, Sales, Delivery, and competency -- across geographies, while working with ecosystem partners to modernize the core and help enterprises create Cloud and Infrastructure foundations for their future-ready digital businesses. In his current role, he works closely with internal and external stakeholders, advisors and analysts, and startup ecosystem partners to help customers fast-track to the future. Adopting IoT Technologies to Rejuvenate Dairy Farming

----- Arcticle source ----- https://www.wipro.com/infrastructure/adopting-iot-technologies-to-rejuvenate-dairy-farming/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Adopting IoT Technologies to Rejuvenate Dairy Farming May | 2022 Dairy farming is considered as one the core functions of agriculture for long-term production of milk. Large scale dairy farms are utilizing modern and innovative technology for automating the milking system and maintaining the health parameters of the cattle. Today, dairy farmers focus more on precision farming by monitoring and developing a database for information provisioning and capturing competitive market data. To ensure sustainability and remain competitive in the market, dairy farmers need to monitor variety of data sources like cattle feeding, calving, nutrition, insemination, and the process of milk production. However, they also face several challenges such as: Impact of IoT on smart farming Today, Internet of Things (IoT) is making a significant impact on milk production. Global milk production to meet the demands of the growing population needs to be enhanced with technology. With this technology, farmers can enhance and improve several dairy related activities such as ascertaining the right time to milk cows, increasing the shelf life of the milk and so on. In dairy farming, the Internet of Things (IoT)

plays a crucial in the monitoring of resources by connecting multiple and heterogeneous objects in mixed dairy farms (which produce milk from cattle and cultivate feed grain for livestock), such as buildings, machinery and vehicles or even living organisms like cattle. The IoT Sensor and Edge Computing (EC) enable resource monitoring and traceability in the value chain, allowing producers to optimize processes, provide the origin of the produce and guarantee its quality to consumers. IoT technology leverages multiple sensors for collecting various data points and data transmission with low power and bandwidth for communication. Adaption of smart sensors and techniques (data sensing methods like pressure sensing, volumetric sensing, sensing schedules etc.) help to improve resource efficiency, are environment-friendly, enable transparency and data security. These techniques maintain a real-time view of the milk levels, monitor the health of the cattle, warehouse management, and safe transportation access. IoT platforms and integrated AI engines, gateways, LPWA networks and smart sensors push the industry into a real revolution. The latest technologies are being introduced to automate many of the processes. IoT and data-driven techniques are creating greater opportunities for smart dairy farming. IoT can support farmers with wearable sensor devices to keep them aware of the status of every animal. The sensor-based system can effectively and correctly detect the illness of the cattle before it affects the milk production. IoT serves as an important foundation for cattle breeding by tracking real-time cattle information such as activity, temperature, and pulse. This crucial information can then be used to conduct a thorough analysis to determine cattle oestrus. Increase in milk yield, reduced labor and medicine treatment costs, and increase in the revenue of dairy farms are the most exciting benefits of this technology. This technology has also received close attention from dairy product enterprises and animal breeding initiatives. IoT and AI based technological methods can be used to minimize the negative factors and enhance those factors that positively affect the production. For instance, an artificial intelligence (AI) model developed based on IoT sensors in milking systems can provide data to help farmers determine when the cattle should be milked or to help the farmer change the feeding pattern. These data can be further enhanced to maintain quality of milk and help to understand production. The state of the art framework by combining IoT sensor, IoT platform and AI solutions should be focused on different aspects of smart dairy farming to assist the farmers increase the milk yield by using different techniques and innovation. Figure 1: Outlines how IoT can be used for various touch points The technological adoption of IoT and AI based approach helps in creating innovative methodologies for production (milk yield) and the process of dairy farming. Process innovation can be different for different sets of activities that are performed at several levels in a smart dairy farm. In a dairy farm, the milking process is viewed as a singular process; however, there are several activities that are performed in the farm such as feeding, cow monitoring, and preserving milk. The intervention of IoT can be in different processes and procedures like the feed system to sense the hunger needs of the cows and automatically feed them. It can also proactively monitor automatic heat detection that will assist in reproduction. Assessing health and monitoring cows for disease detection and prevention will help the farmer to locate any animal that needs medical attention. Smart dairy farming includes real time sensors that collect data from cows with the help of wearable smart collars, machine

learning data analysis, and cloud-based data centers that manage data and support the farmer in order to manage quality of dairy products as depicted in Figure 2. IoT and AI technology adoption can play a significant role in the dairy industry to simplify the operations for milk producers and meet the increasing demand for quality dairy products. The technological advancement in IoT can help minimize environmental issues, decrease the use of resources, and enhance animal health by using advanced sensing and data analyzing technologies. IoT based technology can be used in farm management to reduce costs and make operations efficient. Here are some key outcomes: Health monitoring: Monitoring and tracking of cattle health data like heart rate and other vital signs of a cow can help farmers in early diagnosis of health issues and provide correct medication. Monitoring of anomalies in milk production: It is essential to understand cattle behavior and milk production by monitoring continuously and comparing the regular patterns. Each animal can be tagged with a unique identification number to help track the animal's production and understand their health patterns. Tracking of automatic water and food supply: Technology driven future for the dairy industry New-age smart techniques using IoT devices will help farmers with increased milk production, advanced monitoring of cattle health & anomaly detection, thereby streamlining the business and processes. Although smart dairy farming using IoT gives various features to a common farmer, it may be a costly affair at the beginning; yet offers the promise of cost recovery with longer usage. IoT helps in efficient monitoring of the feeding and drinking method which can lead to better nutrition of cows, and more milk production. The system with overall architecture, better adaptation of technology, and versatile design can make IoT-based farming more efficient. Sampath Kumar Rangadurai Sr. Solution Architect - IoT, Cloud & Infrastructure Services, Wipro Sampath has over 22 years of experience and plays a key role in presales and technical consultancy for IoT / Smart City initiatives. He has extensive experience in IoT/OT technologies across multiple industries including Engineering, Construction, Oil & Gas, Retail, Manufacturing, Healthcare, Logistics and Transportation. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Cloud-Powered Digital Backbone

----- Arcticle source ----- https://www.wipro.com/infrastructure/cloud-powered-digital-backbone/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Cloud-Powered Digital Backbone May | 2022 A backbone for digital transformation Our world today is unquestionably digital. New technologies from augmented reality to artificial intelligence (AI) are changing the way we live, and the worldwide pandemic has only accelerated this reliance on technology. This

rapid rise in technology is requiring enterprises to transform from click and mortar to digital first. To understand this transformational journey, we need to consider the building blocks of this transformation. Digital transformations start with the creation of a "digital backbone." A digital backbone enables an enterprise to react to the rapid changes and new requirements of a digital world. It is the digital thread that weaves several systems, including networks, gateways, hosting services, user interfaces, cyber security, and middleware in a unified backbone to bring out digital insights for enhanced digital omni-channel engagements. A digital backbone comprises of an enterprise-specific architecture built out of data services, next-generation networks, smart platforms, agile processes, and automation capabilities that enable digital insights. Each one of these blocks encapsulates an important element of the corporate's business. In this context, the digital capabilities of a company are mapped onto a set of building blocks, which in turn can easily be joined together to create new and specific solutions. Figure 1: Digital Backbone Digital Loops A digital loop is the connection between customers, employees, suppliers, operations, products, and services into a single digital fabric. A digital backbone is vital to build digital loops that cover end-to-end processes and operations for organizations. Figure 2 Digital Loop Digital backbone in manufacturing In the post-pandemic world, the manufacturing and supply chain have come under extreme stress and are challenged on multiple fronts. Manufacturers are going through a period of disruptive changes which require them to provide sustainable operations and bring innovation at speed, using service-based business models with a laser sharp focus on EBITDA improvement. Using the digital loop, organizations can bring all the issues in focus and rely on the digital backbone to meet the challenges faced by the manufacturing industry. In the context of manufacturing, the digital backbone enables a construct called "lights out manufacturing." It represents a manufacturing paradigm where every action on the manufacturing floor is executed solely by automated processes and intelligent systems without the need of human intervention at any stage. Lights out manufacturing considers fixed (hard) automation, programmable automation, flexible (soft) automation, and totally integrated automation (TIA). All process decisions are either handled by automated systems (IoT sensors, CCTV, robots, computers, AI, automatic assembly machines etc.) or remote controlled and monitored by engineers in another location. Essentially, the factory floor becomes the proverbial "black box" where raw materials go in on one side and a finished product comes out on the other side. Building the digital backbone To build a digital backbone ubiquitous by design, manufacturers need to uplift their existing core services and capabilities in three areas. Figure 3: Building manufacturing digital backbone Personas System of engagement System of record Bringing scale to the digital backbone Fully automated, lights-out manufacturing can only be enabled by processing huge volumes of data at scale. Figure 4: Bringing Scale to the digital backbone Using cloud technologies, the industry champions are not only meeting but also beating the challenges. The cloud-based digital backbone acts as the foundation on which we can build and deliver the future capability that companies require. Cloud enables and delivers on-demand SaaS services and applications that are easily accessible and rapidly scalable; in turn, this will enable companies to provide more services to their end customers, better customer experience, and build new

products. If the manufacturing processes are already automated to some degree, then cloud computing provides a viable next step for building the digital backbone. Digitalisation of the core enhances financial performance and increases speed throughput in all parts of businesses, and reduces NVA (non-value-added) time and efforts. Cloud-powered digital backbone essential for transformation We are witnessing how a vast majority of the companies are looking to transform not only manufacturing operations but also all aspects of their business. This transformation focusses on their customer's outcomes and changes manufacturer's mindset and business from end-to-end. A cloud-powered digital backbone helps organisations across industries in: Thus, a cloud-powered digital backbone is critical for any industry looking to beat the challenges of hyper scaling in an EBITDA-friendly way of bringing forward rapid innovation and keeping customers delighted. Gaurav Parakh Director - Azure Business & Cloud Strategic Pursuits, iCORE – Europe Gaurav is a Director at the Cloud Europe team at Wipro. =======================

Evergreen IT or Nevergreen IT – What's the Ideal Enterprise Strategy?

----- Arcticle source ----- https://www.wipro.com/infrastructure/nevergreen-it-whats-the-ideal-enterprise-strategy/ ----- What are enterprises spending on? Why do you need an evergreen IT strategy? What will enterprises derive from Evergreen IT? About the Authors Related Articles Contact Wipro Please fill the required details to access the content Evergreen IT or Nevergreen IT – What's the Ideal Enterprise Strategy? May | 2022 Enterprises across the globe are spending millions of dollars on procuring world class IT assets, both software and hardware, for their employees to improve productivity and increase efficiency. The cost of managing an IT estate to propel the required business outcomes proves to be expensive as these organizations retain and are largely dependent on legacy systems.

There is a persistent challenge of maintaining the technical health of the organization's enterprise systems. Vendors are constantly changing their release schedules and the battle to manage the underlying technology components such as the operating systems, databases, browsers, and development code requires continuous focus. Enterprises struggle to execute transformation projects as the businesses do not understand nor have a a clear plan of action to maintain "Evergreen IT". This is predominantly because of lack of visibility into the IT estate and unavailability and/ or poor utilization of planning and management solutions, making maintenance of IT estates overly expensive. Why do organizations need to invest in automation? Workplace automation is no longer a luxury. It's now essential to accomplish monotonous and complex workplace processes in a manner that can better utilize the strength of the manpower of the enterprise. The key to mitigating these issues lies in allocating both the right people and the right technology to the Evergreen process. Smart automation solutions, from vendors like Juriba, can be used to speed up the entire process of implementing Windows updates, from planning the deployment to testing all applications and managing the change. Some organizations create dedicated teams within IT departments to focus on the Evergreen process year-round, while others outsource the responsibility to free up the time of their in-house staff. Both strategies are equally valid and yield benefits. Enterprises can: Consumer demands are rapidly changing, and most organizations are working towards digital transformations where adaptations to changes in lightning speed is the call of the hour. Microsoft (MS) is a classic example of how this is done. In 2015, Microsoft announced that Windows 10 would be its final iteration of its operating system. However, MS has now launched Windows 11. Both these OS will be adopting an Evergreen model, meaning that there will be a continuous flow of small, incremental enhancements to either operating system, until Windows 10 reaches its end of life in 2025. Every second Tuesday of the month, Microsoft will release new security patches and new features in updates due in the spring and autumn of each year. The same applies for Office 365 updates as well. Post COVID-19, the hybrid working model is here to stay and majority of the global organizations are embracing it. Gone are the days where most of the OS updates would happen over 12-18 months. With a shorter support window, the cadence is now set for 6 months. How to keep your estate evergreen? Globally, enterprises don't account for "orchestration" in the context of enabling and managing a modern workplace. Migration efforts have not been synchronous across the enterprise leaving organizations to spend millions every year to execute transformation projects and still not be evergreen. Wipro's Evergreen IT services enable you to achieve a high rate of efficiency while allowing you manage, upgrade, and orchestrate all activities involved in maintaining an enterprise-wide evergreen IT estate rather than a poorly managed nevergreen IT estate.   Enterprises have typically tried to utilize new systems and cutting-edge technologies without having a clear plan of action for managing existing IT estate. This leaves a huge gap to measure, maintain and transform the IT estate in an efficient manner. Listed below are the top outcomes enterprises can ensure an Evergreen IT: Evergreen IT is critical to improve productivity and end user experience. The design and processes are key to effectively manage transformations and maintain IT assets. It shifts the focus from "keeping the lights on" to driving digital

transformation — making an organization more agile, competitive, and secure as the IT estate is always up-to-date and compliant. Evergreen IT is here to stay, and we must embrace it. Indeed, in many ways, the Evergreen approach can be seen as a landmark stage in the journey towards 'Everything-as-a-Service', in which all IT requirements will be met with subscriptions. Payel Basu DWS Practice Strategy, Product Evangelist, Wipro Payel is a Practice Development & Strategic Leader with nearly 15 years of industry experience pre-sales, practice, consulting, and transformation in the digital workplace domain. She performs a techno-business role, and currently leads the key alliances for LiveWorkspace™ and various product and practice development initiatives. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. ======================

A holistic approach to scalability and business outcomes in the IoT

----- Arcticle source ----- https://www.wipro.com/infrastructure/a-holistic-approach-to-scalability-and-business-outcomes-in-the-iot/ ----- Related Articles Contact Wipro Please fill the required details to access the content A holistic approach to scalability and business outcomes in the IoT An ISG-Wipro research paper exploring the market changes, challenges and responses driving enterprises toward a holistic approach to the Internet of Things (IoT) May | 2022 As enterprises work towards digital transformation, the Internet of Things (IoT) provides crucial linkages between physical objects and the digital realm. Digital transformation does not entail just modernizing the systems and processes; it helps in service improvement, cost control and better business outcomes. IoT is a critical element in the transformation technology because it supports companies to improve their operational efficiencies. And, big data, cloud computing, and edge computing are key technologies that drive the demand for enterprise digital transformation. In this research paper, ISG delves into the challenges and responses that drive enterprises towards a holistic approach to the IoT. In addition to the features of scalability, interoperability, and security, key benefits of this approach include: Finally, you can also read Wipro's perspective on the IoT and how we strongly believe in the IT-OT convergence to achieve cross functional goals. The impact of IoT on global business and its role in digital transformation is unquestionable. This report provides a dual perspective – from ISG, a leading research and consulting organization, and a practitioners' perspective from Wipro. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications,

People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Realizing the Potential of Smart Buildings with the Internet of Things (IoT) and Other Emerging Technologies

----- Arcticle source ----- https://www.wipro.com/infrastructure/realizing-the-potential-of-smart-buildings-with-the-internet-of-things-iot-and-other-emerging-technologies/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Realizing the Potential of Smart Buildings with the Internet of Things (IoT) and Other Emerging Technologies May | 2022 The use of building automation is not a new phenomenon. In fact, with the rapid advancement in technology and the development of IoT making connected devices a reality, the concept of building management has undergone a paradigm shift. Data by the United Nations indicates that until 2019, the overall global population in urban areas had increased to 55.7%. The concentration of people in urban areas in developed countries is almost 81%. In comparison, 51% of the developing world population lives in urban areas, implying that urban areas have a greater concentration of workplaces. Also, with the growing population, environmental concerns are amplified, reinforcing the idea that smart buildings are not just about managing building infrastructure or operations. A smart building also addresses other aspects such as occupant experience, their health and safety, energy management, sustainability, and cost efficiencies, resulting in heightened user experiences. Smart buildings: the growing need and opportunity It's no surprise that the market for smart buildings is growing exponentially. A Markets & Markets report evaluated the smart building market at $66.3 billion in 2002, which can grow by a CAGR of 10.5% to $108.9 billion by 2025. The report further elucidates that the drivers for this growth include: A smart building uses sensors to collect data related to different aspects of the building. This data is of significant value to facilities managers. The newer technologies help measure asset functioning and overall asset health. With the IoT, building managers can now easily compute the efficiency of assets and equipment in real-time, with prompt notifications enabled via integrated and interconnected systems. Using sensors deployed through the interconnected systems helps enhance asset life and ensure occupant safety. Sustainability – driving the need for smart buildings Buildings and building construction contribute to one-third of the global energy consumption and almost 40% of CO_2 emissions. Smart buildings go beyond just employee productivity and safety. They contribute significantly to energy savings and sustainability. With growing awareness and the drive to reduce the carbon footprint and improve energy efficiency,

smart buildings have the potential to be significant contributors. Data is critical to facilitating energy management. The convergence of IoT and other technologies such as AI, sensors, and smart data ensures abundant data availability, making it simpler to track energy usage and consumption. The prudent use of technology in smart buildings provides efficient energy consumption management and monitoring. Smart technology for smart buildings in the new normal Before the COVID-19 pandemic, organizations had already leveraged the new age technology stack consisting of IoT, artificial intelligence, machine learning, and digitization extensively to make rapid changes in workplace infrastructure, facilities, practices, and how employees worked. In the present context, the significance of these technologies in business success is manifold. Today, IoT is one of the key technologies that enable smart building systems. IoT enables facility systems to work synergistically, enabling the seamless management of temperature control, ventilation, occupancy, elevators, common area usage, and overall employee and visitor comfort through a single pane of view. Plus, this can be done on-site or remotely. Today, IoT sensors are helping companies save energy and costs. Future-thinking companies are no longer creating a physical workspace for every employee. Occupancy sensors and other smart technologies provide accurate data about workspace utilization, thereby enabling the business to free up unutilized workspaces. A contactless desk booking system can further enable seamless and smart operations. A smart attendance facility for employees working from home can help workspace planning and, in turn, provide valuable data to the human resources (HR) team. With the growing impact of social distancing, the sensors can detect employees who do not follow safety protocols and alert the relevant teams, making contact tracing seamless and effective. Visitors can be monitored successfully, right from arrival on the premises through the parking slot allocation to the specific conference or meeting rooms they are in. With sub-optimal occupancy in office spaces today, IoT-enabled sensors can detect hazards, control temperature, regulate lighting, and help in energy saving to provide a better work environment. Figure 1: Wipro's Smart Building solution Framework Research indicates that smart buildings increasingly use augmented reality (AR) and digital twin technology to streamline building operations, automate maintenance and repair processes, and facilitate health & safety requirements, primarily due to the pandemic. A digital twin is a virtual representation of a physical asset (the building or building system) that enables an asset operator (facilities manager) to derive actionable insights into the asset's performance and health. Sensors provide data on the asset's operating conditions and key performance parameters that describe the asset's real-world behavior. When you combine real-time and historical operational data with physics-based scientific insights from asset design, a unique digital representation of each asset emerges– the digital twin. Wipro's smart building solution – towards a better future Wipro's smart building solution leverages the IoT, digital twin, and augmented reality technology stack. The solution monitors, analyzes and manages the operational systems in a smart building. The Wipro Smart i-Connect™ (WSiC™) IoT Platform is a powerful and flexible smart buildings platform. Its vendor-agnostic technology and open-source interfaces based on IT standards are well-suited for controlling all intelligent building systems. As a central component of a facility control center, WSiC acquires, interprets, routes, processes, and visualizes the data from thousands of

devices and sources. The platform controls and monitors different equipment and systems. Wipro has designed WSiC to join different systems for building an intelligent building control center. Amit Amit has over 20 years of industry experience in Cloud & Infrastructure Services, including solution architecture, technical consulting, strategic partnerships, and product delivery of IoT solutions. He plays a crucial role in the IoT initiatives across multiple industries and is passionate about leading and working on emerging technologies. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings.

ISG Momentum Report: The Curious Case of the "Anywhere Operations"

----- Arcticle source ----- https://www.wipro.com/infrastructure/isg-momentum-report-the-curious-case-of-the-anywhere-operations/ ----- Contact Wipro Please fill the required details to access the content ISG Momentum Report: The Curious Case of the "Anywhere Operations" Exploring the Future of Workplace Freedom Powered By Technology and Innovation June | 2022 "Anywhere Operations" is a term that is gaining significant traction in the IT ecosystem as a derivative of the pandemic crisis when companies were forced to transfer their operations beyond the confines of the physical office space to continue business as usual. Anywhere Operations is an operating model that enables a remote or hybrid workforce to achieve location independence for most operational activities. The ISG Momentum report explores the principal tenets of achieving Anywhere Operations. It also demonstrates Wipro's innovative, next-gen offerings like Wipro FullStride Cloud Services' Boundaryless Enterprise (BLE) and Enterprise Digital Operations Center (EDOC) with Wipro Holmes™, LiVE Workspace™, and WANFreedom, that are capable of accomplishing these pre-requisites. Six steps to putting HR on the path

to corporate strategic partner

----- Arcticle source ----- https://www.wipro.com/consulting/six-steps-to-putting-hr-on-the-path-to-corporate-strategic-partn/ ----- Contact Wipro Please fill the required details to access the content The Human Resources function struggles to fulfill its potential as a strategic business partner. In most organizations, HR is reactive when it needs to be proactive, and it's had mixed results when it comes to balancing costly in-house expertise with less costly external resources to create and deliver a seamless set of value-added services. Transforming HR has been promoted and written about for at least 20 years, and certainly there have been improvements in how the function operates during that time. Yet, most attempts to achieve strategic business partner status have fallen short— and for reasons that are fairly common among different types of businesses. Chief among those reasons is that HR hasn't yet completed the process of transformation. The solution? In our work with global organizations we've identified six key steps that HR functions must take to set itself on the path of being welcome at the table as a strategic partner. Six Steps Toward Transformation 1. Separate HR Operations from HR Strategy. While HR strategy and operations are equally important, there is often confusion between them within the HRBP role. What's needed is to establish clearly distinct roles to free strategists to focus on diagnosing and developing solutions to meet business needs, while enabling business partners designated as operational to execute strategy and provide general support. With better defined roles you can adopt a strategic approach to sourcing and developing HR experts, rotating talent into HR from other areas of the business and vice versa. And, you can reduce costs over time since you'll no longer need to pay a premium for all HRBP candidates in pursuit of senior influencer competencies. Once you've defined the operational role, an organization can more easily create flexible pools of operational HRBPs configured to support specific business units, functions, or geographic areas. Working together, the company's HR strategists, the Centers of Excellence, and the business can diagnose needs, develop solutions, and hand off execution to these flexible pools. They are a powerful way to manage supply and demand and prevent individual HRBPs from becoming overwhelmed or under-utilized. Key activities to begin this step include assessing how your people spend their time, determining if they are delivering what the business needs, and investigating organizational options for separating operations and strategy. 2. Customize your HR services and prioritize HR investment appropriately. There must be a clear alignment between the business, HR strategy, and the HR service portfolio. Further, HR service levels should be differentiated and assigned costs. Certainly all business units will receive some mandatory or required HR services, but other HR services should be selected—and paid for—by business units on a needs basis. Create a service catalogue from which

business units or functions can select the type and level of discretionary services they need. For example, units directly involved in revenuegenerating activities may require different services and a higher level of investment in people-development activities than other business units. Differentiating HR services ensures that HR is better able to target services, prioritize investment, and size itself appropriately. It also clarifies what the business unit is accountable for versus HR and service-level expectations. Differentiating HR services ensures that HR is better able to target services, prioritize investment, and size itself appropriately To test your ability to differentiate HR services, start by determining if the right HR services are being provided at the right level to the right groups. Consider which groups will benefit from receiving a greater or different level of HR investment than others, and then formulate your catalogue detailing service options. 3. Harmonize HR policy and standardize lean processes. Many global organizations wrestle with the challenges of having numerous variations in processes and policies. This perpetuates large teams and hinders the possibility of pushing further transactional work to the shared services center. It also limits the chance of freeing up strategists, and turns HR into policy enforcers rather than business partners—the very situation we're trying to rectify. While business and legal impediments make it impossible to harmonize and standardize all global policy and process variants, it should be done wherever possible. In fact, the evolution of shared services is towards multi-function, globally shared services, with up to 85 percent standardization and a hybrid in-house/outsourced approach. The ultimate model is Global Business Services, with true globally standard customer-centric processes. But this doesn't mean treating all customer groups the same. It means standardizing processes where standardization makes sense. Within this step, assess where process and policy variance is essential, and use technology and outsourcing options to harmonize and standardize all other activities. 4. Integrate HR systems, automate activities, and clean your data. Loosely coupled or poorly integrated HR systems are the epitome of inefficiency. Not only does a lack of integration create extra manual effort, it also makes data quality harder to manage. Getting data accurate and consistent in one place is a challenge; having to do the same across a complex HR applications portfolio is even more so. But data quality is a user experience issue. Poor quality data creates a negative user experience—both for those working inside the function and those customers receiving HR service. Tidying up the applications estate in conjunction with a rigorous focus on key global data items, and implementing consistent terms and conditions, can lead to streamlined policies, processes, and data. This, in turn, can lead to a large reduction in any ongoing shared service maintenance costs. Keep in mind that in the context of applications "tidying," some vendors describe the benefits of a "unified" approach (housing in a single application) as opposed to an "integrated" approach, highlighting a difference in outcome. It's obviously self-serving to their architecture and approach, but the concept behind it is a good one. If there's no budget for direct investment available for estate improvements, outsourcing should be considered to gain access to technology. And, you should always consider a data approach alongside any review of sunset opportunities in your current systems. 5. Identify outsourcing opportunities and manage vendors effectively. We believe that HR functions should capitalize on opportunities to outsource processes and services to reduce

cost, manage compliance risk, and access technology. Conduct a thorough assessment of HR services and processes to identify those that are ripe for outsourcing—either now or in the future. The assessment should target activities which can be done better or at a lower cost by a third party and aren't core to your business. When selecting a provider, cost should be balanced with quality. Effective client-side vendor management capability should be in place, underpinned with service-level agreements to avoid services falling short of expectations. For those 60 percent of HR departments already outsourcing some aspect of HR, take stock of how you can incentivize better service delivery and analytical data interpretation that can drive upstream improvements in HR policies, processes, and technologies. 6. Build managers' capability to manage their people and market HR services to the enterprise. Customer interaction is an aspect of the HR model that's often overlooked. If you want the HR service delivery model to function smoothly, you must help managers understand their people management responsibilities and be successful and efficient at using the technology and information that's available. It is essential to promote HR services and access points, and educate and develop managers to ensure they can discharge their people management responsibilities. Top companies drive this by focusing on both manager induction and development programs. The induction should include awareness of typical people-management tasks, how to perform these tasks, and where to go for help and information. Emphasize the practical, as building strong, rounded people managers is the role of longer-term development programs. Key activities to achieve this step include developing a multichannel marketing and communications plan to promote services and keep customers abreast of changes. Deliver appropriate education as a compulsory feature of management and leadership cadre induction and training courses. It is essential to promote HR services and access points, and to educate and develop managers to ensure they can discharge their people management responsibilities. A Structured Approach to Becoming a Strategic Business Player At the ground level the issues can be complex. Start by focusing on what needs to be fixed by understanding what customers need and their perception of how well you're delivering on that need. Understand fully how your current HR staff spends their time and what their work experience is. You can learn this through focus groups, interviews, and a time/activity allocation survey. With that knowledge you can determine which of the six areas you need to address first—and to what extent—so that you can improve customer service, achieve cost effectiveness, and deliver value to the business. HR is a critical component of all organizations. But it has traditionally been seen as a transactional, not strategic, player. If HR functions want to evolve from being followers to being leaders on the corporate team, they must be better positioned internally to address key workforce challenges. They must offer real and perceived value to the business. Focusing on the six steps above will put you on the path to transforming your HR organization into a value leader that deserves a role as a strategic partner. =====================

The Global Supply Chain Goes Collaborative

In today's era of high customer expectations, businesses naturally aspire to the highest levels of service, from order confirmation to guaranteed delivery dates. At the same time, it's imperative that they develop the ability to secure business continuity—to anticipate and mitigate possible supply chain disruptions, both local and global, that can range from political to environmental to economic and can seriously disrupt operations without warning. Yes, most companies have invested in sophisticated enterprise resource planning (ERP) systems within the confines of their own organization; and many have gone further, expanding to include point-to-point connections with external partners. But if businesses are to succeed in both quality customer service and business continuity, they must take a new approach to supply chain management—specifically, the ability to orchestrate suppliers, assemblers, and distributors to a level of accuracy unheard of just a few years ago. Achieving that requires a shift to a singular view of goods and services among all entities that touch the supply chain. From Insularity to Integration Only a few years ago, companies were busily drawing up policies around how to close off and protect their supply chains. Now, to beat the competition it's all about collaboration. Indeed, in a recent supply chain trend analysis, Gartner took it a step further, focusing on the concept of "co-opetition"—the idea that partnering with potential competitors can be a transformational differentiator. Yet, many companies are still using specific and limited point-to-point connections. Certainly that insular approach had value in its day. You could protect the integrity of your company's system while selectively sharing information with your supply partners as needed. But taking this approach today makes little sense. Each dedicated connection point requires its own contractual framework, information exchange protocol, systems, and data security arrangements—essentially a new wheel must be reinvented every time another connection needs to be made. It's a high maintenance model with limited flexibility, especially in the current business environment. At the highest level of collaborative maturity we see organizations taking full advantage of today's communications and analytics technologies by fully integrating suppliers and customers into the core supply chain through a common architecture, such as a portal via Cloud technologies or rolling out a standard interface to suppliers and customers. This full integration and collaboration allows all parties to enjoy seamless end-to-end visibility of relevant supply chain processes and movements, and facilitates the collection of data that can be used for after-event reporting and management, forward-looking predictive analytics, and, of course, smarter supply chain decision-making. It appears to be an obvious solution, so why aren't more businesses adopting it? Although the technologies are there, most organizations have to radically re-think their policies and business

processes. But, consider how a collaborative approach could enhance your success if your plan is to expand your business into new markets, whether geographical or product-related. In either case, expansion requires significant upfront investments and a strong network of local support which could take years to establish. Now imagine you could "set up shop" through integration and collaboration with suppliers and customers, and have the ability to instantly add or remove capabilities based on an agreed global standard. The potential pitfalls of expansion begin to diminish. Preparing for an Integrated, Collaborative Supply Chain One of your initial steps in laying the foundation for a more integrated, collaborative supply chain should be engaging with suppliers and customers to make sure everyone is ready and eager to participate. With buy-in from all parties, begin to modularize each component of the supply chain. A good starting point would be something as basic as agreed-upon definitions. "Open purchase order" can mean different things to different suppliers, for example. Same with "late delivery," "damaged goods," or "stock replenishment." Speaking the same language as your partners is a first step toward standardizing and integrating. Building on this, you'll want to consider rules that lay the foundation of the overall orchestration. So, for example, a rule could determine that if stock is not available at one supplier there's a hierarchy that would automatically route the request to the next available supplier—even if it's more costly—and charge the difference back to the first supplier. On the customer side, start by thinking about your readiness for modern e-commerce best practices. Is your organization ready to commit to a delivery date, regardless of product, geographical distance, component requirements, and order size? If not, what would it take to move you toward this vision? Where does your value chain have its weakest links and what can be done to strengthen them? Putting Technology to Work in Transforming Your Supply Chain One of the goals in establishing this new collaborative, integrated supply chain is efficiency in the face of hyper agility and uncertainty. We're living in a volatile business environment. Assuming you are aggressively addressing the management side of supply chain, there are three disruptive technologies that can assist you in establishing an efficient, seamless collaborative supply chain. The first is Cloud computing. Over the past five years, Cloud has matured significantly, and increasing numbers of businesses are taking advantage of the "utility" aspects of using and paying for IT infrastructure services as and when required—without traditional upfront investments and multi-year deployment timeframes. So, the user would pay the Cloud solution service provider by transaction or by connection. With Cloud middleware, collaborating with other parties becomes truly plug and play. Advanced analytics—or "big data analytics"—used to interpret large swathes of structured and unstructured data is accelerating to the point where rule-based decision-making is replacing what was previously a long-term process of data extraction, compiling reports, and implementing decisions. Affordable "in-memory" computing and faster network connections make it possible to interpret and respond to events with tremendous speed and efficiency. Finally, we have mobility. Information and analytics can now be accessed anywhere at any time—by a sales rep in the field, for example—enabling quick decision-making with better information. So, if you are traveling and receive information on your tablet about a significant increase in demand and you don't know where to supply it from, you can run a scenario across your network to determine

where to source it, and then write that scenario back into your supply network planning and production systems. As an example, consider the Cloud-enabled supply chain architecture shown below: Suppose one of the customers is experiencing volume reductions due to the economic situation in a particular market. As the demand signals reduce and customer stock increases, the core enterprise is able to react instantly by reducing production, re-assigning manufacturing capacity to alternative products, or alerting its suppliers of the expected demand reduction. Similarly when demand picks up again, the customer side pull will be immediately visible through customer stock reductions and increased order frequency. While the majority of the day-to-day decisions would be hard-coded within the rules of the system, human interaction is also important if, for example, certain thresholds are exceeded. In the event of an unexpected factory shut-down or major environmental event, a user alert would be created through, say, a mobile device to which key people involved in the supply chain can respond. The business benefits of this model span the entire supply chain. As demand is constantly anticipated and fulfillment is monitored, inventory levels are reduced, from components and raw materials through finished unsold products and into sold products in customer warehouses. Service levels are increased, and resilience is strengthened without the need to create excessive buffering of products. Supply chain operating costs are reduced, and assets are better utilized as a result of the increased speed of decision-making and capacity prioritization. Collaboration-Enabled Orchestration Technology has made our world an incredibly interconnected "system of systems" and enabled a new age of multi-modal boundless collaboration that opens up almost endless possibilities across the entire supply chain. In the future, we will see more and more supply chains operating with a minimum of human direction. Similar to information networks such as the Internet, they'll be able to automatically reconfigure themselves. Forward-looking enterprises that take advantage of this will dominate tomorrow's market place. In order to differentiate and reach previously impossible levels of efficiency and speed, supply chain strategists need to radically re-think their businesses and decide which markets, operating models, and value creation approaches they want to embrace in order to stay competitive. Driving Strategy to Execution

----- Arcticle source ----- https://www.wipro.com/consulting/driving-strategy-to-execution/ ----- Contact Wipro Please fill the required details to access the content Facing financial and competitive pressures of historic proportions, operations and supply chain executives know they have to create and drive strategies that anticipate future challenges while addressing immediate issues.The more accurate and complete the strategic roadmap, the more effective execution will be. Yet, successful strategic planning remains elusive for most companies. One reason is that planning tends to be treated as an annual event rather than an ongoing process. Additionally, many

organizations fail to align their strategies with their processes and technology. As problems occur in such companies, different silos of activity independently make operational changes on the fly that render the strategic plan irrelevant until it's revised the next year. A successful strategic plan is a dynamic, living document of actions that are grounded in the true drivers of an organization's activities. The plan can reflect new goals and ideas, but it must align with existing processes and technology or, at a minimum, define paths toward alignment that can be realistically executed.The way to create such a plan is through a process called Strategy Alignment and Deployment, or SA&D. Converting Strategy to Action As I discuss in my book Driving Strategy to Execution Using Lean Six Sigma (CRC Press, 2012), SA&D aligns a strategy with all areas of an organization and then guides its execution. The alignment piece validates that all proposed changes support the organization's strategic goals, and the execution piece defines specific activities that each part of the organization must complete. In short, SA&D turns talk into goal-oriented action. SA&D starts with three requirements: Models for Success Among the many models for implementing SA&D we advocate Hoshin Kanri and S2E, both of which should be familiar to operations and supply chain executives. Hoshin Kanri is a Japanese approach for managing the direction of an organization to a specific goal. It reinforces a "Plan, Do, Check, Act" model by focusing on four key perspectives: Financial, Customer, Internal Processes, and Learning and Growth. A scorecard is used to track progress and support the governance system. S2E (Strategy to Execution) integrates the best of all the strategy models. S2E defines the high-level strategic parameters of SIPOC (Supplier/Input/Process/Output/Customer) of the organization, and then works out the details of the strategy via priorities, goals, and objective statements. Each objective statement is assigned a list of tasks to be accomplished and given a clear metric that can be monitored. Regardless of which model you select, you will want to develop a three- to five-year plan. During each year's planning process you'll add a new year and subtract an old one to create a rolling strategy. A rolling strategy allows you to focus on the big picture and align your annual and day-to-day activities with larger goals and objectives. Leadership buy-in is also critical to SA&D. Without it, employees have no reason to shift direction. Transformation Starts at the Top As previously mentioned, Leader Standard Work, or LSW, is a key component of SA&D. Instead of every department acting independently—from strategic planning to process elements— LSW creates a single vision and action plan that every group must adopt.Take performance reviews, for example. Instead of each department having its own system (or only evaluating individuals when projects seem in jeopardy) LSW requires a standardized performance review format and procedure. With LSW in place, routine functions are executed in a systematic and repeatable way, eliminating guesswork and facilitating adherence to the strategic plan. An SA&D Turnaround Story Let's put all this together by considering a major high-tech company that lacked organizational strategic alignment. The performance of its R&D program had deteriorated to the point that engineer-developers were pulled from focusing on new, exciting high margin products and assigned to the larger manufacturing pool to maintain the quality of products that were either stable or in decline. Utilizing the S2E model, the CEO hosted the organization's leadership team in three days of SA&D planning. The group identified objectives, metrics, and improvement initiatives that aligned with

the company's goals; and they developed LSW processes for identifying and governing a collection of initiatives around their pain points—poor quality and a lack of new leading-edge products. The output was a consistent organization-wide LSW methodology for identifying and executing initiatives. This became the foundation for a robust governance system where regular strategic SA&D check point meetings were held to ensure progress towards identified goals. The company used Lean and Six Sigma (LSS) to realign the organization with metrics and initiatives that focused on their specific pain points. This required change management and Lean training and team-based Rapid Improvement Events (RIEs), as well as leadership that was actively involved in the organization's transformation process. In the final change management plan, LSS provided the structure and was used to drive initiative execution. Within a year, not only had the organization been transformed and resolved its issues, but there was an unexpected result.The company's performance turnaround was so dramatic that a larger competitor, struggling with similar problems, decided to purchase the transformed company at a premium price. Driving for Success Driving strategy to execution is a big undertaking, so it's important to remember that most organizations require several iterations—years, essentially—of execution to become proficient in the SA&D process.To get started, planners should follow steps similar to the ones outlined in the above example: SA&D is not an overnight fix, but it's a sustainable, even transformative one. Those who stick with it will achieve their strategic plan's goals and objectives on the path of becoming the most competitive organization in their industry. =======================

Finance Enterprise Performance Management: Transforming Finance

Treasury and Tax Reporting

----- Arcticle source ----- https://www.wipro.com/consulting/finance-enterprise-performance-management--transforming-finance-/ ----- Contact Wipro Please fill the required details to access the content Relevant, current and comprehensive financial, treasury, and tax reports are essential to support good decision-making and regulatory compliance. So why are many companies using outdated methods that often achieve neither goal and create additional problems? Manual maintenance and validation of data sources result in dated reports that can lead to faulty decisions—and the problem is compounded when each unit or division within a company requires individualized reports. If your reporting requirements can't be met at a basic level, consider the impact on your organization when a professional standards organization like IFRS or ASPE inevitably issues new requirements for updating financial processes, validations, and systems.

This document summarizes Wipro Consulting Services' point of view on creating a Target Operating Model and deployment plan to eliminate manual maintenance and validation of data sources, and to create a reporting regimen to support decision-making protocols and meet regulatory requirements. Target Operating Model To improve finance, treasury, and tax reporting, it is essential to redesign the reporting process and rationalize report inventory by assessing information needs and key performance indicators (KPIs). You must automate regular reports and establish end-to-end report ownership, as well as improve self-service capabilities that will enable interactive reporting through executive dashboards. This latter task alone will help provide timely information in a consumable format. The Target Operating Model creates the foundation for driving the decisions made about what your new reporting methodology will look like. It's focused on very specific values that you must incorporate to make your new protocols work and align with the business strategy. These values include strategic insight, financial benefits, improved responsiveness, increased productivity, confident decision-making, and regulatory compliance. By strategic insight we mean that your operational and financial information is aligned, that it's predictive and not historic, and that it is timely and formatted in a way that makes it easy to consume. Financial benefits include improved contract management and compliance, which leads to lower procurement costs. It improves payables and receivables management, which will optimize your working capital, and it contributes to improved productivity, which results in lower staff costs. Improved responsiveness facilitates both better resource planning and reactions to consumer demands, which results in satisfied customers, and the ability to predict and plan for future change and investment decisions. Increased productivity releases organizational capacity, thanks to automation technologies, executive dashboards, and user self-service. Confident decision-making is achieved from data accuracy and integrity that result from established data governance over reported information and a single source of the "truth." Regulatory and statutory compliance is reached as a result of transparent reporting and the ability to adapt reporting to meet changing requirements. With success in compliance, organizations can benefit from incentives from regulators as well as improve their external reputation. We're seeing some companies developing reporting capabilities that focus on specific user groups across finance, treasury, and tax with a single reporting organization. While the objective of this initiative is to ensure data integrity, it offers additional business benefits: Our Target Operating Model is the pathway to achieving these benefits. It is comprised of four integrated components: business processes, enabling technology, organization roles and responsibilities, and data and reporting requirements. Each component is explained below: Component 1: Business Processes Typically, reporting for finance, treasury, and tax can be aligned to the high-level business areas of Purchase to Pay, Lead to Cash, and Record to Report, each with a corresponding process flow. It is important to understand the process flow and pain points associated with each of these processes. Once they are understood, the enabling technology, organization roles and responsibilities, and data and reporting requirements collectively contribute to solving the pain points, resulting in improved reporting. Process Flow: Procure to Pay Procure to Pay, commonly referred to as P2P, refers to the business processes that cover activities of sourcing, requesting, purchasing,

receiving, paying for, and accounting for goods and services. Figure 1 illustrates typical P2P pain points. Some of the reports identified in the P2P business process are supplier contract status (expiring and expired), buying channel analysis, retrospective business order, and supplier payment analysis. Process Flow: Lead to Cash Lead to Cash refers to the business process for receiving and processing customer sales. The pain points of this process flow are shown in Figure 2. Figure 1 – Purchase to Pay: Typical Pain Points Figure 2 – Lead to Cash: Typical Pain Points Some of the reports in Lead to Cash include quotes to sale performance, order fulfilment, billing performance, debt analysis, collection and allocation analysis and invoice/ credit analysis. Process Flow: Record to Report Record to report, commonly referred to as R2R, is the management process for providing strategic, financial, and operational feedback to understand how a business is performing. R2R pain points are shown in Figure 3.The key to effective RTR reporting is the combination of operational and financial information. It is important to provide business users with an insight and ability to track the cost drivers that impact business and financial performance. Component 2: Enabling Technology Once the business processes are detailed, technology plays a key role in implementing them. Adoption can come in two forms: an introduction to new technology, if the existing processes have been manual, or improvements to current technology that incorporate new processes. Of course, regardless of the approach, any introduction of new technology into the system will affect governance Component 2 Pain Points: High technology adoption might lead to less control over unit-specific processes, which could result in resistance to change at the individual or unit level, thereby invalidating the entire change process. Once you have changed processes, the ideal state is to have high technology adoption and high control and governance. Figure 3 – Record to Report: Typical Pain Points To enable scalability, the reporting transition is done gradually across multiple processes—initially with the transactional Procure to Pay and Order to Cash, followed by the consolidation processes of Record to Report and Statutory Reporting. This is done to minimize the implementation risk to business customers through the transition of transactional-based reports, followed by management reporting, with the enablement of greater operational and dashboard reporting. As your organization digs deeper into reporting, you need to ask fundamental questions: What are your reporting objectives? What is your vision? What capabilities do you need to meet those objectives? What controls do you need around it? Figure 4 identifies the balance of technology and control/ governance. For example, a high level of both governance and technology, as represented in the upper right quadrant, would likely be most appropriate for the needs of a large, regulated business, while a Research & Development focused enterprise would need a significant analytical capability requiring a high level of technology and less controls on how information is adapted and transformed. Component 3: Organization Roles and Responsibilities For the Target Operating Model to work effectively, there must be strong governance and a clear understanding of the roles and responsibilities held by those who set and direct strategy, those who establish the processes, and those who actually run and support the system. The relationships between these groups must also be understood, as shown in Figure 5. Figure 4 – Reporting Vision and Capabilities Figure 5 – Roles, Responsibilities, and Relationships Governance Board: This organization has global responsibility for the

strategic fit and direction, policy, compliance, and change control, as well as management of the governance framework. Global Process Owner: The owner controls process refinement, rollout, data compliance, dispute resolution, lead issue resolution, SLA exception resolution, and financial close compliance. IT Application Owner: The IT application owner ensures smooth running of the system, and owns the support model, the execution of upgrades and improvements, the issue resolution and testing of issues, the maintenance of SLAs, and the performance reports given to other teams. Finance Processing: The responsibilities include initiating intercompany transactions, compliance, reference data setup, assisting with issue resolution, and testing by shared service centers, accounting units, and subsidiaries. IT Support Team: The IT support team's responsibilities include issue tracking and resolution, performance monitoring, system tuning, integration, and interface management. Other IT Support: This can include providing assistance with issue resolution, upgrades, and testing. Component 3 Pain Points: Weak leadership means new technology business processes will not be adhered to, technological enhancements will not be accepted in the organization, and a shift from the old to new will not occur. It also means that changes in organization roles and responsibilities will be unclear, and data and reporting requirements will not be clearly defined to improve efficiency. Lack of buy-in from process owners will mean rationalization between process areas will not be achieved. Component 4: Data and Reporting Requirements Data integrity is essential for accurate reporting and is the primary driver for the business process and technology design, as well as the organization roles and responsibilities. As such, information requirements should be established at the start of the design stage and reviewed throughout the implementation. The reporting requirements should be assessed at an early stage to ensure most data can be extracted as a product of the design without additional intervention. Component 4 Pain Points: Failure to involve all information providers and users, and the failure to agree on requirements in the design stages, will result in expensive rework and reimplementation at a later date. Different levels of the organization require their own levels of information. As shown in Figure 6, the executive level won't require the same level of granular data as management, which in turn won't need the level of detail that operations requires. The reporting process moves from manual extraction and manipulation of data from multiple sources to greater automation and transformation from a limited number of sources. This enables greater control over reporting governance, delivery, and analysis that is specifically targeted to meet the needs of the various business customers. While the detail of the data may be different, depending on who the user is, the organization still benefits from having one version of the truth. The Target Operating Model Roadmap A program of this magnitude requires multiple stakeholders and changes to business processes and roles. To get started, you should gather a small senior team to identify the change management program, which should address: Delivery of Reporting Capability Focused on the Needs of Specific User Groups Once you've successfully completed the starting steps, there are still several decisions that must be made before the program roadmap can be defined in detail. These decisions include: Once these decisions have been made, a program management team can be established to plan the project in detail and engage the appropriate stakeholders. A combination of client SME's and third party resources

should be deployed and managed through a joint project governance framework to deliver the project activities as shown in Figure 7. Figure 8 – Change Management Strategy Change Management Strategy A key factor in any program is the change management strategy. Figure 8 shows the key components that must be considered when a change to the Target Operating Model is undertaken. Application of these tools, processes, skills, and principals for managing the people side of change will ensure successful adoption of the new model. Conclusion The difference between where your organization is today and how it will operate in the future once you've improved your reporting capability can be substantial. Improving your reporting capability impacts your ability to foresee and respond to changes in the operating environment resulting in a more agile and responsive enterprise. You can gain strategic insights, resulting in alignments between the goals of each division or unit with the company's overall strategic goals. You can achieve increased productivity, thanks to the application of relevant technology to your processes This increased productivity, in turn, can reduce your operating costs. Plus, better reporting helps improve overall financial management. Additionally, with accurate, timely data sourcing integrated into common reporting processes, decisions can be made with greater confidence at every level within the organization. Finally, you'll have confidence in your statutory and regulatory reporting compliance because any changes in standards are immediately incorporated into your system. Financial and integrated reporting is a fundamental component of any large business organization. It shouldn't be a tangle of incompatible processes based on outdated methods. Streamlining and updating your reporting capability with the appropriate delivery model will enable you to significantly enhance your organization's profitability, competitiveness, and ability to respond to the wider environment that it operates in. Avoiding Quality Chaos: Knowing Which Tools to Use and When to Use Them

----- Arcticle source ----- https://www.wipro.com/consulting/avoiding-quality-chaos--knowing-which-tools-to-use-and-when-to-u/ ----- Contact Wipro Please fill the required details to access the content Many years ago, when Western businesses considered Japanese products to be substandard, Ford of Canada put a car part out for bid.The winning bid came from Japan, and in the contract that followed, Ford specified there could not be more than 5 percent bad parts. But something was lost in translation.When Ford received the parts, they found a bag at the top of the box with a note reading "We don't understand why you wanted to receive 5 percent bad parts, but we separated them out for you so you would not have any trouble finding them." Well, the days of "Japan Junk" are long gone, and the world now looks at Japanese production methods as the global standard for quality. Businesses

in the U.S and Europe have spent substantial amounts of time studying and emulating those methods, most especially the components of the Toyota Production System (TPS). First, the Quality Circles method was promoted as the cureall for Western quality woes. When that didn't solve all of the problems, businesses moved on to SPC (Statistical Process Control) and TQM (Total Quality Methodology). JIT (Just in Time) was next, followed by Lean, Six Sigma, and many others – all in an attempt to find the single most important element of TPS. But all of this dissecting of TPS missed the point. The magic behind TPS isn't in its individual tools but in the cultural integration of those tools. In short, the key to quality success is the ability to have all aspects of TPS available at all times and to use each approach as appropriate. What is Quality? Before you can strive for quality, you need to have a basic understanding of what quality is; and there is an enormous amount of confusion around that. If it were possible to come up with a standard definition of quality that could satisfy everyone's expectations, then defining "optimal quality" would be easy. It turns out there are entire organizations that pursue Avoiding Quality Chaos: Knowing Which Tools to Use and When to Use Them By Gerhard Plenert Many years ago, when Western businesses considered Japanese products to be substandard, Ford of Canada put a car part out for bid. The winning bid came from Japan, and in the contract that followed, Ford specified there could not be more than 5 percent bad parts. But something was lost in translation. When Ford received the parts, they found a bag at the top of the box with a note reading "We don't understand why you wanted to receive 5 percent bad parts, but we separated them out for you so you would not have any trouble finding them." As covered by 2 a meaningful definition of quality. Despite that—or perhaps because of it—identifying a single practical definition of quality is a nightmare. When we surveyed quality systems users for their personal definitions, here are just some of the answers we got: As you can see, there is no consistency in this list. One individual's definition of quality is extremely different from another's, and it comes down to their individual perspective or focus, whether User, Customer or Supplier. This is quality chaos. To avoid quality chaos, your organization must formulate its own definition of quality and create an accountable, quantifiable process to achieve it because we see that far too often quality is only given lip service. If it's not a critical performance driver, and if it's not measured, then quality won't occur. Quality is not the sole responsibility of some obscure quality department or cost center, it's everyone's responsibility, from production workers to office clerks to management. In fact, it's important to remember that the quest for quality is not limited to production. I've often found myself in organizations that take two days to produce a part and 10 days to process the order. To my mind, no matter the definition, that's not quality. Front office quality is just as important as production quality. Front office employees are the interface with the customer. A rude phone response can damage a company's reputation no matter how good the parts are. But the tools used to increase front office responsiveness and throughput (which is often a measure of front office quality) may not necessarily be the same tools that you would use to improve production floor quality. Addressing Improvement Gaps to Achieve Quality Several years ago I joined a high-tech company as director of quality. The company had a defect rate of more than 14 percent, unacceptable to the company's CEO. When I came into the position I discovered numerous problem areas, including performance measure.

Performance was measured as units produced and lacked a quality component. But there were also problems in the front office, in order processing, in engineering, in shipping. The list goes on. All of these, combined together, resulted in a reputation of poor quality performance. So I set out to define the specific quality failure areas. Everyone had opinions about where the quality failures occurred, and, of course, it was always "the other guy" who was at fault. To get beyond management rhetoric and learn for myself, I took a hands-on approach and physically went to work in different departments. After a couple of weeks it became pretty obvious where the problems were -- they were everywhere. It was a combination of errors, process shortcomings, systems failures and more that resulted in the quality issues. With this information, I developed a plan of attack which included a long list of fixes to improvement gaps: 1. Quality improvement processes and tools   2. JIT   3. Lean After the training was well under way (of course, it's never finished) we initiated a Quality Week. The guiding principle was: "You can do anything to your work environment, change and rearrange any of the equipment, do whatever it takes, but you cannot produce any bad parts." It was basically a plant-wide Lean event. When the idea was first introduced to management they were concerned that they would lose valuable productivity and throughput. And, in fact, the first day was a productivity disaster. Employees took machines apart and rebuilt them and moved equipment around, resulting in a considerable amount of lost throughput. Similarly, the front office was rearranged and copiers were moved. However, by the third day, the lost throughput of the first day was not only recovered, workers were ahead of their normal three-day throughput. And they weren't producing bad parts. The focus on quality, including quality training, continued and by the end of eight months we had reduced the defect rate to below 2 percent. In the following months we brought it to below 1 percent. Additionally, cycle time had been reduced, inventory had been reduced by 40 percent, and capacity had been increased by 20 percent. The capacity improvement was the biggest surprise to management, but it shouldn't have been. Not wasting capacity in producing and fixing bad parts increases the capacity to produce good parts. Was there one magical fix-all quality tool that was employed to solve all the problems in this factory? Not at all. It was a combination of several tools, appropriately applied, that eventually resulted in this success story. The Importance of a Quality Manager Even with the understanding that solving quality issues requires the appropriate application of numerous tools, questions remain, including, "Which quality tool do you use where and how do you avoid the quality chaos that is tangling up numerous companies?" The answer is that you need someone in your organization who understands the options that are available for quality improvement. What are the tools that exist? How and when should they be used? Your director of quality should not be an inspector but, instead, someone who offers guidelines for a quality system and quality tool selection and implementation. He or she should know the tools and be able to direct the appropriate application of the correct tool. A quality manager drives an organization towards a world-class environment. How do you get started? One excellent tool to help facilitate the definition and drive toward quality is found in the Shingo Prize program. This program defines the criteria for organizational excellence and has a specific set of criteria that define this excellence. In summary, quality should not be the source of organizational

chaos. A world-class quality system will focus on building leading-edge quality environments; and a quality director should focus on developing a process for identifying and selecting appropriate quality tools. By defining what quality means to the organization, identifying the correct people, and selecting the best possible combination of tools to create a quality environment, any organization can and should become world class. Get in touch: global.consulting@wipro.com. ======================

Supply Chain Segmentation for Manufacturers: Scrapping the One-Size-Fits-All Approach

----- Arcticle source ----- https://www.wipro.com/consulting/supply-chain-segmentation-for-manufacturers--scrapping-the-one-s/ ----- About the Authors Contact Wipro Please fill the required details to access the content When it comes to supply chains, one size rarely fits all. Different products have different characteristics, lifecycles, and customers that can't easily be shoehorned into a single planning and scheduling methodology. Yet, for generations that's exactly how supply chains were managed—until multiproduct retailers realized that a more customized approach improved their bottom line. You would think manufacturers would jump in too. After all, their world is even more complicated, with supply chains on both the demand and the supply side, and completely different SKUs, since what is bought on the supply end is a different product than what is sold on the demand end. Indeed, often the customer requirements on the demand side place stress on the supply side, which is dependent on parts and components, adding an additional dimension of complexity Too many manufacturers, especially those with multiple products and a wide range of customers, have stuck with passé one-size-fits-all planning models. And by lagging, they're missing out on an approach that facilitates customized responses to managing inventory, and, in turn, increases profits and improves competitiveness. The SCS Framework There are three main supply chain models, two of which are traditional one-size-fits-all models. The newer, third model embraces customization that segments unique requirements that are specific to the product, customer, or market dynamics, and optimizes the needs of various supply chain management elements Many multi-product retailers use this customized Supply Chain Segmentation model (SCS) to optimize margins and improve profitability by dividing products by rate of sale, country of origin, customer tiers, variety, and other criteria. The SCS framework has three main components that together equal a return on availability: Lifecycle: The lifecycle stage of any given product is a key driver in manufacturing segmentation. At launch, for example, you don't yet know demand trends, pricing, competition, and other key factors, which means you require analytics to build the supply chain. In a product's active stage you have more stability and can use ERP and similar applications to manage the supply chain for efficiency and the lowest cost of

service. By the end of a product's life, you face declining demand and must be able to respond by quickly repurposing and redeploying capacity and inventory. Cost of Availability: This involves making estimates based on supply chain parameters that directly affect the cost of making the product and services available to your customer. So, you'd look at lifecycle length and stage, volatility, customization, criticality to the customer, source geography, the rate of sale, the cost of transportation, and gross margins. There are also issues specific to your business, such as seasonality, temperature, hazardous materials, and the like. Customer Segmentation: Customers have different levels of value, so we use customer segmentation to tailor the level of responsiveness and performance. Customers are assigned to one of three tiers, as the value of supporting each tier is different. Tier 1 customers are strategically important businesses that are given a high priority. Tier 2 customers are given medium priority, and Tier 3 customers are given the lowest priority in the hierarchy. By segmenting the customer base we can collect and analyze data derived from each of the groups to determine the return on availability and cluster the products into supply chain segments. Then we combine segments that have similar characteristics to come up with a manageable number of unique segments. Organizations, whether in retailing or manufacturing, typically have four to eight segment groups, each of which has customized customer service levels, risk levels, customer response levels, and inventory management strategies. With SCS you define the structure of the segments and use analytics to test the strategies. The Benefits of SCS Retailers were quick to embrace segmentation because retail is completely demand driven. As a retailer, the product you buy is the product you sell. So, it is often based on just three factors: the type of customer, the size of the customer, and the location of the customer. But, as we already noted, manufacturing supply chains are more complex. As a manufacturer, the products you buy are transformed into something different to sell. Your two sets of SKUs must be managed differently, and you have to do segmentation twice and link the two together because demandside segmentation will directly affect supply-side segmentation. But, as we already noted, manufacturing supply chains are more complex. As a manufacturer, the products you buy are transformed into something different to sell. Your two sets of SKUs must be managed differently, and you have to do segmentation twice and link the two together because demandside segmentation will directly affect supply-side segmentation. If you do poor demand segmentation, you can end up making the produced product availability worse, which could have a negative impact on inventory and operation costs. But if you do it right, you potentially gain a host of wins, including gains in customer service reliability and a better alignment of supply chain policies to customer and product value propositions. You'll be able to simplify your systems, since segmentation facilitates automating where appropriate and applying analytics and planning expertise where they'll offer the best results. With a clearer understanding of where inventory distress is likely to occur, and the ability to apply segmentation expertise, you can cut in half current stock write-offs and discount reductions. And, you'll enjoy greater supply chain talent retention and recruitment because your focus will be on more interesting analytics and retention as opposed to firefighting. Getting Started with SCS For manufacturers, transitioning from a one-size-fits-all approach to SCS can take from six to 12 months, depending on the complexity of the analysis.

But, a pilot program is an excellent way to initiate the process . It starts with data analysis utilizing a segmentation expert. Here you'll develop several distinct segments for both sets of SKUs that will maximize value, and you'll conduct an ROI analysis that can make the case for change and garner support, both internally and among your suppliers and customers. IT change will also come into play. For example, segmentation capabilities will need to be integrated into your ERP software. But the good news is that the outcome is simplification, and that simplification will cost less over time. As you begin to make the transition from simple supply chain management to SCS you must consider these issues and how they relate to your organization: Let's look at a manufacturer that recently undertook this transition. The company was facing increased competition that forced it to look for ways to reduce inventory carrying costs. Additionally, since their product was seasonal, stock-outs meant lost sales. By switching to SCS they felt they would gain more product supply control and reduce costs. With SCS in place, the manufacturer developed a higher level of collaboration with its vendors, resulting in a lower need for inventory buffering that reduced costs. The IT department of course, was very involved. They revised their planning and scheduling systems, and made changes to promote increased data accuracy. With a one-size-fits-all model, the same level of data accuracy and utilization wasn't required, but now it was critical. The manufacturer reorganized its planning and scheduling department along with the roles of the planners. With many products now managed automatically through the production scheduling system, planners were given more flexibility and responsibility with the products they manage. As a result of their move to SCS, the company reduced inventory for their high-demand, low-variability product lines by 40 percent while simultaneously reducing the touch time for their planners to nearly zero touches. Altogether this transition gave them the competitive edge they needed, with greater control of the process and lower costs. More Competitive Approach to Supply Chain Since segmentation has become a strategic competitive differentiator used by many businesses around the world, it's past time for manufacturers to adopt it. We've already seen those that have adopted segmentation analytics build responsiveness to customer demands by reducing stock-outs and increasing on-time deliveries. And, because your retail partners will gain by always having what customers want on the shelves when they walk into the store, as a manufacturer you're more likely to keep their business. That's the power segmentation brings to your organization. By breaking your mammoth supply chain into more manageable chunks, your business will gain the agility and control it needs in a competitive marketplace—and you can focus more on getting products to market rather than putting out fires. Manufacturers who have been stuck in the one-size-fits-all supply chain rut need to step out and take advantage of a more competitive approach with segmentation. Source to Pay: Transforming Invoice Processing and Document Management

Major corporations spend billions of dollars on goods and services, and careful management of the ordering and payment process has the potential to deliver large savings—savings that can be channeled into developing the business. Automation is a critical enabler in reducing costs and improving the quality of data transmission and entry in the Source-to-Pay (S2P) cycle. A large number of invoices from suppliers are received in paper form or through emails as PDF attachments, however, and these must be entered manually into ERP systems or through a semi-automated standalone platform. The result is a complex, labor-intensive process with a high processing cost, limited scalability across divisions, and a lack of business insights for optimizing cash outflow. An automated invoice process management platform which is tightly integrated with an end-to-end S2P process can reduce costs, increase productivity, and reduce the time spent on issue resolution. The Document Management System needs to be able to process documents and invoices received as paper documents, e-mail attachments, faxes and scanned files, and the invoice management process should be linked to the AP workflows to ensure automated processing of the invoices. The solution should be scalable and secure, as well as predictable and affordable. This document summarizes Wipro Consulting Services' point of view on a Target Operating Model and implementation roadmap for large global organizations to create a robust solution for their S2P Invoice Processing and Document Management system Target Operating Model The Target Operating Model (TOM) comprises four integrated components: Business Processes, Organization Roles and Responsibilities, Enabling Technology, and Data and Reporting Requirements. Component 1: Business Processes In the Target Operating Model, the invoice processing/ document management process is integrated into the S2P cycle as shown in Figure 1. Receive Invoice: At the start of the process, the invoices are received by mailroom via various channels and formats, Figure 1: Invoice Processing and Document Management Proces including paper, fax, and email. The paper invoices are then scanned and batched for processing and transmitted to the Document Management systems along with e-mail invoices. The invoice is received at a central mailroom for a region and then prepared for further processing. Pain Points: Invoice Recognition: The OCR system extracts the data from the documents and captures the defined data fields. It can match the extracted data with PO and vendor master data, as well as GL account data, and can enrich the extracted data. The business rules can be defined to enrich the data, reject invoices, and trigger workflow for manual processing. Pain

Points: Verification and Validation: The extracted and transformed invoice data is verified and manually updated, and incomplete or incorrect data is corrected. The system extracts the data from the documents and captures the defined data fields. The verified and validated invoice data is then transmitted to the P2P platforms to post the invoices after the invoices are completed and the approval workflow is executed. Pain Points: Key process design considerations for the Invoice Processing and Document Management Process: Component 2: Organization Roles and Responsibilities To ensure the effectiveness of the Target Operating Model, a strong governance and clear definition of roles and responsibilities must be established. Roles and responsibilities must be defined for those who set and direct strategy, establish the processes, and actually run and support the system. The interdependence of these stakeholders with each other should also be defined, as shown in Figure 2. Figure 2: Interdependence of Stakeholders Governance Board: This global organization is responsible for the strategic fit and direction, policy, compliance, and change control, as well as management of the governance framework. Global Process Owner: The owner controls process refinement, rollout, data compliance, and dispute resolution. The owner also manages the Change Board and leads issue resolution, SLA exception resolution, and financial close compliance. IT Application Owner: The IT Application Owner ensures the smooth running of the system. The IT Application Owner is responsible for the support model, upgrades and improvement execution, issue resolution and testing, maintenance of SLAs, and reporting performance to other teams. Finance Processing: The responsibilities of this group include initiating inter-company transactions, compliance, reference data setup, issue resolution and testing through shared service centers, accounting units, and subsidiaries. IT Support Team: IT Support Team's responsibilities include issue tracking and resolution, performance monitoring, system tuning, integration, and interface management. This element of the organization can be delivered as an offshored managed service. Other IT Support: This group provides assistance with issue resolution, upgrades, and testing. Component 3: Enabling Technology There are a number of available standard Document Management applications that can meet the stated requirements with minimal customization and configuration. The deployment of the application could be accomplished in-house or through the SaaS or managed service model. The in-house development of a Document Management tool may not be the best option, given the number of available off-shelf tools and their level of maturity and sophistication. Moreover, an in-house platform will give diminishing returns with decline in the volume of paper documentation. Figure 3 shows the platforms that could support the invoice processing and Document Management Process. Technology Selection There are a large number of OCR solutions available off the shelf, and a detailed assessment is required to choose the best option for the organization. The available tools are assessed to capture cross-functional and cross-divisional global requirements and determine the best fit for the organization. The key considerations for the selection of the Document Management solution are: Figure 3: Platforms Supporting the Invoice Processing and Document Management Process Component 4: Data and Reporting Requirements Data integrity and consistency are key requirements for the final integrated design and automation across the cycle in order to achieve efficiency and other benefits through the Document Management solution. A common data

structure and harmonized and cleansed data are vital to automating and implementing standardized processes and platforms. A single view of data will also enable improved reporting and accurate performance measurement. Business Case for Large Established Countries and Emerging Countries As an enterprise determines how the business case plays out across each one of its business environments, it must be acknowledged that there may be different existing models to consider: Fully Outsourced Model: The business case for this Source to Pay with Document Management solution may fully impact a company's Business Process Outsourcing (BPO) partner. Companies in a first- or second-generation BPO contract may be locked into a 5- to 10-year agreement in which the partner may consider this type of solution a challenge to their revenue stream. Most companies tend to engage their BPO partner early on to ensure that they are able to get the full benefit of this type of program. Partly Outsourced or Partly Centralized Model: The business case for this Source to Pay with Document Management solution may fully impact the BPO partner as noted above. However, most companies tend to have a mixed model of outsourced large established countries or regions and in-house centralized/de-centralized models across emerging markets. In this scenario, most companies realize that if they have a centralized operational model across emerging markets, they will benefit from these type of programs. Companies with a decentralized operational model across emerging markets in which individual countries may not be fully standardized or fully centralized may decide to defer this type of program until the emerging countries have transitioned into a centralized model across a region or a number of countries to obtain the full benefit. Roadmap The Target Operating Model is the cornerstone of the solution, but how should it be implemented? A program of this magnitude requires the involvement of multiple stakeholders and changes to business processes and roles. To launch the solution effectively, you will need a roadmap that details the people and teams that are required, as well as the key steps that must be taken. Before commencing work on the Target Operating Model, a small team of senior members should be formed to identify the fundamental shape of the proposed program. This team should address: Once these basics have been established, several strategic decisions need to be made before the program roadmap can be defined in detail. These decisions include: Internal to SaaS Model: A number of vendors offer a Document Management solution as an SaaS offering, wherein the capture, preparation and transformation of both paper and electronic invoices is done by a third party. The SaaS model enables the organization to: Figure 4: Target Operating Model Roadmap Availability of Existing Functionality: Some components of the Document Management solution may already be available in the organization in the form of tools such as Kofax, Scan One, or insiders. These assets can be assessed and utilized to perform specific functions and integrated into an overall solution. Once these major decisions have been made, the senior team should appoint a program management team to define the program as shown in the Figure 4 roadmap. At a high level, a combination of program and software development lifecycle management should be applied. Conclusion While invoice processing is not complex, establishing a solution that is efficient, accurate, cost-effective, and manageable across multiple platforms, divisions, and regions has proved to be a common problem faced by large multinational enterprises. By adopting Wipro Consulting's Target

Operating Model, organizations can establish the basis for implementing a Document Management system that is integrated with the P2P cycle and addresses their typical pain points. With the model in hand, organizations will be better prepared to develop their vision for a solution and the roadmap to implementing it. The key decisions that will determine the cost, scope, and duration of the program include the choice between an in-house solution or a SaaS solution, and the decision between in-house or outsourced support for the solution. At a time when organizations are wrestling with a host of business issues around product or service development and sales, managing costs, and optimizing profits, the last thing needed is distraction caused by an ineffective Document Management system. This should be a part of the business that is humming along smoothly. With this key issue resolved, organizations can focus on making their businesses profitable and competitive. ======================

Market Scan:Why Cross-industry Innovation is Important in Building Supply Chains

----- Arcticle source ----- https://www.wipro.com/consulting/market-scan-why-cross-industry-innovation-is-important-in-buildi/ ----- About the Authors Contact Wipro Please fill the required details to access the content Where is the hotbed of business innovation in your organization? Is it in the creativity of your people, their knowledge and experience? Is it in your technology? How about your suppliers, customers, and competitors? These are the traditional sources of innovation, but they don't have to be the only ones. In fact, some of the best sources of incremental and disruptive innovation can come from outside a company's sphere of contacts and even outside its industry. This is true not only for the company as a whole, but specifically for its supply chain—especially as supply chains become more complex and critical to the bottom line. The search for cross-industry innovation isn't new. Years ago Toyota studied American supermarkets and successfully adopted just-in-time production techniques.The hub-and-spoke model for logistics efficiency that FedEx applied to overnight package delivery was based on methods developed at Delta Airlines; and Dell's demand-driven supply chain model has been adopted by retailers like Tesco, who have used it to better plan and turn their inventories. Even Coca Cola has looked beyond its industry to drive innovation. Their "Freestyle" soda fountain dispensers use a micro-dosing technology that the medical industry developed for dispensing dialysis and cancer drugs. Installed at the point of sale, Coke's dispensers allow customers to create the flavor or combination of flavors they want. How does this innovation help Coca Cola? It provides a lower cost and lower risk model for introducing new products and assessing their performance. The common thread here is that each of these organizations had a mindset of looking outside their own industry for

innovation. CEOs know the value of this approach. In a recent Wipro survey conducted with Forbes Insight, a majority of the more than 300 C-level executive respondents said they believe cross-industry examination is an effective way to foster innovation. But executing that strategy is another matter, as other studies show cross-industry assessment is just not happening. Supply Chain Innovation Basics Typically supply chain performance is judged by various attributes, such as agility, asset management, cost, reliability, and responsiveness.The trade-offs between these attributes tend to be between cost efficiency and responsiveness.The objective is to achieve a supply chain with higher performance—greater responsiveness at the same cost efficiency, or greater cost efficiency at the same level of responsiveness. The pathway to that higher level of performance is typically called a "market scan," which is an assessment process with distinct phases in which each successive phase results in greater quantity and quality of innovation. The output of the market scan is then screened and evaluated to produce consensus on which innovative ideas should be tested and deployed. Innovation Through the Market Scan Process Most companies are familiar with the market scan process and have experience using it to make regular adjustments to their supply chains. Yet too few companies take the first step of conducting a cross-industry assessment—the very step CEOs cite as important to fostering innovation. By limiting their search to their own industry, these companies have eliminated the potential for true disruptive innovation—and in today's competitive global economy, that's like wearing blinders while crossing the street. Cross-Industry Innovation Basics The ability to think beyond your industry is a mindset; but conducting a cross-industry assessment is also a process. It starts with a series of questions, including: What are the objectives and scope of the project? What is the plan for formulating a list of the outside industries and companies that are best aligned with your issues? With these addressed you can formulate a master list of potential companies to scan for solutions. Step two consists of an analysis that has three main tasks: In the final phase of your cross-industry assessment you compile a list of possible actions and technology enablers for supply chain improvements that utilize the ideas gleaned from other industries. These should include how to address the potential pitfalls stated in your hypotheses. The list doesn't have to be exhaustive, but it should set the direction for innovation and drive future initiatives in your organization. Cross-Industry Assessments in Practice To illustrate how this works in practice we can use an example of a leading energy company that needed to improve its operating margins. In the first step, the company identified the objectives and scope of the project and generated a master list of companies for its cross-industry assessment using various external surveys including Gartner's ranking of the Top 50 supply chains in high-tech, CPG, retail, logistics, and commodities.This yielded companies like IBM, Sun, Dell, Home Depot, Best-Buy, Wal-Mart, Colgate-Palmolive, Procter & Gamble, Seagate, and Sony. In the second step, the company conducted an analysis to establish its supply chain pain points, which were then matched to the companies that had faced similar challenges to create the short-list. For example, demand volatility was identified as a pain point, and the analysis revealed solutions developed by Colgate- Palmolive and P&G. The outside-in analysis, which showed low inventory turns, coupled with benchmarking, revealed demand planning and forecasting accuracy as two areas on which the company needed greater

focus. From its analysis, the energy company knew that Sony and Seagate from high-tech and Colgate-Palmolive and P&G from consumer goods had faced similar problems and had implemented collaborative planning techniques to receive demand data and manage stock. The process then entered the final step, in which hypotheses were developed and corresponding recommendations were made.These included suggestions for tighter integration among planning and operations functions, increased supply chain visibility and the introduction of state-of-the-art enabling technologies. An estimate of the benefits and improvements in return on assets by addressing issues around agility and integration, inventory and logistics optimization, and functional improvements, was conservatively calculated to be more than $1 billion annually. All of this information then entered the last lap of the process—screening and prioritization of the most promising ideas, which yielded pilot projects in separate geographic areas to improve operational margins based on tighter integration between business functions and maximization of IT investment as part of a virtual enterprise. In the area of demand planning, inspired mainly by the experiences of P&G and Colgate- Palmolive, the company entered a phase of further investigation of demand planning techniques and methods, which will undergo additional benefits analysis. Market Scan as a Competitive Edge While there is a well-defined process at work here, scouting around for new ideas in completely different industries is as much an art as a science. It takes a special kind of understanding and imagination to see a successful technology or process in one kind of organization and be able to imagine its potential to work in your own company. In addition, to get traction with a cross-industry assessment some organizations may have to undertake staff training to overcome resistance to adopting and adapting innovation from the outside—or perhaps even to see it in the first place. You won't derive the value you seek from a thorough market scan if the internal mindset is strictly "homemade." Finally, organizations that lack the capacity to conduct a comprehensive cross-industry assessment on their own should consider a partner to manage both the outside-in analysis and the development of external sources and ideas. Understanding how to identify companies with the greatest potential may be one of the biggest barriers to engaging in cross-industry innovation; and in the long-run having a partner can help reduce investment costs and ensure that opportunities are not lost. Today and in the future competition often comes down to who has the most effective and efficient supply chain. That makes innovation essential—a drive for growth and differentiation in the marketplace that's not limited by the experiences and knowledge of your own organization and industry. A market scan that includes the cross-industry innovation component is both a process and a mindset. It's a way of systematically expanding your pool of ideas to access the best supply chain practices across industries and organizations. Businesses today can't be held back by the insular supply chain solutions that worked in the past.Today, it's about looking deeper and wider for effective ideas and making them your own. Brian Nolf is Partner, Strategy & Transformation – Consulting Practice, Wipro Limited. Ramanan Sambukumar is Practice Head – CTO Office, Wipro Limited. Get in touch: global.consulting@wipro.com. =====================

Finding New Insurance Ideas In Unlikely Places

Please fill the required details to access the content Western insurance firms have a problem. Their markets aren't growing, product innovation has stagnated, and costs are rising while customer satisfaction is falling. In short, it's a business that's ripe for the kind of change that radically transformed industries like media, telecommunications, and high tech. For inspiration, Western insurers should broaden their scope by scanning countries in the developing world, where insurers are thriving. That fact is not as strange as it may seem. With fewer available resources, and impediments ranging from physical to cultural, insurers in those regions have had no choice but to innovate—and innovation is a key to success that knows no geographic boundaries. While insurers in developed markets have been fixated on risk management, neglecting consumer-facing sources of value, insurers in developing regions have turned a laser-like focus on the customer. By harnessing popular technology, embracing unique sales partnerships, and creating customized products, insurers in the developing world offer a glimpse of the kind of creative thinking that has the potential to jump start the industry in the West. That makes what's happening in places like Kenya, India, and Colombia important for Western insurers to understand. Key Emerging Market Innovations Emerging markets present insurers with significant challenges and constraints. There may not be a developed infrastructure to reach a critical mass of consumers, and purchasing power can be low, with traditional payment options few or non-existent. Environmental factors from drought to flooding to population density may also present impediments. In adverse situations like these, insurers in emerging markets have had to think differently about product development, sales, and claims processing. While insurers in developed countries don't face the exact same set of issues, they can draw inspiration from emerging-market innovations. Product Development Innovation: Most Western insurance products are designed to serve the needs of a majority of potential buyers, which is to say they may not match every individual customer's precise needs. A "good enough" product will typically offer 80 percent of the performance of an insurer's "best" product at 80 percent of the best product's price, making it attractive to a large number of consumers In contrast, the focus in developing countries is micro-insurance products. These hyper-targeted offerings are created to meet precise customer needs while reflecting the realities of poorer populations and their limited purchasing power. A micro-insurance product might offer 50 percent of the coverage of a "best" product at 15 percent of the price. For example, instead of offering across-the-board crop insurance, a micro-insurance provider might only cover a specific loss caused by a specific event. In Kenya and Rwanda, Kilimo Salama offers a low-cost policy covering the cost of a farmer's crop investment—seeds, fertilizer, and pesticides—in the event of a

loss due to extreme drought or excessive rain. By limiting the coverage to the customer's up-front expenses, and by excluding hazards like pests, hail, and certain types of floods, the cost of insurance is kept ultra low. As of 2012, around 50,000 Kenyan farmers were covered, and payouts have been made to over 10,000 farmers, according to Swiss Re, one of the partners in the offering. India's Vimo provides a micro-insurance product for low-wage, self-employed women. Offered through SEWA, a workers' trade union, the insurance costs the equivalent of $1 per month and provides $200 of protection against life, home, health, and accidents. In South Africa, micro-product provider Hollard insures funeral expenses up to $250 for individuals and families. It sells the product for $2 in packaging similar to cell phone starter packs. Transaction Partnering Innovation: Poverty, the lack of infrastructure, and the geographical remoteness of many regions in emerging countries significantly inhibit insurers from reaching and managing customers using methods that are common in the West. But by applying creative thinking, insurers have found ways to connect. In Africa, Kilimo Salama does all of its business through agrodealers and the mobility service provider Safaricom. When an agro-dealer sells the customer seeds, fertilizer, and chemicals, the cost of these "crop inputs" can be insured on the spot for a small incremental price. Scanning a barcode on the bill registers the policy with the insurer and generates a text message to the customer with the purchase receipt and policy number. In Colombia, Liberty Mutual solved the challenge of collecting premiums for its low-cost health insurance by partnering with the local gas company, which adds the charges to the client's natural gas bill. In Bolivia, Zurich Bolivia Group sells medical and life micro-insurance products at branches of BancoSol, a commercial bank targeting low-income customers. The cost is automatically deducted from the customer's savings account. Filipino insurer Beneficial Life Insurance, known as BenLife, partners with telecom giant Smart Communication to offer a mobile micro-insurance service called InsureTxt, which offers accidental death coverage of up to PHP 50,000 ($1,200) for as low as PHP 3 ($0.07) per month, with all transactions completed through text messaging. South African provider Hollard's funeral insurance is sold through Pep, a clothing and small appliance retailer. bank account. Given the lack of infrastructure in developing countries, insurers have to take a different approach, often by enabling customers to benefit from index-based claims that are automatically triggered by defined events. bank account. Given the lack of infrastructure in developing countries, insurers have to take a different approach, often by enabling customers to benefit from index-based claims that are automatically triggered by defined events. For example, Africa's Kilimo Salama uses automated weather stations to calculate whether it owes customers payments on their crop insurance. If so, it transfers the funds to the customer's mobile phone number via M-PESA, a mobile payments service. Look for coverage gaps in your market—gaps that can be filled with niche products to appeal to those who don't have insurance or those who can be upsold with a valueadded extension to a current policy. Providers in other countries use indexing to determine claims for weather-related events. In India, HDFC ERGO offers a Rainfall Index Policy to farm communities against the potential for drought. The claim settlement is based on a rainfall index collected weekly from an India Meteorological Department station. Claims are settled through an automated process. In the Philippines, two micro-insurance providers also

offer index-based weather coverage. Microensure provides crop insurance to rice farmers against droughts and typhoons. By limiting coverage to the cost of cultivation, premiums are kept to between five and 10 percent of the insured value, depending on the weather station and crop variety. Swiss Re insures farmers against crop damage caused by typhoon-related high winds. Damage is assessed remotely based on the recorded typhoon speed and the distance between the farm and the typhoon track. The policy covers the 120-day period of the crop's establishment, flower, and yield formation stages. Also in the Philippines, Coop Life Insurance and Mutual Benefit Services, or CLIMBS, covers the loan portfolios held by cooperatives and microfinance institutions. Its weather index insurance pays out to client organizations when wind speeds or rainfall in their areas breach predefined levels for their respective regions. CLIMBS' premium rate is 3.5 percent of the covered loan portfolio. The Three Levers of Growth To create and serve new markets, insurers in developing regions have innovatively overcome infrastructure, environmental, and societal challenges. While Western insurers don't face the same obstacles, they can profit from insights gleaned from the developing world—insights that can be described as three levers of growth: Identify unique customer needs. Insurers in developing countries have focused on micro-insurance. Translating this to the West means looking for coverage gaps in your market—gaps that can be filled with niche products to appeal to those who don't have insurance or those who can be upsold with a value-added extension to a current policy. Identify potential partners for bundled sales. Insurers in the developing world have forged agreements to capitalize on customer relationships already established by other businesses. As you assess new niche products and services for your markets, ask yourself what types of businesses can help you market and close agreements through bundledsale arrangements Capitalize on consumer mega trends to simplify claims and disbursements. Insurers in developing countries have tapped trends like mobility to break down barriers in servicing customers. As an insurer in the West, you need to regularly and rigorously examine the potential of all new technologies and trends—and the ways consumers are affected by them—to improve the customer experience and grow your revenue base. Some Western insurance providers already are deploying these levers. For example, a U.S. auto insurance company provides a smartphone mobile app for customers to photograph their damaged vehicle and file a claim on the spot. In addition to increasing customer convenience, the app saves the provider money by reducing fraud and the need for loss-adjuster assessments. In France, an insurance provider acknowledged its market's aging demographic by creating a policy specifically aimed at older individuals. By offering extended coverage for items such as prescriptions, dental work, and hearing aids, it motivates seniors to take preventative actions and engage in physical activity. The product has captured a growing category of customers who were previously uninsured or under-insured. The Insurance Innovator at Work It's all well and good to talk about innovation in other cultures, but how do you translate these ideas into an established way of doing business in the West? The first step is to accept that change is an imperative if you want to reach new markets and refine products to meet your customers' changing needs. There's no ignoring low customer satisfaction anymore. Then you have to break away from old ways of doing business Structuring your innovation and embedding it into a process may sound contradictory at first. But innovation

must be entrenched in your organization or it won't be fast enough to grab market opportunities. Structuring your innovation and embedding it into a process may sound contradictory at first. But innovation must be entrenched in your organization or it won't be fast enough to grab market opportunities. The scope of change that is required is not simple and will take time to accomplish. But time is of the essence. The stagnation of the Insurance industry in the developed world makes it ripe for transformation—a change that either will be driven by forward-thinking legacy providers who prepare for it and act, or by upstart providers who see the opportunity and have the agility to jump on it. The three levers of growth gleaned from innovative insurance product development, sales, and claims processing in developing countries point the way to the coming transformation in the West. You will want to be at the forefront of that change, not watching from the sidelines. Mark Foster Collier is Client Partner – Wipro Limited. Powering the New Supply Chain: Demand Sensing for Small and Medium-Sized Businesses

----- Arcticle source ----- https://www.wipro.com/consulting/powering-the-new-supply-chain--demand-sensing-for-small-and-medi/ ----- Contact Wipro Please fill the required details to access the content The demand-driven business environment spawned by market globalization has strained supply chains to the breaking point. Businesses of all sizes are under pressure to maintain precisely the right amount of inventory to meet customer expectations while simultaneously improving the pace of delivery and keeping operating costs in check. If you fail to meet your customers' expectations, your competitors will win the business. In response to the challenge, large enterprises—including Procter & Gamble, Kellogg, Shell, and Church & Dwight—have embraced Demand Sensing, a no-touch automated supply chain solution that predicts tomorrow's demand based on today's events with a level of accuracy beyond what traditional supply chain tools and processes can achieve. With the potential to remove up to three days of inventory, decrease forecast error by 40 percent, and reduce safety stock by a third, the advantages of Demand Sensing are obvious. Yet, most small and medium-sized businesses have sat on the sidelines of this supply chain sea change, opting instead to restructure their traditional push-pull planning strategies —a costly, complex undertaking that often fails to generate improvements. In our experience, most businesses have been slow to consider Demand Sensing because of the misperception that it only works for major enterprises (i.e., it is costly and time consuming to implement). Yet, by understanding why and how Demand Sensing works in large organizations,

small and medium-sized businesses have the potential to achieve the same or similar benefits. Demand Sensing Basics The traditional Sales & Operations Planning (S&OP) process relies on algorithms that operate in a fairly static manner. Sales orders, stock movements, inventory levels, shipments, returns or other data are fed into systems for sourcing, network planning, production planning, scheduling, and logistics to create a monthly demand forecast. A traditional S&OP monthly forecast might indicate, for example, that the demand for a product will be 1,000 units per week. As the predicted demand fluctuates, the forecast must be manually adjusted throughout the supply chain, and then usually for only a limited number of products/SKUs. Because of the lag time built into the process, the business typically runs a strong risk of having too little or too much inventory against the demand. In contrast, Demand Sensing is an automated process. It records real-time signals from all points in the supply chain and combines them with diverse external business indicators that can include, for example, point of sale data, currency fluctuations and even weather forecasts. Then enormous data processing power and predictive analytics combine to create a kind of artificial intelligence to detect patterns in seemingly unrelated data. The result is daily forecast adjustments that drive informed production and logistics decisions. By automatically adjusting the forecast for every product on a daily basis, Demand Sensing ensures that production is limited to required quantities. More accurate, actionable short-term demand forecasts mean less buffer inventory, higher fill rates, lower expediting costs for labor and materials, reduced production waste, and tighter vendor-partner coordination. In short, Demand Sensing lowers inventory costs, improves product availability, and increases customer satisfaction. Demand Sensing for Smaller Organizations It's clear that Demand Sensing works for large multi-national organizations with make-to-stock operations. But smaller organizations facing similar demand-driven supply chain challenges are just as capable of successfully optimizing forecasts. What most large organizations have that makes them logical candidates for Demand Sensing are: Implementation Options Currently you have a choice of three implementation alternatives for Demand Sensing Deciding among these three options depends on your starting point, your company's strategic goals, and how you measure success. Using a maturity model that evaluates your systems and processes will go a long way in helping you make an accurate assessment and solid decision. We assume that your organization has a single instance, or version, of ERP supporting the supply chain and S&OP process to minimize data errors and connections while ensuring high quality transactional data. But even if that's not the case, the BPaaS implementation option can render this potential limitation moot. Some of the basic issues to consider as you evaluate the implementation alternatives include software and 3 implementation costs, requirements for outside services, internal resources, and operations disruption. There are also ongoing maintenance needs and support costs as well as the cost of integrating this new platform with existing systems. But selecting the best implementation option is just one step. For your project to succeed you must also: As a small or medium-sized organization, you'll probably need the help of an experienced partner to provide an accelerated approach to defining your requirements and specifying the evaluation criteria for a pilot or proof of concept. In a best-ofall-worlds scenario, defining requirements can be done within a few weeks and the pilot project would run from one to three

months. This experience gives you the information you need to ensure that you've developed a solid business case and success factors. With that achieved, you can move into implementation and deployment. Depending on the scope of the project, this could take between three months to a year. With your partner jointly leading the implementation, you'll have expertise in managing any technical, change management, and process compliance challenges. Reducing Supply Chain Uncertainty As increased market globalization continues to pressure supply chains, organizations must step up and embrace technologies that give them an edge over the competition. What better strategy than to have constantly updated, actionable information? Demand Sensing allows businesses to reduce inventory through greater accuracy, and be more nimble in dealing with unforeseen events, such as weather and political upheavals, that can create supply chain volatility and disruptions. Traditional forecasting models can't do that. Demand Sensing supports the process of establishing a platform for integrated planning that enhances visibility across the supply chain while segmenting customers based on expected margin and product profitability. It changes the supply chain landscape, enhancing business decisions that improve profit margins, including facilitating the release of capital that can be invested in other areas. Until now, Demand Sensing uptake has been primarily limited to the world's largest organizations. But the technology can also be a defining advantage for smaller businesses if they have, or can put in place, the right processes and select the appropriate implementation model. The business that has a steady stream of actionable information is the more agile, cost efficient, and better supply chain partner than the competition. How do you enhance the bottom line? In the context of supply chain, you do it with Demand Sensing. =====================

Supply Chain Vulnerability in Times of Disaster

----- Arcticle source ----- https://www.wipro.com/consulting/supply-chain-vulnerability-in-times-of-disaster/ ----- About the Authors Contact Wipro Please fill the required details to access the content While these new business paradigms have resulted in more efficient and responsive systems, the supply chain risk profile has been altered significantly. Many companies have been left vulnerable due to anemic risk mitigation systems, and these systems have yielded to major variations in demand or supply caused by unforeseeable events, both natural and man-made. Caught unaware by such disruptions, these companies have suffered losses of revenue, market share and consumer trust, and in some cases have even faced bankruptcy. Supply Chain Disruptions Can Be Painful In last year's Japan earthquake, tsunami and nuclear crisis, Toyota's operations were affected to the extent that it took over six months before complete recovery was possible. The delay in the launch of two models caused an estimated production loss of over 140,000 vehicles, the company's profits fell by over 30% and it lost its position as the largest automaker in the world. Of course, not all supply chain disruptions are caused by natural disasters. Cisco rode the technology

wave in the 1990's to become the market leader in the network component business, but it had no experience in managing downturns. When the tech bubble burst and demand slowed significantly, the company did not have the capability to track the inventory of products across its geographically-spread supply system. Their systems were designed for high responsiveness, which meant high inventory buffers. Lack of inventory tracking capability resulted in high inventory accumulation which in a bust market led to the eventual write-down of $2.2 billion in 2001 alone. Broadly defined, a supply chain disruption is an unusual spike or steep fall in either demand or supply leading to a huge imbalance between the two. According to Jossi Sheffi, director of the MIT Center for Transportation and Logistics, "The essence of most disruptions is a reduction in capacity and hence inability to meet demand." Companies cannot afford to treat supply chain disasters as 'black swan' events that have a negligible chance of happening. Recent studies suggest that less than 25 percent of Fortune 500 companies are prepared to handle a supply chain crisis and that a $50 million to $100 million cost impact can be incurred for each day a company's supply chain network is disrupted. (Alpaslan, April 2003) As part of a research study on supply chain risk and its impact on equity volatility, Prof.Vinod Singhal and Kevin Hendricks concluded that it could take two years or more for companies to recover from a major supply chain failure. (Hendricks, 2003) What is a Resilient Supply Chain? As illustrated in Exhibit 1, disruptions happen for various reasons and the nature of their impact also varies. For example, a labor union problem can be anticipated whereas a terrorist attack is unforeseeable. Also, the time taken for the impact to be felt differs and is unique to each disruption and to each company. For instance, a fire in a factory can potentially halt operations immediately, whereas the outbreak of an epidemic in a supply zone could have a more subtle impact and will take more time to set in. Companies with a resilient supply chain will be able to anticipate these events better than their peers, and will be able to delay and minimize the impact of the disruption by taking proactive risk-mitigating steps. Following the September 11, 2001 tragedy, U.S. flags, lapel pins and other patriotic objects became extremely popular, but consumers had a difficult time finding them in major retailers like Kmart and Target. That's because Wal-Mart, using its real-time demand tracking and analysis system, responded swiftly to the situation by locking up all the supply resources they could find. Exhibit 1: Categorizing Supply Chain Disruptions Wal-Mart is not the only retailer that knows how to benefit from external supply chain disruptions. Zara, a Spanish clothing retailer, had black clothes on its shelves immediately after the 9/11 events. While the normal lead-time in the garment business is 90 days, Zara was agile enough to assess a market need and respond within five days. Why do some companies do better than others in times of disruption? The answer lies in their ability to detect the disruption and swiftly act on it. While these events cannot be predicted with precise accuracy, their major impacts can be narrowed down to one of five areas: While companies focus on efficiency and responsiveness in traditional "business-as-usual" environments, they should be flexible enough to quickly switch their operation scenarios to adjust for disruptions. A scenario-based strategy for disaster proofing with the focus on impacts of disruptions will not only minimize damage to the bottom line but can potentially help score over debilitated competitors.This is illustrated in Exhibit 2: In Exhibit 2, company B has instituionalized a Business Continuity Plan (BCP) and

invested in visibility systems for early detection of disruptions, whereas company A has not. When a disruption occurs at point T, Company B is able to discover it at point B1 and recover from the disruption rapidly, minimizing the impact of the disruption. Company A detects the disruption only at point A1 and takes a longer time for recovery. Philips was a major supplier of semiconductors to Nokia and Ericsson in 2000 when a fire at a chip plant in Albuquerque destroyed chips for millions of cell phones.When Nokia learned about the incident, they immediately set up a troubleshooting team to assess the full impact of the incident and find alternatives.They rapidly sourced three of the five affected chips from within their existing supplier network with a five-day lead Exhibit 2: Supply Chain Risk Mitigation Framework time. A senior management team from Nokia worked out a deal with Philips to use the latter's capacities in other plants for sourcing the remaining two parts.With these efforts, Nokia was able to make all customer shipments in time. In contrast, Ericsson took several weeks to respond to the situation, and by that time most of the market capacity had already been allocated to Nokia.The impact was devastating for Ericsson, which took a $2.34 billion loss in its mobile phone division, citing not only component shortages, but a poor product mix and marketing failures. Preparing for Supply Chain Disruptions As shown in Exhibit 2, risk mitigation efforts can be classified in three phases: While the strategic vision must take a top-down trajectory, the operational activities need to be implemented from the bottom-up. Based on the efforts required before, during and after the disruption, Exhibit 3 presents a comprehensive framework to build a resilient supply chain: Exhibit 3: Framework for Building a Resilient Supply Chain Proactive Steps:Plan for Disruption Strategic Actions Anticipate Disruption with a Business Continuity Plan Invest in Required Technology Build Resilience through Flexibility Sourcing Decisions Operational Actions Test Your Business Continuity Plan Prioritize Critical Components and Supply Chain Nodes Assess and Monitor Supplier Risk Profile Monitor Your Supply Chain Intelligence   Reactive Steps – Minimizing the Damage Strategic Actions Operational Actions Post-Recovery: Controlling the Damage Strategic Actions Operational Actions The Business Imperative The frequency and severity of supply chain disruptions has increased tremendously in the past two decades of globalization.While investing in supply chain risk management comes at a cost, it is offset by reduced insurance premiums. Besides, companies that have taken steps to mitigate the adverse impacts of a disruption have been able to contain their damages and in some cases have learned to benefit from them.A resilient, flexible, scenario-based supply chain provides a competitive edge during times of major disruptions and is not a choice – instead, it is a business imperative for "best in class" companies. Acknowledgement The authors wish to thank Ms. Charlotte Staf for her creative inputs in designing the frameworks used in this article.

Driving Growth Through Strategic Workforce Planning

----- Arcticle source ----- https://www.wipro.com/consulting/driving-growth-through-strategic-workforce-planning/ ----- Contact Wipro Please fill the required details to access the content The Eurozone's double dip recession has finally come to an end, with the bloc growing slowly through 2013 and early 2014. While the recovery is patchy and core nations are faring better than smaller territories, there are strong indications that consumer confidence is increasing. As a result, now is the time for your business to prepare for growth, including investing in your workforce. In fact, you've got a lot to address. Years of economic stagnation have resulted in: To overcome these issues, you need to focus on workforce planning that strategically transitions your current workforce to meet future needs—and, by doing so, elevates HR into a leadership role in the organisation. Leading Practices that Support Business Strategy and Operations According to APQC, top HR performers spend 20 percent of their time on workforce planning compared to 8 percent by low performers. Since businesses live or die by the strengths Driving Growth Through Strategic Workforce Planning By Robert Staeheli and Gareth Cummins The Eurozone's double dip recession has finally come to an end, with the bloc growing slowly through 2013 and early 2014. While the recovery is patchy and core nations are faring better than smaller territories, there are strong indications that consumer confidence is increasing. 2 of the skills and capabilities of the people who work for them, HR leaders must thoroughly assess their current workforce and understand how they need to develop and evolve their people to meet the demands of facilitating growth while facing increased competition. Certainly most organisations do some sort of planning at some level of detail, but how well do they do it? Successful workforce planning uses a sustainable, methodical, repeatable approach that is recognised and ingrained across the organisation. Successful workforce planning uses a sustainable, methodical, repeatable approach that is recognised and ingrained across the organisation The following six characteristics are keys to HR taking a more proactive leadership role. Do they describe what's happening in your organisation? Getting Started It may seem early in the game if you're still feeling the weight of recession. But, in fact, it's never too early to plan for growth. Your first job is to be clear about what you want to achieve through workforce planning. The challenges will likely include providing innovative ways to measure employee productivity and manage talent costs, developing a more flexible workforce, balancing the cost/risk ratio of in-house versus third-party resources and subject matter experts, and aligning workforce planning to specific functions, such as IT, to ensure you have the right people in place to support future technology. It could also include understanding and preparing your business to deal with a more competitive talent environment and creating a talent pipeline, or elevating HR into the role of critical business partner from supporting player With your goals in place, there are six steps you can use now to set the stage for your plan: The

best workforce planning organisations started small and focused on building credibility first through accuracy and then by providing grounded insights into challenges that matter to the business. But most importantly you need to get started. The best workforce planning organisations started small and focused on building credibility first through accuracy and then by providing grounded insights into challenges that matter to the business. Addressing an Environment of Challenges Over the past several years, many organisations have had to deal not just with the challenges of holding a business together, but also with the recession's impact on employees. Employee torpor is a challenge many businesses face, especially in light of the decline of real wages in relation to the cost of living. HR must take part in re-motivating the workforce, but it needs the right tools and levers to help. As the economy inevitably improves, you'll also face other challenges and risks as you implement your workforce plans. Many older workers who stayed on instead of retiring may feel more financially secure and interested in leaving. You'll be recruiting replacements from a very different generation —and managing the complexities of rapid succession planning. Having said that, we are still seeing older workers stay on the job longer. So, you'll be addressing the needs, cultures, and aspirations of different generations. While you don't want to lose the experience and knowledge your older workers provide, you also need the innovative, creative ideas of a younger generation. Navigating this balance means developing a strategy for how to meld this mix to best meet the company's needs. As the economy grows and more organisations begin to hire, not only will you have the opportunity to pick up talent, your competition will have the ability to do the same. The Internet and social media have made it much easier for employees to learn about workplace culture at other companies. How does your business stack up in regard to benefits, flexible working choices, social and ethical commitments, access to new technologies The best workforce planning organisations started small and focused on building credibility first through accuracy and then by providing grounded insights into challenges that matter to the business. 4 and ideas, career development prospects, and opportunities to innovate, travel, or work overseas? Finally, as mentioned above, if you want the business to view HR as a strategic partner, you must determine how you can provide the business with critical workforce analytics and insights—not just for basic operational activities but also in regard to workforce demographics and forecasting future workforce needs— and the people strategies required to achieve them. Do you have the technology in place, as well as the time and competencies, to accomplish this? Greeting the Other Side of the Downturn As we see a glimmer of light at the end of this vast tunnel— and, yes, it's there—HR is well placed to help lead the business forward to meet new opportunities. Your business relies on the quality of its people, making you the fulcrum of what happens next. You have the ability to revive a diminished, disengaged workforce, cut through the challenges the recession has wrought, and take the initiative in establishing a strategic workforce plan that will help drive business strategy. Growth is coming. Your business can't be caught unprepared. A forward-looking plan that addresses what's just ahead as well as the burst of energy to follow will set the foundation for your company's success and place HR in the position of strategic partner. Get in touch: global.consulting@wipro.com.

Intercompany Reconciliation and Settlement

----- Arcticle source ----- https://www.wipro.com/consulting/intercompany-reconciliation-and-settlement/ ----- Contact Wipro Please fill the required details to access the content Intercompany Reconciliation and Settlement The reconciliation and settlement of a company's intercompany trading balances is a challenge that grows exponentially with the number of subsidiaries. While it's possible to manage a small number of subsidiaries manually, using spreadsheet-based tools or workarounds, there is a tipping point in the growth of each organization that requires a more robust solution. Large multi-subsidiary organizations need either daily or monthly reconciliation and settlement of intercompany balances to satisfy requirements that encompass: Large companies also require a robust solution that is scalable and secure, as well as predictable and affordable. Such a solution isn't available from any of the major ERP or finance software providers, nor is it even in their development program. So an alternative solution is required. This document summarizes Wipro Consulting Services' point of view on a Target Operating Model and roadmap for large global organizations to create a robust solution for the reconciliation and settlement of intercompany transactions. Target Operating Model The Target Operating Model (TOM) is comprised of four integrated components: business processes, organization roles and responsibilities, enabling technology, and data and reporting requirements. They are described below: Business Processes There are two options to consider for the end-to-end process, depending on whether settlement is monthly or daily. These are shown in Figures 1 and 2. Option 1: Monthly settlement of balances In a monthly scenario, the transactions are reviewed and reconciled as part of the month-end close prior to settlement, then reported for group accounts. This approach is better suited to smaller groups with lower volumes of intercompany transactions and data inconsistency. Option 2: Daily settlement of balances In a daily scenario, the transactions are settled daily and reviewed and reconciled throughout the month. This approach avoids a peak in the month-end close cycle, streamlining the reporting for group accounts. This approach is better suited to larger groups with higher volumes of intercompany transactions and data inconsistency. Figure 1: Monthly Settlement of Balances Figure 2: Daily Settlement of Balances Intercompany Trading:This is 'business as usual' trading between subsidiaries using standard P2P and O2C processes but specific intercompany accounts, with liabilities recorded in Accounts Payable or debts being recorded in Accounts Receivable. Pain Point: All data must be correct at the time of entry to enable zero-touch/no rework at the reconciliation and settlement process. This includes standard intercompany vendor/client IDs, currency rates, payment, and trading terms. Failure to establish data standards and trading terms before processing will result in an expansion of the teams required to resolve exceptions. Extract Intercompany Transactions: Transactions are extracted from the subsidiary

ledgers and posted to the solution. Pain Point: It is unlikely that one method of sharing transactions will suit all subsidiaries due to size, volume, local regulations, and the like. Consequently, we recommend three different methods to create options that should reduce resistance to adoption: Settlement Processing: The solution generates settlement transactions, which are payments from the customer to vendor, when the due date is reached for both trading partners. These payments will result in realized currency gains and losses which should be accounted for (separately from any intercompany profit) in the accounts of each subsidiary. The duration between the date of the original transaction and subsequent settlement provides a window for currency forecasting and hedging. Reconciliation: Transactions in the solution are balanced and reconciled monthly using automated routines that report exceptions only. These intercompany balances should also be reconciled to the Group Reporting values at the end of each month. Pain Point: Automated reconciliation is required to enable a scalable solution so that transaction volume increases avoid a linear relationship with support team size. Dispute Management: Disputes can be raised manually by trading partners and manual transactions can be applied to resolve disputes. Since this is a manual process that consumes skilled resources, it should be used sparingly. Reporting: Intercompany balances for group consolidation can be loaded into reporting systems or reconciled with subsidiary ledger balances prior to consolidation. Exception and data integrity reports should also be available to enable rapid resolution of any discrepancies. Additional setup and governance steps are required to: Organization Roles and Responsibilities For the Target Operating Model to work effectively, there must be strong governance and a clear understanding of the roles and responsibilities held by those who set and direct strategy, those who establish the processes, and those who actually run and support the system, as well as their relationships with one another, as shown in Figure 3. Governance Board: This organization has global responsibility for the strategic fit and direction, policy, compliance, and change control, as well as management of the governance framework. Global Process Owner: The Owner controls process refinement, roll-out, data compliance, dispute resolution reviewed and reconciled throughout the month. This approach avoids a peak in the month-end close cycle, streamlining the reporting for group accounts. This approach is better suited to larger groups with higher volumes of intercompany transactions and data inconsistency. Figure 3: Organization Roles and Responsibilities manages the change board, leads issue resolution, SLA exception resolution, and financial close compliance. IT Application Owner: The IT Application Owner ensures smooth running of the system, ownership of the Support Model, upgrades and improvement execution, issue resolution and testing, maintenance of SLAs, and reporting performance to other teams Finance Processing: The responsibilities include initiating intercompany transactions, compliance, reference data setup, assisting with issue resolution, and testing by shared ser vice centers, accounting units, and subsidiaries. IT Support Team: IT Support Team's responsibilities include issue tracking and resolution, performance monitoring, system tuning, integration, and interface management. This element of the organization could be delivered as an offshored managed service. Other IT Support: This can include providing assistance with issue resolution, upgrades, and testing. Pain Point: Transaction values are expected to be very high and there can be realized gains or losses even with

intercompany transactions (for example, missed hedging settlement dates). It is also likely that this application will feed directly into group reporting. Consequently, the entire support network must agree to the priority given to issue resolution and blackout dates for changes. Enabling Technology There are two basic assumptions that must be acknowledged. The first, as we stated previously, is that no off-the-shelf application can satisfy a multi-national company's unique process, organization, and information requirements, so a custom solution is required. The second is that because reconciliation and settlement is a basic accounting function, performed by all multi-nationals, the objective is to have accurate, efficient processing at low cost with no product or strategically sensitive information being shared. With these as givens, technology must be developed that effectively, economically, and discretely fulfills specific business requirements. At a high level, there are two key non-technology questions to be decided that will require technology solutions: 1. How will the solution be delivered? 2. How do we accommodate the multiple subsidiary systems and data formats? The delivery options that follow will help determine the highlevel design and the full-life cost of the solution: The approach for normalizing subsidiary data and extraction to avoid secondary processing includes the following, which will help determine the implementation and support costs of the solution: 1. The technology selected for this solution (Java, HANA, Oracle, etc.) does not need to match the current or future corporate IT strategy, but does need to match the capabilities of the subsidiaries within each organization. 2. Subsidiaries may use alternate ERP systems or previous releases of 'core' systems. The solution should be able to overcome the need for widespread system and data rationalization but should support that change, if selected. Pain Point: It is unlikely that a single method of sharing transactions will suit all subsidiaries due to development plans, system and data constraints, and the like. Consequently, three different methods are recommended to create options that should reduce resistance to adoption: 1. Manual entry directly into the application   2. Semi-automatic transaction extract and posting to a mailbox   3. Fully automated extract and data load with controls and exception reporting 3. Intercompany vendor and customer IDs may also be different among subsidiaries, which may require either: a. A prerequisite Master Data Management project to establish and maintain standard intercompany vendor IDs in all subsidiaries or b. Include mapping tables to be maintained in each subsidiary. Regardless of the above variables, because the solution requires global access, we believe a resilient web or cloud-based solution would be most appropriate. Such a solution would require three layers: Application Layer: Including security, user profiles, transaction processing and controls, reporting, and so forth Web Layer: Including GUI, security, communications, interface processing, and controls Database Layer: Including data management, data integrity and other controls, as well as reporting Data and Reporting Requirements Because the data integrity and accurate reporting are at the crux of reconciliation and settlement, and because they are the primary drivers for the business process and technology design, as well as organization roles and responsibilities, information requirements should be established at the start of the design stage and reviewed throughout the implementation. The data requirements include: Pain Point: Failure to involve all information providers and users and failure to agree on requirements in the design stages will result in expensive rework and reimplementation at a later date.

Roadmap The Target Operating Model is your basic schematic for your solution. But how do you implement it for your organization? A program of this magnitude will require the involvement of multiple stakeholders and changes to business processes and roles. To launch your solution effectively, you need a roadmap that details key steps and the people and teams involved. Before considering the Target Operating Model, a small senior team should be convened to identify the fundamental shape of the proposed program. It should address: With these basics established, you then need to dig deeper and make several strategic decisions before the program roadmap can be defined in detail. These decisions include: Internal or Hosted Solution:The solution is going to operate in a similar way to UK BACS, processing payments between corporate entities. Would you want a similar solution for managing your organization's intercompany payments? What is your organization's risk response for outsourcing payment processes, especially to processes that will transact billions annually? Internal or Outsourced Development: Do you have a development team with scope in the near future to develop a solution? Do you have the organizational capacity to lead and staff a project of this magnitude? Availability of Existing Functionality: Some components required for the reconciliation and settlement of intercompany transactions may already be available in the organization, such as auto-reconciliation tools like Chesapeake and Blackline or Treasury and payment applications. These assets can be utilized to perform specific functions and can be integrated into an overall solution. Once these major decisions have been made, your senior team should appoint a program management team to define the program as shown in the roadmap below. Pain Point: There will be a step change in knowledge, skills and experience required when the program moves from Identifying to Defining. It is a common error for inexperienced program teams to underestimate the resource requirements as well as the level of detail required in the Target Operating Model and in the project plan. Failure to address the full project lifecycle and prepare a detailed vision of the future will result in unexpected over-runs, cost increases and solution gaps. One option is to hire a Solution Integrator with experience of both the business process and largescale development and business change programs. Figure 4: Roadmap At a high level, a combination of program and software development lifecycle management should be applied and follow the roadmap shown in the Figure 4. Conclusion While accounting for intercompany reconciliation and settlement is not complex, establishing a solution that is accurate, costeffective, and manageable across a number of subsidiaries has proven to be a common problem faced by large multi-nationals. By adopting this Target Operating Model, organizations now have a basis on which to develop a custom solution that addresses all their pain points. Fortunately, the lack of complexity in this type of accounting simplifies communications and later adoption. And, since several components of the solution may already be used within your organization, it could reduce the potential cost of a solution and may also help drive its design. With a model in hand, you'll be better prepared to develop the basics of your vision for a solution and the roadmap to implementing it. Remember, your key decisions that will determine the cost, scope and duration of the program include whether you want to own the solution or have someone else host it, and whether you want in-house or outsourced support for the solution. At a time when your organization is wrestling with a host of

business issues around product or service development and sales, managing costs, and optimizing profits, the last thing you need to be distracted by is intercompany reconciliation and settlement. This should be a part of the business that is humming along smoothly. With that key issue resolved, you'l contribute to the success of a more competitive business. The Origins of Origin's Transformation

----- Arcticle source ----- https://www.wipro.com/consulting/the-origins-of-origin-s-transformation/ ----- Contact Wipro Please fill the required details to access the content From Traditional Utility to Energy Retailer Origin Energy is one of Australia's leading energy companies, exploring, generating and retailing energy throughout Australia, New Zealand and the southern pacific region, with some 4,000 employees. In 2008, Origin Energy's Retail business found itself at a crossroads. The company had certainly been growing over the past 10 years, primarily as a result of a series of acquisitions, to become one of the top utilities in the country with three million customers and some 1,400 employees and contractors. It had 20 percent market share and was the most profitable of Australia's energy retailers. But, deregulation in the mid-1990s meant it was dealing with new competition and several years into a new century the utility was still employing a very traditional way of doing business with customers that included door-to-door sales calls. Origin's customer churn was significant; they were effectively replacing their customer base every four years, according to the Retail General Manager Phil Craig. They recognized the need to grow organically, not through acquisition. That meant they needed to be more customer-centric and expand their product portfolio. In short, they needed to be a more entrepreneurial organization. Their strategic goals were to grow earnings, make Origin Australia's most respected brand, and assist their customers in reducing carbon emissions. Previously the organization had launched a CRM upgrade to help them add more customers, products, and services – but the upgrade did not deliver all the capability required, causing tremendous organizational pain for another 18 months. Not only did this make it difficult internally for Origin's employees, it created poor customer service delivery and couldn't support innovation. Origin's management realized they either had to make continued investments in their existing system to fix it or look for another solution. They opted for a new solution but also came to realize that hand-in-hand with that new solution they needed an organizational transformation that would align the new technology platform with a new operating model and together deliver the desired 'future mode of operation' they sought. Through an involved selection process, Origin chose Wipro to partner with them to achieve these goals. Picking a Partner Initially, Origin's management focused on a new system platform. "Three years ago, it occurred to us that we needed to do something about the technology architecture," recalls Craig. "Our systems didn't talk to each other, we had no single view of our customers in our call centers, and it was costing us

money. We wanted to behave like a strong competitive retail business and we looked at our core competencies and realized we didn't have the actual resources to address sales, marketing, and customer management. We started looking at a new system platform but realized we had the cart before the horse and needed a partner." According to Nazzareno La Gamba, Origin Retail's Strategy Executive, one of the reasons the company embraced Wipro was their focus on continuous improvement, innovation, and organizational cultural fit. A partner who they could trust with the employees they would be transferring; a partner to challenge and evolve their thinking and enable their transformation; a partner to manage and deliver the systems platform. Origin's search began in earnest in February 2008 and eventually they narrowed their choices to three providers, which led to WIPRO being selected as the successful partner and SAP as the technology solution. According to Nazzareno La Gamba, Origin Retail's Strategy Executive, one of the reasons the company embraced Wipro was their focus on continuous improvement, innovation, and organizational cultural fit. The attraction of SAP was that their solution would provide an integrated platform, and as Felicia Brady, Origin Retail's Executive for Capability and Change, points out, "Our pain came from a lack of integration and SAP solved that problem." But, even more important, say each of these executives, the choice of Wipro was the values and cultural fit. "We felt if things got tough, Wipro would want to negotiate with us and find a solution together," explains La Gamba. 'It was more of a partnership type of arrangement we were looking for, instead of just a supplier. We felt we could work with them and it would be a mutual partnership in the long term that would benefit us." Mark Sherratt, a Wipro partner for energy and utilities business transformation, has been the project's lead consultant and recalls that they also had a different approach to the bid than their competition. "We were prepared to go in and do transition work prior to doing the transformation," he notes. "Others wanted to do the transformation first but we wanted them to see some initial benefits as soon as possible. Our advantage is that, to us, transforming an organization when in a global model is not a big issue. We're already a globally distributed company." So shifting low-risk jobs first would give Origin immediate tangible benefits. First, the Transition The transition lifted about 30% of Origin Retail's base of 1,400 employees and contractors and transferred them to Wipro. These were primarily back office processing positions in billing and cash collection. Wipro now looks after account set-ups, billing and credit issues. The project came in on time and within budget. "Our task for the first year was huge – to complete the transition seamlessly, locating the employees to locations in Adelaide and Melbourne," says Manoj Varier, Wipro's Account Director for the Origin account. "It's been very successful and is considered a huge achievement." Craig agrees. "The process went very well, it was a smooth transition and we had external stakeholders here who hadn't realized we had outsourced, which is good," he says. In fact, notes La Gamba, "We were worried about problems with unions and staff, but it went very smoothly. That gave us a lot of confidence that Wipro had the ability to deliver and we realize now that is one of their core strengths." Then the Transformation Essentially, Origin was taking two linked journeys. One was the IT project, the other was business transformation. With the transition underway, Sherratt led Origin's management through a series of workshops that challenged their thinking across business vision, brand and employee

values, customer and product strategy, operational and service excellence drawing on best practices from their local competition, global best practices in energy retailing, and best practices in the telecom, retail and retail banking industries. "Together we identified and prioritized 11 key capabilities for retail," Sherratt explains. "From there we agreed on an achievable set for them and jointly identified the competencies needed achieve those capabilities." Some, he points out, were obvious. They needed to build on their continuous improvement activities, implementing a broader Six Sigma program. Origin needed a stronger focus upon credit risk management; and they needed deeper customer insight, differentiated service management, and improved customer advocacy so they could understand customer issues and solve them more effectively. Additionally, the Wipro team worked with Origin to develop key metrics to drive the new operating model. The define phase of this process took about three months, followed by seven months of design integrated with the 'SAP blueprinting' activity on the systems project. "The part of the work that Mark did in leading the design phase was valuable," says La Gamba, "because for the first time we were able to step back and tackle key strategic pieces. We realized we needed to change and Mark was the catalyst." "We were an organization that was product-led and we needed to make a shift to being customer-led," La Gamba continues. "We would build products and find customers to sell to instead of identifying customer needs and building products to those needs." So, he explains, customer segmentation has changed. It's now based on seven behavioral groups around which quantitative research is done on their needs today and in the future. Product development is now aligned with each segment. The segmentation has also helped Origin profile high-value customers to grow their share of the market in that base. These could be customers who are young families whose consumption would grow over time, customers with an interest in green products, and those who want premium services. For Craig, the design workshop process was critical in that it forced management to stop and think deeply about what they were trying to achieve, instead of just writing out requirements and leaving it to Wipro to build them for them. "It's fed into marketing, sales, operations groups, and segment strategy," he says. "It was a watershed pause in the process that we had our thinking right before launching into the doing and the building. Wipro challenged our thinking but enabled Origin to drive the approach. We could own it. It was a really strong contribution to get Origin to get our own thinking around what we want to do. And that's why it continues to evolve. The workshops drove the way we shaped our culture and our skill development. It's behind how we approach brand, customers, and the link between technology and business outcomes. The legacy will be there for years." A New Platform for Change For all these new transformative concepts to be a reality, Origin needs an IT platform that supports them. That part of the project is still underway and is expected to be completed in the summer of 2011. "This is a world-class system," Craig says. "The SAP solution meets our current needs and we understand they will continue to invest in R&D to drive innovation through their technology, which fits well with our aspiration of growth and innovation. Craig recalls visiting SAP's Melbourne offices and the quizzical response the presenter had when someone asked a question about how data changed as it went through the system. "He didn't understand the question because data never changes, never corrupts or is inconsistent. Everyone there looked at each

other and thought, 'We could go one way and get flexibility or we could get data integrity'. We loved that." The SAP system essentially was developed around Origin's customer service strategy and business processes. A critical component has been the customer self-serve function that will allow customers to manage their accounts and their products and services. Not only will this reduce Origin's cost to serve but it should satisfy customer needs, enable different service levels for different customer segments, and provide customer insights to Origin as they manage customer service and build new products based on customer needs. The SAP system is built and is now undergoing several phases of testing. They have planned for phased releases, and according to Varier, that's when most of the work from the product perspective will finish. The plan is to train all staff not only on the new system, but on processes, so they have a better understanding of the business and the customer experience. "That's the biggest piece of work that's picking up steam now," he says. "We're close to the original schedule and budget, which is almost unheard of," Brady notes, "for projects as large and complex as ours."La Gamba estimates it will be 18 months before Origin starts to see churn benefits. "Once the technology platform goes live, our focus remains on stabilizing the new platform and getting our people comfortable with the new system, and then we'll be able to accelerate our strategy of delivering new products and propositions to our customers. Right now, our focus is on completing testing successfully and getting ready for implementation." For Origin Retail's General Manager, the process began with fixing an unintegrated legacy system and ended up as a revolutionary step for the organization that is turning them into a 21st-century retailer to reinforce a brand that is becoming synonymous with innovation and sustainability. By this time next year he expects the new platform to be up and running, their people trained and confidently using the new systems and processes. "We've changed our structure and changed our culture," says Craig. "We're going to move into an Origin-dedicated building configured to support our culture instead of being spread out. We're touching every part of retail. Every person and the way they do their job day to day will be impacted by this transformation. I'm looking forward to when we'll have everything in place to look into a new world and be a leader there as well." For Kirk Strawser, Wipro's Global Head of Consulting, the Origin engagement is an endorsement of the step change in capability that the consulting group has brought to Wipro over the past three years. "The surprise factor will be the transformational piece," he says. "It's not what we're expected to do. We both modified the SAP solution and targeted a future mode of operations for the customer. It's a rare example of doing the most complex type of transformation. We can help our customers to change the way they do business." =====================

Partnering for Success:

Transitioning from Shared Services

to Global Business Services

Most large enterprises have adopted Shared Services to extract significant savings from their operating expenses. Yet, as the model has become part of the business mainstream, the sharp competitive edge it once provided has dulled. When all of your competitors are using Shared Services to drive out costs, where is your leverage? Moreover, many companies have reached the point of "diseconomy of scale," where the cost of removing expenses exceeds the value of the reduction. Others have found that dramatic decreases in cost structure have limited their ability to develop new products, expand to new markets, conduct M&A activities, or support their risk and compliance requirements. Global Business Services, or GBS, is a philosophy supported by an operating model that seeks to extend the value from Shared Services beyond traditional cost reduction. Evolving from Shared Services to GBS can help you broaden strategies to support top-line revenue growth, improve customer retention, and fuel product development. In short, it can help you recapture your competitive edge. The Competitive Limits of Traditional Shared Services Shared Services functions provide a range of benefits, but the overriding one is cost reduction achieved by consolidating and standardizing back-office processes in a low-cost delivery center. Over time, the model has seen changes, but the driver has always been the same— addressing costs through standardization, simplification and/or labor arbitrage. Given the nature of the work, Shared Services functions accrue abundant transactional, customer, and product data— data that traditionally is used almost exclusively to cut costs. With GBS, however, this wealth of information is used more creatively and productively. Consider the maturity curve illustration on page 2. The baseline for the curve is Functional Shared Services, which focuses on transaction centralization and standardization of a single back-office function, such as HR, F&A, or Supply Chain. At Level Two, Multiple Functional Shared Services leverage the investments made in single-function Shared Services by taking on additional back-office functionalities. At Level Three, the Shared Services organization is integrated into the company's value chain and begins to focus on creating value from its cache of transactional data in a work culture of continuous improvement. This is the essence of GBS. While this evolution is natural and logical, it doesn't happen with a snap of the fingers, which is why most companies have yet to make the transition. Adopting the GBS philosophy of leveraging more value from Shared Services is a start, but you must also

adapt your operations—people, processes, and technology—to create an operating model that supports value enhancement. That means employees will need to be trained to analyze data gathered during the processing and turn it into insights that will create actionable information. Processes will need to be designed to capture key value-add transactional data, and supporting technologies must have an enterprise focus that results in reports and analytics that give business managers new decision-making insights. Capitalizing on GBS So, how can an organization rekindle a competitive advantage with data previously used solely to measure and cut costs? There are four key areas where GBS can have an impact: customer, vendor, employees, and reporting. Let's look first at the customer dimension. Your Shared Services organization collects a tremendous amount of information on customer payments—data that traditionally is used to create transactional cost efficiencies such as the number of accounts receivable issues that are resolved on a monthly basis. But that data also holds beneficial clues to customer behavior. Consider the case of a key customer who experiences a temporary setback and begins to show a pattern of late payments. Insights gleaned through the GBS framework would allow you to proactively offer a customized payment schedule to help them more effectively manage their working capital until their situation improves. Delayed payments would stop, a confrontation over billing would be averted, and the business relationship would be enhanced for the long run. Regarding your relationship with vendors, consider a scenario in which you have an urgent need to increase your regular order of components manufactured by a small strategic vendor. Perhaps you have a 60-day payment cycle that wouldn't give them the cash on hand to expand capacity, which would put you at risk of not meeting the market demand for a key product. By leveraging the GBS framework, your data analysis can identify options to help your vendor and reduce your risk. One option would be temporarily adjusting the pay cycle to 45 or 30 days to provide more working capital. In the context of the company employees, adopting a GBS mindset can help HR manage recruiting and retention more efficiently and lower the cost of business. By analyzing the collected transaction data, along with established industry data, your HR function now has useful information to drive strategy development aimed at talent retention. Your HR function may find, for instance, that salaries aren't the sole driver; other perks, like telecommuting or working off site, may stem defections. Finally, GBS can improve the reporting experience dimension by leveraging the wealth of data collected to develop on-demand reports and analytics with drill-down capabilities. These reports and analytics could be used to not only manage the day-today activities of running a business, but could also be utilized to satisfy regulatory and statutory requirements without having employees spend an enormous amount of time sifting through data to manually generate reports. In essence, GBS functions become more of an advisory service and part of the organization's ecosystem instead of merely serving as a transaction-processing engine Adopting a GBS Ecosystem GBS can be deployed with a pragmatic pilot test prior to being rolled out in a controlled phased-in approach. You'll start by targeting a specific area within your organization and developing a realistic business case and transformation strategy. Start with an area over which you have the most direct control, like your supply chain, which also happens to be rich in data. For example, you could task your GBS team to assess your supply chain data to uncover

intelligence on your sourcing patterns and projections, supplier behaviors and conditions, including their financial health, their ability to help you meet market demand, and their product reliability. That takes us to some high-level steps you should take to adopt the GBS mentality. Clearly, this transition can be complex, as long time expectations shift and dynamics change. It likely will require the help of a third party to see you through the process so you reach your goals. Partnering with an Eye Toward Revenues Today, it's no longer enough to keep scratching out new ways to reduce costs. It's time for smart growth. You already have the fundamentals, but you haven't been using them to their full potential. If you're looking for a competitive edge, you'll find it in the GBS philosophy and framework, which takes data you already have and translates it into actionable information throughout your organization's ecosystem. Evolving your existing Shared Services into Global Business Services morphs the familiar face of cost cutting into a new mechanism that can power your top-line revenue growth, customer and employee retention, and product development. Get in touch: global.consulting@wipro.com. =====================

Agile Change: The Key to Successful Cloud/SaaS Deployment

----- Arcticle source ----- https://www.wipro.com/consulting/agile-change--the-key-to-successful-cloud-saas-deployment/ ----- Contact Wipro Please fill the required details to access the content The rapid adoption of Cloud/SaaS is upending traditional enterprise resource planning for IT. Cloud/SaaS has accelerated development cycles, increased innovation, and reduced costs. But it has also created significant challenges It puts the business in charge with a clear responsibility to achieve a return on investment. But when new IT solutions move from concept to rollout in weeks rather than months or years, the anticipated benefits can be significantly delayed or lost if users aren't brought up to speed quickly. Successful Cloud/SaaS adoption starts with three required changes in the way your organization thinks: Change Management is a key discipline that must be applied in order to obtain the many benefits of Cloud/ SaaS. Without it, those benefits may be lost. The key to success is Agile Change. Agile Change In our experience, a specific change approach is required, using techniques and interventions that support fast-cycle change and can deliver measureable benefits over traditional methods, as shown in Figure 1. Reaping these benefits requires Change Agility—the ability of your organization to be flexible, adaptable, and able to operate in a state of constant flux. Change Agility is built on five principles that guide the way change is managed: 1. Use Business Engagement to Create Early Momentum The promise of a new IT deployment creates a high sense of anticipation, but interest starts to erode when the process spans six months or more. One of the strengths of Cloud/ SaaS application development is its short concept-to-deployment timeline. You can use this timeline advantage to create momentum among user

groups that will support positive anticipation, user readiness, and high levels of adoption. Figure 1: Benefits of Cloud/Saas 2. Embrace Peer-Based Learning Systems You'll benefit from your new systems only when a critical mass of employees can work with them effectively while adapting to the continuous learning curve that Cloud/SaaS requires. To reach that tipping point, each new system must be intuitive and easy to learn quickly. You can achieve this with the knowledge exchange and support experienced between peers, as shown in Figure 2, which illustrates the desired agile adoption path in contrast to a typical ERP implementation. Intuition and peer support won't be enough for everyone, which means you must develop a users' learning platform that's tailored to suit different groups. This can be in a classroom or via online webinar classes or tutorials. Your learning platform can also include vendor forums in which your employees can get assistance and tips. Vendor forums can be two-way, providing a unique channel of influence over vendor development priorities. You'll benefit from your new systems only when a critical mass of employees can work with them effectively while adapting to the continuous learning curve that Cloud/SaaS requires. 3. Adopt Agile Change Methodologies to Support Increased Rate of Change Another advantage of Cloud/SaaS is that the reduction of typical time and cost barriers can drive faster business evolution. But your business has to keep process change in sync with the new, accelerated system upgrade path. This is supported by agile methods that include constant feedback and learning, more frequent smaller releases, user pull at each stage instead of a central project push, and creating a highly collaborative work environment. The shorter the feedback cycle, the faster you can adjust to the customer's need, eliminating the time required to build features that aren't needed. Figure 2: Adoption Curve The Agile Change approach will follow the same principles by creating a learning environment in which the prototype can be developed with input from a wide range of stakeholders and access to the necessary technical expertise. Using workshops that engage stakeholders in each part of the process will result in a solution that is designed to achieve your specific business outcomes. This will happen in a series of iterations, as shown in Figure 3. The first iteration creates a prototype that helps each user group understand the impact on the organization and individual roles. Subsequent iterations capture core requirements and good practices, while the final iteration addresses issues uncovered through testing. Figure 3: Agile Development Cycle Effective communication with staff and between groups of staff and those running the program is essential for this type of iterative development to succeed. A good way to establish and encourage good communication is by mastering blogs, forums, and other online channels. 4. Treat Change as a Core Capability With Cloud/SaaS, the old project mindset is no longer relevant, and business leaders must learn to manage change as an ongoing process. The business must develop the ability to maintain a consistently high and successful pace of change. You can accomplish this by creating a change function in the organization—one that establishes the roles, processes, and tools needed by each part of the business to work through the change cycle. For example, there are five fundamental change roles: With Cloud/SaaS, the old project mindset is no longer relevant, and business leaders must learn to manage change as an ongoing process. While these roles aren't new, they must be embedded in the organization centrally and at the local level to align the business with the ongoing upgrade and development program.

Filling and sustaining these roles may pose a resource challenge for many organizations, so working with an external partner who can provide the appropriate tools and resources can provide a long-term solution. 5. Encourage Collaboration to Maintain Alignment and Make Change Stick The rapid pace of change, freedom from traditional central IT constraints, and local business ownership can cause initiatives to overlap or be poorly aligned across the enterprise. To avoid this, decision processes are needed during and after the deployment to balance local opportunities with central benefits. Traditionally this balance is achieved through a project management office with rules, standards, and compliance reviews. In this new agile environment, harmonization and alignment are realized through collaboration rather than a single decision authority (although central decision-making and coordination roles are still essential). There are three ways you can support collaboration: through forums that quickly spread best practices and better ways of working across business areas; through knowledge management systems that make it easy to publish and share resources; and by developing a culture that seeks collaboration and alignment rather than independence. Agile Change as the Underpinning of Success Cloud/SaaS is facilitating a new approach to using and upgrading software and applications. The rapid pace of development and implementation and its constant iteration have significant implications for business. It can reduce costs and increase innovation and, thus, competitiveness. But if your business isn't prepared for the speed of this new environment, you won't capture the value. Agile Change can help ensure the viability of Cloud/SaaS by creating a transitional path and instilling a culture of constant confident adaptation to change. By adopting the five sustainable levers of Agile Change, any organization can enjoy a greater return on investment Get in touch: global.consulting@wipro.com. =======================

Build it on Blockchain: A sustainable

palm oil industry

----- Arcticle source ----- https://www.wipro.com/consulting/build-it-on-blockchain-a-sustainable-palm-oil-industry/ ----- About the Authors Contact Wipro Please fill the required details to access the content The production of palm oil has risen to unprecedented levels in the past decade to meet its consumption demand. As a result, there is a great deal of public scrutiny into its use, environmental impact, and the sustainability of its supply chain. The industry's initiatives to address growing concerns by developing sustainability benchmarks have made some headway. For example, the Roundtable on Sustainable Palm Oil (RSPO)1 works to implement best practices in production and trade, while leading brands have pledged to be committed to 100% RSPO-certified palm oil and oil products. However, despite their best efforts, only 17% of global palm oil production is certified sustainable.2 In reality, the supply chain is still relatively opaque, making it

hard for regulatory bodies to ascertain whether a producer is genuinely sustainable and for consumers to know they are buying ethical products. There is no foolproof system to trace back the produce to the plantation, and traceability is still in its infancy – and in many cases almost impossible. However, there's good news for producers, regulators, and consumers. Emerging technologies like blockchain could have a transformative impact on the palm oil industry – not only by creating near-perfect transparency in the supply chain but also creating value for its stakeholders, both upstream and downstream. Blockchain to the rescue The financial services industry has already embraced blockchain technology to create more transparency in its transactions and reduce leakages. What's more, there is a precedent for the use of blockchain in building sustainable supply chains. British technology platform Provenance piloted the use of blockchain to bring greater transparency to the controversial tuna fishing industry so that the entire sourcing process – from farm to table – was visible to every stakeholder in the supply chain. We believe that by 2030, the use of blockchain combined with smartphones, RFID, IoT networks, and mobility applications could create a palm oil trading industry with near-perfect sustainability records. While we may realize this vision earlier, there are real technology adoption challenges in palm oil-producing countries that must be factored in. What is a blockchain? Simply put, a blockchain is a tamper-proof, encrypted database that resides with every participating entity – or node – in a value chain. Each of these nodes contains precisely the same transaction records – be it the farmer, producer, transporter or buyer, every transaction in the value chain will exist in every node. Transaction data is encrypted and stored in containers of information called "blocks" which are pushed out across all the nodes. A blockchain can also embed business rules, known as "smart contracts" into the system that apply "if this, then that" logic, making actions free of human arbitration. Building sustainability on Blockchain Blockchain finds an astute place in the palm oil supply chain, where it is capable of closing current gaps in transparency. Exhibit 1 shows the concept of how a digital layer can shift the value chain into a sustainable digital supply chain with an audit trail that runs from end to end. Exhibit 1: Sustainable palm oil supply chain supported by Blockchain technology A plantation worker (1a) tags the fresh fruit bunches to the palm tree using a mobile device. Information such as the tree's location, plantation identity, worker identity, date and time harvested, and batch ID can be captured and uploaded into a blockchain application in near real-time. Blockchain can support the registration process for compliant plantations, which can then be used to check the geolocation data of the harvested fruit bunches (1a & 1b). This not only provides an unprecedented level of transparency, but also contributes to protecting the working conditions and legal employment of field workers, and gives plantations rich data on crop harvesting. Thanks to digital maps with geolocation features, farmers, governments, certification authorities, and producers can maintain digital inventories of the plantations, and implement sustainable land usage planning policy. Another primary concern that blockchain can address in the supply chain is to minimize the spoilage of oil. Palm oil has a propensity to rapidly oxidize or hydrolyze under sub-optimal storage and transport conditions (2a, 2b, 3 & 4). Both these reactions – activated by high temperature, moisture, or impurities – can increase the contents of Free Fatty Acids (FFAs) in the oil, which could prove to be hazardous for human consumption. With blockchain

and IoT-backed sensors, transportation companies can monitor temperature and humidity during processing, storage, and transport, and integrate the data on a blockchain to record out-of-range instances, thus efficiently identifying poor batches. Blockchain's smart contracts can then enforce rules that automatically grade products in a way that only those that meet the highest standards enter the market for human consumption. Similarly, in the palm oil's multimodal transportation chain, shipping companies could use tamper-proof GPS-enabled seals to lock containers, and mobile devices to record product shipment information in the blockchain application. Once the shipment reaches the destination, only authorized personnel can access the credentials from the blockchain application to open the seal and start the receiving process. Finally, retailers can (5) present the end product with identifiers such as RFID, NFC chips or QR codes, enabling buyers to view the oil's journey back to its source. In the age of the environmentally aware and health-conscious consumer (6), this level of transparency will usher in a new era of trust and brand loyalty that is of great value to companies in a competitive age. Addressing challenges to implementation Despite blockchain's many benefits, there are several hurdles to building a truly sustainable supply chain. Some of the prevalent challenges are: Adopting the following four-step approach could potentially address many of the implementation challenges: We anticipate that our aspirational timeline to 2030 will shorten as trust and understanding of blockchain technology deepens, and new enabling technologies emerge to make it easier for users to adopt blockchain, even in the most remote locations of palm oil-producing countries. A business architecture primer

----- Arcticle source ----- https://www.wipro.com/consulting/a-business-architecture-primer/ ----- About the Author Contact Wipro Please fill the required details to access the content A business architecture primer Architects who work in the built environment understand that planning is the foundation of design, development and building construction. They rigorously assess current conditions and document their plans to avoid costly construction errors. Likewise, business leaders should implement holistic business architecture as the firm foundation for change within their enterprises. In a business environment, architecture provides a framework for leaders to plan organizational changes and future initiatives, ensuring that their business works holistically towards a unified goal. Without recording business architecture, how can any requirement for change be correctly assessed? As a result of mergers and acquisitions and process offshoring, a business' subject matter experts can often be left believing they have the knowledge to assess and implement change when, in fact, these new structures and processes are no longer fully visible to them. A clear business architecture policy ensures that employees can consistently produce and manage artifacts across the business. It also provides

employees with structural transparency, a granular view of interactions between areas, services offered, and controls in place. Employees can benefit from accessible business architecture at all levels of the business, and for multiple purposes. For example, a business architecture review will highlight where disparate parts of an organization undertake the same process, offering significant opportunities for both process and system optimization. Who benefits from business architecture? Employees at every level of an organization can use clear and accessible business architecture in multiple ways: Senior managers may be held personally liable for operational issues and can analyze business architecture to identify gaps in control frameworks. They can plan future initiatives in a more informed way when they have full visibility of their organization's business architecture. Managers are likely to have visibility of their business structure, but within large companies that operate in siloes, they have no unified visibility into the specific responsibilities and activities performed by disparate teams. Often, they may make assumptions based upon the names of teams; but with processes split across locations, they are unable to see someone's specific responsibilities. This can lead to multiple teams duplicating processes, or inconsistent processes evolving across regions. Without a clearly defined and managed business architecture, there is no way to ascertain whether this is the case within your organization. Subject matter experts are repeatedly approached by business analysts who request details of current processes relevant to their project. This is not only irritating for the subject matter experts, but can also impact their existing 'business as usual' (BAU) responsibilities. To avoid this situation, analysts often gather information from individuals who were previously in the role—a practice that can have serious implications for the project, as BAU processes continually evolve and analysts may capture current processes incorrectly. Project managers/ business analysts are often frustrated by the slow progress of initiating a project because current processes, services or controls have to first be recorded before a target state is mapped and they can begin development. As a result, they may start a project before fully understanding the existing landscape, resulting in coding inefficiencies and delays in delivery. However, they can dramatically accelerate the project initiation if they have consistent business architecture artifacts. "As an architect you design for the present, with an awareness of the past, for a future which is essentially unknown." – Norman Foster Key business architecture artifacts An organization that consistently creates and maintains standard artifacts will provide its employees with structural transparency and a granular view of services offered, controls in place, and interactions between internal and external stakeholders. Business architecture artifact requirements may differ from one organization to the next—for example, some will also have a Business Capability Model. However, the following four artifacts are key to all organizations: Business Model Canvas (BMC) is a high-level overview of a specific business area or team that captures how the organization creates, delivers and captures value. BMC captures a value proposition, key activities, key customers, key partners, key resources, costs, and revenue streams in a one-page format. Business Process Models (BPM) are graphical representations of business processes. These record the initiating event(s), tasks and end event(s) for a specific process. Notation is used to ensure that they are intuitively understood by both business and IT users. Service Catalogue is a list of services provided to either the other areas of the

organization and/or external clients. This includes the service category, high-level description and the internal team responsible. Service Catalogues can be used to link common processes between areas/teams identified in the Business Model Canvas. Key controls are mapped directly to the Operational Risk Catalogue, Service Catalogue and Business Process Models. The controls may relate to an entire process or specific task within a process. Mapping controls to the Operational Risk Catalogue ensures that controls are in place to for all identified operational risks. An organization that consistently creates and maintains standard artifacts will provide its employees with structural transparency and a granular view of services offered, controls in place, and interactions between internal and external stakeholders. Figure 1: Key business architecture artifacts Business architecture best practices The key to producing useful business architecture is to standardize and reduce complexity, whether recording current states or proposing target states. An organization can only achieve this directed (or preferably, if the architecture is produced) by a knowledgeable central team. While anyone within an organization can produce business architecture documentation and models, only documentation and models that have been produced using a standard methodology will be valued across organizational boundaries. Some business artifacts only require a template and description of expected field content; others, for example, Business Process Models, will require precise documentation to complete. Creators of a Business Model Canvas should include a mediated group discussion as part of their planning process. Here are five key points that organizations should adhere to: Current SME involvement – Employees currently performing this task should be included in, and have approval rights on all business artifacts. Engaging contributors across all levels of a team is particularly critical to producing a Business Model Canvas. Ongoing attestation – Business architecture can only be used as a reliable source of information if an organization has an ongoing attestation process in place. A central team should ideally record and oversee the production of artifacts so that these can be produced in a consistent manner. Without the guidance of a business architecture team, artifacts could be modelled at varying levels of granularity, and may be unusable in building a view of the entire landscape. Accessibility – To maximize usage among stakeholders, it is essential to make business architecture artifacts accessible and easy to use. When the organization regularly refers to these artifacts, those responsible for attestation will appreciate the importance of business architecture accuracy. Business architecture mapping – Existing artifacts should be mapped to business architecture artifacts where possible. These could include IT application registers, operational risk classifications, and product categories. However, the mapping should not become so complex that it becomes unmanageable. Standards for Business Process Modelling – BPM should be system-agnostic and use a specific notation. The modelling standards should be recorded in a versioned, continually refined document, to ensure modelling consistency is maintained. BPM documentation must include: After undertaking the initial modelling initiative,an additional subset may be produced with more detailed content for specific purposes. By recording processes using this methodology, areas/teams can find similarities among them, leading to complete transparency for system requirements, and revealing opportunities for the business to automate and rationalize common processes. This is

particularly relevant for organizations that continue to operate with a legacy system of acquisitions. Our opportunity, as designers, is to learn how to handle the complexity, rather than shy away from it, and to realize that the big art of design is to make complicated things simple" – Tim Parsey The importance of communication and consistency Beyond the specifics detailed here, business architecture is only successful when it is grounded in clear communications and consistency. By establishing lines of communication between various stakeholders within the organization, leaders not only ensure that they can adhere to high standards, but can maintain enthusiasm for the initiative and the tasks at hand. Without consistency of use, an artifacts archive that could inform the entire organization will lose its value and become nothing more than a vault of unused artifacts. "It is not the beauty of a building you should look at; it is the construction of the foundation that will stand the test of time." – David Allan Coe Annette Lovell - Managing Consultant, Financial Services – Consulting Practice, Wipro Limited With over 25 years of experience in the financial services industry, Annette Lovell, Lead Consultant in Wipro's Consulting practice, works with clients across business functions, including operations, finance and IT. With deep expertise in business architecture ,Annette Lovell drives largescale change initiatives for Wipro's clients across business functions, including operations, finance and IT. Blockchain in wealth management

----- Arcticle source ----- https://www.wipro.com/consulting/blockchain-in-wealth-management/ ----- About the Authors Contact Wipro Please fill the required details to access the content Blockchain in wealth management Blockchain is the underlying technology that will bring about the next-generation internet: a transition from a web of information exchange to a web of value exchange. Blockchain technology is increasingly considered a disruptor to the status quo across industries, and the wealth management industry is no different. Cryptocurrencies are the first real-world use case of blockchain technology, and their rise over the past decade has sparked increasing debate about how this new asset class might alter the current financial and economic structures of society. Blockchain is important to the wealth management industry because of two important capabilities. First, they can act as a digital wrapper around any asset; and second, they allow the exchange of those assets on decentralized networks. There are also two reasons why the decentralized exchange of digital assets is vital for wealth management. Firstly, because these exchanges are distributed, they have strong potential to disintermediate many centralized business processes within the financial services industry. Secondly, cryptocurrencies have ushered in a new asset class and Initial Coin Offerings (ICOs) have allowed investors to invest in this asset class without using the banking system. This has opened up new paradigms of resource allocation: investors can participate in a global exchange of assets outside conventional structures, where stocks and other financial instruments trade on centralized exchanges under the supervision of centralized authorities and geography-specific regulations. Technological impact of blockchain Today, the wealth

management industry is running on business models and processes fabricated on decades-old technologies. These legacy systems and processes often result in costly data maintenance and pose severe threats to client-related sensitive data,transactional data and the institution's reputation with clients and regulators. A leak of such data can lead to hefty monetary fines and the loss of customer trust. Additionally, many legacy systems are not flexible enough to implement new workflows as per market needs. Blockchain technology's underlying ingredients including decentralization, consensus, immutability, and faster/cheaper transactions can revamp existing business models to make business transactions more fluid than ever. Blockchain technology can improve an institution's service quality for a range of processes such as client onboarding, asset transactions, and portfolio management. Blockchain brings a whole range of use cases built for real-time settlement models, exchange of money and value, KYC processes, automated investing, and rebalancing of portfolios based on smart contracts. Blockchain technology is gaining traction in the industry from both the client side and regulatory bodies as well. Clients are curious about the new asset class built on this technology, and regulators are interested in embracing this technology for broader purposes, ranging from improving interbank financial transactions to regulatory reporting. What technological leapfrogs has blockchain made over current technology (i.e., Web 2.0)? The existing Web 2.0 primarily evolved on the Open Systems Interconnection model (OSI). In this model, where the network layer and data layer are separate, organizations started working on data structures (data layer) long before TCP/IP protocols (network layer) evolved, and later kept building on top of the new network protocols. The architecture then eventually grew with dependencies on a client-server model, which required more layers of security to be built on top of it. Taking an OSI view, blockchain essentially combines the data layer, the transport of information and cryptographic elements in a single concept: Distributed Ledger Technology (DLT). In a Web 2.0 network, centralized authorities maintain data ledgers and dissipate to participants. On a blockchain network, the data is distributed across various nodes and consumed as per rules defined in the protocol. This storage and distribution of data has implications in the way techno-social systems can restructure organizations, government functions and peer-to-peer exchange. The blockchain is a secure transaction ledger database that is shared by all parties participating in an established, distributed network of computers. Let us define blockchain again in its simplest form: The blockchain is a secure transaction ledger database that is shared by all parties participating in an established, distributed network of computers. It records and stores every transaction that occurs in the nodes, substantially eliminating the need for "trusted" intermediaries. Figure 1: Evolution of web information sharing and web-based technologies Use cases Coming back to wealth management systems, implementing blockchain will allow firms to store a golden copy of reference data in a decentralized manner on a permissioned blockchain (i.e., only the approved list of systems have permission to make changes). In a blockchain environment, an organization can run on two different chains, i.e., one interacting with the external bodies like consortia, and another internal to the firm. Client book building is a critical aspect of the wealth management business; it enables client advisors to understand client needs, bring in new business opportunities and enhance their relationship with existing clients.

Let's look at an example of using blockchains and smart contracts for portfolio rebalancing in client book development. Once clients are onboarded, and their portfolios set up, smart contracts on a blockchain network can actively monitor the client book. A smart contract will be triggered if there is any change in asset allocation within a portfolio or the bulk risk for a single asset class increases beyond a threshold value, resulting in sending alerts to clients and their financial advisors in real time. Figure 2: Portfolio and client book management The client portfolio will be realigned based on the client or advisor response through available channels. Several other rules can be implemented in smart contracts regarding the client's investment suitability review as well. The following diagrams detail two other wealth management use cases for blockchain: KYC and client onboarding Figure 3: Client onboarding Figure 4: Trade booking and settlement Challenges in the near-term and how to respond On the technical front, blockchain is still facing scalability challenges due to its nascent experimental state, and only a few organizations and conglomerates are testing blockchain-based implementations in incubated environments. Also, companies are not sure as of now if they should go all-in on blockchain technology, or run their legacy infrastructure in parallel until blockchain becomes mature enough to minimize operational risks. The majority of banks in developed economies are comfortable using the current technology in their everyday operations. On the regulatory front, only a few development initiatives have been taken on by central banks and governments to lay down the foundational protocol and infrastructure for implementing blockchain. However, this should not hamper growth. Institutions should explore more use cases for low-risk internal applications —like loyalty points for credit cards or internal file transfers—to test the initial blockchain infrastructure and then ramp up to more critical applications. This way, they can identify the possible benefits and opportunities according to their strategic and long-term vision. Also, banks can partner with growing Open Source community platforms like Hyperledger and R3, where they can pool their resources to achieve the desired results in a more focused way. Another way is through inorganic growth—over $1 billion USD has been invested in blockchain startups since the inception of technology in 2009. Fintech players' platforms are close to being production-ready, which have the possibility of integrating with existing business lines without going through painful and costly implementations. Finally, and most importantly, due to the decentralized nature of blockchain, all the participants in the chain—including internal and external stakeholders—should agree to implement the solution. So the only way to address these challenges is to take initiative to lead the change, which means innovating in collaborative environments at the same exponential pace as nimble startups. Experimentation with disruptive blockchain solutions should not be ignored by any wealth management firm. Glossary Blockchain Glossary OSI Model Akshay Arora - Consultant, Financial Services, Consulting Practice, Wipro Limited Manish Ramrakhani - Consultant, Financial Services Consulting Practice, Wipro Limited Manish Ramrakhani and Akshay Arora are consultants in Wipro's Consulting practice, where they serve clients in the global financial services industry. Three considerations for enterprise-

wide implementation of intelligent

technologies

----- Arcticle source ----- https://www.wipro.com/consulting/three-considerations-for-enterprise-wide-implementation-of-intelligent-technologies/ ----- About the Author Contact Wipro Please fill the required details to access the content Three considerations for enterprise-wide implementation of intelligent technologies The world has come a long way since the first large-scale automation effort in the 19th century, which saw the industrialization of weaving, with the advent of the automated power loom. Automation has always been about more quickly and efficiently performing tasks that are otherwise time-consuming, prone to error, and not easy to accomplish manually. Hence, organizations have never shied away from any opportunity to automate, as proven by the ubiquity of computers and industrial automation by the latter half of the 20th century, followed by the increase in software robotics currently have made evident.. The ongoing digital revolution, and its accelerating convergence with the physical world, has spawned an array of interesting use cases that extend the potential of automation into cognitive tasks of reasoning and judgment – so far the dominion of human intellect. There's a lot of buzz around various intelligent technologies, some of which are seeing mainstream adoption such as Robotic Process Automation, algorithmic trading, Geographic Information System, and automated self-service solutions - to name a few. Other technologies such as Virtual/Augmented Reality, blockchain, Conversational AI, autonomous transport, AI-driven intelligent automation, and the Internet of Things are in various stages of adoption, tacross multiple industry segments Challenges posed by automation While automation is predicted to increase global GDP by more than $1.1 trillion in the next 10-15 years, many organizations still face significant challenges in realizing its potential and benefits such as a cultural backlash against automation, losing momentum midway, teething issues during IT/OT integration, threats of data exposure and ownership, to name a few. Here are three key considerations for successful enterprise-wide implementation of automation technologies: Automation-centric strategy It is common to see organizations having multiple automation initiatives, with many of them struggling to scale. While sponsored with the best of intentions, these initiatives lack clarity in how they affect organizational strategy, which leads to a hugely overstated/ understated return on investment. Organizations should therefore clearly define the role of automation, determine how it fits into their long-term strategy, and clearly define ownership. Since many governments have

started considering policy responses in the wake of massive automation, organizations should be duly cognizant of not only possible regulatory oversight, but also the broader societal implications of having an automation-centric strategy. Bridging the generational gap Generational diversity in today's workforce has reached levels never seen before. The real differentiator for organizations will be how they bring a multi-generational workforce on board during their automation journeys – they must recognize how each generation perceives automation technologies, and customize training practices for effective adoption. Moreover, they should implement innovative learning models, like mutual mentoring, which enables different generations to come together to learn from each other and help build positive relationships. This will, in turn, ensure complete worker commitment on the automation journey across generations, and help organizations focus on generating tangible benefits from their investments in automation. Active cyber-risk mitigation As seen by the audacity of recent cyber-attacks, organizations are being exposed to cyber threats at unprecedented levels. Still, organizations are held accountable for failing to prevent cyber-attacks and the exposure of personal information. For example, an investigation by the National Audit Office of the UK concluded that the National Health Service (NHS) could have prevented the WannaCry ransomware attack. By far the greatest consequence is the damage to brand image. Since many automation technology initiatives are now often owned by the business side, it becomes imperative to get the IT side onboard as early as possible. When scaling up automation across the organization, IT brings valuable insights into challenges pre- and post-integration, and ensures adequate safeguards are enacted proactively to prevent cyber-attacks. Anticipating disruption before it happens Organizations are facing the high tide of automation powered by the Cloud-Big Data-Artificial Intelligence trinity. The ever-evolving ecosystem of automation technologies brings in both feelings of excitement about its potential, and the anxiety that comes with any business transformation. While no one can avoid increasing automation, organizations can be better prepared to embrace it by clearly defining an automation-centric strategy, bridging generational divides, and actively mitigating cyber-risks. The author would like to acknowledge the contribution of Avdhut Hirave and Alex Veytsman. Vignesh Nainar - Manager, Strategy & Transformation Consulting Practice, Wipro Ltd. Vignesh Nainar is a manager in Wipro's consulting practice. With over 14 year of experience, Vignesh helps clients navigate digital transformation and implement innovative technology solutions to improve business performance. The case for a smart enterprise data

hub: Why IT and business need to

collaborate

About the Authors Contact Wipro Please fill the required details to access the content The case for a smart enterprise data hub: Why IT and business need to collaborate It is estimated that by 2025, the digital universe (the amount of data created and copied annually) will grow to 163 zettabytes (ZB), or one trillion gigabytes.1 How will your organization manage this data tsunami to your advantage? An antidote to the big data problem is the enterprise data hub (EDH). A data management solution, EDH provides storage, processing, and analytics applications that support both emerging and legacy use cases. The needs of new open source technologies, machine learning, artificial intelligence, and cloud-based architectures are calling for a versatile EDH that promises flexibility, faster data access, and lower costs than traditional data stores. Yet organizations that have built large-scale EDHs without considering their users' consumption needs will fail to reap these benefits. In this paper, we envision the journey toward a "consumption-driven," smart EDH and outline the success factors and pitfalls. Why do EDH projects fail? It is estimated that 85% of big data projects fail due to problems presented by legacy technologies and pre-existing corporate biases.2 Yet many organizations only maintain a technical focus on landing data into an EDH; the end result is a high-cost platform that provides little business value in return, making it hard to justify the program altogether. Here, we name the five pitfalls to watch for when deploying an EDH. Lack of business objective The scope of an analytics project should not be limited to the unique objectives arising from select teams. Companies that do not have robust strategy around analytics beyond a few use cases will struggle to derive value from these projects. Lack of integration across legacy systems In many organizations, legacy systems have multiplied due to mergers and de-mergers, increasing data integration challenges. Lack of data assurance An EDH is usually missing one or more of the key elements of data assurance including data metrics, data quality, data reconciliation, data cleansing, and data cataloguing and lineage. Lack of responsiveness to evolving industry trends and business needs Bound by legacy systems, established organizations often struggle to respond to changing business needs. In contrast, fintech companies can, often, quickly and cost-effectively keep pace with evolving business needs. Lack of agility Established organizations are hampered by a lack of agility owing to multiple stakeholders, long processes for gathering requirements, rigid business processes, and a dearth of input from business teams until an

output is delivered. This lack of agility is another nail in the coffin for data projects. Critical success factors for an EDH Organizations aspiring to make business decisions based on reliable data must create a smart EDH. What does a successful EDH deployment look like? Consistent insight at a lower total cost of ownership Insight gleaned from data should be consistent and repeatable. Any incremental "data items" required for analysis should be cost-effective while data is democratized and available to every user, anytime and anywhere. Data innovation through data consumption patterns Although data consumption primarily focuses on a unified and enriched view, it often leads to new data discoveries, which foster growth and innovation. Revenue growth Consumers now do most of their banking through web and mobile apps. The data held in an EDH can help business users surface insights about these omni-channel customers, including their experiences and preferences, creating marketing opportunities and revenue growth. Improved efficiencies A smart, consumption-driven EDH makes processes more efficient by providing timely and accurate data. Figure 1: The journey to a smart EDH Business focus Establishing a clear business case to support analytics through an EDH is a critical first step. From there, kick off deployment by gathering input from key business stakeholders on how to improve their business or process with data. The business should be involved in every step of the deployment, driving user stories, constantly validating and refining the business benefit and quantifying the return on investment. Data-driven Become a data-driven organization. Know where your data lies and how to access and integrate it to enable a unified data view of the data that can be accessed by the entire organization. Wide lens When designing the outcome, adopt a wide lens and apply these best practices: Data assurance Data must be complete, accurate, available, reliable, consistent, timely and up-to-date. Without this assurance, the business will have little faith in the data provided by an EDH. Be sure to put in place data metrics, quality, reconciliations, cleansing, cataloging, and lineage. Adopt change Ensure that organizational change involving people, processes, and technology are in place to initiate and sustain valuable business outcomes. Figure 2: Consumption-driven business and IT roadmap for EDH Step 1 involves combining the business strategy and vision, engaging stakeholders whilst also agreeing on the technical data consumption and curation needs. Step 2 is the enabling phase, which involves setting up business-driven agile scrums, managing backlogs and creating analytical sandbox environments. Step 3 allows the platform to be used to define business-driven glossaries and design a self-service marketplace. In step 4, we begin to operationalize the EDH by defining the target operating models within the business along with technical automation optimization. The final step in the set-up of a smart EDH involves maximizing the return on investment by decommissioning the legacy processes and technology. Importance of a smart EDH strategy This business-IT collaboration for building an EDH will lead to reduced time to market, product diversity, and higher profits. A well-planned and executed EDH strategy delivers the following benefits: References Amrita Mukherjee Consulting Partner, Analytics and AI Consulting Global Sales, Wipro Limited With over 20 years of experience, Amrita helps Banking and Financial Services clients solve complex business challenges and advises clients on strategies and industry trends on modern analytics platforms and AI. Change Management: A Consulting

Add-On? Think Again.

----- Arcticle source ----- https://www.wipro.com/consulting/change-management-a-consulting-add-on-think-again/ ----- About the Author Contact Wipro Please fill the required details to access the content Change Management: A Consulting Add-On? Think Again. Though it is essential to the successful delivery of any analytics initiative or for that matter, any project change management (CM) often gets little attention. Project leaders neglect to include a change mangement component in their planning or, at best, push it to the project's periphery. Since CM does not fall neatly into any of the traditional workstreams or operational functions, the impulse is to bolt it onto the project as a consulting add-on. This means it is usually one of the first items to go when project budgets are under pressure. Yet, both clients and consultants should treat change management as a non-negotiable deliverable. After all, if users do not adopt the new solution, even the most flawlessly executed project will have failed. Indeed, a recent Gartner survey found that only a third of change efforts are clear successes, 16% show mixed results, and half are clear failures.1 The good news is that companies have increasingly adopted this view in recent years, and many have established internal change management teams to help support key enterprise initiatives. Yet these relatively new teams' capabilities and availability may not align well with a given project's focus or timeline. Furthermore, when a company incorrectly assumes that the internal project stakeholders or hired consulting firm is fully equipped to minimize the disruption created by a new project, the consequences range from poor stakeholder engagement to an outright rejection of the new approach, jeopardizing the firm's entire investment. Change management: An imperative for project success Beyond advocating that change management be a part of the project, a project team can take the following actions to ensure post-project continuity for users: 1. Identify the existing client capabilities. From the outset, the combined project team should explore what capabilities the business has developed that can be leveraged to assist with change management. Questions to resolve should include: 2. Create awareness early. Create awareness of the impending changes as early in the project as possible. While the vast majority of projects begin with a degree

of uncertainty, informing affected users of impending changes as soon as is reasonable will help advance overall adoption. Early notification will not only enable users to prepare for the pending changes, but will also provide an opportunity for them to alert the project team to potential issues that were overlooked in the planning phase. 3. Create a transition plan. Many project plans fall short on creating even soft cutoff or retirement dates, leading to the unintentional vestige of legacy processes, systems, tools, and reports. Such oversights jeopardize the entire project, as many users will inevitably return to legacy approaches. The growing list of potential issues and the impact created by these inconsistencies grow exponentially over time as unsupported tools and data linger in the new environment and may be unwittingly used for strategic projects to detrimental effect. 4. Track user adoption. To quote management guru Peter Drucker, "If you can't measure it, you can't manage it." Understanding who in the organization is participating in the change management process is almost as important as creating the process itself. Important leading indicators of user adoption include who has attended training sessions, who has viewed the training videos, and who has attempted to leverage or explore the new environment. At a high level, activity volume can illustrate to program managers a need to throttle up or throttle down training opportunities. It can also help identify potential distractors. In one project that I had exposure to, data analytics demonstrated that a manager who expressed confusion over training materials had, in fact, never logged in to the system or attended a single training session. Enhance project adoption and success with effective change management. Above all, successful change management depends on a robust communication plan. Companies that focus on relevant status updates, meeting reminders, and training opportunities throughout a project significantly increase the likelihood of user adoption and overall project success. Data Analytics and AI in Retail

----- Arcticle source ----- https://www.wipro.com/consulting/data-analytics-and-ai-in-retail/ ----- About the Author Contact Wipro Please fill the required details to access the content Data Analytics and AI in Retail Creating delightful customer experience If customers have a negative experience shopping with one retailer, they don't have to go far to find another. The advent of online retail has put a staggering number of options within a few taps of the keyboard. A retailer that abruptly discontinues a beloved product will just as abruptly lose that product's customers, while a retailer that sends its customers tailored offers stands to gain their loyalty. Let's take a look at some real world examples: For both online and brick-and-mortar

shops, success hinges on understanding enough about their customers to create individualized experiences—a fact retailers are recognizing. The global retail analytics market is estimated to reach $10.4 billion by 20231 and, according to a JDA Software survey, 40 out of 100 merchandising professionals and category managers said big data and predictive analytics are their top investment priorities over the next 5 years.2 A changing retail landscape Retailers who have embraced digital transformation successfully are gaining a significant competitive advantage in an atmosphere where customer experience rules. And while traditional retailers are adopting digital technologies such as Internet of Things (IoT), mobile, augmented reality (AR) and virtual reality (VR), artificial intelligence (AI) and machine learning (ML) to connect with customers, digital players have recognized the advantages of establishing brick-and-mortar locations to round out the experience they can offer their customers. Here are a few of the most disruptive developments in retail today: How data analytics and artificial intelligence will reshape retail operations To achieve a successful digital transformation, retailers need to do more than simply acquire huge data sets. Artificial intelligence capabilities can equip retailers with the ability to ingest large volumes of data in various formats across locations, learn from patterns, and respond in real time. In our experience with providing data analytics support to a leading US electronics retailer, we saw that artificial intelligence (AI) and machine learning (ML) resulted in 4% increase in sales and 5% improvement in promotion effectiveness. Creating a 360˚ customer profile also helped generate relevant, personalized offers to customers. In addition to helping retailers customize their offers, AI and ML enable predictive analytics, allowing retailers to project the details of a customer's history into the future, and calculate outcomes for events such as product sales or store renovations. Understanding these outcomes vastly increases retailers' ability to prepare for events and respond to customers proactively. Thus, AI and ML offer enormous potential for retailers to deliver compelling customer experience, drive cost efficiencies, and even improve employee motivation. Data analytics, AI and, ML have already begun to disrupt the way retailers do business. Retailers that successfully adopt digital technologies will reap competitive advantages. Delivering on the "last mile": A shift from the traditional supply chain

Delivering on the "last mile": A shift from the traditional supply chain As consumer shopping behavior has shifted, so has the "last mile", the distance between a product's point-of-sale and its final destination. Before online shopping, consumers owned the last mile delivery, transporting their purchases to their home. Today, as people shop online for everything from shoes to sofas, and new technologies continue to spur double-digit ecommerce growth, online merchants must innovate their last-mile delivery experiences or lose customers to competitors that offer superior services. Globally, e-commerce is experiencing high growth CAGR ~10% enabled by next generation technologies.1 The last mile moves to center stage These days, online retailers are playing perpetual catch-up with consumer behavior and desires. Shoppers are demanding both fast and free shipping. With a device in nearly everyone's back pocket, people have easy access to online stores as never before, and this has exponentially spawned order and fulfillment options. Now, customers expect their orders to meet them where they are, whether it's their home, office, or vacation destination. All of this make the "last mile" experience not only pivotal in leaving a lasting impression, but also in gathering additional customer data. Meanwhile, businesses face other challenges related to the disrupted supply chain, with the flow of predictable inventory levels from producers and wholesalers to point-of-sale becoming a thing of the past. All of these seismic shifts should serve to remind businesses that they need to manage both the opportunity and costs of optimizing the last-mile experience in this rapidly changing ecosystem. Figure 1: eCommerce trends for top 10 countries1 Figure 2: Global B2C e-commerce sales and growth – Pitney Bowes Parcel Shipping Index 2 Approaching the last mile challenge Given the supply chain's rising complexity and growing customer expectations from the "last point of sale" to the last mile, businesses must organize their processes and systems to meet the small package and small delivery mandate. While the move from large warehouses to smaller storage spaces in close proximity to dense markets will see low utilization with higher costs, businesses can nonetheless reduce these costs by first consolidating the boxes. Since the cost of delivery would depend on the density of its final destination, the consolidation of freight through aggregated deliveries in a small geography will be key to optimizing the cost per delivery. Figure 3: Component-wise view of the global supply chain footprint Figure 4: Estimate facilities and floor space in US (Source: Annual reports 2017) Figure 5: Last mile distance of new facilities (under 200,000 sq. ft.) for top 15 US cities (Source: CBRE

Research and U.S. Census Bureau) 5 Evolving and emerging delivery options Successfully orchestrating orders to reach the last mile requires a combination of solutions. Currently, these solutions are either emerging (adopted or in process of being scaled), or evolving (in development and under pilots). We can break these solutions down into three areas: Figure 6: Fulfillment solution path Point of fulfillment Delivery medium Point of handover The three areas are brought together through dynamic dispatch and routing, i.e., learning from historic data, factoring situation, location, and business. Autonomous and automated fulfillment centers are active 24x7 to meet the order demand. Because localities vary in their regulations and geographic attributes, so will specific solutions to problems posed by the last mile. Evolving and emerging delivery methods will grow for high density areas, and storage solutions will move closer and closer to the locus of demand. Businesses will make better use of vertical spaces and develop artificial intelligence and bots to ingest data and improve planning efficiency. Ultimately, businesses will expand their partner ecosystems to support their entire supply chain footprint to enable them to keep pace with the ever-shifting expectations of their customers. In short, e-commerce-driven innovations to the supply chain are inevitable. IoT shines light on contract manufacturing supply chain visibility

IoT shines light on contract manufacturing supply chain visibility The outsourcing of manufacturing that made Southeast Asia the world's factory for decades is evolving to nearshore manufacturing as factories crop up across Mexico in response to demand from U.S. manufacturers. This tactical shift, however, does nothing to solve the longstanding challenge that manufacturers have grappled with: how to gain visibility into the supply chain once production is handed off to the contract manufacturer. Contract manufacturing is like a black box. The order goes in, and the only cue the manufacturer has that the order has been fulfilled is when the goods are received at its dock, or at its customers' dock. If anything goes wrong at the plant—asset failures, scheduling delays, departures from best practices—the costs of outsourcing can add up. These include higher production costs, penalty payments for missed delivery deadlines, and low customer satisfaction that could lead to a loss of future business. Decoding the black box with data The missing link in the supply chain visibility is the availability of data, and the Internet of Things (IoT) can unlock this data. Currently, most contract manufacturing plants don't capture data at the level of assets and material. Even when they do, without infrastructure in place to move data from the plant to the cloud securely, the data that is captured remains sequestered on the premises. The advent of the IoT presents new opportunities to lift the lid on the contract manufacturing black box. Businesses are poised to leverage IoT to solve their supply chain and logistics challenges as various forecasts suggest. According to Gartner, Internet of Things endpoints will grow at a 32% CAGR from 2016 through 2021, reaching an installed base of 25.1 billion units. Total spending on endpoints and services will reach $3.9 trillion in 20211. As manufacturing becomes increasingly networked, companies must devise strategies for data acquisition, processing, and analytics that extend to their contract manufacturers. How the IoT will enable supply chain visibility To maintain the benefits of outsourcing without incurring high costs, companies should work with contract manufacturers that are willing to equip their plants with IoT infrastructure. Technologies such as wired and wireless sensors, secure internet gateways, data staging and processing servers, and edge computing can provide visibility at all the following levels: Figure 1: IOT-enabled supply chain visibility: The entire value chain. Making the shift to IoT-enabled visibility Companies that want better supply chain visibility through the IoT should proceed methodically, using a 5-step process: Once this vision has been deployed, all stakeholders will have access to appropriate key performance indicators (KPIs). Figure 2:

IOT-enabled supply chain visibility at a contract manufacturer: KPIs for all stakeholders Supply-chain visibility has been a challenge for manufacturers for decades. Even truly digital manufacturers have yet to succeed in expanding their digital visibility to their contract manufacturers. The advantages that IoT offers in manufacturing don't end with visibility. Improving data acquisition, processing, and analytics through connected things has the potential to optimize manufacturing execution systems, business models, and revenue streams. Figure 3: IOT-enabled supply chain visibility at a contract manufacturer: The complete journey. Business after Brexit

----- Arcticle source ----- https://www.wipro.com/consulting/business-after-brexit/ ----- About the Author Contact Wipro Please fill the required details to access the content Business after Brexit Five opportunities to win in the age of trade restrictions In the integrated world of commerce, the results of the 2016 UK Brexit referendum have triggered a global avalanche of speculations and scenario-planning to prepare for various outcomes of the United Kingdom's exit from the European Union. Fuelled by scenarios of job losses, product shortages, and economic slow-downs, businesses are considering relocating their operations, transportation, and logistics to prepare for arguably the biggest impact on international trade since the end of the Cold War. As we enter a new age of dynamic uncertainty, a fragmented, disrupted, and volatile view of the world of commerce is replacing a more stable, integrated view, resulting in a number of shifts in macroeconomic focus. Below, we detail these shifts using Francis Aguilar's 1960s six-dimensional PESTEL framework[1], a tool used to assess macro-environmental factors. Figure 1: PESTEL framework comparison of historic and current macroeconomic outlooks Brexit sheds a glaring light on these shifts, in particular on the political, economic, and legal dimensions. But is all this change for the worse, or are there emerging opportunities for new digital business capabilities that can withstand volatility? We believe there are. As potential trade barriers from Brexit and between major markets such as the US and China increasingly become part of everyday life, digital-age capabilities – coupled with enterprise agility – will become more and more critical to international operations. Here we consider five capabilities that businesses should consider prioritising to not only sustain existing

operations but also expand their digital capabilities and turn current uncertainties into value-generating opportunities. Five opportunities for agile enterprises Value chain risk and resilience management Business impact: In the current operating environment, the main challenge is increased macroeconomic volatility. Value chain disruptions caused by natural disasters, supplier problems, or isolated industrial actions were historically managed through a business continuity framework. Today, the ability of a business to accurately simulate and respond to disruptions in an integrated value chain is becoming a key differentiator. Opportunity: Whether deployed to seamlessly re-route shipments, change schedules for manufacturing operations, launch a new e-commerce portal at speed, or rapidly establish new legal and trading entities to respond to changes in the macroeconomic environment, the ability to manage value-chain risks and maintain operational resilience are becoming corporate priorities. This know-how is key to protecting both revenue and the ability to explore new market opportunities. The way forward: Establish practices to regularly and proactively measure and stress-test operational resilience and address the greatest risk vs impact combination. As well as, establish dynamic business rules and autonomous cells for critical operations. Tariff and trade optimisation Business impact: While most major trading channels for physical and financial flows have long been established and optimised, there are continuous changes in most major markets that require consistent monitoring and optimisation. Opportunity: Consider maritime logistics, where recent developments have created new opportunities in customs clearance and value-added taxation. Smart ports, which allow seamless API-based integration across all physical and information transactions (and recently the legal acceptance of electronic bills of lading in most geographies), are enabling fully digital information flows and much faster transaction processing. The way forward: Baseline and monitor tariffs as part of regular cost-to-serve analysis and explore-optimisation simulations. Consider segmenting major business channels to optimally manage tariff vs the volume of goods shipped. Information brokering Business impact: The age of outsourcing operations and greater use of fungible assets is putting significant emphasis on the core competency of brokering information across a changing array of parties. In most scenarios, these exchanges follow established routes of trading partners and trading lanes. Opportunity: In times of trade restrictions, businesses can leverage information-brokering capabilities to manage and optimise higher complexity information flows and new legal barriers more quickly than the competition. The way forward: Elevate information brokering from its traditional place in the data and information-technology world to the position of a strategic enabler. Consider information-collaboration platform architectures that will allow seamless integration with third-party providers, as well as deep analytics to improve speed and processing volume. Business model redesign Business impact: The new normal is operational agility. Businesses need to rapidly react to the new rules, which will likely continue to evolve. Organisational rigidity, on the other hand, can cause businesses to lose pace with marketplace dynamics and fall behind.Business impact: The new normal is operational agility. Businesses need to rapidly react to the new rules, which will likely continue to evolve. Organisational rigidity, on the other hand, can cause businesses to lose pace with marketplace dynamics and fall behind. Opportunity: Businesses can differentiate themselves by developing a

business service architecture for a modular supply chain, for instance, using fungible assets or micro-services to bridge a changing landscape. Businesses should also continuously redesign legacy operations to remain competitive. The way forward: Regularly review business models (market-to-order and order-to-cash) in order to optimise speed, profitability, and customer-centricity. Enable portfolio segmentation and rapid responses to shifts in portfolio priorities. Actively create new revenue streams Business impact: Trade restrictions are as old as commerce itself and clearly still very much alive in today's world. Trade restrictions in the digital age are the ultimate test of enterprise agility, but business model redesign might not be sufficient to create sustainable future growth. In a rapidly changing world, exploring new ways of monetising information, assets, and volatility will become an important business capability. Opportunity: Digital businesses have embraced the notion of orchestrating anything and everything to satisfy market demand rapidly and economically. Combining established operations or underlying assets such as distribution networks or manufacturing capacity, customer service centres or billing operations in conjunction with a highly developed ability to broker information allows rapid creation of a differentiated orchestrated market offering. Here are a few examples: Figure 2: Illustrative list of differentiated orchestrated market offerings The way forward: Reconsider the revenue-generation potential of your organisation's established assets, information, and business-partner landscape through the lens of digital business enablement to identify revenue streams in new value constellations. The impact of trade restrictions on the global economy will likely result in short term challenges for business. However, this is also an opportunity for enterprises to become more agile and adaptive for future volatilities in global trade. Enterprises that can build agility into their DNA will lead from the front in the future. Scaling the pyramid of trust

----- Arcticle source ----- https://www.wipro.com/consulting/scaling-the-pyramid-of-trust/ ----- About the author Contact Wipro Please fill the required details to access the content Scaling the pyramid of trust How banks can leverage AI to become proactive advisors to customers Artificial Intelligence (AI) and Machine Learning (ML) coupled with digital channels could change the way banks engage with customers in real time—from understanding if the customer interacting with the bank right now is likely to churn, to what is the best proactive advice or offer suited for this customer. AI and ML enable real time insights, proactive advice, and automated actions for creating rich personalized customer experiences. They allow mass customization of campaigns and offers at scale while a bank is engaged with customers and online prospects. This article explains why and how banks need to move beyond churn prevention, batch insights, and massive acquisition campaigns to the next level...a future full of real time insights, proactive advice, automated actions, and individual campaigns using AI, ML,

and digital channels. It shows how banks and FIs will need to scale the "pyramid of trust" to enhance the trust they have earned as safe keepers of money and transaction agents to being respected as proactive advisors. Such business transformation will create a spike in the number of prospects onboarded for banks and minimize investments in customer churn prevention and mass acquisition campaigns. No wonder banks are one of the leading adopters of AI and ML. They invested over $4 billion in machine learning in 2018 alone and this is expected to exceed CAGR of 40%[1]. Tectonic shifts in expectations of digital customers Gone are the days of using bank branches as primary channels of acquisition and account opening or answering questions of walk-ins. Also, the days of customer care centers receiving calls from customers seeking answers to questions may be gone in the future. Banks have spent too much time and effort positioning themselves as safe keepers of customers' money and reactive transaction fulfillers. A Celent report[2] on "trust gap" (difference between percentage of adults who trust their banks for the safety of their money and those that trust their bank's advice) explains how retail banks have largely delivered on safekeeping of money and fulfilling transactions but failed to deliver advice and proactive engagement. With digital all of that is changing. Figure 1 shows how expectations of digital customers have changed and how banks will need to climb the 'pyramid of trust' in engaging with these customers across all banking and financial services products. In the 'low trust' zone, at the very least, digital customers expect alerts and notifications and self-service capabilities. For example, competition in the cards industry as well as prevalence of increased fraud have led to prompt informational or fraud alerts from card issuers to cardholder mobiles as well as ability to lock and unlock card usage from mobile apps. However, such capabilities barely impress a digital customer. In the 'medium trust' zone, digital customers expect automated transactions, proactive insights, and customized offers. Some large banks are already giving customized offers but proactive insights are still lagging. In the 'high trust' zone, digital customers expect proactive contextual advice. Once their confidence levels improve, they could be open to automated implementation of advice such as an investment or savings plan to achieve a specific mutually agreed financial goal. Both larger banks and digital challengers are in the race to provide an impressive hierarchy of alerts, advice, and automated actions to engage their digital customers. One can see examples in Royal Bank of Canada's NOMI Insights[3], Commonwealth Bank of Australia's Customer Engagement Engine4 and Huntington Bank's "Hub" with insights and advice features5. Figure 1: Pyramid of trust – How banks can earn their customers' trust "Banks have a vital asset—customer trust. In today's competitive environment, h The Celent report[2] referred to earlier also shows what steps banks must take to close the trust gap with their retail customers and presents case studies from model banks. In the following section, this article takes the use case of campaigns to show a bank can transform itself to climb the pyramid of trust. "Banks have a vital asset—customer trust. In today's competitive environment, however, banks must continually earn this trust. Moreover, they must strive to go beyond basic trust and achieve higher levels of trust that allow them to become valued advisers to their customers." - Alenka Grealish, Senior Analyst, Celent Digital approach to insights and campaigns Figure 2 shows how banks conduct acquisition campaigns today and how they can make them more personalized, engaging,

and proactive using AI, ML and digital channels. Figure 2: Campaigns—Today vs future Today's campaign process (Figure 2) is focused on generating insights for the bank's marketing department and then planning campaigns around these insights. Most of the insights are generated using statistical regression models for descriptive and predictive analytics. There is hardly any use of artificial neural networks (ANNs). Risk of non-acceptance and feedback cycle time are quite high. Marketers have to wait for at least several weeks, if not months, to get feedback on the effectiveness of campaigns. In future, data will be processed as event flows and streams to be able to generate real time alerts with low latency (Figure 2). Auto-encoders using ANNs can generate alerts from streaming data. Banks stuck in the low trust zone will be busy providing alerts and self-service capabilities, albeit smart and useful. Progressive banks will attempt to climb the pyramid of trust using capabilities such as "Do-It-For-Me (DIFM) transactions" (automated mundane tasks). They will leverage ML to generate proactive insights and offers by analyzing data at rest and in motion. As they build more trust with their customers, they will offer proactive contextual advice. As they consolidate their trusted customer relationships, they could finally end up offering "DIFM advice" automated actions to realize mutually agreed financial goals. AI-ML-powered customer engagement will compel prospects to switch banks and reduce the need for banks to conduct mass campaigns. Most ML products offer tools for visualizing data and modeling using statistical as well as ANN-based models. Automated feature engineering (ability to predict which of the input variables have a high degree of correlation to output automatically) capabilities are also critical as they reduce the need for manual intervention from expensive and specialist data science resources. ML models are trained and tested offline using batch data. However, once the F1 scores (measure that balances between precision and recall) and accuracy reach acceptable levels, ML models in production can generate insights, advice, and automatic actions customer by customer in real time while the bank is engaged with the customer. Optimizing metrics such as F1 and accuracy is to help minimize business costs and impact (e.g. avoid classifying a customer likely to churn as someone loyal). Other factors that are critical in ML adoption are the ability to reduce over fitting of input data and the ability to explain predictions. Based on outlier patterns and errors in insights, offers, and advice generated, the models can be retrained manually. Several of the fintech vendors provide such capabilities today. In future, unsupervised learning could produce "self-learning ML models". Benefits of ML led digital insights Looking ahead Banks have earned valuable customer trust as safe keepers of money and reliable fulfillers of financial transactions, but they have yet to push their trust bar higher. The majority are still fixated on customer churn and mass acquisition campaigns. It is time they redirect their energies and budgets towards engaging, personalized, contextual, and proactive insights and advice powered by AI and ML technologies. As they scale the pyramid of trust, they will automatically experience a marked surge in prospects wanting to sign up!

Collaborate 4.0: Optimizing the consumer value chain

----- Arcticle source ----- https://www.wipro.com/consulting/collaborate-4-optimizing-the-consumer-value-chain/ ----- About the Authors Contact Wipro Please fill the required details to access the content Collaborate 4.0: Optimizing the consumer value chain The rapid transformation of the retail and consumer goods (CG) industries over the last five years will accelerate over the next decade, hastened by the twin forces of evolving consumer needs and constant digital disruption. These trends are creating an imperative for businesses to understand their customers so they can create personalized experiences and drive positive brand sentiment. The automated supply chain, marked by the collaboration between all its members, will have a key role to play in meeting this imperative. We refer to the practice of connecting all the partners in the supply chain through technology to optimize business outcomes as Collaborate 4.0. This point of view analyzes the latest consumer trends and preferences, and outlines the opportunities to optimize the supply chain in order to serve the modern shopper. Keeping up with next-gen consumers Millennials and Gen-Z, two generations born after 1997, are shaping the next-generation shopping trends. They want personalized experiences that are quick, easy, and fun, and prefer digital wallets and Near Field Communication (NFC) payments over credit card payments (Figure 1). These two groups differ in preferences: millennials are more price sensitive and value-driven, while Gen Z is more focused on a brand's social responsibility, and less tolerant of connectivity issues and inferior service. The retailers of the future will need to satisfy their demands by deploying more conversational chat-bots and Augmented Reality-Virtual Reality (AR/ VR) for personalized experiences. They will have to support digital wallets, and adopt other technologies that enhance the customer experience.1 Figure 1: What consumers want Current digitization efforts are not enough Retail and CG companies are scrambling to win the wallet share of millennials in ecommerce, but neither have strong ROIs to show for it. In the absence of meaningful loyalty programs, CG companies are falling short in reaching their customers. While some brick-and-mortar retailers have found success with white- and private-label brands, others are haunted by the perpetual bankruptcies, and store closings that plague the industry. Leading brands are shutting down stores by the hundreds and laying off employees by the thousands. Given this uncertainty, retailers and CG

businesses need to act quickly and step up their digital transformation or risk being swallowed by digital-native companies with an appetite for ambitious growth and ever-expanding areas of competition.2 The retail and CG of the future To know what it takes to give consumers what they want, let's consider a royal case study (Figure 2): Within 24 hours of Meghan Markle showing up at Queen Elizabeth's annual Christmas lunch in a self-portrait dress, the dress sold out.[3] Social media allowed consumers to identify an influential celebrity and what she was wearing, driving demand to spike beyond the retailers' ability to respond. This is a classic retail and CG Collaboration 4.0 use case, as a smart retailer using the latest machine learning technology could have spotted an opportunity and sent demand signals to the manufacturer who would have immediately shipped the dresses to the retailer. If the demand is overwhelming, the dress-maker can prioritize completing the 3D-printing, then manufacture the dress at a nearby facility. The customer who visits the retailer showroom sends demand signals for her desired customizations – a typical consumer insight which is critical in converting a consumer into a shopper. The manufacturer follows the same 3D-printing process and manufactures the dresses quickly, shipping them the same day to the retailer. This "Mock Up to Mall in a Month" is a win-win-situation for the retailer, CG manufacturer, and the customer. Figure 2: A case study on collaboration between CG companies and retailers[3] Collaborate digitally! While the norm today is for CG companies and retailers to operate independently rather than collectively in their best interest, Collaboration 4.0 is nonetheless catching on. Indeed, managers are seeing the benefits of data sharing, with a single version of the truth across the consumer value chain that paves the way for operational, tactical, and strategic collaboration between all partners in the ecosystem. If retail and CG businesses collaborate throughout the supply chain, they stand to realize their shared goals: higher sales, cost savings, optimized processes and systems, and happy customers (Figure 3). Figure 3: Digital collaboration platform The elements of a Collaboration 4.0 platform include: Strategic collaboration: Partners co-innovate in product development, leverage joint strategic volume and market planning, and participate in joint supply chain improvement activities. They also swap customer insights including shopping behavior. Tactical planning: Partners share planning, scenarios, and forecast information, along with a collaborative sales and operations planning process, deploying capable-to-promise checks across the entire value chain. Operational execution: Partners share inventory location, tracking, and automated replenishment, powered by seamlessly optimized joint logistics. Supply chain in the era of disruptive technology New technologies have begun to disrupt the supply chain, offering a plethora of opportunities across the retail and CG value chain to both, enhancing the consumer experience and improving collaboration between supply chain partners. Figure 4 shows the latest technology trends at each stage of the supply chain. Figure 4: Enhancing the retail – CG value chain Figure 5: Collaborate 4.0 As Millennials and Gen-Z have set the bar high for customer experiences, it is imperative that businesses learn to collaborate with every member of their value chain (Figure 5) to meet the evolving needs of their customers while gaining actionable insights into their desires. In order to succeed, retail and CG businesses will need to develop a collaborative supply chain that integrates data from customer-facing systems, such as point-of-sale systems and

websites, and manufacturing, delivery, procurement, and supplier systems, to effectively deliver a tailored and differentiated experience to the next generation of consumers.

Accelerating business value realization

using the Agile approach: Part 1

----- Arcticle source ----- https://www.wipro.com/consulting/mergers-and-acquisitions-accelerating-business-value-realization-using-an-agile-approach-part-1/ ----- About the Author Contact Wipro Please fill the required details to access the content Accelerating business value realization using the Agile approach: Part 1 This article is the first in a two-part series,"Mergers & Acquisitions: Accelerating business value realization using the Agile approach," in which we outline the challenges inherent to acquisitions, and present the solutions offered by the Agile approach. Businesses have long recognized the acquisition of a company as a means to drive growth and gain a competitive advantage. Yet, acquisitions entail serious risks that companies must manage through negotiations, legal transfer, and post-acquisition integration. An acquisition can lead to myriad problems – a flawed valuation of the assets of the target business, cultural issues created by integrating diverse workforces, conflicting operating models and policies, challenges posed by a workforce spread over disparate time zones, legal and regulatory hurdles, represent only a few. Even if a business successfully navigates these risks, either the target business or acquiring company might still lose value before the acquisition is complete, if the integration process drags on too long or no clear agreement is reached regarding the best

operating model for the business in the future. The mergers and acquisition (M&A) team within the acquiring business typically holds the unenviable job of mitigating all these risks while meeting the sky-high expectations of the acquiring company board and stakeholders. This paper looks at ways to reduce integration risks through a pragmatic approach to planning the integration phase, accelerating the delivery of business value to the board and stakeholders, and minimizing the activities required to deliver an integrated business as a process outcome. The key challenges of integration Given the integration challenges, acquisition failure rates could be as high as 70 to 90 percent, although there is no clear standard for determining failure. Since most acquisitions are considered complete from a legal standpoint once offers have been made and accepted. For this paper we will define a failed acquisition as one that did not deliver the level of returns anticipated by the buyer. While most companies assume a failed acquisition is the result of insufficient due diligence, the root cause of failures typically lies in how they approached the acquisition. Since a company's acquisition plans are known only to top managers, due diligence is frequently left to senior stakeholders, who may not understand how their own business operates at the level of detail that enables optimal decision making. Meanwhile, these managers have to balance their acquisition responsibilities with their day-to-day duties, so due diligence may not get its fair share of time and effort. As a result, the focus tends to be on regulatory considerations, and the target's valuation and financial performance by using Excel templates, to understand all the dynamics of a business. This approach overlooks integration, operating models, business value protection and the details of pre-acquisition planning. Consequently, it can take an inordinately long time to conclude due diligence and be ready to make a recommendation to the board for even the smallest of business targets. Due diligence from a new perspective We recommend a few changes to this approach. First, to tackle the problem of too much information, create a due diligence plan designed with the post-acquisition integration in mind. For example, if the plan is for the acquired company to continue to operate at arm's length, with only financial reporting integration required initially, then it isn't necessary to consider dynamics such as the impact on bill of materials (BOM) systems, logistics, website, email, or HR policies as part of the initial integration activities. With an eye on the end state, due diligence can focus on areas that will be impacted, such as charts of accounts integration and reporting processes. Partner to succeed Our second recommendation for improving the due diligence process is to take on a partner. Most companies, without an in-house M&A team, may need to seek the expertise of external parties for specific integration or divestment programs. Even where an in-house team is available, supplementing the team with independent third parties offers a number of tangible benefits. Often, the diligence focuses on the target company's people, processes, products, financial performance and overall value to the acquiring company. There is an unspoken assumption in most cases that the acquiring company has superior processes, tools, systems, and structures. Thus, the question becomes about how best to integrate the target company into the acquirer's way of working, rather than whether there are areas of the acquired company's business that are superior and should be retained. Considering that the acquiring company may have initiated the acquisition in order to gain new capabilities, it's essential to be critical of the acquiring company to

ensure the best parts of each business are retained. Partners can bring their independent experience of acquisitions together with run books, planning tools, and a knowledge base acquired through multiple programs. They should also be able to challenge the buying organization on its approach, suggest viable alternatives to in-house views, and act as a sounding board for the leadership team to assess the risks of the proposed acquisition. Be more agile Here's the typical acquisition approach: a business conducts due diligence, decides to purchase the target company, plans the acquisition, determines the final integration plan, and finally enters the execution phase. A few legal processes run in parallel with these activities, but the process is serial. This makes for a long-winded process that consumes considerable resources and takes a big bite out of the acquisition price. It also does not scale well, as each phase becomes more complex and onerous as the target business increases in size. Applying the Agile approach can significantly accelerate the entire process. Though it was originally applied to software development, the Agile methodology has now proven applicable in many areas. An Agile program breaks up work into manageable chunks, known as sprints with each sprint comprising a complete "mini-project" that delivers a designed outcome. Between sprints, an Agile team undertakes a quick exercise to assess whether the target end state is still relevant and achievable. Then it makes small adjustments to the target objectives to address challenges encountered in the completed sprint and ensures the team remains on track. By constantly monitoring the progress of a sprint, a team can make micro-adjustments to the overall plan without major impact on the timelines or costs. Embedding both business and technical resources within the same Agile sprint team, or"cell", and empowering this team to drive solutions and make decisions, considerably shortens the timeline between idea and delivery. This dual-function approach also ensures close, consistent alignment between business and technology, ensuring that technical solutions are more likely to support business needs with fewer compromises, in terms of functionality or business process support. Multiple Agile cells can operate simultaneously, each working on different areas of the business. However, a central design authority should coordinate change and solution architecture to avoid incompatible decisions or solutions. Another reason for applying the Agile approach to acquisitions is to accelerate some of the activities that are typically undertaken in later phases. Tackling activities earlier allows teams to plan ahead better and minimize focus on non-essential activities. Consider the following diagram, which lists some of the activities performed in each phase of an acquisition program: Figure 1: Typical activities performed in each phase of an acquisition program Carl Booth Consulting Partner, Strategy &Transformation Consulting Consulting Practice, Wipro Limited Carl Booth leads key client initiatives in business transformation, target operating models, mergers and acquisitions, program management, and enterprise architecture across multiple verticals. He has advised senior executives of leading companies how to improve business performance through transformation and business restructuring and has led a number of strategic mergers and acquisitions initiatives. Accelerating business value realization

using the Agile approach: Part 2

Accelerating business value realization using the Agile approach: Part 2 This article is the second in a two-part series, 'Mergers and Acquisitions: Accelerating business value realization using the Agile approach', in which we outline the challenges inherent to acquisitions and present the solutions offered by the Agile approach. To see part one of this series, please click here. In the first article in this series, we looked at the challenges of the acquisition process and discussed how keeping an eye on the end state, partnering with a third party, and taking the Agile approach can improve outcomes and allow companies to realize benefits faster. In this article, we will present specific recommendations for implementing the Agile approach. Level-set with the board At the start of the acquisition journey, consider setting the acquiring board down in a room to discuss key aspects of the acquisition. You may be surprised by the level of disagreement on the rationale or value of the proposed acquisition between members of the leadership team, and if they can't come to an agreement, then success is going to be difficult to achieve. The structure of such a meeting will vary depending on the target, the current business environment, and other factors, but it should aim to assess the level of agreement and find a way to bridge significant gaps. Evaluate the consensus in the room on these four questions: Figure 1: Typical activities performed in each phase of an acquisition program Using the third question to determine how the business will operate can help set business priorities, for either the long or short term. For example, if you acquire a business unit rather than an entire business, you will need to operate on Day 1 at arm's length, as you will not be able to integrate immediately. The selling company will normally operate the systems and processes of the divested entity under a transition services agreement (TSA), though the plan may vary depending on the willingness of all parties. Once you establish your Day 1 operating model, as well as the operating intent for the acquisition post-TSA, you can focus your due diligence and Day 1 planning activities on the most impacted areas. By setting lesser considerations to the side, you can streamline the program and ensure the presence of sufficient resources with skills in the focus areas. Identifying priorities The intent of this exercise is to identify a prioritized list of business areas that will be integrated in order to derive maximum value for the acquiring business. If, for example, the business has identified merging the raw material procurement processes as significantly valuable due to the contracts held by either or both businesses, then procurement could well be a candidate for early integration. In this case, your focus would be on the following activities: Figure 2: Focused Target

Operating Model (TOM) Impact Analysis Figure 3: Business decisions drive TOM planning Finally, while you are being more agile, don't discount opportunities to improve productivity by simplifying processes, removing handoffs, rationalizing applications, and implementing cloud computing and robotic automation. While doing anything over and above the work required to exit a TSA agreement can increase risks to exit, and therefore potentially add cost, companies rarely revisit acquisition opportunities once the merger has been completed. Conclusions The delivery of a successful post-acquisition integration is never going to be without its challenges, and the options highlighted in this paper won't eliminate all of the risks. However, the Agile approach to all key phases in an acquisition will mitigate risks to a more acceptable level and allow an acquiring business to realize the value of its purchase much faster than traditional approaches allow. Businesses often lose time and money focusing team efforts on attributes of an acquisition that are not immediately relevant and miss potential opportunities to speed up the process or innovate around the end vision. Using the Agile approach and partnering with an experienced integration team that can recognize the value in both businesses can have a huge positive impact on the success of your acquisition. Carl Booth Consulting Partner, Strategy & Transformation Consulting Consulting Practice, Wipro Limited Carl Booth leads key client initiatives in business transformation, target operating models, mergers and acquisitions, program management, and enterprise architecture across multiple verticals. He has advised senior executives of leading companies to improve business performance through transformation and business restructuring and has led a number of strategic mergers-and-acquisitions initiatives. Manufacturing Processes Standardization:

Digitizing Batch Records

and Device History Records

----- Arcticle source ----- https://www.wipro.com/consulting/manufacturing-processes-standardization/ ----- About the Authors Contact Wipro Please fill the required details to access the content Manufacturing Processes Standardization April | 2020 A consolidated strategy is required to improve manufacturing process efficiency by harmonizing processes for electronic batch records (EBR) and electronic device history records (eDHR) for pharmaceutical and medical devices plants. This can help improve real-time visibility, data integrity and enhance data quality besides ensuring compliance and traceability. This article provides an overview on a case study for electronic batch records and electronic device history records process harmonization strategy. The life sciences and medical devices industries are currently facing many challenges in a competitive global

market. To maintain market position and meet customer demands, the organizations are under pressure to introduce new products early to the market with optimized costs. There is another challenge to conform to evolving local and global regulatory guidelines for ensuring manufacturing quality and minimizing product recall, which can be achieved by keeping track of batch records (BR) and device history records (DHR). Regulatory agencies emphasize keeping track of production details for each product manufactured by organizations, which is a cumbersome process, as management of BR and DHR is largely paper based, people dependent process in many organizations. The manual processes take a lot of time and efforts and are often error prone, impacting overall costs and operations. Incorrect entries, unclear documents, rounding and calculation errors can significantly affect approval processes. Industry is exploring an efficient process to generate electronic, digitized batch record and device history records. Business Needs Data level Improving manufacturing processes by replacing paper based mechanism with electronic data capture is utmost important. Typical outcome at data level is: Plant level Due to the unique nature of production processes across various manufacturing plants, data capture processes and compliance needs are inherently complex. Examples of these complexities include: Need of the Hour– Best Practices EBR/eDHR implementation for batch records and device history records automation has become paramount and this can serve as a springboard for connecting the stakeholders for governance, data capture, and quality as well as providing a platform for manufacturing process improvement. It is recommended that process mapping should be performed to identify and eliminate waste before the EBR implementation. Industries are adopting some of the best practices to move towards digitization and automation of EBR and eDHR, which are discussed below. Elements of Electronic Batch Records Key enablers of EBR/eDHR for each benefit area and specific examples of improvements that will be realized when manufacturing execution and data capture moves from manual/paper based to automated/electronic are depicted in figure 1. Figure 1: Elements of Electronic Batch Records The technology layer in the figure 1 provides general descriptions of the types of applications cutting across multiple benefits "pillars" to enable EBR creation. These descriptions are generic as there could be multiple technical pathways to achieve the endpoint. For instance, the requirements for a digitization solution can be met by applications with custom PI sheets in SAP or electronic work instructions and data capture. Key Business Benefits Manufacturing process harmonization and digitization benefits business with: Digitization of EBR and eDHR coupled with manufacturing process standardization can help improve compliance, data quality and data integrity, and enhance operational excellence and global collaboration. Managing COVID-19 Disruption with Cloud

Managing COVID-19 Disruption with Cloud July | 2020 Challenges in a post COVID-19 world The global COVID-19 pandemic has become one of the biggest calamities in recent times. The pandemic has prompted almost every country in the world to go into damage control mode to protect their citizens. The experience as customers, employees, citizens, and humans has changed forever, and our attitudes and behaviors are changing as a result. In addition, IT workforces globally have switched to work from home. In this crisis, cloud companies suddenly are the backbone of a global virtual learning and collaboration experiment. While the Internet backbone has long been a lifeline and reached over half the world's population in 2019, without scalable cloud services, the current disaster would be unimaginably worse. Fortunately, cloud companies are weathering the pandemic stress test caused by the sudden spike in workloads and waves of new, inexperienced users. The magnitude of demand surge has led cloud providers to prioritize COVID-19-related workloads and place tighter caps on its free cloud service offerings for new users. For the cloud, COVID-19 is just a busy day at the virtual office. In fact, cloud companies' confidence in their ability to scale even further to support many more users forced to work and learn from home is so great, that some are offering free collaboration and conferencing services for those impacted by COVID-19, including some promising free services for the remainder of 2020. In this crisis, secure cloud architectures are essential for not only large enterprises and governments, but for all small, medium, Private government and institutional bodies. Protecting against malware and viruses of the computer variety may not appear to be as deadly as COVID-19, but cyberattacks on WHO's COVID-19 efforts (fortunately of limited impact, so far) among others could have devastating consequences. The security & elasticity offered by Cloud is unmatched. Cloud not only helps enterprises to scale up their workloads but also offers them high availability to ensure continuity of operations even during these testing times. The collaboration and video-conferencing platform offered have been used extensively by educational institutions, governments and corporates as a means of regular communication during these tough times. Cloud is the only enabler for enterprise IT operations during these unprecedented times. This paper discusses various challenges that enterprises are faced with due to the spread of COVID-19 and how cloud is acting as an enabler for enterprise IT operations. Enterprise Risks Worldwide from COVID-19 The effects of the pandemic – as the World Health Organization declared officially on March 11 — are predictable. The impact on our organizations, customers, vendors, and communities is tangible. Even so, there is a natural tendency for panic to arise. The Coronavirus is exactly the type of fast-emerging risk with uncertain consequences that can be ignored until it's too

late for traditional escalation procedures to be effective. When initial reports of a lockdown started to come in from China, most organizations in the West had weeks to act on this information but "Gartner research shows that an agile response occurred far more often when clear processes already existed." chose to wait and see. Gartner research shows that an agile response occurred far more often when clear processes already existed to report & escalate absences or issues due to infectious diseases. In other words, a proactive ERM team had already set the threshold for escalation quite low to account for potentially extensive consequences of the risk if no action occurred. Organizations are trying their level best to keep employees productive and taking proactive steps to prepare themselves, if this unforeseen situation continues for a bit longer. Enterprise Business Risks currently faced by organizations and leading to disruptions in the normal day-to-day operations are as follows: Risk 1: Disruption Due to Social Distancing and Lockdowns Social distancing is a term applied to certain actions suggested by public health officials to stop or slow down the spread of COVID-19. Social distancing also disallows the aggregation of more than 5-10 people at a single location. To curtail the spread of the pandemic, governments around the world have provided guidelines to people to adhere to social distancing. Most business events and travel have been cancelled during this peak period. Governments of all major economies are under lockdown to contain the impact of the pandemic. As the economy slows down, some industries are more impacted than others. It's just a few players in the online learning and entertainment space that are doing well, with most people locked up at home. Risk 2: Plummeting Employee Productivity The pandemic has affected all business sectors directly or indirectly. It is estimated that around 40%-60% organizational staff during the Lockdown period will be unable to work properly due to non-accessibility of their working premises Also, at most IT companies, more than 90% of the employees have been enabled to work from home. This has affected the overall margins of major IT companies. All manufacturing, travel, aviation & hospitality services are experiencing a complete halt of operations and suffering huge losses because of the same. Risk 3: Stressed Supply Chains The global economy is still highly integrated and most countries and companies rely on vendors for their business. From pharmaceutical raw materials to electronics and other consumer products, there will likely be purchasing delays. Transport sector has been impacted due to sealed borders. Companies are not able to get their raw materials lifted from the ports due to shortage of transportation and lockdown for nonessential materials. Heavy equipment and manufacturing supply chains have come to a standstill due to lockdowns in various regions of the world including movement of goods. Stressed supply chains have also led to a decrease in consumption of oil and this has led to decreasing demand of crude oil in the global market. The Global oil prices fell to 0.1 $ per barrel on April 20 due to non-demand of petroleum products as all major nations were under lockdown. The world witnessed disruptions across all major supply chains halting the movement of goods. Risk 4: Recession, Unemployment and Investment Pullback The economic engine of growth is driven by continuous investment as well as consumption. Experts are uncertain whether a COVID-19 vaccine will be available before the first quarter of 2021. Investments have been negatively impacted by uncertainty and corporations have started to prepare for strategies to mitigate the impact of the situation

on revenues and will likely cut back growth investments. This will likely contribute to a rapid rise in unemployment, as fewer investments will result in job losses. There may be significant layoffs at existing businesses in the "second wave" of COVID-19 that may surge again in the third quarter. Majority of corporates are taking decisions to do away with salary hikes for this year. Some companies in the consulting business have even declared pay-cuts during this period. During the period of March, unemployment numbers in the US stood at a whopping 22 million. "Per a survey conducted by CMIE, India's unemployment percentage rose to 23.4% in the week that ended on April, 5th 2020" Risk 5: Economic Instability and Civil Unrest Economists suggest that the world economy may contract for the first time since the 1970s. As the coronavirus spreads around the world, stock markets have experienced their worst crash since 1987. Many countries with large economies, such as Italy and Spain, have enacted quarantine policies. This has led to the disruption of business activities in many economic sectors. Except pharma and consumer goods companies, all other industries' operations have come to halt. Civil unrest has been reported in the US and across other parts of the country due to enforcement of lockdown in all major economies. Cloud as an Enabler for Managing Enterprises in the COVID-19 Realm The effort to maintain operations during the COVID-19 pandemic puts cloud computing at center stage for many organizations. COVID-19 has forced millions of people to work remotely. It is hard to imagine a world without cloud technology. At no other point in time has there been such a need for the instant availability of IT resources, enabled by the cloud, than during this coronavirus pandemic. The cloud continues to transform connectivity between people and businesses on a global scale. Today, organizations that do not embrace cloud technology adoption have put themselves at a significant disadvantage in terms of profitability, speed, and agility. Their ability to recover from unforeseen disasters is affected and they cannot react anywhere near as quickly to events within the market as competitors. Some of the key areas where cloud will prove to be a differentiator in the future are highlighted below: This can severely hamper business success and lead to the situation of being phased out of the market within a matter of years.   Key enablers that cloud offers Enterprises during COVID-19 Conclusion Every industry has already taken a financial hit as a result of the COVID-19 pandemic. Now is the time for enterprise software providers to go the extra mile for their customers across all industries and help them recover and grow again. Empowering customers in their time of need by freely providing remote collaboration tools, secure endpoint solutions, cloud-based storage, and CRM systems, is an investment in the community that every software company needs to make. Cloud has been one of the enablers for enterprise during these testing times. From collaboration, virtual meetings, video conferencing, unlimited expandable storage, anywhere access, elasticity and expandability to secure architecture, cloud has been pivotal for a majority of enterprises by helping them stay resilient during these tough times. Many organizations that were apprehensive about moving to cloud now consider this a preferred option. Application Modernization using Cloud Native Approach

----- Arcticle source ----- https://www.wipro.com/consulting/application-modernization-using-cloud-native-approach/ ----- About the Author(s) About the Co-Author(s) Contact Wipro Please fill the required details to access the content Application Modernization using Cloud Native Approach A Point of View July | 2020 Executive Summary Agility, cost optimization, and faster time to market are the key objectives for a majority of organizations while moving to the Cloud. Most of them choose the easiest 'Lift and Shift' model to migrate their workloads on to cloud. Eventually, they have begun to realize that cloud has much more to offer than the normal infrastructure-as-a-service option, and they can create more value and innovation by adopting cloud-native strategies and architectures. Simply continuing on the old-world applications and architectures would not only prevent the ability to innovate, optimize and be agile but also impact their core objectives of moving to cloud. Cloud native is the future of application development, with massive potential for business impact—the ability to move an idea into production quickly and efficiently Companies should adopt a new, "cloud-native" mindset—reorganizing people, processes and workflows, and creating applications with the cloud specifically in mind. This calls for adopting an application development strategy that fits well with the overall cloud strategy and utilizes cloud-native architecture. Currently, business pressures demand faster time to market and app modernization. Modernization approaches include refactoring into cloud-native microservices and re-platforming traditional apps on container platforms. Cloud Modernization strategies offer full flexibility to migrate to cloud

during the app modernization process without any challenges. With a cloud-native microservices approach, clients can capitalize on the scalability and flexibility inherent to cloud. Modernizing applications using cloud-native tools enables applications to run concurrently and seamlessly. Barriers that prohibit productivity and integration are removed to create new user experiences. Containerization of existing applications, adoption of microservices, and server-less architecture are few examples of cloud-native architectures, addressing the requirements of quick scaling up and down, thereby optimizing the compute and cost. Business environments these days demand shorter development cycles followed by faster integrations and deployments. This calls for integration of development and deployment cycles. By using DevOps tools, integration of the entire development to deployment cycle can be done, thereby cutting down the entire cycle time from days to hours. Benefits of App Modernization Accelerate digital transformation: Application modernization is driven by the need to transform business to build new capabilities and deliver them quickly. Adopting DevOps and Cloud-native tools accelerates the overall time from development to deployment, reducing it from Days to hours, thereby helping businesses transform faster. Change the developer experience: Quickly create and deliver new applications and services through adoption of a cloud-native architecture and containerization. Developers can deploy multiple changes within hours without worrying about the integration and deployment part. Accelerate delivery: Adopt DevOps best practices to drive a culture of automation and transformation, can cut down time to market from Weeks to hours. Quick code changes can be deployed on to Production without much delay and human intervention. Deploy enterprise applications on hybrid cloud platforms: It helps to improve efficiency by automating operations in hybrid multi-cloud environments. This leads to "Build Once and Deploy on Any Cloud". Reduces Integration and Build Time: DevOps principles facilitate multiple code streams and their integration into one. Entire integration cycle can be integrated without worrying about the changes in the current environment since the last deployment. Strategies for transforming the existing Applications Containerize the monolith. Reduce costs and simplify operations by moving applications to a cloud runtime. Majority of code can be reutilized while containerizing the same. Expose on-premise assets with APIs. APIs enable legacy assets that are difficult to move to the cloud, thereby enabling a seamless connect between applications. Refactor into macroservices. Break down monoliths into smaller deployable components which can independently exist, thereby enabling faster changes within individual components without the need to manage the whole code and deploying the whole code at one go. It also helps in the addition of new services without impacting existing services. Strangle the monolith. Incrementally phase out the monolith, which cannot be converted to microservices. Challenges while adopting Cloud-Native Development Managing the business case Making the business case for cloud-native requires thinking beyond just cost and operational efficiency to areas such as improved speed and business agility, a better customer experience, and a reduction of technical risk. Managing complexity New complexities in platforms, operating models, and security also need to be managed. Multiple platforms need to be operated as companies wind down the old and spin up the new Platforms. Managing change Finally, organization, people, and culture change needs to be effectively managed.

Roles and responsibilities are likely to change, as will skills definitions. Principles and attributes of Cloud-Native Applications Whether creating a new cloud-native application or modernizing an existing one, developers should consistently follow the below set of principles. 1. Follow the Microservices architectural approach. Break applications down to microservices, which allows the incremental, automated, and continuous improvement of an application without causing downtime. 2. Rely on containers for maximum flexibility and scalability. Containers package software with all its code and dependencies in one place, allowing the software to run anywhere. This allows maximum flexibility and portability in a hybrid multi-cloud environment. Containers also allow fast scaling up or down with Kubernetes container software as defined by the user. 3. Adopt agile methods. Agile methods speed up the creation and improvement process. Developers can quickly iterate updates based on user feedback, allowing the working application version to match as closely as possible to user expectations. IDC found that, by 2021, 80 percent of application development will take place on cloud platforms using microservices and cloud functions Some Key attributes of well-written Applications Adopting Cloud-Native Meeting the challenges of cloud-native development and making a strategic move will often necessitate changes to processes, operations, people, and culture. Cloud-native is not just substituting one technology for another, nor is it just a different programming model. Companies should be prepared for more widespread change. The skill requirements expectation gap is likely to increase dramatically. In fact, by 2020, it is estimated that more than a third of the desired skillsets of most jobs will comprise skills not yet considered crucial today. Containers are technologies that allow packaging and isolation of applications with their entire runtime environment—all of the files necessary to run. This makes it easy to move the contained application between environments (dev, test, production, etc.) while retaining full functionality. Containers are also an important part of IT security. By building security into the container pipeline and defending infrastructure, one can make sure containers are reliable, scalable, and trusted. Containers help reduce conflicts between development and operations teams by separating areas of responsibility. Developers can focus on their apps and operations can focus on the infrastructure. Container technologies—including CRI-O, Kubernetes, and Docker—help teams simplify, speed up, and orchestrate application development and deployment. Already, 40 percent of employers report talent shortages and with significant upshifts Actual development or programming should be driven by business events/requirements and serve business needs. These can include competitive or marketplace events; new products and services; innovation; and end-user/client/customer interactions Architecture can be divided into four separate layers: application software development, service scaling, application network, and container orchestration platform. Having the architectural tenets or paradigms in place is critical to true cloud-native computing. Key Elements of App Modernization In today's technology era, cloud is the execution platform; to the left are DevOps processes, which are driven by agile development—all of which are a result of today's microservices architectures, which are driven and invoked by business events. IDC research has found that 100 percent of businesses with "optimized" cloud adoption (Organization-wide cloud strategies and policies) have adopted microservices compared to just 18 percent of those with an

"ad hoc" approach-just lines of business or other groups experimenting with the cloud.   Element 1 – Microservices Architecture By structuring applications as a collection of loosely coupled services, microservices strengthen continuous delivery and deployment. In addition to improving modularity and making applications easier to develop and test, microservices enable different development teams to create, deploy, and scale their services independently. Organizations can break down their monolithic applications into discrete components, each of which can then be developed, scaled, and maintained independently. Element 2 – Serverless Architecture Serverless is a cost-effective method of enabling microservices. It is a way to deploy applications while leaving all infrastructure details to the cloud provider. These event-driven, function-centric systems are increasingly becoming an essential capability for digital ecosystems. Serverless architectures enable developers to focus solely on revenue-generating functions, not wasting time on non-value-added issues. According to IDC survey data, organizations use DevOps to manage, on average, 25 percent of their application portfolio today, and expect that percentage to rise to nearly 33 percent in five years. Strong adoption of DevOps suggests that the development methodologies are already in place to support the adoption of cloud-native development practices and the development of cloud-native applications. Element 3 - Agile Development Agile is all about coping with and driving change-making development processes fast and easy. By splitting the development process into time windows and providing a continuous Feedback loop, Agile enables rapid, more effective development and the creation of super-nimble organizations that can innovate quickly. Consider an example from the U.S. Air Force. Although the organization has a huge technology budget, 70 percent of it was previously going toward just maintaining existing infrastructure. Only 30 percent was going toward research and development, and new software. By implementing Agile practices and developing apps to run on multiple clouds, the Air Force now finds that 70 percent of its budget is going toward R&D & 30 percent toward maintaining existing infrastructure. Element 4 - DevOps DevOps focuses on speed & how quickly a program can get from the design stage into production. It's largely about automation—i.e. eliminating the need for human involvement in the production process. By equipping developers and infrastructure experts with the same tools to track and control changes in both code and infrastructure— treating it all as software assets—DevOps lets you create a production environment within days or hours, rather than in the weeks or months previously required. Some of the DevOps tools include: Element 5 – Cloud Cloud is an extremely flexible delivery platform. It can support many different architectural & deployment styles, from big, monolithic systems, to large, virtual-machine deployments, to nimble clusters of containers, to large farms of serverless functions. Cloud is flexible enough to carry most of the IT architectures from the last 20 years. Again, however, to get the maximum business benefits & value from the cloud, one should understand that the platform itself is only one part of the overall cloud-native picture. Wipro's Capability in Cloud-Native tools for App Modernization Wipro's RAPID Ops (Release Application Platform for Industrialized DevOps) offering enables enterprises to achieve a connected DevOps tool chain for end-to-end application release thereby enabling reliable releases and faster time to market. The offering provides comprehensive capabilities across application release management, release

automation, and continuous deployment in collaboration with our partners and leveraging best-of-breed technologies across each layer of the tool chain. White paper on Integrated Supply Chain Management - A Strategic Perspective

----- Arcticle source ----- https://www.wipro.com/consulting/white-paper-on-integrated-supply-chain-management-a-strategic-perspective/ ----- About the Author (s) Contact Wipro Please fill the required details to access the content White paper on Integrated Supply Chain Management A Strategic Perspective July | 2020 Executive Summary SCM market is poised for a double-digit growth for the next 6 to 8 years and Wipro has to capture this momentum to increase its share. With a combination of tech platforms, new age solutions, automation and consumer insights driven approach, this space will go through a rapid transformation. In the current international business environment, heightened customer expectations impact every part of the supply chain. At the same time, next-generation delivery and logistics management solutions are making global supply chains smarter, faster, more

customer centric, and sustainable. Supply chain integration is an increasing focus for large companies. Wipro has good capabilities across domains and practices but is currently adopting a fragmented, reactive approach in tapping opportunities in this space. There is a need to create an integrated SCM framework, deep diving into scope and breadth and building offerings catering to the holistic SCM landscape. This strategic view would require integration within Wipro to build and seamlessly reuse IPs, assets, platforms, use cases, solutions and competencies across verticals and Geos. This paper provides a comprehensive view on the SCM market, Wipro's capabilities and a strategic perspective towards Integrated Supply Chain Management. Integrated Supply Chain Management – At a Glance Integrated supply chain management refers to an enterprise resource planning approach to supply chain management. A business facilitates relationships with all of its suppliers and manages all distribution and logistics activities through a centralized system rather than having multiple systems within the organization. Levels of Supply Chain Management Strategic - deals with future planning than in looking at market evaluation, capacity issues, new products, and technology changes. This is accomplished at the executive management level. Tactical - involves a shorter planning cycle. It is more concerned demand planning, inventory planning, and supply planning. This is determined at a less senior level than Strategic SCM. Operational - deals with current planning activities measured in at most weeks. It includes demand fulfillment, scheduling, production, transport, and monitoring. Benefits of Supply Chain Integration Better understanding of customers and better ability to serve them, reduced wasted material & time and redundancy in supplier function, More Cost effective & efficient with increased ROI and profit margins, keep up with demand and be more flexible to changing markets, Less risk and enhanced competitiveness. Get early warnings for problems anywhere in supply chain due to information sharing, better opportunity for investment when operating with collective power SCM Integration – Horizontal and Vertical SCM as integration strategies aimed at coordinating functions across suppliers, manufacturers, distributors and retailers to ensure that products and services are produced and distributed at the right volume, location and time with the aim of reducing operational costs, maximizing profits and ensuring satisfaction across the supply chain. There are two types of SCM strategies: a)Downstream/Forward Integration - A merger situation where the company acquires control over its distributors. b)Upstream/Backward Integration - A merger situation when the company acquires control over its supplier.   Supply Chain Management – Best Practices Key Supply Chain Best Practices Some examples of Supply Chain Best Practices are: Use of business intelligence and predictive insights driven partly by machine learning. Seamless integration of Supply Chain has enabled it to capture data on a real-time basis & simultaneously analyze data points and trends. Scope and Breadth of Supply Chain Management Supply Chain Management (SCM) Landscape Control Tower Control tower provides holistic management of supply chains. This includes management of revenue forecast, sales and operations, consumer demand & order, manufacturing, transport and logistics, warehouse, worldwide material sourcing and positioning. On the other hand, control tower also takes care of the collaborative response mechanism, cognitive computing engine and 360 degree visibility to the holistic supply chain operations. Control tower helps

in self correcting, predictive and prescriptive decision support, early management of alerts and exception management, collaborative information sharing and end-to-end visibility. Various logistic processes play an important part in the overall supply chain management using control tower. All the logistic processes – inbound, outbound, intra-logistics, line feeding, logistic routing and warehouse management are covered using control tower management. Key Challenges and Disruptions in Supply Chain Key Disruptions and challenges posed by the current market trends are Globalization (Managing Complexity), Planning is Data driven (business need to invest in analytics tools), Ecosystem limitations (Geographical Barriers), Building Transparency (Unified Single Source of Truth), Innovation (Shorter Product Lifecycles) and Everything as a Service(Switch from a Capex to Opex Model) Supply Chain Technology Trends Maturity of SCM Segments – An Analysis The above table shows the maturity of various SCM segments. The components in BLUE are highly mature and YELLOW are nascent as per the competitive market of service offerings and customer case studies from large number of service providers. Integrated SCM Offerings – Theme Layer References Nikhil Goel Consulting Partner – India, Consulting Business, Wipro Limited Nikhil Goel is a Consulting Partner Digital in the Global Consulting Business for Wipro. Air Travel Post COVID-19

----- Arcticle source ----- https://www.wipro.com/consulting/air-travel-post-covid-19/ ----- About the Author (s) Contact Wipro Please fill the required details to access the content Air Travel Post COVID-19 Aviation Moving Toward Singularity September | 2020 The COVID-19 crisis is disrupting the aviation industry in a big way, leading to a significant decline in passenger numbers and a shift in passengers' perception about air travel safety. How we help allay these fears and address the evolved needs of passengers post-pandemic will define the new normal for the aviation business. Emerging technologies will power business transformation with new operation

processes and new service practices at the airport to drive self-sustainable digital transaction that will provide greater autonomy to the users, the delivery staff at the airport, and the ensuing partner ecosystem. Airline passenger experience post COVID-19 Let me take you on a journey with Rita, whose work requires her to travel extensively. Today is her first post-pandemic flight. This time, at the airport, Rita's anxiety and stress levels are peaking, but to her surprise, airport infrastructure and ambiance look different. There are wider physical spaces, multiple fever scanners, on-screen and audible alerts to identify individuals in a large crowd situation, aiding rapid detection and maintaining pedestrian flow. Airport staff is stationed at designated locations, safely behind transparent counter shields, and dispensers for PPE safety kits, sanitizers, and antimicrobial packaging are placed at multiple locations within easy reach of the passengers. The airport floor is covered with self- cleaning carpet and all information, schedules etc., are displayed on huge digital screens. Rita is delighted to find that these digital screens can be mimicked on her personal device through a simple QR scan. An additional access to her wallet on the phone to link the boarding pass eliminates the need to touch any commonly used screen, which could be a breeding ground of contamination. These screens are designed to make use of her phone's real estate and does not require her to download the airport mobile app, though there is a link to do that if she wishes to. Once inside the airport, Rita avails the newly installed self-service bag drop counter and makes her way through the non-intrusive and frictionless airport security process supported by camera vision-enabled body scanner. Using the new interactive indoor navigation map, Rita moves to the retail area and is relieved to note that passengers are evenly spread out maintaining the norms of social distancing, guided by floor markings. The airport staff is seen keeping an eye on passengers through camera vision technology to mark and identify those not wearing masks and/ or not following social distancing norms. Rita finds that the mobile app driven by the conversational AI bot Ansh, can efficiently guide her to offers, notifications, information, availability of sanitized seating places, retail, F&B and other amenities around her. Using the GPS coordinates, she also gets an option to view the sanitization reports of the seating and other common facilities like the washroom, prayer room, and water dispenser in her vicinity besides having extensive videos about the new safety measures, practices, emergency and exit plans at the airport. As Rita is settling down with a steaming mug of coffee, she notices that Ansh has quietly offered her a plethora of engagement channels, from music and video streaming apps, to e-library filled with e-papers, e-books, magazines, audio books, documentaries, and exclusive online games. She is amazed to see that the engagement channels are premium and she is not required to pay for the content while she is at the airport. Rita gets notified on her mobile app about boarding in 'just-in-time' method, which is calculated exclusively based on her distance (enabled by GPS location) from the boarding gate, resulting in free flowing, and social distance maintaining queue for safe, secure and easy boarding. Rita is delighted with her experience at the airport - the uncrowded, clean and sanitized areas, and the attention to detail displayed by the airport comforts her as a passenger and enhances her experience with multiple thoughtful gestures embedded as functionalities. Reimagining aviation in the new normal Travel will prevail over post-pandemic stress, making it incumbent on the aviation industry to

bring about the changes that create safer infrastructure and practices that take care of the safety and wellbeing of passengers, airport staff, and partner ecosystem. Along with safety, airports also have to look at building a collaborative and efficient operating environment, which will not just facilitate recovery from this crisis but also shape the new normal. Evolved workforce management practices should be deployed to enforce a culture of safety in the very fabric of travel service industry. Organizations will have to encourage employees to rigorously practice and transparently report the hygiene and sanitization processes. Technology will help airports establish best practices. Human-centric design thinking that draws insights from cognitive, social psychology, neuroscience and behavioral economics should be applied to build airport's digital applications. These design principles will enable frictionless digital experience for passengers and build positive perception among users along with discouraging stigmas and misinformation. While airports are now focusing on redesigning the passenger journey touchpoints to build contactless solutions and ensure safety of passengers and employees in compliance with government guidelines; they also need to think beyond, and in collaboration with airlines and other ecosystem partners at the airport, build a digital ecosystem that enhances the complete passenger experience. Over the past few months, Wipro has worked with Airports and Technology partners to facilitate seamless, touchless journeys for passengers. We have enabled integrated and collaborative management systems powered by digital. These digital airport solutions aim to build a connected ecosystem for end-to-end airport systems management from IT and OT systems integration to flight and airside digital operations management. Our customers - three large global airports - have been ranked as best airports in ASQ rating for 2018, 19. Contact us to know how we can help you adapt to the new normal of air travel and achieve high passenger satisfaction. Shubhi Jaiswal Business consultant with Wipro's Global Consulting Group for the Airport Industry. She has over six years of experience working across Retail, BFSI, Manufacturing, and Airport Industries in Technology, Business Transformations, Innovations, and Operations. Shubhi can be reached at shubhi.jaiswal1@wipro.com   Wipro Ltd. and Aviation Industry Wipro Limited, a leading global information technology, consulting and business process services company, has a dedicated airports business division to address the challenges faced by the industry. We build industry reference solutions using a combination of digital airport vision, smart airport model, and solutions/accelerators for improved efficiencies that drive velocity, flexibility and cost benefits for our customers. We deliver end-to-end services for global airports across geographies.
===================== ----- Arcticle source ----- https://www.wipro.com/consulting/resetting-the-future-of-work-agenda-disruption-and-renewal-in-a-post-covid-world/ ----- Contact Wipro Please fill the required details to access the content Resetting the Future of Work Agenda: Disruption and Renewal in a Post-COVID World December | 2020 The future of work has been predominantly linked to advancements in technology, workplace design, and business transformations. The conversations around the workforce, its principles, and governance have undergone a drastic shift during the COVID-19 crisis. This change has presented employers with a rare opportunity to reset traditional models. Chief people officers and other human resources and business leaders have the responsibility to build on

what they learned from the crisis response and reset their agenda for the future of work. Access the report Resetting the Future of Work Agenda: Disruption and Renewal in a Post-COVID World to know Wipro's key insights and lessons from the COVID-19 crisis response. The report, developed by the World Economic Forum, brings together perspectives of over 60 Chief Human Resources Officers from leading global employers, including Wipro, on how organizations are preparing for the post-pandemic 'new' future of work. ======================

How User Persona-Based Services Can Transform Your Organization

----- Arcticle source ----- https://www.wipro.com/consulting/how-user-persona-based-services-can-transform-your-organization/ ----- About the author(s) Contact Wipro Please fill the required details to access the content How User Persona-Based Services Can Transform Your Organization December | 2020 What is digital transformation? Is it an injection of technology to simplify and automate day-to-day activities? Or is it leveraging advanced technologies such as augmented reality and artificial intelligence to derive insights? We see that it is all of these and more. Digital transformation, for us, is about enabling transformation across People, Process, Data, and Technology to deliver a greater experience to end users and drive desired business outcomes. Figure 1 shows the 4 pillars of digital transformation and the technology involved in building these. Figure 1: The 4 pillars of digital transformation   How can we engage the 4 pillars to simplify the life of end users and provide them an ideal experience driven by insights? Persona-based Services is the solution. What is persona-based service and why do you need it? Persona-based service provides hyper-personalized services to end users. This is essential as the end users today expect a seamless and personalized experience with minimal manual interventions. They want customized solutions to meet their specific requirements. Hyper-personalization creates highly contextual communication relevant to the user leveraging behavioral and real-time data. Personalization of services improves engagement levels and productivity. An increase in overall satisfaction promotes loyalty and retention. It also allows organizations to gain more data about their employees to tailor their experiences proactively, rather than reactively. Figure 2 shows the relevance and impact of persona-based service management in an organization. Figure 2: The relevance of persona-based service   With COVID-19, the uncertainty and disruption in the day-to-day workspace and well-being of employees has exponentially increased. While the focus is currently on reviving operations, we believe the time is right to orient and map unavoidable upgrades with the employees at the center. What are the personas in a manufacturing organization? The personas are built on various parameters, ranging from the roles they perform to their interactions with the client and the support they need from other teams, including IT. As an example, here are some of the personas we have created for a manufacturing organization: CIO – This persona provides thought leadership to the manufacturing organization and leads the digital transformation for IT. Connected Field Engineer – A critical

persona who acts as the face of the organization for its various clients. They should ideally receive priority support as any delay caused in their services impacts client experience. Connected Corporate User – These personas are part of the corporate roles such as Finance, Marketing, and HR and generally expect a seamless, omni-channel and self-service enabled experience. Connected Plant Engineer – They are the critical personas who support the day-to-day manufacturing activities in the plant and ensure that plants function with minimal unplanned downtime. Interns – These work in a range of roles and act as evangelizers of the organization. They have high expectations and expect a hyper-personalized, digital experience. Figure 3 depicts illustrative personas in a manufacturing organization. Figure 3: Personas in a manufacturing plant   How does persona-based service help end users? Persona development allows services to be mapped to the various personas. This enables organizations to hyper-personalize various services and improve end-user experience. Figure 4 shows how services are categorized and aligned to personas for personalizing IT end user support. The services range from hardware and software distribution to Tech Bar and vending machine support. Even hardware types such as a standard laptop to rugged devices and iPads are assigned to each persona, allowing faster onboarding and increased productivity. Figure 4: Mapping services to personas   How to create persona-based services? Building persona-based services is a 5-step process that ranges from 8 to 12 weeks for a mid-sized organization. Figure 5 demonstrates the process to create an effective persona-based end user support services in an organization. Figure 5: The 5-step approach to persona-based services   The impact of persona-based IT Support Let us take the example of Clayton, who works as a Plant Engineer at Track-Type Tractor Assembly in Charlestown, Boston. He is responsible for ensuring that various plant equipment runs seamlessly, with minimal downtime. A day in Clayton's work life Persona-based service interventions Increase in CSAT Clayton leveraged an iPad from Digital Locker, enabling collaboration and image capture. This resulted in faster resolution of the issue and reduced equipment downtime. All this was done with no intervention from any other team, again optimizing the actual time spend on resolution. If you're interested in learning more about Persona-based Services and how you can leverage the same to transform your employee experience, contact us today to begin. We can perform a Design Thinking workshop to develop a roadmap for your organization. Namit Bhargava GM & Head of Digital Sales, Digital Transformation, Wipro Namit brings innovative strategic perspective on Digital Transformation and Industry X.O themes for superior customer experience. How to Build a Digital Initiative Transformation Office?

----- Arcticle source ----- https://www.wipro.com/consulting/how-to-build-a-digital-initiative-transformation-office/ ----- About the author(s) Contact Wipro Please fill the required details to access the content How to Build a Digital Initiative Transformation Office? Program and Portfolio Management Post COVID-19 February | 2021 Have you recently wondered if your program and portfolio management (PPM) capability has kept up with the ever accelerating pace of digital change during the pandemic? If yes, you are thinking right. As other digital practices mature, it is now the time to kick-start a PPM upgrade that scales along with your upcoming initiatives and gives you a head start out of the COVID-19 crisis.   COVID-19 accelerates existing program and portfolio management trends The ongoing Coronavirus pandemic is a pressure cooker for business and IT capabilities alike. While organizations with a low digitization maturity risk falling behind the curve even faster, competitors will excel and come out of the crisis stronger than ever. Increased pressure on an organization as a whole and PPM comes via the following trends: 1.   Agile methodology: Companies have invested in upskilling their teams in agile methodologies and started to adopt frameworks like SAFe1 or LeSS2. The future will therefore see fewer traditional v-model based programs and projects. 2.   Remote collaboration: Offices and delivery centers are closed, forcing colleagues to work from home. With COVID-19, agile teams must therefore be well equipped to deliver initiatives remotely across the globe in a seamless way3. 3.   IT metrics: The approach to measure the success of IT initiatives is shifting away from traditional cost-center driven metrics such as on-time and on-budget delivery towards more evolved means such as release frequency, risk mitigation and time-to-market. 4.   Product centricity: Internally, many organizations are moving away from a project-oriented delivery model towards a more product (or service) centric organization. New roles such as the product owner are emerging and other roles like the traditional project manager are becoming less prominent. 5.   Technology shift: The technology landscape is changing rapidly, especially trends around cloud computing4 have significantly impacted not only how infrastructure and software is delivered and hosted but also how IT organizations are structured. 6.   Customer first: Besides agile, related methodologies such as design thinking6 are shaping how products and services are delivered in the future and therefore, have a major impact on PPM capabilities. 7.   As-a-service models: On one hand, many organizations discover as-a-service as an additional lucrative source of income for their own business models. On the other hand, they intensively leverage the whole bandwidth between infrastructure and software as-a-service offerings to increase scalability, flexibility and drive down costs. While the traditional role of program management will eventually disappear, there is a great opportunity for the PPM capability to reposition itself as a key enabler and driver for digital

change in a post COVID-19 world. This is what can be referred to as a Digital Initiative Transformation Office. Why act now? During COVID-19, every organization realized that being digital is paramount for survival and therefore, many new digitization initiatives have been started. Organizations are now building the foundation for future growth. Operating in this new-normal world with a "survive - grow - transform" mindset requires a stable foundation for planning and execution that can scale quickly and reliably. Scaling only works though with the right people, processes, methods, metrics and tools in place. This is where the implementation of a Digital Initiative Transformation Office (DITO) becomes relevant. Form a mission statement To provide guidance on setting up a DITO, it is important to understand the overarching objectives and mission statement of this entity. Typical objectives are: Those objectives need to be tailored for each organization. Based on the identified objectives, a mission statement for a DITO could be the following: Mission statement: The Digital Initiative Transformation Office is the central umbrella view across all digital initiatives from ideation to go-live and operations. It will a) provide transparency on how well we perform towards achieving our business objectives and b) accelerate and mature our digital delivery capabilities by c) foster a strong alignment between business and IT. It will do so by providing the right mix of people, processes, metrics, methodologies and tools. Introducing the Digital Initiative Transformation Office The DITO is an integral part of the end-to-end digital decision-making cycle. Only then can it provide the needed holistic support throughout the digital investment lifecycle. It enforces a structured approach that all stakeholders can adhere to. The key capabilities of a DITO are depicted in Figure 1. Figure 1: Key capabilities of Digital Initiative Transformation Office The supported digital investment lifecycle typically consists of the following six phases. Those phases might vary for each organization and the model should be adjusted accordingly. 1.   Shape business strategy: Reinvent or update the business model and challenge every aspect of an organization. Design how an organization will interact with customers and its ecosystem and how that affects processes and structures. 2.   Evaluate digital maturity: Conduct an honest assessment of an organization's digital capabilities in comparison to competitors. 3.   Identify digital opportunities: Identify, which ideas have the highest potential and how does that stack up to an organization's capability. Define how success will be measured and who will be accountable. 4.   Define digital transformation roadmap: Define the right mix of initiatives and resources that best align to the identified business ideas. Take into consideration the current organization's capabilities and architecture. 5.   Implement digital initiatives: Execute the implementation of agreed initiatives. Setup the right governance and delivery methodologies. Move quick and maintain the needed agility to react to an ever-changing environment. 6.   Harness digital capabilities: Rollout products and services to end users as quickly as possible. Get feedback early and adapt accordingly. Conduct an outcome-based assessment of what your organization is delivering to customers. PLAN capabilities Figure 2 shows the five core planning capabilities where the DITO can position itself to support the wider organization. Figure 2: Core planning capabilities DITO supports A big paradigm shift impacts most organizations during their digital transformation: the need to break open existing silos and move towards a more product / service centric organization. Therefore, all

planning related capabilities must be adjusted. Agile cross-functional teams can be formed and eventually the definition and approval of demand is conducted within the different products. The product is where IT and business colleagues work close together and where an impulse for future growth is sparked. This itself has an impact on how IT budget is allocated. Rigid IT budgets no longer suffice. Instead, organizations are moving towards flexible budget guardrails to give teams the needed level of agility. Decision making metrics must be rethought and engrained in the demand- and portfolio management processes. In a digital world, it is even more important to find the right mix between traditional business and investments made for rapidly growing or emerging business. As technology is a significant enabler for innovation and therefore business growth, mechanism must be put in place that ensure that enough time is allocated for technical innovation and experiments. To avoid waste, it must be incentivized to share insights on new technology across teams and products. To not lose sight of the big picture, activities across products and services must be streamlined based on a clearly defined set of rules that a) have the built-in flexibility to react to change and b) provide the long-term guidance needed in larger organizations. EXECUTE capabilities Once an initiative goes into execution mode, the set of capabilities given in Figure 3 play a crucial role. Figure 3: Core execute capabilities DITO supports From a delivery viewpoint, having the right processes and tools for scaling in place is paramount for a successful IT organization. An organization must balance the need to move quickly with the best fit-for-purpose technology while at the same time not piling up additional technical depth across the organization. Especially larger, established organizations rely on existing programs and applications that are best delivered via a traditional v-model approach. At the same time, agile teams have become the norm. Hybrid approaches must be designed that allow agile teams to release features in short time intervals while still adhering to an organization's quality gates and release windows. Change never comes easy: every organization needs to adapt to the new ways of working. True digital leaders understand the networks within an organization and can bridge the gap across formerly divided silos. They understand that innovation happens at the intersection of different disciplines and they can apply systems thinking. The organization should always work towards the global optimum instead of looking for the local optimum. The performance management process and associated metrics must be rethought so that the envisioned way of working is incentivized. In case an organization wants to become more agile and flexible, KPIs must be reworked and the right tooling needs to be in place to measure them. How can you start? Take a minimum viable product approach! Any of the five DITO building blocks (people, processes, tools, metrics and methodologies) can be taken as an on-ramp scenario. As a rule of thumb, pick one or multiple building blocks and implement them across one (at most two) capabilities as a starting point. This results in a maximum of ten initiatives that will be targeted in parallel (See Figure 4). The less items you focus on for your MVP, the more likely you are to set yourself up for success. Figure 4: Creating on-ramp scenarios Here are four potential on-ramp scenarios that have proven successful: Scenario 1: An integrated tool suite for target landscape design and delivery management Tooling is a great starting point to drive behavioral change within an organization. With this scenario, it is important to pick tools that already come with preferred-practice processes,

data model, reports and workflows. It is important to choose a trusted implementation partner to avoid upfront design decisions that will hinder wider adoption when ready for scaling. Figure 5: Tools for target landscape design and delivery management Delivery management and target landscape design are two capabilities that are well suited due to the high tool maturity and relative ease of tool setup. Those type of tools also have an immediate impact and can be deployed quickly for agile teams doing product development or cloud transformation initiatives. Scenario 2: Introduce a common agile methodology for delivery management Typically, an organization has already deployed a variety of agile teams without ever developing a clear vision on how their work can scale and blend in with the rest of the organization. This is where agile frameworks such as SAFe come in. The DITO can become the leading unit to streamline agile initiatives and, together with the agile teams, define the ways-of-working that should be adopted by all agile teams. It is advisable to listen to the lessons that successful teams have learned previously. Figure 6: Agile methodology for delivery management The added value that the DITO can bring on top of the mentioned frameworks is the fact that hardly any organization will make a 180-degree turnaround to fully adopt one of the frameworks. Instead, different components of the framework(s) must be leveraged in perspective. Scenario 3: Move towards product-centricity True agile organizations must move towards a more customer-focused setup and form cross-functional teams. One solution is to reorganize around products and services and set up the respective agile teams. Figure 7: Product-centric approach The DITO can become the entity to give the right impulses and provide guidance on this endeavor. Scenario 4: Agile demand and portfolio capability If portfolio visibility is your biggest pain point, then try to go with scenario 4. You will leverage the DITO to establish common processes and metrics for demand requestors and portfolio managers that combines v-model and agile initiatives. Figure 8: Agile demand and portfolio capability It is advisable to target a certain project or product and use it as a prototype to establish new ways of working, tooling, etc. Once operational, this model can be scaled and rolled out across the wider organization. 3600 digital transformation management This article has introduced the concept of a Digital Initiative Transformation Office. The DITO forms a central umbrella view to manage the diverse set of digital initiatives in your organization. The DITO is a combination of people, processes, metrics, methodologies and tools (building blocks). The on-ramp scenarios can be used to discuss potential starting points in your organization. References Nils Ackermann Managing Consultant, Wipro Digital CIO Advisory Nils has more than 15 years of experience in delivering the whole bandwidth from smaller strategic IT assessments up to multi-year systems integration initiatives. He has implemented agile and v-model aligned IT Governance processes and tools across a wide variety of global organizations. Nils is based out of Frankfurt, Germany. If you want to find out more on how to set up a Digital Initiative Transformation Office, reach out to Nils at nils.ackermann@wipro.com
=======================

How a Change Management Office Can Solve the CIO's ROI Problems

How a Change Management Office Can Solve the CIO's ROI Problems March | 2021 CIOs are increasingly questioned about the ROI from technology investments, but shortcomings don't always lie with the technology itself. Management research studies indicate that 60-70% of technology programs fail or do not meet the intended objectives due to poor people adoption and organizational issues. Many companies undertaking large-scale programs are beginning to factor change management into the process, but some still do not. They should. Change management is critical to the success of any transformation project. Today, many transformations intended to meet the challenges of digital disruption are of a varied nature, scope, and scale. When starting a new project, the lack of synergy and coordination within the organization leads to inconsistent messaging, lack of best practices, and incompatible tools and processes. There are also challenges about how to manage the people side of disruption to derive business value. A change management office (CMO) is uniquely positioned to address these issues while managing change across the organization. The issues preventing most projects from success can be summarized into three themes: These challenges can each be overcome with a CMO managing the change. Without one, enterprises risk slower adoption and potentially greater expense. Consider the following examples: Key change management challenges for CIOs Today, CIOs are finding it increasingly difficult to prove positive impact across the organization. The value created by IT is not properly recognized. Most of the organization views IT more as an operational department rather than a strategic enabler. Among the many variables contributing to this view, absence or poor change management in IT projects is a key factor. The primary change management challenges faced by CIOs of large organizations include: Due to the complexities inherent in global organizations, many are now seriously exploring the idea of having a centralized change management office to build enterprise-wide change capability. The idea of a change management office has been there for some time, but few organizations embraced the concept. Most studies show that organizations that do not adopt CMOs have largely remained dysfunctional and project management continues to operate in silos. The Change Management Office (CMO) is an entity within the organization which takes care of all the organizational change management requirements. It is a department or group formed by a team of specialized individuals mandated to bring uniformity, common language, and framework to change management efforts. CMOs support integrated change management effort bringing synergy and consistency to any project by designing common tools and templates to use across the organization and serve as a center of excellence. The key advantages of having an integrated change management office can be summarized as: The CMO can help build

change maturity in the organization. It operates similar to a project management office (PMO), and includes a centralized pool of dedicated change consultants. The CMO provides a focal point for governing, structuring and implementing change initiatives. It legitimizes change activities and ensures a consistent approach to the "people side of change", which is where many projects fail. It addresses communications, training, and effective management of change across a portfolio of change programs. A structured approach is followed, increasing the likelihood of a successful implementation and adoption of new or existing programs in any organization. Industry and research insights on the CMO Change management research conducted by many organizations like Prosci shows that a change management office is increasingly being used to develop enterprise change management capabilities, build agility, and increase change readiness. In 2017, 40% of the participating organizations reported to have a CMO, or a "functional group" dedicated to change activities. Larger organizations were more likely to have a CMO, especially in retail, banking, government, finance as well as oil and gas. A CMO should not be confused with an office supporting one change activity; the CMO should be used in all projects that result in change. In Prosci's 2017 study participants identified the establishment of a CMOs as the number two trend expected in the discipline of change management in the coming years. How to build a Change Management Office This approach provides a roadmap to effectively create and transition to the new model of managing change, built on previous experiences and globally accepted practices The CMO is designed to manage multiple programs within multiple portfolios, eliminating duplicative work, creating a better user experience, and consistently managing change. CMO establishes a centralized hub for all organization change management activity across all projects. The CMO function will align itself in the current structure to drive consistency. Whether the change management office is an independent department within the organization, is part of human resources, or within IT, depends on the unique working style of each organization. But wherever the CMO sits, an operating model of managed change will benefit any organization. Based on our collective experience over a range of geographies, cultures, and industries, we can categorize the journey to build a CMO across four levels Operating Model of a CM The CMO may operate in multiple models depending upon the organization, its geographical spread, culture, needs, scale, change maturity, and agility. The following hub and spoke example model demonstrates how each project, based on size and complexity, may be delivered via different hub teams. This model gives the flexibility and scale to meet the unique needs of any organization. It can operate in a centralized, decentralized and hybrid structures, whether the change function reside in the organization generally, the IT, or HR department. Wipro's change management as a service solution proposition For organizations to achieve successful adoption of new process and technology adoption across the enterprise, we look to standardize the way change is executed. Through our change management as a service model, we help enterprises implement change plans with a flexible resourcing model and provide innovative tools, templates, and best practices to expand industry wide accepted models. For a repeatable process, we engage the business to drive change within their organization, and build capabilities to sustain enterprise wide change. Mohammad Tanweerul Hoda Consultant, Wipro

Digital Consulting Tanweer is part of Wipro's Talent & Change practice in the Middle East and has over 12 years of experience. Recently, he has been working with organizations on managing organizational changes due to shifts in strategy, new technology implementations, managed services transition, IT BAU Demand Management and change advisory. Before switching to consulting he spent his years as part of Corporate HR team for a global telecom OEM in various HR functions bringing a holistic, harmonized, and viable approach to consulting engagements. How Healthcare Companies Can Get their Data Monetization Strategy Right

----- Arcticle source ----- https://www.wipro.com/consulting/how-healthcare-companies-can-get-their-data-monetization-strategy-right/ ----- Contact Wipro Please fill the required details to access the content How Healthcare Companies Can Get their Data Monetization Strategy Right April | 2021 As per a BCG report "while many companies have high data ambitions, few achieve those ambitions. In 2019, only about 10% of companies reported that they had met the data targets set in 2016. Moreover, most were far from achieving their 2021 ambitions set in 2018." [1] Many companies have been unsuccessful in identifying the right data strategy that can give them sustained competitive advantage. Lack of data maturity has been a reason for this failure. To achieve their data ambitions, organizations need to focus on the impact areas based on available data and applied algorithms. Companies like John Deere, Kroger have identified their most valuable set of data using technologies such as IoT, analytics sensors etc. They have successfully used their data sets to understand their customers, and sell insights to their suppliers and third parties to create additional sources of revenue. In this article we will explore data monetizing models, pricing strategies, and how advanced analytics platforms help in generating insights which can help the businesses get their data monetization strategy right. Data collection strategies Companies can use various strategies to collect or acquire data. This can include both, organic and inorganic methods. Collecting data from customers. Using this strategy, a company can understand their customers, take decisions related to marketing, store locations, and create hyper personalized solutions. Flatiron has developed its own oncology based EMR platform by collecting data of 2 million patient records as of 2018. Lifesciences organizations use these datasets for various use cases in areas such as R&D, and clinical trials. [2] Partnering or purchasing data. John Deere in partnership with Cornell University has created a data platform (Ag-Analytics, data platform that syncs with John Deere's operations center to access and analyze farm data) which has become a source of revenue and has created significant value for their farmer ecosystem. Using this platform John Deere performs analytics of the data and farmers use these tools for estimation, forecasting, risk management of crop maintenance, and soil health.[3] Acquire a company.

Companies that are not able to process the data or not able to get the data required from any partnerships, could go for acquiring a company. Kroger has acquired a data analytics firm 84.51, which helps its biggest suppliers to understand the behavior of customers (60 million households) that shop at Kroger. This helps the supplier design better solutions and services.[4] Building an ecosystem. A company that possesses a significant amount of proprietary data and can buy or partner for additional data may be able to orchestrate an ecosystem that other companies participate in. Goldman Sachs in 2012 acquired a credit-reporting firm TransUnion and converted it into a data mining giant in just 3 years. TransUnion now has a large base of data sets, it continuously analyses those data and sells it to insurers and lenders.[5] For these strategies to create full impact, companies need to build a data-first culture. This can be done by investing in skills specific to using analytical insights. They should also run change management programs to create new mindsets and ways of working, and break silos by making cross-functional teams to share data, and create new roles and governance process. [6] Data monetization operating models The two main roadmaps for data strategy and monetization are internal and external. The first one focuses on leveraging company's data to improve its operations, productivity, quality of its products and services, and marketing campaigns. The second focuses on increasing the number of revenue streams - sell data as a service, sell data platforms, and create personalized products for its customers and partners. Analytics Platform as a Service. Companies use proprietary and sophisticated algorithms to generate highly personalized insights and data. Real-time insights are provided through a platform that is cloud based or self-service. Data analytics platform Predix owned by GE provides services to customers that helps increase the efficiency of its equipment. It also provides Energy Management Systems to its commercial and industrial customers. [7] Insights as a Service. Companies combine internal and external data sources, apply advanced analytics methodologies to provide insights to their customers. AkzoNobel provides an analytics based iOS app to its ship operators that provides performance prediction, financial predictions, and cost-benefit analysis thus enabling them to make informed decisions. They also provide a decision support model to its ship operators enabling energy cost savings. [8] Data as a Service. This is one of the simplest models where data is aggregated, anonymized and sold to partners and customers. Kroger helps consumer packaged goods companies in understand evolving habits and trends of shoppers by selling shopping data generated from their loyalty and reward cards. [7] Improving Outcomes and Productivity. Companies use Big Data solutions, which help them analyze their costs, selling price, and marketing campaigns, thus improving their savings, profitability, services etc. A battery manufacturing company used data from inventory and datasets of order backlog to optimize raw materials costs, maximize selling price and increase margins. [9] Hurdles in the data monetization journey Considering the sensitivity of data, any data monetization strategy must adhere to regulations like GDPR, HIPPA, and data protection acts of respective countries. [10] Consent Management. Getting the consent of consumers to use their data is the biggest challenge for companies. Companies have access to loads of valuable consumer data such as transactions, financials, and biometrics. Companies need to find a way to incentivize consumers for access to their data and make sure to handle it securely. [11] Data Governance. Companies should efficiently

onboard diverse set of data, ensure right quality of data in the system, have the right security in place and should be able to trace insights to the data source. [11] Data Security. The most critical part is the safeguarding of consumer data. Companies should build capability in role-based masking, anonymization, encryption of data, and network safety to make sure data, be it personal or enterprise, is safe. [11] Pricing strategies for data monetization Building a successful pricing strategy is one of the vital aspects for a data provider to have a successful data monetization strategy. The two primary strategies of pricing data products are: Cost-Based Pricing & Value Based Pricing[12] In cost-based pricing, the price is determined by adding a markup to the unit cost. Vendors need to determine the variable and fixed components that will be needed to build, maintain, and deliver the product. In value-based pricing, the value that customers derive from the product determines the cost of the product. This is not an easy task and requires many considerations and assessments. The pricing techniques that can be used are given in Table 1. Table 1: Pricing techniques for data monetization Winning with a solution built on data pipeline and AI-driven decision engine An advanced data analytics platform can provide a framework that allows Data Scientists to leverage data to create value-added insights. Companies can use this kind of platform to unlock value from data across the value chain and this can become an integral part of their data monetization strategy. It should have features like deep learning platforms, pre-built data science applications, high processing event processing platforms.[11]. See Figure 2 and 3. Figure 1 - Data Discovery Platform – Building analytics apps Potential data monetization market segments for health sector companies Research Organizations. There has been a huge growth in the volume of data and real-world evidence. Harnessing this will provide a great opportunity to reimagine and develop new approaches to clinical development, speed innovation and improve clinical outcomes. Leveraging a robust big data analytics platform will enable companies to take advantage of data. Using advanced analytics methods such as machine learning and predictive modelling, data scientists of IQVIA are able to provide insights and predict challenges before they occur.13] Innovators. Data sets in pharmaceutical innovators pose a challenge for analytics programs due to their complexity, density and diversity. To overcome this challenge, innovators can use robust data analytics platforms, for instance, through strategic partnerships that will enable them to improve efficiency, and clinical outcomes. Roche acquired Flatiron, an oncology based data platform that captures data from hospitals, health centers and generate insights from it. This will enable Roche to leverage data to boost its capability in R&D, and drug development. [14] Providers. As the trend of patient-centric approaches for healthcare keeps increasing, the providers need to align accordingly. With increasing complexity in surgeries like robotics, providers will need to have a robust data analytics platform to cater to image data, patient data etc. Advanced analytics models need to be deployed to have better accuracy and efficiency in surgical performances. With the help of advanced analytics using business intelligence platform, Western Maryland Health System was able to reduce the cost by 78%. They were able to generate valuable insights from their patient data, which resulted in cost savings of $112,000 over 6 months. [15] Payers. With the industry moving from volume-based care to value-based care, payers are faced with challenges to shift their business models. Payers

will need data analytics tools to overcome the challenges and enable better revenue recognition, new payment models, better options to patients, and fraud detection. Oscar Health is using data to help its customers increase their awareness about care they are receiving. They are able to help the patients with better choices of doctors using better pruning mechanism. [16] Digital Health Startups. Digital health startups are increasingly using data to devise their product offering. They are well positioned to cater to the ever-changing consumer behaviors due to their agility and smaller size. With the help of data, they can provide more predictive healthcare offerings, detect disease outbreaks, and personalize offerings. A digital health startup Medopad has developed an app that collects data from wearables, mobile devices, and medical bodies and analyzes those data to prohibit chronic disease. [17] Internal beneficiaries Companies can benefit in various functions internally in terms of cost savings, improving efficiency, and optimizing operations. Sales & Marketing. Sales & Marketing divisions can use analytics platforms to focus on reducing infrastructure costs, and maximizing sales outcomes. Enterprises can look at adopting cloud based Big Data platforms to accommodate their customers and vendor base. A global pharmaceutical and medical device major was able to achieve a savings of $1.5 mn from campaigns by using high performance Big Data platform. [18] Supply Chain & Operations. The need to manage product, customer and vendor, clinical and research data is extremely critical to the pharmaceutical industry. Companies can look at building a data management platform that can transform their sourcing and procurement function. A global pharma major was able to reduce cost by 25% in operations through master data management lifecycle solutions. [19] Workplace Management. Data analytics can offer many gains in the area of workforce management like using data analytics to determine the payroll of employees based on KPIs and workload management. A leading US retailer was able to increase customer satisfaction and $100 Mn in savings with the help of predictive analytics used for store labor optimization. [20] Reshaping healthcare with data monetization As the volume and complexity of data keeps increasing, there will be ample opportunities for companies to monetize their data. Companies in the health domain can leverage their data to gain advantage by improving the efficiency of their own business unit and/or by selling services using the data. To overcome the complexity and regulatory challenges of data monetization, companies will need to have robust data analytics and AI capabilities, which will enable them to tackle high volume of data and empower them to generate real-time insights for their ecosystem of partners and customers. Want to know how Wipro's Data Discovery Platform can help make your data monetization journey successful? Schedule a discussion with our experts. References

Organization Change Management: A Key Ingredient For Successful SAP-ERP Implementations

----- Arcticle source ----- https://www.wipro.com/consulting/organization-change-management-a-key-ingredient-for-successful-sap-erp-implementations/ ----- About the Author Contact Wipro Please fill the required details to access the content Organization Change Management: A Key Ingredient For Successful SAP-ERP Implementations May | 2021 Implementing or upgrading an SAP-ERP can provide an advanced, flexible IT landscape that helps organizations adapt quickly to dynamic market requirements and to improve efficiency, digitalization, and cost optimization in the long run. But SAP implementations are rarely just technical implementations. They can fail when companies neglect the need for organization change and the transformation journey. Many enterprises underestimate the effort required to change their internal behaviors and ways of working. For example, a leading multinational conglomerate implemented an order management system as part of its SAP package, which cost around $120 million. The system was supposed to save the company more $10 million per year, but it had quite the opposite effect. The organization's sales representatives struggled to adapt to the new system. Getting early buy-in from the end users and providing adequate training was overlooked. Another construction materials company implemented an SAP system and estimated it would generate $12 million to $14 million in net sales after it went live. In fact, the company's profit dropped by 45%. The major reason for this failure was not the new process or system but the lack of user adoption. In fact, when organizations and their people are not prepared for the transformation, implementation can take more time and more money. The key to a successful SAP implementation is a comprehensive Organizational Change Management (OCM) strategy. To achieve actual business benefits and increase user adoption, people need to engage continuously, sharing their concerns and feedback through a constructive change management roadmap. Software Advice, a Gartner company, has identified the key reasons for SAP or any ERP implementation failure as shown in the graph below. Half the respondents cited poor change management as the primary reason for SAP transformation failure. Fig: Why ERP implementation fails? Organizational Challenges in SAP Implementations The business impacts of an SAP implementation demonstrate the importance of change management: These challenges can be illustrated through real life cases. Case 1: SAP Concur Implementation A major oil and gas company wanted to leverage their expense management process and systems by implementing SAP Concur and integrating it with their core SAP system. Users are dispersed across 10 different countries. This new SAP implementation resulted in a new way of submitting the expenses. User adoption was not to the expected level and, as a result,

business benefits were not achieved. The company did not have the proper channels to handle the people side of change. and facing difficulties in spreading awareness and conducting training as their people across locations and time-zones. Employees were not using the system effectively. Change management was not initiated until late in the project life cycle when change resistance and misinformation were on the rise. After handling the people side of change through a change consultant, the client was able to achieve the desired end-user adoption levels across locations and the number of helpdesk tickets related to expense was significantly reduced. Case 2: Vendor Invoice Management The client implemented the SAP invoice management workflow to automate the end-to-end invoice process. The scope covered internal and external stakeholders and business processes, and the new SAP system implementation introduced a new way of submitting, processing, and approving invoices. However, end-users were not properly or adequately trained, and post-implementation adoption levels were low: less than 10% of the invoices were being processed using the new system. The organization resisted embracing the transformation because the client did not have a proper change management strategy and approach to onboarding internal and external stakeholders. The actual business benefits of the system were not achieved, and leadership considered canceling the project. However, they decided to introduce a strong change management team to help bring the project back on track. Stakeholders were onboarded and engaged effectively. Vendors started using the new system to submit their invoices, and internal users started using the new system to process the submitted invoices. Adoption was measured as part of the change strategy and communicated to leadership periodically. Now, the project is running successfully, with more than 90% of invoices processed using the new SAP solution. Risk of Focusing More on Technology Traditionally, executives have placed more importance on the technical aspects of implementations including functionality, reliability, timeline, and budget. In-house and external IT teams have often concentrated more on system engineering aspects than adoption and change management. Nonetheless, project overruns and failures still happen – primarily when SAP projects are managed from the technical perspective and neglect the people side. Wipro's view is that change management should be an integral part of SAP implementation from the beginning. This involves deploying a dedicated change manager or change management team with the necessary skills to handle the people side of the change effectively. Characteristics of Change Don't think about "users" – think about the people who are using the system. People have emotional reactions to change. Change management will educate leadership and end-users and make them aware of the changes that are coming their way. The key focus should be on these elements: Change management for SAP implementation follows a structured methodology that should be adopted to encourage the organization to understand and accept the changes. An organization can only get the full value and potential from a new SAP implementation after all the people who use the system have accepted the changes. Key Change Levers to Drive Any SAP Implementation Project Effectively driving change management will lead to achieving effective system adoption. Listed below are change levers used in the invoice management problem mentioned above, but which are valuable for any SAP implementation project. 1. Create a Business Case A business case will provide the end-to-end information about the change, particularly

in terms of why the change is triggered and what benefit or value is expected from it. Example: On the invoice management project, a detailed case study was prepared regarding the change. Initially, the vendor would submit invoices manually into a submission box. The expectation is to onboard all vendors and make this new solution the single window for all invoice submission. This will provide better cash flow and hence, strengthen the relationship between vendor and client. This was measured frequently against the expected results covered in the business case. 2.   Leadership Alignment Leaders across all levels must have absolute clarity on the purpose of the change and be aligned strategically. Leaders must have clarity on: Example: The executive team should have a regular update on statistics such as number of invoices submitted, processed, and paid (among others). Also, monthly reviews should be conducted to keep them engaged. 3.   Stakeholder Management Stakeholders are dynamic, and it's important to form and maintain constructive relationships with different stakeholders. People who were once supporters of the project may have learned something that causes resistance now. By spending time with stakeholders on regular basis, a change manager can monitor and maintain good relationships. Stakeholder management drives change management. Example: The invoice management project impacts both internal and external stakeholders. A stakeholder analysis provides different categories of audiences across the organization and leads to understanding of their perceptions of the project. Then, change strategies were devised to manage external stakeholders and internal stakeholders efficiently. Focused vendor sessions, and internal stakeholder sessions are conducted to listen and address their concerns and feedback. 4.   Change Impact Assessment (CIA) CIA is a detailed analysis comparing the current state to the future state and understanding the impact of the implementation on process, people and the organization. CIA helps drive the change from the organizational level to the individual level. CIA will act as the input for building communications and training strategies. It also covers a detailed analysis of job or role mapping. Example: A detailed analysis of existing and new invoice management processes against each stakeholder segment was completed to figure out the most efficient communication and training strategy. People react to communication differently and a customized change strategy is needed based on the user group. 5.   Change Agent Network Effective and excellent change management delivery requires establishing a change agent network across the organization. A group of people was selected from various department to be influencers and drive change within their user communities. They are the focal points and the carrier of the change program. Example: An influencer for every department was appointed across organization. These focal points act as change agents. Constant engagement with change agents helps take the change to the grassroots level across departments. Communications and training were executed well with the help of the change agents. 6.   Business Readiness and Adoption How prepared are users to accept changes? Before the system goes live, the enterprise should evaluate business and transformation readiness, in order to understand the level at which users are ready to accept change. After going live, the same process can be repeated to understand the adoption level of the new SAP system. 7.   Communication Communication – the right message, to the right audience, using the right communication channels, at the right time – is one of the key levers of the

change program. A good frequency of communications will keep the audience engaged. Example: With input from the impact assessment, a detailed communication strategy plan was made and very well executed. The key benefits of the new invoice management solution were communicated periodically to different stakeholder groups through all possible and available communication channels across the organization. 8.	Training Another key lever of the change program is to educate stakeholder groups about the new process, their roles, responsibilities, and the system. Understanding training needs and training the users on relevant modules, using an effective training strategy, enhances the user's readiness to adopt the changes. Example: The Concur case adopted a "train the trainers" approach. A group of internal users was educated to conduct further training and reach out to audiences across different countries. In the invoice management project, the training strategy was based on input from the impact assessment and executed at department level to reach the audience effectively. 9.	Change Reinforcement Once the change is implemented, an organization tends to move on to the next change program. However, it may not sustain the change in long term. People can turn back to their original level of comfort. That's why reinforcement is required to sustain change. For example, a celebration event or a reward and recognition program directly linked with the change can help to sustain momentum. Example: To reinforce the change in the invoice management project, a new email and helpdesk channel to address the stakeholder's concerns was provided after system go-live. "On the job" training was provided to the stakeholders required to adapt to the new solution. Detailed statistics were prepared on people struggling with the new solution, and they were supported through targeted communication and training sessions. Vendor meetings and stakeholder engagement sessions were been arranged to embrace the change. Feedback was collected and success stories were shared with audience to create positivity. Overall progress and success of the project was communicated in every stakeholder meeting to reinforce the change. Technology & People For enterprises adopting an SAP system, the focus should be two-fold: on the system-related changes on SAP but also on people side. This will increase user acceptance and adoption and leads to the desired results. Change management consulting can be the key to improving success. Organizations can also set up a change management office to increase the effectiveness of change programs if the SAP implementation is running as a different project. It is better to have a common pool of change professionals to run the programs with uniformity, common language, and framework to change management across organizations. Wipro's change management capabilities and its global pool of consultants can help technical implementation teams achieve high a degree of client satisfaction, run projects on time, and with the desired adoption outcomes. Pradeep Kumar R Senior Consultant, Digital Consulting Currently based out of India, Pradeep specializes in driving large-scale Organizational Change Management (OCM). He is an engineering and MBA graduate having total experience of nearly a decade, the majority of which has been devoted to OCM. Pradeep has also worked on technology, digital transformation, ERP implementation, and mergers and acquisitions projects.
======================

Next-Gen ITSM Blueprint for Digital Enterprise

Next-Gen ITSM Blueprint for Digital Enterprise June | 2021 Introduction In today's world, virtually every sector and every enterprise function has been disrupted by digital transformation – including information technology (IT), the nervous system of any business. Facilitating digital transformation is central to the IT function; IT, after all, facilitates the adoption of technologies and solutions that make digital work. But how enterprises manage the "business of IT" also needs radical transformation to thrive in the digital era. In order to provide quality services and meet enterprise expectations, many IT processes and operating models require transformation, including IT Service Management (ITSM). Stability and resilience have always been key elements of ITSM success, but today, agility and experience are becoming de facto standards. Stakeholder expectations are shifting from "first-level resolution" to "first-class experience." With these rapid changes, CXOs are finding it difficult to align their ITSM models with new organizational strategies. Taking the existing challenges to a next level... Traditional ITSM best practices and frameworks have served companies well, but now, users demand faster services and better experiences. Meeting these expectations with a traditional ITSM model can't be done. Most existing ITSM efforts still operate with legacy processes and siloed functions and are output-focused. Many organizations also face significant issues such as IT landscape complexity, reactive processes, inadequate process definitions, and the lack of integrated platforms. And there is less focus on ITSM-related organizational change management. The time is ripe for a digital approach to ITSM. Organizations should design a well-thought-out ITSM blueprint that will complement their digital strategy and provide a great service experience. Wipro understands these new realities for ITSM. With Wipro's Next-Gen ITSM Blueprint, enterprises can transform an existing, traditional ITSM model so it aligns well with their organizational digital strategies. Wipro's Next-Gen ITSM Blueprint makes existing ITSM models simpler and more user experience-centric. It enables digital transformation. The Next-Gen ITSM solution is a holistic approach to help organizations become more digital-savvy by addressing a whole spectrum of current industry trends, including customer experience. Built on current industry best practices, Wipro's Next-Gen ITSM Blueprint can accomodate leading-edge processes and technology solutions. Introducing Wipro's Next-Gen ITSM Blueprint Solution Figure 2: Key tenets of Next-Gen ITSM blueprint solution Transformation Programs Where Next-Gen ITSM Model is a Key Differentiator Several enterprises have used Wipro's Next-Gen ITSM Blueprint framework with great results. It provides the power and agility to handle a variety of business needs and situations, but it is particularly valuable in these initiatives: The Core of Wipro's Next-Gen ITSM Framework Figure 3: Core principles behind the solution framework Wipro's Next-Gen

ITSM Blueprint is based on these core principles: Value Drivers, which refer to the core outcomes for a specific enterprise and sector. Provisioning Levers represent the a set of levers that Wipro will apply to achieve the Value Drivers. Enabling Platforms represent Wipro's underlying technology and platform solutions make it all possible. For example, for a telecommunications company seeking to provide exceptional customer service, one of the value drivers might be user experience management. Achieving this could require a provisioning lever such as an "experience excellence office" – a unique charter to ensure a unified experice across personas, locations, and channels. The relevant enabling platforms could be Bot Govern, Bot Factory, HOLMESTM intelligent routing, Remidiation Engines. The combination of all these key components would help the company realize the desired outcome. Embarking on this challenge would require blueprint contextualized to the telecome company so that the provisioning levers and underlying enabling platform work cohesively. Wipro's Next-Gen ITSM framework has been designed to achieve the outcomes as described below. Figure 4: Next-Gen ITSM Blueprinting Framework Contextualized Service Design Contextualized service sesign focuses on defining business-centric IT services and documenting them in a service catalog. Services will be different for different businesses and sectors; for example, service definitions for retail and finance will be very different. A more contextualized business and IT service definition should represent the real-world IT and business organizations. User Experience Management Because user experience is at the center of digital transformation, the Wipro blueprint explicitly focuses on user-centric, persona-based processes created with design thinking methods. The Wipro solution helps manage all forms of user experience – for customers, of course, but also for employees. Service Ecosystem Integration The Wipro blueprint focuses on integration of the whole service ecosystem so that suppliers, processes, solutions, modern technologies, and platforms work together seamlessly. Empowering end-to-end IT supply chain integration requires data-driven integration of services and business process improvements. Smart Governance Smart governance provides a real-time view of service performance through a single pane of glass across the service landscape in the form of a service dashboard. Wipro's service dashboard solution is based on a unique concept known as delivery-led value which foicuses on outcomes more than output. This type of governance enables efficiency by using digital technologies that span strategic and operational layers. Next-Gen Operating Model With advanced tools and technology platforms disrupting ITSM, the traditional operating model won't work. The new operating model must align with modern digital ways of working including the enterprise's AMSC (analytics, mobile, social, cloud) strategy. The Next-Gen operating model supports service management, business, and IT in a holistic way to aid in making critical decisions and improving ROI. Wipro helps clients deliver on the potential of these value levers through its extensive experience of well-established technology and platform solutions. Ease of Implementation Delivers Maximum Gain Wipro has specifically designed a transformation methodology to design and implement its Next-Gen ITSM Blueprint solution. This transformation methodology is complemented with a rich set of accelerators, from tool kits to reusable assets, along with enabling platform solutions and products. These capabilities accelerate the client's transformation journey while

delivering tangible benefits and outcomes. Key Benefits of Wipro's Next-Gen ITSM Blueprint   Subhasish Das Principal Consultant, CIS Consulting Subhasish is part of the Applied Service Management Consulting Practice (ASIC) within CIS Consulting at Wipro. He has more than 15 years of consulting experience, which spans across ITSM transformation, operating model design, platform implementation, service and integration management (SIAM), and automation. Subhasish has worked with prestigious clients across industries and helped in their transformation journey. He is currently leading the Next-Gen ITSM product charter within ASIC. =======================

Reimagine Business with an "Art of the Possible" Roadmap

----- Arcticle source ----- https://www.wipro.com/consulting/reimagine-business-with-an-art-of-the-possible-roadmap/ ----- About the Author (s) Contact Wipro Please fill the required details to access the content Reimagine Business with an "Art of the Possible" Roadmap June | 2021 In the current climate, enterprises must move fast to stay ahead of the competition and to ensure survival in the face of quickly evolving industry boundaries and business models. More and more enterprises are looking at digitalization to help them thrive and compete. However, rushing headlong into digitalization can lead to trouble. Organizations can get bewildered by a kind of technology euphoria that leads to too-frequent strategy reviews, budget erosion, and, sometimes, very little headway on their transformation journey. True transformation requires a thoughtful, strategic approach. It requires deep understanding of how users really interact with an enterprise's systems, products, and services. It requires new platforms to ensure round-the-clock availability on all relevant channels. And it requires an infusion of artificial intelligence to generate new insights and to deliver experiences that are contextually aware, personalized, and differentiating. The best way to enable digital transformation is by thoughtful strategic planning. Wipro formulated an approach called an "art of the possible roadmap." The roadmap identifies areas where digital technologies can be leveraged in innovative ways to build user-friendly and contextually aware products and services. To help enterprises create such a roadmap, Wipro developed a five-step approach (see Figure 1) designed to help enterprises reimagine their business processes with intelligent capabilities to realize strategic goals. Figure 1: Constructing the Roadmap: A Five-step Plan Step 1: Identify Relevant Value Streams Many enterprises start digitalization at a granular level, like for a particular business unit or function or sub-business unit, but these rarely deliver the outsized benefits that companies are looking for – they're just too siloed and narrow. Instead, start by analyzing the "value stream," the path that extends from initial engagement with a customer or prospect all the way through to delivering a product or service as well as after-sales support and whatever tasks are required to build the ongoing relationship. Typically, an enterprise will have many value streams. Some example value streams might be "order to cash," "prospect to customer," or "source to pay." The fact that there are many value streams

means the enterprise will have to make choices about which value streams to start with on their implementation journey. Organizations have limited capacity to absorb too many changes in people, process, and technology that require multiple changes in their culture and behaviour. Value streams should be evaluated and selected based on business value, readiness for process digitization and technology maturity parameters outlined in Figure 2.   Figure 2: Factors for determining Value Streams for Digitalization 2. Evaluate "Intelligence" in Value Streams Once the value streams have been identified, each individual value stream needs to be broken down into value stages and assessed with respect to its potential for leveraging automation and intelligence, along two dimensions: a. Intelligent Interactions: What is the potential to reimagine the way users in the value steams interact with more intelligent (i.e., AI-powered systems) considering the context of the moment of interaction? Each use case within a value stage can be assessed using multiple paradigms: empathy, speech, language, touch interactions, gesture interactions, and immersive experiences. b. Intelligent Processes: This dimension drives the potential to reimagine how processes can become more dynamic and adaptive using cognitive/intelligent capabilities. Each value stage can be assessed using several possible paradigms: Here is an real-world example of applying intelligence to value streams: Amazon has achieved impressive results from its 2016 acquisition of Kiva, a robotics company that automates picking and packing in Amazon warehouses. Using manual workers, Amazon's "click to ship" cycle time ranged from 60 to 75 minutes; Kiva's technology reduced this to 15 minutes. 3. Reimagine Value Streams Business problems are complex – often too complex to solve by merely identifying digital opportunities and applying digital technologies. Enterprises should take an outside-in, customer-centric approach to reimagining intelligent value streams with design thinking workshops and crowdsourcing. For example, consider holding innovation workshops with all business stakeholders participating and present the latest digital technologies, potential capabilities identified in Step 2, and use cases across industries. These workshops also provide a forum for business stakeholders to really think about the status quo. This approach will help identify the initiatives/use cases that need modification in order to redefine employee, customer, or partner experiences and how processes will be executed in the new world of automation/intelligence. Figure 3 shows the "Source to Pay" value stream broken down in value stages. Each value stage has been reimagined along two dimensions of interactions and processes to come up with ideas and initiatives for interjecting intelligence. Figure 3: Art of the Possible – Initiatives for "Source to Pay" Value Stream Initiatives identified through the reimagining process will often need to be supported by foundational technological capabilities or platforms. Platforms play a crucial role in bringing together common computing infrastructure, cognitive capabilities, event-driven services, and contextual capabilities. Ultimately, platforms influence strategy, partnerships, and business needs and have a huge impact on the business outcomes of digitalization. One of the key forces behind the success of tech companies such as Amazon, Google, Facebook, and Alibaba are the intelligent platforms they have built for their innovative products and services. 4. Define the Art of the Possible roadmap The first three steps – identifying value streams, assessing them for the potential to become intelligent, and reimagining in light of digital technologies – will generate a set of initiatives to enhance experiences,

embrace intelligent automation, and build platforms to support scaling. Now, analyze that set of initiatives using a portfolio-based approach, looking at use cases over a one- to three-year horizon and based on the organization's strategic directions, market conditions, risk, and reward. In the near term, the enterprise should focus on use cases where there are proven technology solutions today – but should also identify use cases where a technology is emerging but not yet proven at scale. Over the medium to longer term, consider selecting unproven use cases to collaborate with third parties to innovate for first-mover advantage in the market. Many of these initiatives require challenging the status quo, taking risks, breaking rules, and challenging existing policy and governance models. It may be related to modifying an existing governance model, organization structure, change management, etc. These supporting initiatives should be included as part of the overall plan. The plan requires buy-in from the executive suite to generate momentum within the organization, hence these initiatives should be co-led by both business and technical leaders. 5. Realize business benefits iteratively This art of the possible roadmap should be implemented in the form of virtuous cycle – design, try, learn, and redesign – using a design thinking, DevOps, and agile approach to manage risk and derive the benefits quickly. Embracing agile concepts like "fail fast," "minimum viable product (MVP)," "user feedback," and "time boxing" will help ensure the roadmap takes the enterprise on a meaningful, valuable transformation journey. While the benefits of the art of the possible roadmap are immense, they can be difficult to measure. How, for example, can a company measure competitive advantage, or how well they are embracing digital adoption? Organizations should develop a model that clearly defines and articulates all the required areas, and a reasonable way to measure them. It is also important to establish a feedback mechanism to facilitate continuous monitoring of outcomes once the model is adopted. Such a monitoring mechanism will translate the practices to tangible outcomes throughout the timespan of the project. The Roadmap is Just the Beginning The reason enterprises develop strategies is to generate real results. The art of the possible roadmap is a powerful approach to developing digital strategies and the journey to digital transformation – but the real challenge comes when enterprises begin to implement their roadmaps. Even when compelling commercial use cases have been identified and created, regulatory and social barriers can raise the cost and slow the rate of adoption. Moreover, it is critical that roadmaps and initiatives have very strong support from executive leadership – essentially everyone in the C-suite and the board of directors as well. Intelligent capabilities are important not only to stay competitive, but also to survive amidst the changing industry boundaries and business models. Wipro's "Art of the Possible" framework evaluates the intelligence that can be embedded in processes by infusing cognitive capabilities. This is supplemented by our expertise in the emerging technologies that identify future technology scenarios that can be leveraged to further transform business capabilities. Rajnish Kasat Practice Partner, CIO Strategy and Advisory Services Rajnish has over 24 years of experience in building and managing global teams to deliver digital consulting engagements and architecture services across industries. He routinely advises boards of directors, CXOs, and executive management on various aspects of IT and digital. Karthik Reddy Nareddy Lead Enterprise Architect, CIO Strategy and Advisory Services Karthik has 13 years of experience in

advising clients on IT strategy, digital enterprise architecture, and cloud strategy. He has a blend of experience in strategizing and also, driving IT transformation implementation to ensure business-IT alignment.

Beyond the Financials: How Organisational Change Management is Critical to M&A Success

----- Arcticle source ----- https://www.wipro.com/consulting/beyond-the-financials-how-organisational-change-management-is-critical-to-m-and-a-success/ ----- About the Author (s) Contact Wipro Please fill the required details to access the content Beyond the Financials : How Organisational Change Management is Critical to M&A Success July | 2021 "People are our most important asset." It's the kind of verbiage that appears on mission statements and value propositions in corporations and institutions around the world. And here's why: because it's true. Because people deliver products, services, and experiences. People turn strategy into results. And when people work in a culture that empowers and inspires them, they do great things. For many executives, mergers and acquisitions are driven by the numbers, the cold, hard realities of revenues, profits, and balance sheets. But the best and most successful M&A deals are driven by something else: an appreciation of the importance of people and an awareness of the immense uncertainty people experience in the midst of a merger or acquisition. As a technology leader, Wipro works with many companies to ensure a smooth melding of IT and business process landscapes through our post-merger integration practice. But Wipro has also built a team focused on talent and change management because of this reality: The typical cause of failure for an acquisition is neglecting people and culture. We help companies ensure that human resources remain at the forefront of M&A activities in recognition of the importance of people in successful deals. A recent experience for Wipro's Talent and Change Management team illustrates the point. In late 2020, the German company METRO AG wanted to strengthen its focus on its core wholesale business and decided to spin-out two subsidiaries focused on digital and IT, METRO-NOM GMBH in Germany and METRO Systems SRL in Romania. In a deal valued at about $700 million, Wipro acquired the subsidiaries and transitioned more than 1,000 employees to Wipro. Of course, the deal made financial sense to both parties, METRO and Wipro. But it would only be successful if Wipro was able to successfully manage the employee transition from METRO and integration into Wipro. And at the height of the global COVID-19 pandemic, this was even more crucial than ever. It's a credit to METRO this was an important consideration in their decision. Both companies shared a vision of what a transition should do: By their very nature, acquisitions create huge uncertainty, fear, and anxiety about the future and risk loss of talent, resistance to change, and damaged morale.

Wipro's challenge was to manage and mitigate people issues with the same focus and discipline as functions like Legal, IT, and Finance. Align, Engage, Enable The Talent and Change team at Wipro know how to approach and manage these kinds of large-scale enterprise organisational change challenges, by focusing on three big themes: Here's how this worked out with METRO AG. It was critical that pre-Day 1 and post-merger integration activities would be supported with robust change management interventions. Wipro's organisational change management team is human centred in its approach, so the project team could focus on the acquisition's design and development. Wipro's involvement started several months before the acquisition "went live." The designed approach was aligned with key business change objectives: rapid adoption and ensuring the transitioning employees would be emotionally committed to the strategy behind the change. This was achieved by developing a strong leadership structure, consisting of transitioned leaders as well as those already within Wipro. We also made open and honest communications a primary concern, aligning priorities, and promoting teamwork. This ensured the acquired businesses functioned as smoothly as possible, minimizing disruption and accelerating time-to-results. To mitigate any human capital risks, Wipro's Talent & Change team conducted business readiness and change impact assessments both before the acquisition closed and during integration. These assessments served as the framework for the ultimate change strategy. The team also worked with the leadership of the three entities to ensure the acquisition's strong value was clearly and repeatedly communicated to employees. Specific interventions were employed to increase cultural alignment and build connections between Wipro, METRO-NOM, and METRO Systems employees, such as virtual coffee get-togethers and expert talks. Employees from both parties were able to share their individual transition experiences and share knowledge of best practices. Townhalls, monthly newsletters and a dedicated Q&A microsite provided an ongoing drumbeat of communication activities to deliver timely, relevant and consistent information. In addition, a network of 'Change Influencers' further supported these change activities. Led by employees of METRO-NOM and METRO Systems, and assisted by Wipro, this network acted as ambassadors, bridges, and translators to help the transition and integration proceed smoothly. Regular measurement for meaningful insights to drive execution excellence and transformational success provided direction to help ensure these interventions drove the successful adoption of the change, for both sides of the acquisition. Paving the Way to Future Success Successful post-merger integration is the key to generating sustainable added value for companies. Every merger is unique and requires a customized solution. Effectively managing the people issues that resulted from this M&A integration took discipline and focus to ensure change would be lasting. Improving engagement, measured through employee engagement software, as well people working together as one company with a common vision and shared goals were key indicators of success. The OCM team provided a valuable perspective on the people-related risks which may otherwise be overlooked. It was important to partner OCM with the acquisition team early in the due diligence process, whilst also forming a blended change team. This helped identify and mitigate cultural as well as structural, talent, and financial risks that could have arisen in the transaction. Importantly, the team were able to ensure that the transitioning employees could

successfully navigate the new terrain and were supported in their continued cultural immersion. By focusing on organizational change management before, during, and after the deal, Wipro ensured that human capital is now a key focus area moving forward. Wipro will look to provide the acquired employees with new opportunities to advance their careers, access innovation, work with leading digital technologies, and adopt new ways of working that enable agility, speed and scale in engineering. In M&A situations, planning for the human consequences of change and disruption can make a tremendous difference at both the enterprise and individual employee levels. But experience and expertise in organizational change management can add value during any kind of restructuring or strategic shift because people really are "the most important asset." Click here to learn more about Wipro's organisational change management expertise and our Talent & Change team or email David Lyons on david.lyons@wipro.com. Thomas Howell Senior Consultant - Talent & Change Team at Wipro. Tom has 6+ years Change Management experience, delivering complex multi-stream, multi-capability end-to-end change consulting and advisory engagements. David Lyons Partner - Talent & Change Team at Wipro David has 20+ years Change Management, Organisation Design and HR Advisory experience, leading multiple end-to-end consulting engagements for many household brands. =====================

Moving ERPs to the Cloud: The Importance of Program Management

----- Arcticle source ----- https://www.wipro.com/consulting/moving-erps-to-the-cloud-the-importance-of-program-management/ ----- About the Author (s) Contact Wipro Please fill the required details to access the content Moving ERPs to the Cloud: The Importance of Program Management August | 2021 According to Gartner, worldwide public cloud service revenue will reach $364 billion by 2022, which represents a compound annual growth rate of 12.6% since 2018. And the reason is simple: More and more enterprises are embarking on their digitalisation journey and migrating their infrastructure and applications into the cloud. In fact, cloud adoption has become the default choice for many CIOs planning strategic digital transformation. But for enterprise resource planning (ERP) systems, which have been vital for all kinds of businesses for decades, cloud adoption has been much slower. For some companies, ERP systems are so important that they are reluctant to tinker with them; for others, the attitude is along the lines of "if it's not broke, don't fix it." In many cases, however, ERP systems and their underlying infrastructure have decayed into the legacy systems. And ERP systems are costly in terms on-premise hosting and application maintenance. Cloud can help, and ERP systems are finally starting to embrace cloud computing. In fact, Gartner predicts that business intelligence, supply chain management, project and portfolio management and ERP will see the fastest growth in end-user spending on SaaS applications over the next few years, reaching $143 billion by next year.

Traditional, on-premise ERPs offered CIOs the freedom to adapt these powerful solutions to suit their enterprise's needs, offering differentiation and competitive advantage. But insight from Gartner – its Pace-layered Application Strategy – highlights the fact that there is no real advantage in heavily customizing systems of records used primarily for operational efficiencies (a layer within which almost all ERPs fail). Some enterprises may require a unique, differentiated approach for their systems of engagement or systems of innovation. One consequence of this idea is that adopting standard processes for systems of records, hosted by a SaaS ERP provider, can ensure world-class processes that are tested and proven and can be used in many industries. Small- and medium-sized companies are already moving to a SaaS ERP, but even large multinational enterprises are finding it safe to adopt SaaS ERPs for their systems of records. CIOs are increasingly keen to move ERP systems to the cloud – not just their custom-built, on-premise cloud-based ERPs but also SaaS-based ERPs. They want to take advantage of the many benefits of cloud computing: lower total cost of ownership, much greater scalability, reduced risk of deployment, access to innovation (via continual upgrades), and enabling accessibility to critical enterprise applications for global users. The CIO dilemma: From strategy to implementation This trend begs the question: What's the best approach to successfully putting ERP systems on the cloud? Wipro believes that modern program transformation practices can help organisations improve efficiency and ensure success in their SaaS-based ERP implementations. The right program management approach helps ensure effective alignment, integration, and control. It requires strategies for prioritising and sequencing a series of multiple projects, managing their interdependencies, implementation methodologies, benefits, stakeholder management, establishing and implementing governance, and orchestrating organizational change management. In fact, the decision about how to proceed with a SaaS implementation may be as important as the decision to proceed. SaaS-based ERP transformations do entail risks, at the implementation phase or in the long run, that may negatively impact the initial business case. A truly informed decision will reflect many factors and challenges: Methodologies: Waterfall, Agile Fusion, and "WAgile" Traditionally, ERP applications have been implemented using the highly structured waterfall approach: requirements, design, coding, and testing. Gartner's Pace-layered Application Strategy suggests that this highly structured implementation method is ideal for implementing systems of records. Take conventional ERP implementations as an example of the waterfall approach. Typically, this involves these steps: Each of these steps is discrete and distinct; each is completed before moving onto the next. But waterfall is not an ideal methodology. For example, a waterfall approach can make it very challenging to visualize the application from the requirements documentation, one of the most difficult parts of software development. This can lead to dissatisfaction with the delivered product. Also, the waterfall approach is not change-friendly. Changes are often difficult and costly to implement. And, finally, waterfall approach is not fast, which means it could take months or even years before the customer sees the final product and starts to see results. However, the rise of SaaS ERP providers has tilted the balance more towards the agile development process, an iterative, team-based approach that emphasizes rapid delivery of complete functional components. Tasks and schedules are broken into sprints or iterations.

Completed work can be reviewed and evaluated by the project team and customer through daily builds and end-of-sprint demos. These benefits are why agile is so popular, but it's not a silver bullet that can address every implementation challenge: On the plus side, agile shortens the delivery time and makes it easy to gather feedback in the early stages to better suit customer requirements. Agile is good, but many development and implementation projects today use the WAgile – the phrase combines "waterfall" with "agile" – approach that dismantles the siloed approach. In WAgile, planning, design, and requirements definition are done using the waterfall methodology, but development and modular tests are conducted in in short sprints using the agile (scrum) methodology. Some other key points about WAgile: The WAgile implementation model for SaaS ERP applications uses the minimum viable product (MVP) approach, which starts with the premise that end-users have a minimum fundamental need and the application chosen for implementation satisfies that need. The project team then delivers a MVP – essentially a subset of the desired end-goal application (in this case, a SaaS ERP system) – with enough features for a reasonable sampling of users to try out and provide feedback for further development, fine tuning, or for the phased rollout. MVPs are valuable in that they help developers avoid lengthy and potentially unnecessary work. Instead, they iterate on working versions, responding to feedback and challenging and validating assumptions about meeting the application requirements. This approach helps avoid application configuration that customers do not want or seek, avoiding unnecessary costs and delays. A MVP also becomes a quick win in and of itself because it helps the business become familiar with the application. Essentially, a MVP entails independent development of some modules or components while the planning phase is still underway along with some activities – such as setting up the cloud infrastructure or planning for data migration – are being tackled as separate workstreams. The diagram below illustrates a WAgile process flow for end-to-end delivery. o During daily scrums, the team shares what has been done, discusses what is to be done, and raises flags on potential blockers. o At the end of the first sprint, the team conducts a sprint review during which the first iteration — a fully functional iteration — is presented. o Then, testing and feedback of the first iteration by stakeholders is begun and gaps on initial assumptions are identified. Under the WAgile methodology, the MVP approach is split first into small modules, which are then broken down into components, features, or user stories that can be delivered incrementally. Ultimately, the components will cover the entire business need and, eventually, the broader rollout. Adopting a hybrid model like WAgile, which combines the best aspects of both waterfall and agile, can be a win-win for business units and the implementation program team. Implications for Organisation Change Management Organisation change management (OCM) is an essential component of large IT ERP transformations, and covers a wide set of activities: new organisation design, roles and responsibilities; skill sets required for the new technology; understanding change impacts on processes, users, and roles; designing and delivering training programs; and communications management. A conventional waterfall project will experience intense support demands at the beginning of the program, tapering off during code development and configuration, followed by a spurt in support requirements during user acceptance testing and training. In a WAgile scenario, OCM tends to move

towards more of an agile approach. OCM will be required throughout the project lifecycle, from the introduction of the MVP all the way to the realisation of full business objectives. OCM demands will vary from project to project based on the volume of business change and the organisation's maturity to accept and adopt change. Conclusion As ERPs continue to move from on-premise configurations to SaaS cloud-based solutions, implementation delivery methodologies will also evolve in order to achieve the desired timeline and business benefits associated with a cloud strategy. The WAgile approach combines the best of both agile and waterfall methodologies, and it can be easily adjusted to the size and complexities of each SaaS ERP implementation and the inherent business transformation. Shripad Ghanekar Sr. Partner, leading Program Transformation Practice within CIO Advisory Consulting. Shripad has over 25 years of progressive experience in multiple roles and has successfully executed some large Programs Wipro has delivered globally. Spanning across multiple industry sectors these programs include ERP transformations of strategic importance as well as Merger, Acquisition and Divestiture scenarios. Jesus Oregui Partner at the Program Transformation Practice within Wipro's CIO Advisory Consulting. Jesus has over 20 years experience across industries, Jesus has helped organisations to implement their ERP based driven transformation programmes as part of their digital and cloud migration journeys. With strong roots in manufacturing and engineering, Jesus has actively led the development of the digital agenda in the supply chain while leading global project delivery teams for implementing latest SaaS ERP solutions. Vijay Venkat Partner in Program Transformation Practice within WIPRO's CIO advisory Consulting He has 25plus years of experience. Vijay Venkat has successfully delivered many largescale ERP transformation & Consulting projects in Retail, Energy (Oil & Gas), manufacturing and Utility Sectors. Have extensive experience in managing Enterprise Architecture solutions around PaaS, IaaS, SaaS, TaaS and Hybrid solutions. With a strong domain knowledge in Supply Chain, has extensively worked on New Dimension products of SAP like S/4, BW4HANA, SAC, Ariba, Concur, GRC, IBP and also other technologies like Hyperion, MES, Workday, FIS-QUANTUM in various project implementation methodologies like Waterfall, Agile and also the proposed WAgile methodology.
======================

Change Networks:

A Key to Success in Enterprise Transformation

Whether it's a new application or an enterprise-level digital transformation, progress cannot happen until people embrace and adopt the change. One of

the best approaches to helping people embrace the new is through change agents and change agent networks. Change agents are sometimes called "change influencers," "change champions," or even "ambassadors" of change – but the nomenclature is less important than their common characteristics. They are eager to lead the way forward. They volunteer themselves to be at the forefront of transformation. They want to help their co-workers understand what is actually going on and embrace the "new ways of working." They are the people within the enterprise who help make change happen, sometimes without a formal role, and they play an outsized role in successful enterprise transformation. In a report on "The people power of transformations" from McKinsey in 2017, the authors wrote: Change agents...appear to have a notable impact on success. Less than half of respondents say their organizations select these employees, who dedicate a significant part of their time to work as facilitators or agents of the transformation. But those who do report overall success more often than other respondents—and are twice as likely to report success at transforming their organizational cultures. Why are change agents so important? For a simple, almost obvious reason: Because employees are more willing to accept change when they: The most effective to ensure that these things happen is by identifying change agents and building change agent networks. In Wipro's work with change management, change agents are an essential component of ensuring change happens and change endures. The Power of Change Agents Enterprises that are serious about evolution and improvement either are considering transformational journeys or have already launched one or more of them. They consider the financial and technological implications as a matter of course, but they should also consider this reality: people should be at the heart of the transformation journey. Change agents can play an enormous role in helping the broad employee population accept change and, most important, ensuring that change becomes embedded in the company culture. Change agent is not an official job title (though perhaps it should be in today's dynamic enterprise). But what makes a good one? According to the book "The Change Leader's Roadmap: How to Navigate Your Organization's Transformation" (Linda Ackerman Anderson & Dean Anderson, Pfeifer, 2010), good change agents share several characteristics: First and most important, they are very open to change; they are not rigid in their thinking or approach to work. Second, they appreciate the differences between current ways of working and how things might be in the future, and they are excited by the possibilities and opportunities that something new offers. Third, they are effective in both communicating and listening, able to empathize with their colleagues as well as take direction from above within the organization. Change agents also have a growth mentality. Their positivity and willingness to embrace new ideas is great for them, personally, but those traits are also great for the dynamic enterprise. Their enthusiastic belief in the purpose and benefits of change can help lead other, perhaps more hesitant, colleagues to embrace transformational initiatives. One change agent is good, but a network of them spanning the enterprise is phenomenal – if (and it's a big if) that network is empowered to drive and deliver change at the local level. Often, the best change agents don't need a formal mandate to work their magic, but change networks only work if they have the approval and the tools to actively effect change through educating, coaching, and supporting their colleagues in new ways of working. That's why change agent networks

should work closely with project and program teams; that enables change agents to become early adopters of new ideas. Change agents serve as ambassadors and translators – the bridge between the inner circle of a project and the rest of the organization. They deliver information (what, why, and how), and they are the conduit for feedback from the rest of the organization. By doing so, they promote understanding and commitment to the change. Effective Change Agent Networks The effectiveness of a change agent network is driven by two ideas. First, the change agents must have a real understanding of the business area that is changing or transforming in terms of process, systems, or stakeholder perspectives. They must believe that the change is beneficial. This gives change agents the ability to make the case for change with conviction. Second, the rest of the organization should respect the network and have confidence and trust that the change agents are genuine. Change agents should have a kind of charisma and be seen as leaders by their peers – so choose them wisely. The ideal change agent network is composed of people who have a high level of understanding of the business and change and have positions of authority (formal or informal) within the enterprise. What Change Agent Networks Do Enterprises undergoing change can put change agents and change agent networks to work in multiple ways: Communication: Change agent networks help clarify and deliver messages around new initiatives to the people they influence. They can ensure communication is clear, concise and uses the right language to be easily understood by the intended audience. They typically understand the best channel, the best format, and the best opportunity to communicate. And they can collect feedback regarding how people feel about changes. Creating change plans: The "one size fits all" approach generally does not work for organisational change management. Most enterprises create a framework that can be applied across a multitude of different scenarios, but for meaningful change to take place, a change plan needs to be adapted to address the intricacies and nuances of affected teams. Change agent networks are in a prime position to support the development of change plans for their areas, especially for organizations lucky enough to have employees who understand the change management and business transformation. Stakeholder engagement: Change agents understand the rationale for change but also can empathise with the reasons for resistance to change – which helps address resistance. They can help change management teams build a targeted, persona-led approach to engage appropriately with different stakeholders and build commitment. Because change agents tend to be in the trenches of the business, they can help ensure people are receiving the change message from a source they respect and a source who understands their situation and concerns. Change impact assessment: Changes involves risks; change management seeks to mitigate risks, and that's where the change impact assessment (CIA) – an articulation of the magnitude and complexity of required changes – becomes so valuable. The change agent network can provide valuable, "real world" insights into potential organisational impacts of new initiatives. The CIA is essential for effectively planning and managing change. Business readiness assessment: A key element of any change management effort is to know when to put the key in the ignition and go. A business readiness assessment helps determine the willingness and ability of the people within the organisation to adapt to change. The change agent network can help by encouraging participation in things like surveys and focus groups, which can

create picture of how ready the business is to change. By engaging with affected groups, the enterprise gets a better understanding of root causes that can ultimately mean the difference between success and failure. Next Steps Organisations should approach the social architecture of change by ensuring that affected users and employees (and, through them, customers) are engaged from the outset of a project and are actively involved throughout the journey. They should strive to embed "change thinking" in everything they do, from design to build to deliver, to ensure that the initiative delivers the maximum business benefits. Wipro recognises that change agents are amplifiers of change, a bridge between the programme team and employees. At Wipro, building and managing change agent networks has played a significant role in designing and implementing substantial change management initiatives. We know first-hand how to help our clients build and scale a network of change agents so that we can improve awareness at the grassroots level, reduce resistance to the change, support leadership engagement, and provide a two-way communication mechanism. =====================

The cloud immigrant and native divide - The grass is greener on the digital side

----- Arcticle source ----- https://www.wipro.com/consulting/the-cloud-immigrant-and-native-divide-the-grass-is-greener-on-the-digital-side/ ----- About the Author Contact Wipro Please fill the required details to access the content The cloud immigrant and native divide – The grass is greener on the digital side The cloud world is changing fast, and everyone wants to be on board. There are two distinct groups of cloud adopters - cloud immigrants who, for long, have been running IT in the traditional form, using on-premise data centers, and trying to match steps with the needs of the business. And the cloud-natives, who are born in the cloud. They execute at the speed of thought, know what the cloud can bring to the table and how it can respond, scale, and deliver. While the adaptation curve is almost non-existent for cloud-natives, traditional cloud immigrants traverse a long and winding path, one that influences how they view the value and its associated dependencies for transformation. What does cloud-native mean? "Cloud-native technologies empower organizations to build and run scalable applications in modern, dynamic environments such as public, private, and hybrid clouds. Containers, service meshes, microservices, immutable infrastructure, and declarative APIs exemplify this approach." The Cloud Native Computing Foundation1. The cloud immigrants are aware and open to the power of the cloud; however, they bring their baggage of constraints. Every brownfield migration needs to take care of multiple factors, build an app on the cloud, manage a double cost of running on-premises simultaneously to ensure business continuity. Add to it the reality of never being able to exit the cloud completely – with data that must remain on-premise, custom legacy workloads, and other regulation demands - the immigrants may not warm up to the cloud the way the natives would. What

do the cloud-natives see in the cloud? And why is the view counter-intuitive? Cloud-native organizations look at the cloud and its benefits and caveats a little differently. Sometimes, not having a previous experience can be a good thing. The natives have a fresh perspective – they do not have an on-premises set-up, have not managed leases in a colocation facility, or had staff to maintain cooling, power, networking. What they see is the infinite scale and power of the cloud. They look at the ease of deployment and scale of microservices on containers, quick detection and response to Distributed Denial of Service (DDoS) attacks, cheaper storage on demand. They look at creating immutable, swift, consistent, error-free infrastructure and maintaining business continuity. The list goes on. A new frame of reference brings to the fore many value drivers not limited to cost and helps create business differentiation. One can distill the ways of working of a purely cloud-native organization into a mindset, which is a great starting point for the immigrant type of organizations.The Cultural Shift Towards A Cloud-Native Mindset (forbes.com)2 Once the mindset finds favor with the leadership – both business and tech – it can then be shaped into a strategy, an actual path that the organization can follow. A tailored cloud-native strategy delivers many benefits. The recent Wipro survey of 1300 global executives (Making Business Thrive: A Cloud Leader Roadmap for Achieving 10x) is a case in point. It illustrates how organizations that embrace more of the cloud-modernization of its core, adoption of cloud-native applications, and related tech- show a significant increase in their bottom-line. However, it is essential to note that the challenges immigrants face are real – and in a VUCA world (Volatile, Uncertain, Complex, and Ambiguous), the challenge is at multiple levels. However, while these can be daunting, new problems need new thinking, not old. "The greatest danger in times of turbulence is not turbulence itself, but to act with yesterday's logic" - Peter Drucker. Cloud-native helps move the industries forward Cloud-native thinking is helping multiple industries get a better grip of the transformation and have an action plan that can yield quick and meaningful results. A healthcare company uses the power of big data and AI-based platform on the cloud to help doctors personalize each patient's radiation treatment.Innovation in health and life sciences with Microsoft for Startups - Microsoft Industry Blogs3. Investment platform businesses scale up during market hours and scale down seamlessly when the markets close for the day – controlling costs and optimizing capacity. Telcos are integrating 5G and Edge using the cloud for differentiation. Connected cars provide a step-up in the mobility space with sensors, data exchanges, and cloud connectivity for safe and innovative driving. EdTech is serving worldwide insights on demand through cloud content delivery networks - the power of an integrated business and tech-led cloud-native mindset and strategy is limitless. Learnings from Cloud-native There are many areas for businesses to learn from and close the cloud-native gap. The road ahead There is a need to embrace the thinking that cloud-native brings forth. While the objective of the transformation remains the same, the new rules need to be understood. As a car is not a faster cycle and is much more, one has to look at cloud-native needs with different optics to solve things in previously unthought-of ways. With more innovation on the cloud-native front, there would be more adoption, leading to technology democratization, reducing entry barriers to modernization. It is time to shed inhibitions and leave the baggage behind! References Nikhil Warrier Nikhil Warrier is a Cloud Consulting Partner with Wipro's iCORE Consulting group

and advises customers on cloud strategy, governance, and operating model transformation journeys. He strives to continually create value across the business and technology continuum by converging business strategy with technology enablers. =====================

Building a Future-Ready Workforce

----- Arcticle source ----- https://www.wipro.com/consulting/building-a-future-ready-workforce/ ----- About The Author Contact Wipro Please fill the required details to access the content Building a Future-Ready Workforce March | 2022 Ten years ago organizations relied on centralized change centers of excellence, deploying standardized change methodologies in a traditional mechanistic approach. Typically, these frameworks were waterfall in nature, running in parallel with the overall program and designed to smooth the integration of program outcomes into business as usual. This approach was relatively stable and predictable, but often took too long to drive adoption and realize organizational benefits. Today the differences are significant: While this evolution from traditional and mechanistic change to organic and digital is highly beneficial, it leaves one question unanswered. As organizations struggle to keep up with the pace of technology advances and market drivers, how much change can be accommodated before breaking the business? For an organization to benefit from continuous digital change, it must recognize that a future-ready workforce is vital to the success of any digital transformation program. Companies must add workforce readiness to project roadmaps and implement continuous workforce recalibration programs to ensure that everyone is fully prepared for the changes of tomorrow. Continual Calibration as a Transformation Enabler The core question of all workforce calibration is this: Is the current workforce the one needed three years ago, or what will be needed three years from now? As the workforce risk associated with each transformation is understood, the need to progressively cultivate the workforce of the future becomes increasingly urgent. This continual recalibration of workforce capability ahead of coming changes is critical to achieve a sustainable return on investment in each transformation program. Program-based change adoption is now well accepted as essential in integrating program outcomes into business as usual. However, can the people comprising that 'business as usual' keep pace not only with the volume of transformation programs in any large organization, but also be work-ready for external changes impacting their company? Technological advances and market forces will impact every organization, whether they are sought out or not. Change is coming, and for organizations to win in this environment a perpetually future-ready workforce is essential. This requires an underlying and continual layer of workforce calibration to shape the right questions, then build the right answers. If coming automation necessitates the reduction of 100 employees in a specific area, where will these people go? The tribal knowledge held by these people are organizational assets worth retaining, so leading organizations are increasingly seeking to re-skill and redeploy these people

in other areas of the business. Calibrating the existing workforce often delivers a faster and better outcome than continuous cycles of redundancies and hiring. Integrating program outcomes into the business will always be required, though in many companies this remains a piecemeal and reactive approach to workforce management. In contrast, a genuinely holistic and strategic approach to enterprise change management should address the heart of the organization itself, ensuring that the business keeps pace with the new normal of continual change. Building a Future-Ready Workforce There are three fundamental components in building a future-ready workforce. Identify the technological drivers that are most impactful for the organization's industry in the coming three to five years. Automation, IoT, 5G and others still in the research and development stages are all analyzed to generate high quality and highly relevant data on upcoming changes to the organization's workforce needs. Predict the adoption rate of these technologies in each geography through web scraping and neuro-linguistic programming analysis of job advertisements. Alliances with leading industry research and technology providers can also be leveraged to identify local insights. Identify the impact of current external forces (such as the ongoing COVID pandemic) and predict the impact of market forces (such as changes to government regulations). Depending upon the insights derived from the data analyzed, the workforce calibration roadmap may include: The Future is Now Organizational change management has evolved significantly over the last 10-15 years from a centralized and traditional approach to frequently delivering change in highly agile programs. While this comes with its benefits, it also requires a workforce that is nimble, adaptable and forward-focused. This means knowing upcoming technological and market drivers and adapting ahead of the curve to minimize business disruption. This underpinning layer of perpetual workforce calibration ensures the organization is ready, willing and able to embed transformational outcomes into the business. Wipro's Workforce Transformation services enable our clients to cultivate a future-ready workforce. Companies can leverage our ecosystem of AI-enabled technology and labor market data analysis to continually recalibrate their enterprise workforce. This ensures that organizations remain perpetually equipped for rapid changes to the new ways of working. The workforce of the future will not suddenly appear in the future – they are already here, and they need to be prepared. Jim Hughes Consulting Partner, Wipro Ltd. Jim has over 25 years of experience in workforce transformation, change and program management, and is passionate about leveraging AI to uplift business results. Jim leads the Wipro Workforce Transformation consulting service in the Asia Pacific region and manages complex global programs involving enterprise workforce calibration. =====================

Improve Cloud Adoption Success by Focusing on People

----- Arcticle source ----- https://www.wipro.com/consulting/improve-cloud-adoption-success-by-focusing-on-people/ ----- About The Author Contact Wipro Please fill the required details to access the content Improve Cloud

Adoption Success by Focusing on People May | 2022 Cloud adoption in the telecommunications industry has accelerated due to the growing need for business agility, cost reduction and the opportunity to reposition for new services and markets. But many organizations in other industries that adopted the cloud failed to achieve desired benefits mainly due to the people and organization-related challenges. A successful cloud implementation requires more than just technology; it requires the adoption of new ways of working, adding different capabilities and cultural shifts. Communication Service Providers (CSPs) are large organizations with entrenched culture, structures and long-standing skills. Such environments can prohibit achieving agile operations and ultimately a successful cloud adoption. How can CSPs address these issues to become a cloud-ready organization? The answer lies in understanding and proactively managing people, processes and cultural requirements. CSPs beginning a cloud adoption should start the process by addressing these blockers up front. Start with Questions to Evaluate Cloud Adoption Readiness Cloud migration programs can be overwhelming for the technology and project teams to manage. A program can include one or more significant technological changes for the organization such as different ways to harness data, infrastructure services, on-demand software applications, machine learning and smart development. From a people and process perspective, these changes are complex, impacting people across the organization in different ways. There may be role changes, requirements for new skills and compliance and security policy changes that could impact the entire organization. To manage all this change successfully, it is essential to shift the employee mindset and organizational culture toward agile principles. This is the most challenging aspect of the technology transformation. From the outset, CSPs should ensure proper alignment with the program objectives. The questions below can help assess cloud adoption maturity from a people perspective and identify what to add or amend as needed for success: A Shared Vision at the Core A critical aspect of the people-focused strategy for transformation success is to share and constantly communicate the change vision. To drive changes across the organization, program objectives must be understood. This is an important enabler for business transformation and individuals' growth and development. Employees should see that any new skills required will enable them to thrive in a global environment that demands greater agility, speed and improved customer orientation. By focusing on people, and organizational readiness and capabilities to operate effectively in a cloud-enabled environment, CSPs can monitor the changes required to develop and implement tailored strategies and adjust accordingly. Wipro helps clients succeed with business and cloud transformation journeys by applying Organizational Change Management (OCM) principles and best practices to guide leaders and teams. These principles build the commitment, engagement and capabilities that are necessary to become a cloud-ready organization. Putting the shared vision at the center of the cloud transformation program unites technology, process, business and people perspectives. CSPs can refer to the guiding principles to drive the required changes successfully, as depicted below: Figure: Guiding Principles for a Successful People-Focus Transformation Identifying Organization-Specific Changes CSPs have different maturity levels and capabilities. While there are some common characteristics of cloud-ready organizations, the change focus areas and plans will be unique to each organization. The sponsors and

leaders of the cloud transformation can start by assessing the cloud strategy and organizational components together with the desired outcomes to identify where there are opportunities for change and better alignment. CSPs should focus on leadership, people, culture and structural aspects of organizations to assess the current state and identify the steps and gaps to build change plans for organizational and people development. Cloud Adoption is an Opportunity for CSPs to Revitalize Business Models The cloud is the foundation for business transformation. CSPs can reposition themselves with new products and services that significantly improve the lives of their customers – both businesses and individuals, at work and home. These new offerings can provide better personalization, enriched interactions and connected living solutions. All of this is possible, supported by a cloud-enabled digital foundation, new ways of working and emerging technologies like open architecture, scalability, artificial intelligence (AI), data analytics and 5G. While Cloud adoption enables unprecedented opportunities, many such initiatives fail to achieve their promises mainly due to overlooking the impact on people, culture and process-related changes required throughout the organization. Using the guiding principles outlined above and building a core team with representatives from the different functions, CSPs can start to shift their journey to a people perspective. This is critical to successful cloud adoption and business transformation. Ozlem Peevey Managing Consultant, Talent & Change, Asia Pacific Region, Wipro Limited Ozlem is focused on managing the people-side of digital transformations and developing and leading the delivery of end-to-end organizational change programs for improved business performance. She combines expertise in technology, business and people domains with over 20 years of experience working for leading technology companies in global and Asian operations. Collaborating with the digital teams and client change leaders, Ozlem helps drive tailored, value-driven solutions for successful change. =====================

Change Management: The Retail CIO's Ally

----- Arcticle source ----- https://www.wipro.com/consulting/change-management-the-retail-cios-ally/ ----- Reference About The Author Contact Wipro Please fill the required details to access the content Change Management: The Retail CIO's Ally August | 2022 Digital transformation is seldom about technology alone. People have to get their heads around it; behaviours have to change. For that to happen in the retail industry, businesses need a CIO with a strong vision. And retail CIOs are often hired exactly for that transformation vision. They are brought in at crucial times in the history of organisations when major changes in operating models, ways of working and culture are required to make sure the business survives and is competitive into the future. In the past two years, few industries have gone through as much change as retail. Post-pandemic, this sector is still battling with staff shortages, rising inflation, supply-chain disruptions caused by the current geopolitical situation and consumers continuing to relocate from city centres to less urban areas. In addition, long periods

spent in lockdown have forced people to alter their shopping habits with online purchases and delivery services becoming much more prevalent. All this volatility and ambiguity are placing unprecedented pressure on retail CIOs. New CIOs only have a short window of opportunity to prove their transformation is going to succeed. Armed with the experience of other projects they have led in the past, CIOs set out to design a path forward for companies they are just getting to know. Inevitably, transformation anxiety is one of the first challenges they encounter. Some board members might not appreciate the necessity of a major IT investment at a time when the company is struggling but still showing positive results. They might also worry about their teams and the extra burden the program means for them, particularly given the tight recruitment market. Employees might also be concerned about their roles becoming obsolete. Those close to retirement might be reluctant to learn the new skills required. Before CIOs can get down to shaping the system change they want to achieve, they have to battle with a series of people-related challenges, both at the board level and on the ground. That's where involving a change professional from the early days can make a difference. A change manager can act as a trusted advisor and an ally to a CIO, helping him or her tune into the mood of an organisation. There are several scenarios where such an advisor has proven invaluable. We would like to highlight a few. Win the board over The scope and scale of a transformation program can make board members uneasy. They might not understand the benefits of the new technology. They might fear that the anxiety the transformation is causing among their teams could offset, at least in the short term, the advantages the new system is promising to bring to their business. Take, for example, a board member in charge of marketing and communication at a large retailer, and who doesn't want his overall corporate communication strategy linked to the digital transformation. He probably doesn't really believe in the transformation and therefore doesn't want his communications associated with it. This kind of disconnect could prove highly disruptive. The CIO needs to get the board member and marketing team on her side. And she needs ammunition to be able to convince them. A change professional can help by carrying out research among different stakeholder groups, evaluating their propensity to change and assessing the way they would like to learn and consume information about the transformation program. Armed with such knowledge, it will then be possible for the CIO to present the hesitant board member with facts and convince him of the importance of building a common front and joining up their communication efforts. A vision to relate to Analysts agree that CIOs have become as influential as CHROs when it comes to setting the culture of a workplace. And culture has become paramount in retail for attracting and retaining staff. CIOs are also instrumental in creating the identity of a transformation program. Every digital transformation needs a vision. We are talking about unprecedented long-term projects likely to unsettle large groups of employees and encounter their resistance. We need a compelling vision able to inspire minds and mobilise efforts.   And that vision has to be broken up into chunks that people can easily relate to and get excited about. Otherwise, they will feel left behind. As Jonathan Smart describes in Sooner Safer Happier, the bigger the capital 'T' in transformation, the steeper the Kübler-Ross change curve1 an employee has to ride through. One of those chunks could be data. Data and analytics are some of the most inspiring aspects of a transformation. The prospect of being able not only to collect

data, but also to extract unique insight from it is irresistible. Data's potential inspires people. All of a sudden the vision behind a new system becomes tangible, less abstract. Every employee in retail knows the difference that having better consumer analytics could make to his or her job. For store managers, the possibility of getting more data from interactions with consumers and combining it with social media or weather data means they can handle their inventory in a more proactive way, exploiting predictive insight.   Change professionals are used to gauging the appetite of an organisation for the new. They can spot the most compelling arguments behind a transformation, like data, and turn them into a powerful story. They are ideally positioned to help a CIO create an identity for a program and strengthen its vision by making it more relatable and easier to communicate. The workplace path How fast an organisation is able to transform also depends on its openness to cloud technology. CIOs are often confronted with the issue of an organisation not being able to fully grasp the benefits of moving from on-prem to cloud. And retail has often proved a rather traditional sector.   In our work, we have become aware that the path to cloud often goes through workplace modernisation. Office 365 has become for some retail clients an entry point. Once their employees are exposed to the freedom of accessing files anywhere from any device or the experience of collaborating on the same document with unprecedented version control, they can start picturing the difference cloud can make to other processes. CIOs can use the energy around a workplace transformation to get buy-in for their overall vision. Again, a highly tangible digital experience can be utilised to help users visualise changes at a much larger scale. Workplace collaboration tools alleviate the administrative workload of store staff. They free up time staff can spend interacting with consumers at the front of the shop, rather than having to fill out paper-based form after form in the back. Workplace transformation is one of the main areas of expertise of many change professionals. It has an impact on how employees behave, share content and connect. That's why change managers are instrumental in making sure that workplace technology is not merely rolled out, but fully adopted and its new ways of working internalised. Change professionals are ideally positioned to advise retail CIOs on how to turn the success of a workplace modernisation into an engine of further transformation. Our experience tells us that, rather than being an afterthought, change management needs to be positioned as a key supporting element of a transformation roadmap. With a change manager as a trusted advisor, a CIO will be able to build powerful alliances throughout the business and keep an ear on the ground as the transformation program progresses. Summarised, here are some of the primary ways in which a change professional can support a CIO embarking on a transformation for a large retailer: The speed at which the retail sector is changing and embracing digital is only bound to increase in the near future due to an overall rise in inflation and a decline in customers' purchasing power. A growing number of employees will continue to have little time to adjust to new operating models. Strong partnerships with change professionals are what CIOs will continue to need in order to be able to deliver successful transformations.
=====================

Why Do Energy Firms Fail at Digital Transformation?

Why Do Energy Firms Fail at Digital Transformation? October | 2022 The energy industry today is at a crossroads, and depending on one's point of view, one might see either boundless opportunity or tumult and disruption. Decarbonization is accelerating, digitization is reshaping our capacity to track and model the energy ecosystem in real time, and the trend toward devolution will continue to move power generation away from centralized monopoly suppliers. Decarbonization, digitization and devolution have at least one thing in common: In each case, the supporting technologies will require fundamental digital transformations within all major industry players. While new digital workflows and data capabilities may theoretically promise significant return on investment, that ROI will not be realized if the digital transformation is not enthusiastically embraced throughout the organization. Many steering committees and program managers focus on technical progress and assume that exciting new innovations will sell themselves and naturally scale throughout the company. Because of this assumption, they do little to pave the cultural road that will socialize the new ways of working. This "build it and they will come" model is rarely successful. Rather, successful digital transformation in the energy industry requires sustained user engagement that begins early in the planning phase and extends past the go-live moment. In particular, five crucial components of a user engagement strategy can help energy companies find success and avoid failure as they scale digital-first mindsets and workflows throughout their organizations. Stakeholder Mapping With any transformation initiative, levels of enthusiasm will range from "Bring it on!" to "This will never work here." To optimize the messaging and engagement, the program team needs to think of members of the organization as falling into three camps: the supporters, the neutrals (probably the majority) and the naysayers. A stakeholder map should be used to track which key stakeholders fall into each camp (this document should not be widely shared by the change manager, for obvious reasons). The stakeholder map serves as a guide for how and where to deploy specific types of messaging. Tracking the sentiments of every individual employee is certainly excessive; one recent digital transformation project successfully tracked the sentiments of all relevant team leaders, and below that level, developed personas to represent groups of affected users. While the core message should be consistent across the organization, different emphasis may be required depending on how the changes are perceived by various team leaders and user groups – hence the need for an engagement plan. Engagement Plan The engagement plan describes how the key groups of stakeholders will be informed and updated about progress and defines the messaging that the program wants to reinforce. When it comes to particularly critical stakeholders, plan for periodic one-on-one engagements, which ensure consistency of messaging and provide

opportunities to develop rapport with key organizational influencers. For a large global energy company in which the transformation will affect operations in a specific region, this might mean one-on-one conversations with leaders in the field operations and production management teams, as well as stakeholders in central corporate functions, including the communications team. The engagement map should include a mechanism for tracking the status of each engagement, as well as a "heat map" that captures specific areas of concern and triggers urgent messaging activity. Comms Plan Once the key stakeholders have been mapped and incorporated into an engagement plan, the program team should create a separate communications plan to present the digital transformation to the rest of the organization. This plan should capture all organization-wide channels that may be used – Yammer, email, Slack, team briefings, town halls, etc. – along with the key messages that need to be shared with a wide audience. Most importantly, the purpose of each message should be clearly defined. Is it meant to increase awareness, drive anticipation, impart knowledge or reinforce earlier messaging? Impact Assessment A Change Impact Assessment (CIA) is both one of the most important pieces of a digital transformation messaging strategy and, ironically, the one most frequently overlooked. In its simplest form, the CIA visualizes the implication of the resulting changes from an end user lens and determines what needs to happen to socialize and embed the proposed changes. The changes may require new training programs, project management tools and reporting structures. A CIA is best developed in a workshop setting that brings together technical, program and user resources stakeholders after the technical design work is completed. In one recent capital programs management transformation project, the CIA process included representatives from front-end engineering design, engineering management, data standards, contracts and procurement, and operational readiness – all of whom contributed unique perspectives and surfaced concerns that might not otherwise have been addressed. Readiness Assessment A final – and, again, often overlooked – element of a digital transformation program is an assessment of business readiness. Ideally, this should take the form of a series of workshops scheduled about one month prior to go-live. The aim is to measure and track to closure the activities needed to ensure a successful go-live, and is a first step toward permanently embedding the new changes to ways of working. Remaining training needs and the delivery of go-live communication should receive careful attention, as should arrangements for resolution of end user queries and issues at go-live.   As energy sources and distribution ecosystems continue to evolve, the energy companies that seamlessly integrate new data-driven digital solutions will be the ones that seize the present moment and shape the future of energy in the 21st century. Yet even the most advanced digital solutions will make little difference if they are not rapidly and enthusiastically adopted throughout the company. While change management should not be seen as a "silver bullet," focusing on the key elements of change management dramatically increases the probability that a digital transformation initiative will meet or even exceed expectations. Keith Simmonds Managing Consultant, Talent & Change Keith has successfully delivered a number of technology enabled transformation programs, the majority in the energy sector. His experience confirms his belief that addressing the people side of change is critical to achieving a

sustained and cost-effective transformation.
=======================

Team Charters – The Secret Sauce for ERP Transformation Success

As many as 78% of all significant corporate transformations fail.1 Because enterprise resource planning (ERP) transformations require a unique blend of functional and technical diversity, ERP transformation can be particularly challenging for complex global organizations. Often, the core problem turns out to be a lack of intentional and effective organizational change management. Without robust organizational change management and a focused team to drive it, an expensive and strategically critical ERP transformation can be derailed. To ensure a successful ERP transformation, companies must consider team dynamics from the very outset and maintain that focus throughout the project. An emphasis on building trust between the diverse and scattered team members is paramount, and one promising tool to create that foundation is a team charter. Why ERP Teams Fail An ERP team is defined by a blend of functional, technical, change and governance team members. The major stakeholders arrive at the project with different priorities, preferences and approaches. Team members may also be working across different countries and cultures, and the project typically blends employees, external consultants and other types of system integration contractors. Because of these complex team dynamics, misalignments and power struggles can appear immediately. Lack of leadership vision, blurred governance, unanticipated scope changes, resource pressures, unmet deadlines and financial overruns can all contribute to a potentially toxic project and team environment. In one case, we found ourselves working with a change team that was riddled with competing sub-factions. There was no true accountability, and regular arguments focused on who was responsible for delivering key aspects of the program work. The same ingredients that cause challenges, however, can also become the transformation's greatest strength. With a clear team charter supporting proactive change management, the ERP transformation team's rich diversity of viewpoints, even in conflict, can be unified into a high-performing transformation chorus. High-Performing ERP Transformation Teams are Defined by Trust Extensive research on high-performing teams has demonstrated the primacy of building trust. As neuroeconomist Paul J. Zak summarizes, "Employees in high-trust organizations are more productive, have more energy at work, collaborate better with their colleagues, and stay with their employers longer than people working at low-trust companies."2 Trust is the foundation that allows teams to access their full range of strengths and creativity. Trust is generated by building an environment that encourages creative thinking, risk-taking, openness and collaboration. Establishing trust means developing an environment of resilience that learns from mistakes and manages the inevitable setbacks and constant pressures.

It means connecting on a human level, whether virtually or in person, and moving from purely transactional discussions toward understanding and empathy.   Building a trusting environment means creating a space in which people feel confident and safe, and where they are willing to demonstrate honesty and vulnerability to form lasting cohesion. This is particularly true in a new cross-functional team. Seniority and decision-making authority might not yet be completely clear. Some parties may feel that their task is primarily to protect their own department or business unit's agenda, rather than represent the broader goals of the business or the project. Trust is not likely to emerge on its own; it needs the right catalyst, a proactive approach and ongoing focus. Building a Team Charter: How to Set Teams Up for High Performance While an ERP change team has the shared goal of a successful ERP transformation, the team members may not be aligned on things like process, decision-making protocols, responsibilities and collaboration practices. At first, they may not even realize that they are not aligned. A team charter (Figure 1) is designed to align the team around a unified purpose, define the supporting factors that will achieve that purpose, and create mechanisms to continually hold the team accountable not only for what it does, but also how it does it.   The goal of a team charter is to provide clarity on what a high-performing team looks like in context of the organization's ERP transformation mission and vision. A team charter captures the key goals of the project, but then goes further to set behavioral expectations, define roles and responsibilities, and institute ways of working. The team charter might lay out preferred communication methods and even communication styles. It can document best practices for avoiding groupthink and encouraging respectful disagreement and debate. To drive change, colleagues on the change team must be rowing in the same direction, but they should also have recourse to healthy ways of challenging each other and providing constructive criticism. The team charter process will initially require active promotion by one or more senior members of the team. But overall, it should endeavor to be a fully democratic process. Typically, the team charter's ground rules can be developed over the course of two or three facilitated workshops focused on brainstorming and team discussion. The key is to define the principles that will guide the team and build out clear examples of what those practices look like in terms of day-to-day actions and behaviors. Once a team charter has been established, its guidelines need to be periodically revisited. This can be accomplished with periodic meetings focused exclusively on team dynamics. A team charter leader or coach might take full responsibility for team dynamics, or that leadership position might rotate over the course of the transformation project. The team leader(s) should be able to observe behaviours, keep notes on team-related developments, and coach team members toward higher levels of performance with honest and direct feedback. During an ERP transformation, some contributors may be involved only for small portions of the project, rolling in and out over a period of months. Because of the shifting nature of an ERP team, it is often necessary to periodically recalibrate during key inflection points, such as when moving from Design into Build and Testing. It is also important to remember that a team charter is not set in stone. It can and should adapt, if necessary, to reflect a changing context and sustain its value. While a team charter and attention to the evolving nature of relationships, actions and behaviors might seem like a luxury, consider that an average ERP transformation program for a

large company can cost anywhere from $1 million to $10 million.3 Those millions can evaporate quickly unless a high performing change team ensures the transformation program's success by adhering to the governance structures of a clear team charter. With a proactive and sustained approach to change management, even the most massive and complex ERP transformation can defy the daunting statistics about corporate transformation failure. RESOURCES 1. The Secret Behind Successful Corporate Transformations, Harvard Business Review, 2021 2. The Neuroscience of Trust, Harvard Business Review, 2017 3. ERP Software Report, Software Path, 2022 Andrew Shapiro Managing Consultant, Talent & Change, Europe, Wipro Andrew is focused on managing the people-side of digital transformations delivering organizational change and people development programs for improved business performance. Accelerating AR/aR Adoption in the Energy Industry

----- Arcticle source ----- https://www.wipro.com/consulting/accelerating-arar-adoption-in-the-energy-industry/ ----- About the Authors Contact Wipro Please fill the required details to access the content Accelerating AR/aR Adoption in the Energy Industry February | 2023 The biggest danger, when it comes to introducing a new technology across an organization, is to over-promise and under-deliver. During the early stages of any emerging technology, the use cases will be compelling but limited. To maximize the ROI of emerging technologies, organizations must carefully balance excitement about potential benefits with realism about current capabilities. In the energy industry, augmented reality (AR) and assisted reality (aR) adoption have both accelerated in the past several years, particularly as companies turned to new technology-enabled methods of monitoring and managing assets during the COVID-19 pandemic. Augmented reality (AR) refers to a computer-generated overlay to real-world objects, while assisted reality (aR) delivers digital content in a user's immediate field of vision. Both technologies are about more than just wearable headsets and include the associated software and the user experience provided by the integrated solution. From a user experience perspective, the AR/aR rollout in the energy industry has often been less than ideal. Our first-hand experience across connected worker programs and emerging technology adoption with global energy clients has reflected this challenge. Many recent AR/aR adoption efforts did not reach their full potential. By over-promising and under-delivering, IT and innovation leaders ensured that frontline workers would eventually revert to legacy ways of working. Frontline workers began to suspect that AR/aR were being driven by empty hype. This backsliding on AR/aR is unfortunate, because AR/aR do bring significant benefits when it comes to monitoring and maintaining assets in the field. Among other

benefits, AR/aR deliver: Problems in the Field: The Causes of AR/aR Adoption Challenges In our experience, most problems related to the daily use of AR/aR devices were due to IT or innovation teams not understanding the nuances of assets, sites and frontline teams. Each site and asset presents unique requirements when it comes to AR/aR-enhanced inspections. If not addressed, frontline workers experience those unique requirements as baked-in limitations of AR/aR, particularly if they feel that they have not been consulted as part of the solution rollout.   In one recent client engagement, users reported network connectivity issues when working in onshore assets surrounded by metal buildings. In the context of floating production storage and ship offloading, users regularly reported motion sickness when using AR/aR devices. Workers were also troubled by the absence of "hey, while you're here..." conversations during remote inspections, finding that the narrowly task-oriented nature of a remote inspection via a wearable headset did not tend to provide a broader view of the state of the site/asset. This last roadblock was not due to the inherent limitations of remote inspections, but rather insufficient training on how to fully leverage the new tools.. In all of these examples, the message to the field workers was: The technology team that is pushing this new solution has not bothered to understand the basics of what you do every day.   How to Smooth the AR/aR Transition When launching a new AR/aR solution – and particularly when launching a new solution when a previous AR/aR effort has failed – technology and leadership teams need to think carefully about both their own blind spots and how the new solution might be perceived. In particular, they need to emphasize the value to the end user, tailor solutions to individual sites and involve frontline workers to drive business readiness. 1. Emphasize the value to the end user As IT and innovation teams become enamoured with the potential of new technologies, they can fall into the trap of assuming that new technologies are inherently exciting to everyone. When deploying a new technology and explaining its many features, they often forget that they have a responsibility to articulate the "why" behind the technology. Frontline workers are not immersed in futuristic trend-spotting, and they are not likely to adopt something simply because it is new and innovative. They want to know that it will solve their current challenges better than their legacy solutions. Often, technology teams focus exclusively on the hardware: "We are deploying a wearable Augmented Reality headset that enables hands-free, voice-activated remote assist and work assist functionality." For a frontline worker in a high-stress onshore refinery, this emphasis on learning new hardware will come across as a burden rather than an opportunity. Instead, descriptions and explanations of new AR/aR programs should focus on articulating the value to end users and asset managers. After all, an AR/aR solution is not simply a piece of hardware, but a combination of hardware and software that delivers a value add to the user. Technology teams might emphasize how AR/aR can lower operational costs and necessitate fewer helicopter flights for remote support. They can explain how the solution will deliver faster responses while presenting less risk to frontline workers, and how the solution will accommodate the constraints of offshore assets. 2. Tailor solutions to individual sites Force-fitting an asset simply for the sake of standardisation is a surefire way to undermine new technology adoption. An AR headset that is ideal for a refinery worker, for example, might cause motion sickness for oil rig workers, and such nuances can only be discovered through on-the-ground

testing. Consequently, technology leaders should undertake trials and POCs for different assets and sites to identify context-specific challenges and opportunities before beginning an organization-wide rollout. An agile method of testing, failing fast, and further testing with first-hand users is the best way to ensure that the ideal solution is deployed for each particular asset, whether upstream or downstream, FPSO or fixed platforms or wind farm. Standardisation has benefits at an organisational level and does provide economies of scale, but if doesn't serve the user, standardization is unlikely to yield better ROI than customization. 3. Involve frontline workers early and at every step While thoughtful communication to employees is important (see point 1), deployment is a two-way street, and it is crucial to involve frontline workers in decision-making well before deployment begins. To enlist the help of users in developing the solution, organizations should focus on making them "sponsor users" rather than just users. This active involvement sets a baseline for success and helps identify constraints, and more importantly provides a community of users who will advocate for the solution with their peers. A carefully crafted communication plan can include targeted messages designed to be shared by individual site managers, advertising the context-specific benefits of AR/aR adoption. Pre-deployment messaging can often be effectively shared through posters/ stickers on shared assets such as terminals, desktops and laptops. Trainings on how, for example, to seamlessly adapt to a new headset must include ample opportunities for feedback, to ensure that no potential drawbacks or problems are overlooked. This feedback loop can be extended by ensuring strong channels for resolving technical issues, including clear instructions for who to contact for support to ensure minimum disruption. An often-forgotten part of the adoption curve is ensuring sustained use of the solution. Periodic long-term engagement from the operations team or OLMs (Operations Landscape Managers) to collect data on the quality of new devices and services will feed into continuous improvement. Conclusion: A Bright Future for AR/aR Deployment Energy companies should not assume that recent struggles with AR/aR deployment are the result of inherent limitations in the underlying technology. AR/aR can and will transform asset monitoring and management. So far, many of the challenges have been rooted in poor communication and planning, and a lack of focus on how simple site-specific factors like connectivity and motion might impact the effectiveness of AR/aR solutions. By focusing on the needs of frontline workers and actively adapting AR/aR solutions to individual sites and assets, energy companies can ensure that their next AR/aR implementation program will impress frontline workers, making their day-to-day work more safe, efficient and effective. Sreedhar Menon R Principal Consultant, Organizational and Change Management Sreedhar is a Prosci-certified change and communications practitioner focusing on digital transformation and the future of work. He has experience deploying and increasing adoption of emerging technologies while delivering sustainable growth through a people-centric change approach, supported by a strong background in business intelligence and analytics. Peter Floyd Managing Consultant An upstream oil and gas work transformation consultant considerable field operations and maintenance experience, Peter's work spans numerous geographies and MCP lifecycle phases, including FEED, detailed design, EPC, SU, and operationalisation. His specializations includes asset TAR planning, IM, mobility and field work, ERP, operations

and subsurface. He designs and deploys effective technology solutions that support upstream, new asset, field development, production, operations and maintenance users.   Contributor Luke Sykora Content Writer, iDEAS ======================

Collaborative Working in a Hybrid World: Five Steps for Successful ERP Programme Delivery

----- Arcticle source ----- https://www.wipro.com/consulting/collaborative-working-in-a-hybrid-world-five-steps-for-successful-erp-programme-delivery/ ----- About the Authors Contact Wipro Please fill the required details to access the content Collaborative Working in a Hybrid World: Five Steps for Successful ERP Programme Delivery April | 2023 Proactively strengthen team relationships through both digital and in-person interactions. What is the defining feature of successful ERP implementation programmes?   It is safe to say that programmes rarely fail due to a lack of technical know-how — there is an abundance of technical ability out there. Rather, the difference between success and failure usually comes down to people's ability to work together and integrate into a cohesive team. This differentiator, however, is hard-won. Large ERP programmes typically consist of clients, contractors and third-party vendors with different priorities and perspectives. While collaborative intent often exists, this mix can provide a fertile ground for dysfunctional relationships, siloed working and partisan agendas. Furthermore, we have observed that in the cut and thrust of ERP transformation, people in programme team leadership roles, under pressure to deliver results, tend to default to a more dictatorial leadership style. Conversations with the team are focused on tasks, deadlines and deliverables; information is highly controlled; and the course of action is predetermined. These team dynamics are exacerbated in the hybrid world, as a relative lack of in-person connections makes it difficult to build the strong, trusting bonds required for optimal performance. So how can leaders and teams build and maintain levels of trust that can serve as the foundation for collaborative working and successful programme delivery? And how can they best replicate the benefits of high-performing, face-to-face teams when working in a remote or hybrid environment? We have found that the following strategies will build the sorts of collaborative relationships that help ensure ERP programme success in a hybrid context : 1. Implement active measures to build relationships Relationships don't form by magic. They need to be worked at, particularly when the team is operating remotely or at an early stage of maturity. Relationship-building needs to be planned, supported and considered essential to core programme delivery. Team members need to find occasions to step away from purely transactional task-orientated dialogue and get to know each other.   Hybrid teams, in particular, need to make a concerted effort to plan for in-person time. In-person team-building and social activities should become part of the drumbeat of programme life, built around mobilizations, key milestones and programme successes. Even when working virtually, teams can carve out

time for non-work-related conversations at every opportunity. Meetings can include 'check-in' and 'check-out' periods for looser conversations and rapport-building, rather than jumping right into the working agenda and then ending abruptly. Teams can also organize formal relationship-building time through activities like "coffee roulette," in which meeting participants are randomly paired and then spend 30 minutes getting to know each other better, or simply a quick review of everyone's status on a team "emotional mood wheel." 2. Define norms around trust and fun Culture starts at the top, and leaders set the tone. Leaders need to act and speak in a way that encourages trust and collaboration: setting others up for success, being inclusive, avoiding blame and allowing people to feel supported. At the outset of a programme, the integrated leadership team can set the tone by creating a behavioural charter that transparently lays out acceptable and unacceptable behaviours. This charter should emphasize the importance of trust and specify how desired behaviours will be both demonstrated and reinforced. Displays of vulnerability are more likely to help the rest of the team open up. Leaders can also build trust by recognizing positive behaviour in others; for example, applauding someone's courage for raising a risk early or highlighting a recent collaborative approach that led to innovation. Nor should leaders forget to find opportunities to simply keep things light-hearted. They can schedule a fortnightly team connect and rotate the facilitator to inject some fun and get conversations going. Team members can share a skill, run a short quiz or game like "guess who's fridge it is," or even have a mindfulness session. The exact activity isn't as important as the effort to tap into the team's creativity and get everyone engaged. 3. Be transparent and communicate Without transparency and clear communication, the rumour mill dominates, creating a fertile breeding ground for speculation and mistrust. The entire programme team should have equal access to relevant information about what's happening on the programme. When they understand the big picture, people stop fearing the worst and make well-informed local decisions. Tactics to ensure transparency need not be complex or onerous. They might include a weekly soapbox address by leaders to share programme status and celebrate success, joint townhall events for programme members where suppliers and the client stand shoulder-to-shoulder to reiterate the vision and field Q&A, and open forums for discussions on specific hot topics that require a deeper dive. On the technology side, enterprise apps like Flowdock, Trello and Quip have been designed to optimize innovation, collaboration and sharing. Even encouraging teams to take advantage of the simple social media-style features of more familiar tools like Teams and Webex (e.g. likes, hearts and thumbs-ups) can enhance idea-sharing, engagement, consensus and support. 4. Be empowering, caring, and supporting Leaders rarely invest sufficient energy in influencing team culture, climate and motivation levels. This is short sighted: Engaging the hearts and minds of the team will unleash additional discretionary effort and creativity that would otherwise be lost. To motivate high levels of effort and engagement, leaders need to proactively shape the tone of all their interactions. They have a massive opportunity to bring out the best in those around them – whether employees, clients, vendors or contractors – if they can use their communications skills to actively support and empower their team members. Coaching skills like careful, intentional questioning and listening techniques can unearth individual preferences and traits and access deeper and more meaningful

connections with team members. Building time to connect like this can feel like time away from driving the programme forward. However, leaders need to remember that a supported and empowered team will be more inclined to go above and beyond when faced with unexpected challenges. 5. Monitor relationships and address breaches of trust During an ERP programme implementation, the complex mix of clients, vendors and contractors can quickly devolve into disfunction. To avoid spirals into misalignment and outright conflict, it's critical to monitor the health of team relationships, and particularly the relationships between the client and vendor at the leadership level.   To monitor relationship health, leaders can make relationship health a standing agenda topic at key leadership meetings. They might also institute periodic 'drains-up' with their team, or leverage "temperature surveys" to evaluate the team's satisfaction with programme collaboration. Relationship-related questions can be open-ended: "What's working well, and where can we improve?" But they might also be more probing: "Are you being kept in the loop?" or "Do you feel like you are set up for success?" Answers to these questions are indicators of the current level of trust and the effectiveness of collaboration; they should be used as a springboard for discussions on how to improve. Sadly, relationships do sometimes deteriorate despite even the best efforts. At the outset, the programme should establish clear mechanisms to address such issues quickly when they cannot be resolved between peers. When a resolution cannot be found at the programme team level, there should be a clear escalation route to programme sponsors for appropriate mediation and intervention. Conclusion: Enabling Hybrid Collaboration For large ERP implementation programs, hybrid delivery is becoming the new norm. It is certainly more efficient: Enterprises are able to reduce travel time and costs, while leveraging the talents of a more geographically distributed network of team members. The downside is that teams often fail to build the strong bonds that reduce conflict and spur innovative collaboration. The upsides of hybrid ERP implementation can absolutely outweigh the downsides. The key is to proactively strengthen team relationships through both digital and in-person interactions. When digital tools and careful relationship-management allow diverse teams to work together toward a common aim, the experiences and skills of each team member are amplified, contributing to ERP programme success. Andrew Shapiro Managing Consultant, Talent & Change, Europe Andrew is focused on managing the people-side of digital transformations, delivering organizational change and people development programs for improved business performance. He has more than 25 years of experience across many leading global businesses, including experience with numerous SAP- and Microsoft-enabled ERP programs. David Lyons Partner, Talent & Change, Europe David has more than 20 years of experience in change management, organization design and HR advisory, and has led end-to-end consulting engagements for many household brands, including programs involving Oracle- and SAP-enabled ERP transformations. Agile Change Management in the Energy Sector: A New Approach Requires a New Mindset

Agile Change Management in the Energy Sector: A New Approach Requires a New Mindset May | 2023 As they navigate the shift toward renewable energy sources, leaders of today's energy companies are simultaneously dealing with many other complications: geopolitical tensions, soaring prices, global slowdown anxieties, waves of restructuring, an aging workforce, and an imperative to build new relationships with non-traditional technology service providers and startup acquisitions. They fully expect the margins of the past to disappear and are under pressure to adapt their fundamental operating models. To navigate these momentous shifts, many energy enterprises have embraced agile change management. Agile change management promises to deliver unforeseen innovations and rapid results through iterative "test-and-learn" approaches that enable individuals across the organization to design and drive change. Unfortunately, through our change management work with energy companies around the world and our conversations with industry leaders, we have observed first-hand that agile change management in the energy sector often under-performs. The problem, we have found, is that organizations often approach agile change management as a set of tools with catchy new names: sprints, daily "stand-ups" and the like. What is often forgotten is that the "secret sauce" of agile change management is a much more fundamental mindset shift. Agile approaches work because they actively engage and empower more people throughout the organization to define and drive change incrementally, rather than waiting on a "big bang" solution to arrive from the top. Why Agile Change Management Fails Often, senior leaders — especially those in corporate functions such as finance, human resources, risk management and other siloed departments — have experienced organizational change as a process in which leaders direct others to change. This entrenched culture of command and control impedes the distributed leadership model that is an absolute necessity for genuine business agility. Even good intentions can end up backsliding. When organizations set up agile squads as silos amid traditional cost centres and resourcing plans, for example, the small agile teams are sidelined by the inertia of traditional hierarchies and industrial organizational arrangements. As soon as the familiar rhythms of the planning and budgeting cycles kick in, career managers tend to revert to the behaviours they've always used to win the periodic competition for department budgets. Leaders retreat to closed-door meetings, attempting to solve their own problems rather than leaning on more collaborative agile solutions. Servant Leadership: A Catalyst for Agility Navigating complexity and uncertainty in the energy sector will increasingly require leaders to acknowledge an uncomfortable truth: They don't have all the answers, and

they can't guarantee or fully control linear progress towards strategic outcomes. Rather than revert to traditional top-down structures, leaders in the energy industry can respond in a new way: They can become servant leaders. Servant leaders drive innovation by creating trusting, collaborative communities. They unlock creativity by encouraging employees to speak up even if it means challenging the thinking of company leadership. They motivate colleagues to learn from inevitable mistakes rather than avoid risks due to a fear of failure. Crucially, servant leaders understand that top-down decision-making can have negative consequences as well as positive ones. During one recent client project, we took leaders through a simulation exercise in which they examined several potential outcomes from a key project decision. As they explored how their decisions cascaded in unforeseen ways throughout the project, they grasped in a concrete way how a command and control approach might actually impede change and innovation throughout the organization. Servant Leadership's Role in the Agile Process Servant leadership is the bedrock of truly transformative agile change management. That's because servant leadership is a key enabler of the other strategic tools and elements of agile change management, including: Strong partnerships with change professionals can support CEOs, CIOs, COOs and transformation leaders as they seek to nudge other leaders throughout the organization toward the servant leadership mindsets that enable design thinking, data-driven decision-making and continuous learning. Making the Most of Agile Mindsets Working in a truly agile organization can be a thrilling experience. In an organization defined by agile mindsets, as author and agile consultant Steve Denning eloquently puts it, people are "preoccupied — and sometimes obsessed — with innovating and delivering steadily more customer value, with getting work done in small self-organizing teams, and with collaborating together in an interactive network." To succeed in the 21st century, energy enterprises will need to disrupt their entrenched "business as usual" mindsets. Opportunities to innovate amid complexity will come from people all across the energy sector changing how they work, but change needs to start from the top. To prepare their organizations for momentous change, it's time for senior leaders themselves to undergo momentous change. Silvia Cambie Partner, Talent and Change Silvia has more than 25 years of experience in change management and communication, helping clients increase adoption of workplace tech and other systems. She had advised the C-suite and senior stakeholders in a number of industries, including banking, retail, FMCG, manufacturing and energy. A former business journalist, Silvia applies a people-centric approach to her work that is focused on developing inclusive change narratives with the help of design thinking and agile methodologies. Carlien Coultate Director, Talent and Change Carlien is a versatile change leader with more than 25 years of experience in change, transformation, workplace learning, process improvement and leadership coaching. She has worked across numerous industries — including energy and utilities, finance, telecommunications, life sciences and the public sector — with a focus on design-led change strategies that leverage agile approaches and lean thinking to pave the way for new ways of working. Neil Harrison Managing Consultant, Talent and Change With more than 20 years of experience in business change and transformation leadership and delivery across Europe, the US and Australia, Neil applies expertise in human-centred change management and design thinking to enable clients' strategic

goals. He coaches change leaders to champion and realize people, process and technology-enabled benefits. Contributor Luke Sykora — Content Writer, Wipro Consulting ======================

Design the future: An interview with Karina Vazirova and Katia Lang, co-founders of FemTech Lab

----- Arcticle source ----- https://www.wipro.com/consulting/design-the-future-featuring-femtech-cofounders/ ----- Is your organisation looking for ways to innovate? Let's chat. Contact Wipro Please fill the required details to access the content "Innovation doesn't happen inside a computer screen, it doesn't even happen at the product level. It happens in our minds and in our imagination." Welcome to the second instalment of The Interview by Designit, a new series to bring you perspectives, insights, and advice from business and industry leaders who are designing the future. In this edition, we chat with Karina Vazirova and Katia Lang, co-founders of FemTech Lab. Tell us about your role and remit within your organisation We are the founders of FemTech Lab, a global ecosystem and startup accelerator for cutting edge innovators in women's health. FemTech Lab is a mission-driven venture. Our goal is to improve the lives of 1B women globally by supporting the most forward thinking entrepreneurs in the sector. We believe that the rapid innovation happening in women's health today will shape the future of humanity and society. Tell us how you go about innovating. Is there a process you use? When it comes to innovating, we don't follow rigid rules or frameworks. As entrepreneurs, our process always starts with imagining a vision of the future. That vision is usually a product of discovering a real market need and a passion to actually make the vision a reality. We then figure out creative ways to get there. When you are disrupting existing status quo, you often have to find routes that no one has taken before. It's all about being in tune with the market, having the right creative instincts and knowing when to pivot. You also have to leave room to get lucky, rather than trying to control every outcome. What is one innovation of which you're most proud? We're incredibly proud of FemTech Lab and its rapid achievements. Our vision was to create something unique by harnessing the momentum and passion of the FemTech sector. By breaking away from the traditional accelerator model and embracing the sector's mission-driven nature, we built a global platform for people to come together. In just 2.5 years, we have accelerated 52 innovative companies. Our startups received support from 500+ world-class mentors, investors, and partners. FemTech Lab surpassed being a mere startup accelerator and evolved into a movement. Katia Lang Co-Founder & CMO FemTech Lab Karina Vazirova Co-Founder & CEO FemTech Lab What has surprised you most in your role in delivering innovation? The profound influence of human emotion and connection. In order to create something different or build a business, you have to get other people on board. Innovation doesn't happen inside a computer screen, it doesn't even happen at the product level. It happens in our minds and in our imagination. To get others on board - customers,

employees, partners, supporters - you have to be able to communicate a message that resonates, not just intellectually but also on an emotional level. What do you feel is one of the greatest challenges to innovators in today's climate? It's the best and worst time to innovate. The best because incredible technological advancements, especially in AI, are reshaping our lives, work, and creativity. Social media has revolutionised how brands connect with audiences. Perfect for envisioning new products and services! The worst because rapid change makes it challenging to stay focused on the right things. Many companies pursue innovation (like AI) just to follow trends or out of fear of falling behind. Another challenge is the social media echo-chamber. Every industry faces it: LinkedIn and Twitter feeds flooded with repeated opinions and critiques. The echo-chamber is not productive, yet easy to get stuck in because fundamentally it's easier to throw jabs than to take consistent action towards change. Lastly, the current economic climate pushes larger companies to reconsider resource allocation. Innovation remains vital, but some reduce budgets and opt for external innovation partners for efficiency. What advice would you give to others in similar roles given this challenge? It's more important than ever to build a partner network to share market insights, opportunities, and lessons learned. If you are part of a larger brand - working with entrepreneurs, startup ecosystems and relevant communities can be incredibly insightful in seeing where your sector is heading. These relationships may also lead to productive opportunities in the future. The worst you can do today if you are leading innovation in any business is to stay siloed and receive all your insight from social media. Go out there, meet other innovators and builders, and get inspired! Contact Us =====================

Is There a Future of Work with AI?

----- Arcticle source ----- https://www.wipro.com/consulting/is-there-a-future-of-work-with-ai/ ----- Contact Wipro Please fill the required details to access the content Is There a Future of Work with AI? Is the future of work hybrid, remote, in-person or freelance co-working? Probably all of the above, but AI will fundamentally transform work itself. For the past several years, amid unprecedented rates of hybrid and remote work, the future of work has been a topic of intense conversation among global businesses. Recent advancements in GenAI are taking that conversation to a new extreme. The emerging question: is there a future of work? As machine learning takes over previously human-occupied analytical roles, and as GenAI stakes its claim in content and code creation, there's increasing anxiety about economy-wide job displacement and rigid automation. Some of this anxiety is perhaps well-founded, but the future of work will involve a heavy dose of AI whether we like it or not. It won't be apocalyptic, but there will be change. At its best, the future of work will be about viewing AI as an ally, a hyper-intelligent collaborator that can augment human potential. So, while AI skeptics find it easy to ask, "Is there a future of work?" a better question is "How do I cultivate an AI-ready workforce of the future?" In many cases, AI itself will provide some answers. In the coming years, enterprises will

leverage AI to identify emerging skills gaps, build talent transformation programs on top of AI-powered platforms, and retain top talent by personalizing employee engagement through AI-driven insights. For all of the ink recently spilled about in-person vs. hybrid vs. remote working, there's a deeper reality: Wherever and however employees work during the next several decades, they will need to be prepared to add value amid relentless technological change, particularly in the context of the AI revolution. The companies that win the AI revolution and successfully ride the waves of other emerging technologies will achieve resilience by prioritizing people through an AI lens. In the process, they have an opportunity to not just adapt to changing circumstances, but truly create the future of work. Find the Talent to Power the Future In a rapidly changing job landscape, companies need to emphasize agility in their talent strategies. Every large company in every industry will need a workforce that's fluent in emerging technologies, including but certainly not limited to AI. But it won't be easy. Already, an AI recruiting frenzy is putting pressure on HR teams while creating an escalating war for talent. Pursuing the future of work means, first, activating cutting-edge talent-acquisition programs. AI-driven talent-acquisition strategies are already leveraging predictive insights to refine the talent pipeline. These tools will increasingly allow recruiting organizations to identify potential talent around the globe, predict their cultural fit, and reduce hiring biases. Companies can establish an AI-powered skills lab to further analyze market trends, internal business metrics, and the evolving nature of industries to predict the skills that will be in demand. This requires a diverse set of analytical capabilities, like those available through Wipro Consulting's partner ecosystem, to define the skills needed for future success and more-effectively plan for the skills gap. Meet the Upskilling Imperative The pace of technology evolution is threatening to outstrip our capacity for upskilling. Traditional learning methods are failing, leaving a deep skills chasm. Increasingly, employees will need personalized learning ecosystems powered by AI to bridge the skilling divide and offer bespoke learning journeys that map out gaps and recommend upskilling paths. The cost of retraining existing employees often competes with the cost of hiring new ones, yet investments in continuous-learning platforms more than pay for themselves if used wisely to cultivate capable, experienced leaders. As these new-age training programs are developed, organizations will need to rapidly educate employees on AI. At Wipro, for example, we've launched an ambitious effort to train each of our 260,000 employees on GenAI awareness. Beyond AI, organizations will need frameworks for deciding which new skills need to be socialized across the organization, plus concrete learning and development (L&D) strategies and platforms to rapidly scale learning across the enterprise. Bolster Employee Engagement and Retention A positive and seamless employee experience leads to better retention, higher productivity, and greater levels of engagement. AI can personalize the experience and improve motivation by tailoring solutions to individuals' needs and adapting to their learning styles and pace. Enterprises will increasingly leverage AI to analyze employee engagement metrics in real-time, understand what makes top talent perform, and iterate on their AI-powered personalized retention strategies. Meanwhile, new technology tools will foster work cultures in which collaboration is rewarded and where digital experiences feel as genuine as face-to-face interactions. Embrace AI for the Ethical Future of Work AI is not

eradicating the future of work. AI is the future of work. Its workplace invasion is a double-edged sword: It can dramatically improve efficiencies and augment human intelligence in powerful ways, yet if deployed carelessly, it can deliver biased algorithms, privacy breaches, intellectual property risks, and potential job displacement. To truly make AI an ally in the future of work, enterprises will need to embed strong AI ethics at the heart of their operations, including their HR operations. AI guardrails will need to eliminate bias in skills analysis, predictive forecasting, hiring, talent cultivation and succession planning. And workforce strategies will need to build AI-driven skills development initiatives that can counteract any AI-driven job displacement. To identify, attract, and support a dynamic and committed global team, such AI guardrails will be non-negotiable. Rather than bringing on a dystopia of job displacement and rigid automation, the AI revolution can give birth to nimble companies that are great places to work and build a career. This requires enterprises to leverage data to identify skill gaps and recruit top talent, invest in comprehensive upskilling programs, and use technology to supercharge employee engagement. Technology has always been a tool, not a silver bullet. The real magic of the coming decades will happen when companies merge the strengths of their human workforce with AI to create a potent blend of empathy, creativity, and efficiency – the three keys to thriving in the future of work. About The Author John Arnold Smith Global Head of Talent & Change, Wipro Consulting John is a Senior Partner with Wipro Consulting and Global Head of Wipro's Talent & Change practice. He leads a dynamic team of talent and change management consultants who advise top Fortune 500 companies on strategic solutions to solve their toughest HR, talent, and organizational challenges. In his 30 years of experience in management consulting, organizational design, talent development, and strategy execution, he has led consulting programs across a wide range of industries in Europe, North America, and Asia. To address the complex needs and market demands of the workforce and workplace of the future, he leverages a global perspective on talent strategy that enables diversity and inclusion and develops leaders with the competencies needed to successfully create value in the international marketplace.

Championing the Chatbot

----- Arcticle source ----- https://www.wipro.com/consulting/championing-the-chatbot/ ----- Contact Wipro Please fill the required details to access the content Championing the Chatbot Chatbots and other virtual assistants will soon be much more ubiquitous across the employee experience. Change management will de-risk their implementation. Soon we will all be collaborating with robo-colleagues. The chatbot market is projected to grow at a CAGR of 22.6% between 2023 and 2032, with much of this growth occurring in the IT service management segment. Virtual assistant solutions will also see heavy adoption in HR, sales and marketing, operations and supply chain, and finance and accounts. GenAI and advancements in natural language processing will improve the accuracy and responsiveness of virtual assistants. But how will employees themselves respond to their virtual colleagues? The success of these human-virtual agent collaborations will be

largely determined by how quickly and enthusiastically people embrace these new ways of working, and how well they sustain newly learned behaviors. So far, enterprises have found actual virtual assistant (VA) implementation to be a challenge, largely because many employees are inherently skeptical of these automated support solutions. Across all industries, leaders know that virtual assistants will advance productivity. As a result, they're not slowing down their digital transformations. To keep pace with the technology, organizations will need to double down on human-centric change management strategies to build a currency of trust and foster positive relationships between human and virtual assistants. Why Employees Resist Virtual Assistants One important reason employees resist virtual assistants is that, in the past, VAs simply weren't very impressive. This leads to some common preconceptions about VAs: that they are not intelligent enough to make strong recommendations, for example, and can't solve complex problems. Employees assume that VAs continue to struggle with complicated or unusual language such as colloquialisms, abbreviations, fragments, and mispronunciations. Lacking a deep understanding of AI, employees may believe that VAs are simply reading from a script. Some even worry that interacting with VAs will contribute to loneliness and erode social skills. Beyond these specific objections to VAs, employees are also experiencing a more generalized "change fatigue." Employees who have experienced frequent and disruptive shifts in enterprise technologies often lose their willingness to cooperate with change. Gartner now cites change fatigue as one of the top emerging concerns for today's HR leaders.   Given all of these challenges, organizations often face an uphill battle as they encourage the adoption of even the most capable VAs. Six Strategies to Pave the Way for VA Adoption IT and change leaders need to reckon with these negative human perceptions of VAs. Ideally, a VA service experience should be perceived as superior to phoning or emailing a live agent/service desk. This will encourage people to enthusiastically embrace virtual agent colleagues and learn to fully leverage their capabilities. Because so many of the issues associated with VAs are human rather than purely technological, a human-centric change management approach is required to build symbiotic relationships between humans and their VA counterparts. Human-centered change management leverages principles from psychology, sociology, and behavioral science to instill the mindsets and behaviors that can deliver digital transformation goals. The following six change management strategies, in particular, can de-risk VA implementation: Virtual Colleagues: A Key to the Future of Work As organizations embrace the future of work through digital transformation, one of the top priorities will be to create a humanized workplace in which smart digital colleagues perform many of the repetitive tasks once performed by humans, improving productivity and enabling the human workforce to focus on projects that benefit from human creativity and critical thinking. In the past, virtual agents have been perceived as a hindrance rather than a digital transformation catalyst. In the future, they will be a positive force, reducing menial and repetitive tasks across all global enterprises and powering a more dynamic employee experience. But success will not be automatic. As technologists build the fluent, reliable virtual assistants of the future, change leaders need to prepare their teams to work seamlessly with those virtual colleagues. An intentional, human-centered change management effort is the best way to create positive experiences with these virtual

colleagues and ensure that they become a respected presence in the future of work. About the Author Promity Chakraborty Senior Consultant- Talent & Change Promity has more than 15 years of diversified experience in consulting, change management, digital transformation, organization design, HR transformation and organizational development, along with post M&A integrations across multiple industries and geographies.

De-Risking GenAI with Prototypes

----- Arcticle source ----- https://www.wipro.com/consulting/de-risking-genai-with-prototypes/ ----- Contact Wipro Please fill the required details to access the content De-Risking GenAI with Prototypes Rather than figuring out how to deploy GenAI everywhere, enterprises need to first deploy GenAI somewhere. The launch of ChatGPT grabbed the interest of business leaders everywhere, catapulting GenAI from its technology silo into high-level business strategy discussions. Since then, it's become clear that GenAI is here to stay and will add value across all industries. Even so, enterprises may hesitate to move forward with GenAI initiatives because they are unsure which use cases to prioritize, or are worried about the risks around data privacy and algorithmic bias. Enterprises will find it difficult to resolve these questions about use cases and risk in the abstract. GenAI is an extraordinarily iterative technology — more like a musical performance than a machine. Think of the GenAI model as the instrument, the enterprise's data estate as the sheet music, and the enterprise itself as the musician. The outputs of GenAI will be intimately tied to the quality and characteristics of an enterprise's unique data estate. Rather than coming up with some high-level theory of how GenAI will transform their business, enterprises need to start simply practicing with GenAI. Launching early, low-risk GenAI prototypes and proofs-of-concept (POCs) is the fastest way to gain the experience necessary to craft a more high-level GenAI strategy that delivers significant competitive advantages while building robust risk-management frameworks. Starting a GenAI Prototype or POC When it comes to GenAI, the most important thing is to simply get started. To identify appropriate GenAI POCs, enterprises should consider how tactical use cases can enhance their near-term efficiency and operational advantages. They should also consider the ability to scale, prioritizing tactical use cases that seem likely to contribute to key business processes and competitive advantage in the long term, but without letting the perfect be the enemy of the good. The business case for a GenAI POC — and how to measure the impact on that business case — should be clarified as part of the discovery process. Clear definitions of success are crucial, as they will decide which POCs are worth scaling. For organizations facing cost-optimization pressures amid macroeconomic turmoil, GenAI has arrived at the perfect time. Many of the more obvious tactical GenAI use cases — for example, rapid text summarization and automated code generation and testing — are tailor-made for enabling measurable efficiencies and cost-reductions in the prototyping phase. As GenAI foundation models proliferate, enterprises have numerous options for running GenAI prototypes. Even the simplest prototypes will require understanding the general suite of large language

model (LLM) capabilities and finding a reasonable match between the LLM and the use case. Given the costs and skills required to train a foundation model from the ground up, most prototypes will take alternative approaches. These approaches may include working with established players like Google and OpenAI through corporate partnership models, engaging with smaller GenAI startups looking to scale solutions for corporate clients, or standing up a team to deploy open-source models in-house. Managing GenAI Risks A prototype-based GenAI strategy inherently manages one of the core risks of any technology transformation: investing too much, too fast without a clear path to business impact. But other risks (including very real legal and reputational risks) need to be managed as well. Fortunately, especially for early prototypes, organizations can begin with "minimum viable governance" frameworks. These relatively simple checklists allow experimentation with new GenAI tooling. Any enterprise exploring GenAI will already have data controls and risk management frameworks in place; by refining those frameworks to address GenAI-related risks specific to their use cases, enterprises can run sandbox experiments with lower risk using offline models on their existing infrastructure. Of course, governance and risk management frameworks will need to mature as GenAI use cases mature. A prototype setting is a perfect opportunity to develop "responsible AI" checklists that both inform the viability of emerging use cases and identify future needs for risk policies and frameworks. Use cases that involve communicating with customers or employees, for example, will need strong anti-bias guardrails that draw on emerging approaches like constitutional AI. Any GenAI project that intends to publish GenAI-generated material for public consumption will also need automated checks for copyright infringements. Enterprises can socialize frameworks to address these risks in an iterative way, implementing learning and development activities as prototypes become mature use cases that impact multiple team and business units. Constraints are GenAI's friend. But rather than building guardrails for all potential GenAI use cases on day one, enterprises can de-risk their GenAI prototypes by constraining GenAI to very discreet tasks, measuring how well GenAI performs those tasks, and preventing GenAI from doing anything outside of the defined problem space.   An Early Look at GenAI Impacts Globally, McKinsey's recent influential report on the economic potential of GenAI forecasts that GenAI could add between $2.6 trillion and $4.4 trillion in value annually across more than 60 business use cases. A Goldman Sachs analysis, meanwhile, predicts that GenAI will contribute to a 7% global GDP increase over the next 10 years. But even today, early adopters are already experiencing measurable benefits from GenAI, which should give enterprises confidence to ramp up their GenAI experiments. In the consumer industry, generative AI is already helping brands build stronger relationships with customers. We have also observed firsthand how GenAI-led transformations are beginning to deliver concrete value. One media client, for example, used GenAI to automate the generation of contextualized abstracts, resulting in a direct cost savings of 33% in addition to other productivity improvements. It's Time to Practice GenAI outputs will be intimately tied to the quality and characteristics of an enterprise's unique data estate; the results and ROI, therefore, may not be entirely predictable. Some experiments may be barely audible, and others will resonate across the enterprise. While the first GenAI prototype may seem like cautious attempts to tune a new instrument, enterprises will

quicky find themselves with an orchestra. In time, an enterprise should aim to achieve a GenAI flywheel in which time/effort savings from one initiative can fund further GenAI initiatives. Building a GenAI center of excellence, meanwhile, will help both upskill talent and serve as a hub for exploring the art of the possible. Leaders need to imagine how their organization will function when GenAI is available in every business process. But just as no amount of reading sheet music turns a student into a concert violinist, no amount of abstract strategizing will achieve remarkable GenAI outcomes. Delivering outstanding business performance through GenAI starts with practice.   About the Authors Dr. Colin Kelly Managing Consultant, AI Advisory, Digital Consulting An AI transformation expert with an academic background in natural language processing and a passion for deep learning and generative AI, Colin has more than a decade of experience deploying machine learning capabilities into challenging commercial environments. He currently chairs Wipro Consulting's Generative AI Special Interest Group. His experience spans multiple industries, including insurance, telco, defence, government, healthcare, and financial services. He has defined and guided responsible AI initiatives and led applied research teams to deploy cutting-edge AI technology into production systems. Sreejith Kurup Principal Consultant, Wipro Consulting – AI Advisory Sreejith works with organizations across the globe to solve business problems by applying AI and other digital transformation interventions. Contributor Phani Solomou Senior Partner, Wipro Consulting – AI Europe Lead ====================== ----- Arcticle source ----- https://www.wipro.com/consulting/these-five-trends-are-reshaping-the-energy-industry-in-2024/ ----- Contact Wipro Please fill the required details to access the content These Five Trends Are Reshaping the Energy Industry in 2024 These Five Trends Are Reshaping the Energy Industry in 2024 On the heels of COP28 and the pledges made there, the global energy industry must accelerate efforts to bring alternative, low-carbon energy sources to market. To make progress in areas like the energy transition, decarbonization, and scaling/integrating renewables, energy companies will need to focus less on identifying innovations and more on deploying and scaling them. But how? What's the best way to approach these initiatives to ensure returns? Collaboration is vital to the success of these programs. Energy companies must cultivate an ecosystem of technologies and partnerships to maximize business value and impact. The following trends highlight key focus areas for energy companies in 2024 and beyond and show how an integrated approach to digitalization can help companies develop lucrative new business models for sustainable growth. 1. Renewed focus on Industry 4.0 New regulations and market demands are putting significant pressure on oil and gas companies to modernize legacy assets and enhance operations. For example, the growing demand for localized energy sources forces countries to update aging infrastructure and improve cyber-resilience while unifying capabilities that have developed piecemeal over the years. Country-specific standards for industrialization, like those in Germany and India, will help guide digital transformation, leading to more sophisticated digital operations requiring compliance with local laws and frameworks. As governments crack down on the environmental impact of industrial operations, resource efficiency and detailed reporting will become increasingly important, putting additional pressure on suppliers throughout the value chain to invest in Industry 4.0 to increase data capture and

transparency. Further refining digital operations can help companies – both early and late adopters – cut costs and free up more resources to invest in larger, more ambitious projects. 2. Technology collaborations for systemic decarbonization Decarbonizing value chains will require energy businesses to work with various technologies, innovators, and service companies throughout their operations. Collaborations with fuel distributors, battery manufacturers, vehicle manufacturers, and technology service providers are helping to build the infrastructure, platforms, and EV capabilities needed to support the energy transition. Forward-thinking companies combine data analytics, IoT, and responsible GenAI to analyze distribution while developing more energy-efficient supply chains and less carbon-intensive products. Robotics, AI, and machine learning will improve asset operations by automating inspections, enhancing predictive maintenance, and assisting in detecting issues like flares and methane leaks. With improved emissions capture, energy companies are leveraging modeling platforms to explore alternate modes of operations for decarbonization. Global coordination of responsible AI must underpin these efforts. 3. A tech-first transition to new business models Advanced technologies can help companies explore new products and business models, such as converting plants to produce adjacent products that are less carbon-intensive. Data analytics, AI/ML, and digital twins are helping with research and development and testing new models and products. Blockchain technology will play an increasingly important role, supporting the development of distributed energy resources and the traceability of molecules, products, procurement, and credits. Energy-as-a-service offerings will become more popular to drive the adoption of low-carbon energy sources by minimizing upfront capital expenses for customers. This is a significant opportunity for energy providers. To seize it, companies must review their existing technology programs to be sure they have the necessary capabilities to support managed service offerings. Technologies like cloud, 5G, connected edge, and remote sensing will be critical. 4. Continued transitions to data platforms and open standards To scale new business models and improve the performance of existing assets, companies must shift siloed data to platforms that are more accessible and flexible. Cloud platforms and open industry standards will enable new capabilities through data consumption and applications designed to meet specific industry requirements, such as security protocols and reporting standards. Shifting to more accessible data platforms will also help companies address challenges associated with knowledge management and cross-generational training. Increasingly, AI-driven training will synthesize employee experience data points and other information to build programs that create the energy industry workforce of the future. 5. Scaling and integrating renewables Energy businesses are diversifying their portfolios with renewable fuels and renewable power assets, influencing Scope 1, 2, and 3 emissions. As companies overhaul their business models to support ambitious sustainability goals, they must scale and integrate capabilities to launch products like hydrogen, sustainable and renewable fuels, wind, solar, and geothermal assets. This requires encouraging entities throughout the value chain to adopt standard practices, as seen in the shift to sustainable aviation fuel. Companies will need to extend existing digital capabilities to advance the development of renewable energies and the underlying platforms and integrations needed in emerging operational landscapes and business models. Energy companies have a

unique opportunity to redefine the industry by pursuing alternative fuel sources and business models. This is not a small undertaking, and 2024 will be just one year of an extended journey. Strategic implementation and coordination of technologies like AI, industry cloud, 5G, IoT, and data analytics will help accelerate returns on investment and maximize impact at this moment when the industry has reached an inflection point. About the Authors Sidharth Mishra Vice President – Global Practice Head, Domain & Consulting Energy Susie Coppock Senior Partner - Domain & Consulting Energy Contact Us ===================== ----- Arcticle source ----- https://www.wipro.com/consulting/these-five-trends-will-reshape-the-retail-industry-in-2024/ ----- Contact Wipro Please fill the required details to access the content These Five Trends Will Reshape the Retail Industry in 2024 These Five Trends Will Reshape the Retail Industry in 2024 Retailers have been gradually settling into the post-pandemic paradigm. The in-store experience remains important, but retailers also know that recent upticks in eCommerce and newer delivery models are largely permanent. That's simultaneously a store operations challenge, a customer experience challenge, and a supply chain challenge that retailers need to solve for. Traditional retailers are focused on building brands that are equally strong in digital and physical formats. In an omnichannel environment, the most successful retailers will leverage technology to strengthen their strategies and efficiently serve customers across all channels. Given these imperatives, the five technology trends below should be top of mind for retail leaders this coming year. 1. Artificial intelligence for everything Artificial intelligence will make a meaningful impact across numerous retail functions, from merchandising to forecasting, marketing, sales engagement, loss prevention, and after-sale support. At the same time, retailers need mechanisms to ensure that AI is used safely and effectively. Some large retailers, for example, have rolled out responsible AI guidelines. As AI experiments proliferate – particularly GenAI experiments designed to automate customer touchpoints in new ways – retailers must ensure some level of centralized governance that can vet and de-risk experimentation while empowering the most impactful prototypes and proofs-of-concept to scale rapidly. 2. Secure and convenient payments Digital retail is growing, and retailers need to guard themselves from fraud. Biometric technology can give retailers another layer of protection against fraud. Retailers will play an active role in building customer trust by more accurately authenticating customers and reducing fraudulent transactions. Biometric data points like fingerprints, retina scans, and facial recognition will further improve the customer experience by enabling capabilities like rapid contactless checkout. As a side benefit, store employees can use this technology to log attendance and hours seamlessly. The most recent data suggest that the biometric POS market will experience a CAGR of 13.9 through 2028. 3. Technology-driven shoppable content Creating a best-in-class digital retail experience is now about much more than searchability, pricing, and payment. Retail brands are competing for mindshare as much as wallet share. To remain competitive, they must embrace technologies that will power the next generation of customer engagement, from OTT integrations to AR visualizations. Retailers must also be prepared to adopt the next generation of emerging platforms quickly. As new platforms become popular venues for user-generated content, brands need to be ready to jump in with a high-quality content strategy. 4. Retail media networks

Omnichannel strategies have allowed retailers to build brands across multiple channels, and they are now growing retail media networks to monetize those channels and broaden their revenue mix. Retailers are creating new brands using their omnichannel platforms and, at the same time, enticing existing brands to utilize their infrastructure (both physical and digital) for marketing products. Advertisers are projected to spend over $55 billion on retail media this year. In the last few years, retailers like Walmart, eBay, and Amazon have proved the importance of retail media networks to boost demand and increase sales. Based on their successes, this year will see an increasing number of large retailers building, refining, and monetizing their media networks.   5. Robotics, computer vision, and automation The combined power of robotics, computer vision, and automation can reshape every aspect of retail. Automated robotic solutions will increasingly facilitate mundane tasks like picking, sorting, and replenishment. Computer vision already enables cutting-edge digital shelf management solutions, and drone-based visual inspections will further accelerate the journey toward picture-perfect shelf sets. Automated solutions will improve efficiency along with KPIs like order fulfilment time. More importantly, they will free retail talent to focus on improving and innovating the core customer experience. Usually, these automation-focused technology solutions are high-cost, higher-reward propositions. The ROI is clear; to pursue these long-term enablers, retailer leaders will need to drive organizational alignment around deploying working capital with an eye on the technology-defined competitive landscape of the future. Retailers find themselves in an exciting but complicated position. On the one hand, the industry has identified numerous innovative ways to leverage emerging technologies for efficiency, resilience, and customer success. On the other hand, only some retailers can afford to invest in everything simultaneously. The most rewarding approaches will be iterative and agile, allowing retailers to stack-rank potential technology transformations and press play on the most strategic business transformation opportunities available. About the Authors Sreekumar Veluthakkal General Manager and Senior Partner, RSAT Consulting Yogesh Pitkar Consulting Partner – Retail & Distribution Vineeth Kadasi Associate Consultant, RSAT(Retail, Services and Transportation) Contact Us ====================== ----- Arcticle source ----- https://www.wipro.com/consulting/these-tech-trends-will-reshape-airports-in-2024/ ----- Contact Wipro Please fill the required details to access the content These Tech Trends Will Reshape Airports in 2024 These Tech Trends Will Reshape Airports in 2024 According to Airports Council International (ACI) World, 2024 will be a milestone for global passenger traffic, with global air travel reaching 9.4 billion passengers. To handle this growing volume of travelers, airports must address the turbulence on the ground by further improving the airport experience. As they seek to enhance the traveler experience in a way that simultaneously drives new revenue, airports across the globe can leverage three technology trends to pave the runway. 1. Digital IDs Become the Norm This may be the year digital identities truly take hold in some regions. We are moving toward a future in which passengers can travel without needing to present physical travel documents or stop to confirm their identity. As of August 2023, Finland is the first country to allow its citizens to re-enter with a digital passport. Other countries like the UK are gradually introducing digital visas. The US is testing digital visas for some K-1 applicants, and India has introduced its

DigiYatra, a contactless digital travel program. As global travel continues to grow, digital passports and travel identities will help streamline the movement of passengers through airports, from check-in to departure to baggage claim. Digital identification works on technologies that many airports already use, like the cloud, biometrics, and private 5G networks, making the adoption easier than other transformations. As these new identity verification methods take hold, airports will have an opportunity to measure their impact on passenger processing and adjust staffing, procedures, and physical infrastructure accordingly. 2. Analytic-Led Traveler Experience Improvements In 2024, airports will leverage traveler data analytics to build better home-to-home journey experiences for every passenger. Soon, airports will send customized dining recommendations to travelers the minute they land, using data to select the options that best match the traveler's digital profile. In addition, airports will begin using innovative engagement strategies like gamification. In-airport scavenger hunts, for example, will entertain travelers, award them discounts at participating vendor locations, and collect data to advance key customer-related KPIs further. As these experiences enhance the airport journey for guests, they will drive sales for airport vendors and ultimately increase non-aero airport revenue. 3. New technology-led sustainability initiatives IoT-enabled solutions will increasingly help airports achieve sustainability goals by managing energy sources and consumption while improving terminal operations. Sensors can monitor facility systems like HVAC, conveyor belts, and water systems and enable predictive maintenance, automated control, and ongoing inspections with connected cameras. In addition, IoT can be configured to monitor escalators, restrooms, and waiting rooms to optimize cleaning and maintenance schedules for energy management, waste management, water management, air quality monitoring, and more. With 5G connectivity accelerating and IoT devices growing cheaper by the day, 2024 will present opportunities to implement new technology-driven sustainability improvement activities cost-effectively. Digitalization and automation technologies are becoming the core value drivers for the airport industry. As airports focus on using technology to improve the passenger experience and overall efficiency further, they will inevitably need to address retooling and retrain their workforce to work differently. The airports that navigate these new routes effectively will be well-positioned to boost both aeronautical and non-aeronautical revenue for years to come. About the Authors Manish Kumar General Manager – Domain & Consulting Head of EC&O and Airports Industry Practice Tushar Batra Global Practice Lead & Industry Partner - Engineering, Construction & Operations and Airports Contact Us ===================== ----- Arcticle source ----- https://www.wipro.com/consulting/these-tech-trends-will-reshape-ec-and-o-in-2024/ ----- Contact Wipro Please fill the required details to access the content These Tech Trends Will Reshape EC&O in 2024 These Tech Trends Will Reshape EC&O in 2024 The engineering, construction, and operations (EC&O) industry is poised to undergo significant changes in 2024. Technology advancements are maturing, and there are numerous opportunities for these new technologies to improve visibility, accuracy, and efficiency in the design, construction, and maintenance of complicated physical infrastructure. According to the Associated General Contractors of America, surveyed members reported that 72% of projects do not finish on time. The widespread prevalence of project delays and rework continues to

be costly, impacting the profitability of construction firms and the feasibility of projects. New technologies are poised to alleviate this longstanding industry challenge – and many others.

1. A new horizon of data-driven precision

Precision and accuracy are required to ensure safety and avoid costly rework. This year, emerging technology tools will continue to usher in an era of data-driven precision. GenAI-assisted design will analyze large sets of design requirements to provide options and recommendations. This technology will streamline many planning, permitting, and design tasks in the building construction lifecycle, optimizing both processes and outcomes while enabling collaboration between stakeholders across the value chain. In addition, the autonomous site theme will continue to scale, bringing advanced AR/MR hardware, robotics, and AI/analytics to more jobsites and improving inspection accuracy during multiple construction phases. The same connectivity advances that enable these solutions will also spur the adoption of new IoT devices that can help construction managers track building supplies for just-in-time provisioning. On-site wearables will further improve worker safety, and enhanced sensors will monitor and predict needed maintenance for expensive equipment assets.

2. Construction sustainability

Emerging government policies are bringing in new construction sustainability standards. At the same time, owners, operators, and occupiers are seeking more sustainable living and working environments. Advancements in sustainable building materials, supply chains, and technologies could make 2024 the year that sustainability becomes the standard in the construction industry. Modular and prefabricated construction are already generating renewed enthusiasm. Preconstruction drives efficiency and cost-effectiveness, and prefab materials are more sustainable than traditional building supplies. Components built off-site and assembled on-site reduce construction time and labor requirements. Adding automation and analytics to the design and planning stage can identify excess waste upfront to help firms further reduce inefficiencies.

3. Renovating real estate and facilities management

This year, property management will be re-engineered to incorporate smart technologies like artificial intelligence and automation. IoT and advanced analytics can monitor systems (HVAC, electrical, and plumbing systems), automate smart operations and predictive maintenance, manage and shift energy sources, and use cameras for continuous inspections. Facilities management will gradually shift to occupier-centric operations to deliver safer, cleaner, more sustainable, and more productive workspaces. IoT, AI, and data analytics will become integral to optimizing facility operations and enhancing occupant experiences and workforce safety. Engineering and construction is a capital-intensive business. As such, enterprises in the sector usually take a wait-and-see stance rather than aggressively adopting the latest technology trends. But digital technologies that simultaneously improve precision, drive efficiency, and save money have been around long enough to prove their worth. This year, technologies like AR/MR, automation, AI, advanced analytics, digital twins, and even GenAI will gradually make their way into construction firms that have been resistant to change. The risk of being left behind in an increasingly tech-driven industry is no longer worth taking.

About the Authors Manish Kumar General Manager – Domain & Consulting Head of EC&O and Airports Industry Practice Tushar Batra Global Practice Lead & Industry Partner - Engineering, Construction & Operations and Airports Contact Us

These Tech Trends Will Reshape Healthcare in 2024 These Tech Trends Will Reshape Healthcare in 2024 In the last few years, emerging technologies have positively impacted the health and well-being of people around the globe. Connected devices and other new data sources are increasing, as is our ability to synthesize data using AI. Across the healthcare landscape, data collection and advanced analytics will improve everything from back-office efficiency to patient experiences and concrete patient health outcomes. The following three technology trends will define the industry's trajectory in the coming year. 1. The continuing adoption of connected care enablers Studies have shown that patient outcomes are better and less costly when care is given at home rather than in a hospital. The COVID pandemic spurred a telemedicine wave, allowing care protocols to catch up with the data. But there is still much work to be done when moving more care out of a hospital setting. The home care of the future will be deeply connected care, and this ecosystem is now being improved and extended with wearable devices and new digital tools. Connected digital tools play a significant role in connected care by assisting patients and providers in streamlining the care continuum. Digital therapeutics, disease screening, patient education/training, and care navigation can be improved using digital tools. Wearable devices can now monitor a patient's vitals (blood pressure, A1C, etc.) in real-time and send readings to a patient's provider. Beyond opportunities to track and monitor a patient's condition, new approaches to patient-facing applications will allow patients to have more frequent virtual check-ins with their providers. Virtual healthcare assistants, meanwhile, will guide patients to the information they need and make recommendations. Digital therapeutics will also powerfully impact mental health and behavioral health determinants. These connected care/home care advancements will reduce hospital strain and improve patient outcomes. As the ecosystem of connected care tools evolves, organizations must focus on adjusting their delivery models to accommodate more data, changing reimbursement requirements, and measuring connected care's clinical and financial ROI. 2. Operationalizing GenAI (and teams to support it) GenAI's ability to process massive volumes of data makes it a valuable tool for healthcare. While there are many regulatory concerns about how GenAI will interact with patient data, the technology can still move the needle in assisting clinical diagnoses and advancing genomic sequencing for disease detection. On the administrative side of healthcare, it promises dramatic workflow benefits. GenAI can provide efficiency benefits for insurers in billing management and operations, and GenAI chatbots can produce human-like interactions for patients in healthcare customer service tasks. Physician practices can utilize GenAI for care personalization and optimization, billing management, payer automation, and provider task automation – all potential areas of disruption. A critical first step is building teams equipped to develop GenAI use cases and deploy GenAI tools. AI tools and models need to be taught and constantly tested, which helps ensure that the outcomes are trustworthy. Creating centers of excellence (COEs) for GenAI will allow healthcare organizations to align the resources and technical talent to drive GenAI's success. 3. Building an interoperable data foundation Connected devices and healthcare systems are making data more

available, and AI/ML has made data analytics more efficient. However, those technologies can be hamstrung by suboptimal data practices. The industry continues to need help with data interoperability. All stakeholders need to store and share electronic health data in a way that is intelligible across healthcare systems and settings. Fully integrated and interoperable health data will allow healthcare providers (and public/NGO entities) to leverage advanced analytics more fully and identify trends and patterns that will impact medical care and population-level health outcomes. To leverage health data for good, the healthcare industry must abide by robust data governance to protect patient privacy. Data architecture requirements have become more complex with multiple streams of data inputs. Many health organizations have immature data processes and technology, such as segmented datasets. Others do not own their data or do not provide practical self-service data tools to their employees. Healthcare businesses must overcome these challenges to remain competitive, drive growth, and convince patients and regulators that their data practices are secure and highly impactful. In healthcare, technology developments have the potential to improve patient outcomes, reduce costs for everyone, and open patient access to better care. Data is the crux of all these trends. The growing digital tool market will enrich patient data and present healthcare companies with a more accessible data landscape. Ultimately, these advancements drive a whole patient data approach that improves care for all. Given the current stress on the US and global healthcare systems, these technology-enabled efficiencies and advancements will be a welcome development. About the Authors James Collier Senior Partner, Global Head of Healthcare Consulting Philip Handal Senior Partner, Payor Consulting Leader Stephen Favaloro Partner, Provider Consulting Contact Us ===================== ----- Arcticle source ----- https://www.wipro.com/consulting/these-tech-trends-will-reshape-the-utilities-industry-in-2024/ ----- Contact Wipro Please fill the required details to access the content These Tech Trends Will Reshape the Utilities Industry in 2024 These Tech Trends Will Reshape the Utilities Industry in 2024 The utilities industry is experiencing a fundamental shift driven by aging infrastructure, significant technology advancements, and growing demand for alternative energy sources. The recent geopolitical instability in Europe and the subsequent energy crisis have emphasized the critical importance of both energy sovereignty and a stable supply. In 2024, the convergence of these forces and events will continue to create challenges and new opportunities for utilities companies. The following technology trends can help enterprises address the challenges and seize the possibilities, and should be critical considerations in strategic agendas in 2024 and beyond. 1. Preparing for the energy transition with AI The utilities industry is becoming increasingly data-driven. Some utilities already use AI/ML to enhance predictive asset maintenance, supply and demand forecasting, and automated data collection/summarization. GenAI advancements will enhance those capabilities further. It's no secret that the coming energy transition will require modernizing legacy infrastructure and enabling intelligent grids, peer-to-peer energy exchanges, and microgrids. AI will play a role in each of those imperatives. AI will also help companies optimize energy transfers and asset management while minimizing loss and other inefficiencies, contributing to sustainability gains. In the near term, utilities should focus on building the AI-driven data processing capabilities necessary to manage a

transformed grid and leverage the scalable cloud capabilities to build a solid and sustainable foundation for future digital programs. 2. Enabling new operating models with smart meters, grids, and connected assets Smart meters, agile grids, and connected assets will be critical to the energy transition and will play a significant role in the integration of alternative energy sources. Localized energy generation and peer-to-peer marketplaces will continue to need the support of reliable, centralized energy sources, and utilities companies will need to update their systems to account for more flexibility in supply and demand. Smart meters, smart grids, and connected assets will work together to provide real-time insights on usage and allow companies to optimize distribution (less waste, more reliability through enhanced forecasting) and integrate distributed energy resources more effectively. With smart grid and smart metering deployment accelerating in many geographies (particularly in Europe), utilities have an opportunity to update their operating models to fully leverage the capabilities of these agile new technologies to advance both affordability and sustainability. Meanwhile, connected generation and T&D assets will continue to help utilities enhance grid visibility, improve reliability, economize maintenance, and enable prosumers (energy producers and consumers) to better participate in flexibility and demand-response programs. 3. Building customer experiences and business models amid decentralization As utilities pave the way for the energy transition, they face numerous questions about future customer experiences and business models. The emerging Utilities 3.0 era will displace traditional business models in the utilities industry, particularly in deregulated markets. Energy suppliers must diversify by providing energy services such as aggregation, energy advice, and energy infrastructure services rather than just selling energy as a commodity. Centralized electricity generators may need to equip themselves with new technologies that enable them to sell on decentralized energy marketplaces and rapidly identify and leverage new trading platforms as they emerge. Web3 technologies like blockchain-based smart contracts will help utilities serve customers and preserve their market position in a more decentralized energy marketplace. In 2024, as the world emerges from the energy crisis and turns its focus squarely on sustainability and the energy transition, utilities will have numerous opportunities to gain a deeper understanding of consumer needs and preferences and focus on providing a digitalized and connected experience aligned with consumer personas, analytics-based insights, and end-to-end digitalized interactions across energy and energy services. Utilities will advance energy management and smart home solutions, further define their role in the EV charging ecosystem, enable consumers to better manage their usage and participate in demand-response programs, and provide new clean and sustainable energy options. As consumers begin to play a greater role in energy generation and distribution, connected assets will likely become a new revenue stream for utilities providers. Companies should already be considering business models that involve selling equipment and support services to prosumers to help prosumers establish, manage, and monetize their own energy systems. 4. Refining cloud capabilities with industry clouds Industry clouds are verticalized offerings tailored to the specific needs of an industry, coupled with the advantages of cloud computing. The approach offers pre-built applications, templates, data models, and processes based on critical industry considerations such as regulatory requirements and

complex infrastructure management procedures. Utilities industry clouds allow companies to deploy new solutions and services quickly, respond to industry changes and market conditions, and adapt to customer needs. Many utilities are already utilizing industry clouds as they seek to accelerate digital transformation. As they standardize functionalities and data, utilities can pave the way for an ecosystem of cloud services that will advance new, more distributed operating models. However, to derive the maximum benefits from these industry clouds, utilities need to continue reimagining and streamlining their legacy business processes to make them more customer-centric, automated, and agile. As they review their legacy application landscape, utilities will need to identify and retain the system capabilities that provide differentiation (customer engagement, products, pricing, etc.) while utilizing the capabilities of industry clouds to optimize standardized capabilities such as billing, metering, and market data exchange.   The energy transition is accelerating, but it will be several decades before the utilities industry approaches anything close to a steady-state business model and operational landscape. Not all current business models are guaranteed to survive, but industry leaders can view that reality as an exciting opportunity to invest in the data and technology tools that will reveal new horizons of innovation and efficiency. The utilities that are equally data-driven and inventive will be the winners in an increasingly decentralized future. About the Authors Shirish Patil Head of Consulting – Utilities, ECO, and GIS   Diptarka Sensarma Enterprise Transformational Leader – ENU Contact Us ===================== ----- Arcticle source ----- https://www.wipro.com/consulting/these-technology-trends-will-reshape-the-communications-industry-in-2024/ ----- Contact Wipro Please fill the required details to access the content These Technology Trends Will Reshape the Communications Industry in 2024 These Technology Trends Will Reshape the Communications Industry in 2024 As the AI wave converges with 5G, the power of cloud computing is steering the communications industry in exciting new directions. At the same time, cost takeout remains a core priority for the telecom sector, with key themes around consolidation, productivity prioritization, and automation. This year will present communication service providers (CSPs) with numerous opportunities to enhance customer experiences, improve network reliability, and deliver innovative connectivity solutions. Three technology trends will define what's next in the communications space. 1. A GenAI revolution Generative AI will drive a seismic shift in the telecom transformation agenda. Efficiency, cost-effectiveness, data-driven intelligence, improved IT services, and network connectivity will form the backbone of the GenAI-propelled customer experience. As enterprises in all industries finalize responsible AI governance models and zero in on scalable GenAI use cases, telcos will be challenged to go far beyond the GenAI "hype factor" and deploy real-world GenAI applications and experiences to ride the next wave of services. This year, telecoms can push the boundaries of customer service by using GenAI to turn reactive call centers into proactive customer experience powerhouses. GenAI will also help build customer and network digital twins to optimize network performance. Cost optimization strategies built on responsible GenAI frameworks will supercharge service providers' ability to provide a broader range of telco services that drive topline and bottom-line growth. 2. Telecom cloud with strategic partnerships and robust security Telecom companies are increasingly turning to the cloud in the race

to stay ahead. Prominent cloud hyperscalers are accelerating this next phase of growth by bringing telco industry cloud offerings to market, thus challenging existing NEPs. Having seen this hyper-growth in the cloud, ecosystem partners are keen to drive the next wave and orchestrate network space in a more scalable, integrated, and collaborative way that caters to the enterprise market segment with diverse products and business models. This development will be a core area for telco cloud investment for the upcoming year. Cybersecurity is always paramount, and building cloud-native services that are as secure as they are seamless will also be a top priority for telco investments this year. Today, data is currency, and cybersecurity protects the industry's most valuable assets, including networks, data, and customer privacy. The future of cloud in telecom rests on ensuring communication networks' robust integrity and trustworthiness. 3. 5G: paving the way for innovation 5G means much more than faster connectivity and lower latency. 5G is a catalyst for transformative communications technologies. As data processing speeds accelerate, 5G will advance capabilities like augmented reality and IoT-based edge computing. As 5G-enabled network slicing continues to gain momentum, telecom companies will bring increasingly sophisticated network performance optimizations to clients with increased reliability. This year, telecoms will need to leverage the speed and flexibility of 5G to lay a diverse groundwork for transformative technologies like autonomous driving and IoT. Open RAN and "future of work" propositions will also continue gaining momentum. Open RAN — using open standards-based connectivity of radio network components to seamlessly integrate NFV and Edge Cloud architecture — will be a key component of use cases like "smart cities" build-ups. When it comes to the future of work, 5G will integrate with emerging applications in areas such as healthcare (remote patient monitoring, robotic surgery), manufacturing (field devices/field force management and AR/VR connectivity for troubleshooting), and enterprise sustainability (healthy connected workforce and efficient warehouse management). Beyond these particular 5G use cases, it's time for telecom enterprises to focus on monetizing the new-age services required to build tomorrow's capable and integrated enterprises. The fusion of AI, 5G, and cloud computing with ironclad cybersecurity is not just a technological evolution; it's a strategic imperative. The industry's commitment to these imperatives, as demonstrated by the groundswell of new collaborations and investments, will lead to unprecedented innovation in the telecom industry. Across all these developments, telecom operators focus on balancing cost optimization while holding a durable operational advantage. The most successful innovators will spend big this year to infuse AI and GenAI across their businesses and chase the best value-generating use cases for their companies. As this new frontier continues to evolve, this will be a critical year for communications service providers. Success will lie in integrating these new technologies into new and existing offerings to create a seamless, highly productive telecom of the future. About the Authors Padman Kumar General Manager and Global Practice Leader, Communications and Media, Wipro Consulting Subratha Pathak Partner and Europe Leader, Communications and Media, Wipro Consulting Contact Us ===================== ----- Arcticle source ----- https://www.wipro.com/consulting/these-tech-trends-will-reshape-the-global-banking-industry-in-2024/ ----- Contact Wipro Please fill the required details

to access the content These Tech Trends Will Reshape the Global Banking Industry in 2024 These Tech Trends Will Reshape the Global Banking Industry in 2024 Digital transformation and the acceleration of artificial intelligence continue to disrupt all industries, and these forces have heavily impacted the banking sector in recent years. These trends have buoyed fintechs but present a complex puzzle for traditional banks. The fintech ecosystem provides transformational new partnerships and presents stark new competitive dynamics. At the same time, banks are tasked with constantly evolving their cybersecurity posture and responding to new regulations, including regulations around sustainable finance. Somehow – amid all of these technology and market shifts – banks also need to maintain a laser focus on their end customers. The banks strategically leveraging the following technology trends will be best prepared to strengthen their resilience, emphasize agility, and win market share in 2024. 1. A turning point for AI The global market for artificial intelligence services in BFSI stood at $22.5 billion in 2022. It is projected to reach $368.6 billion by 2032. AI-powered tools like chatbots have already been driving contact center transformation; the emerging capabilities of GenAI will supercharge that effort this coming year by reducing customer support costs and simultaneously improving customer engagements in ways that banks never thought possible. More broadly, various forms of AI will transform how banks think about data. This is a year for banking leaders – even those who have previously prioritized human decision-making over tech-first solutions – to think deeply about how AI will inevitably change how banks forecast market trends, improve their lending and investment decisions, and interpret valuable customer data to deliver personalized services. The AI paradigm shift can boost bank revenue and lower costs through automation and process efficiency. Many traditional banks must continue evolving clear AI strategies to overcome challenges like weak core technology and suboptimal data ecosystems. And they will need to be vigilant about AI accountability frameworks and regulations. 2. From demographic to psychographic hyper-personalization Growing digitization and the emergence of fintechs and challenger banks have significantly enhanced customer expectations. Customers are no longer satisfied with offerings targeted at broad demographic categories. They now expect a bank to have a nuanced understanding of their unique needs, preferences, and behaviors. Banks need to respond, but they need to respond efficiently. Recent developments in AI and ML will help banks simultaneously automate and hyper-personalize their messaging, offerings, and services to enhance brand equity and differentiate themselves in the market. Currently, only a limited number of banks can offer meaningful, personalized advice and recommendations due to various challenges (lack of efficient enterprise data management, for example, and an inherent lack of AI/ML expertise). Because banking personalization can drive revenue while reducing customer acquisition costs and marketing spending, a wider range of banks should consider significant investments in technology-driven hyper-personalization in 2024. 3. A neo-banking acceleration Neo-banking is transforming the financial industry, offering customers convenient, cost-effective, and innovative banking solutions. As they expand their services and geographic reach, neo-banks are positioned to be critical players in shaping the future of financial services, enhancing accessibility and personalization for individuals and businesses. In 2024, we can expect the emergence of more

digital-only banks focused on providing seamless digital experiences to customers across onboarding and lending. Amid the emergence of neo-banks, traditional banks can retain market share by leaning on their legacy of trust and offering competitive, digital-only services. To compete with neo-banks, traditional banks should accelerate their digital transformation, consider moving to coreless banking, and provide innovative products and services by partnering with niche fintechs. 4. A banner year for open banking The industry has been discussing open banking for years, but this broad and deep transformation continues to evolve. Already, the conversation has moved from the more straightforward concept of open banking to the more complicated models of ecosystem banking and open finance. This coming year will be an inflection point as open banking matures across geographies and customer segments. Regulatory changes will drive some of this. The JROC continues to refine the next phase of British open banking, while the EU's Financial Data Access Regulation (FiDA) is maturing the open banking ecosystem on the continent. The market-led open finance transformation in the US will swerve dramatically toward competition if the proposed Personal Financial Data Rights rule comes into effect. Meanwhile, fast-paced adoption will continue in the APAC region (Singapore, Australia, Hong Kong, China, India, etc.). Regardless of the exact regulatory environment, API performance continues to improve, and new approaches to digital identity continue to gain traction. Meanwhile, the fusion of AI and open finance will open up new use cases, such as hyper-personalization, where AI algorithms can analyze account transactions to issue personalized offers based on customer spending patterns. This data-rich landscape will also better serve consumers with poor or no credit history, who often get rejected by banks' traditional underwriting models. In such instances, AI models could analyze open banking transactions to assess a consumer's creditworthiness. 5. Security everywhere (especially in real-time payments) According to an AAG report, cybercrime costs the global economy around $7 trillion in 2022, which is expected to rise to $10.5 trillion by 2025. Given the speed and frequency of digital transactions, security is a perennial top priority for banks. Payments, in particular, are accelerating. In the US, the highly anticipated FedNow real-time payments rail launched last year, and real-time payments continue to gain traction worldwide. Fortunately, AI can play a role in smoothing over the transition to real-time payments, particularly by automating and accelerating fraud prevention efforts. Advanced authentication methods like biometrics (face recognition, fingerprint scanning, behavioral analytics), anti-hacking software, and other new fraud detection mechanisms will increase customer trust and bank credibility. Customers will increasingly pay close attention to their bank's security posture, and advanced security features will become monetizable differentiators. Cybersecurity is indeed an enabler for banking businesses, with implications that will increasingly extend far beyond simple compliance. Banks must recognize and adapt to the latest technological advancements as they seek to attract and retain customers in a fast-changing market. Identifying novel emerging technologies that integrate with a larger business strategy is pivotal in gaining a competitive advantage. The strongest banks will build experiences that are highly automated and data-driven yet feel deeply personalized, leveraging a broad partner network defined by unshakeable security and trust. About the Authors James Curzon Global Head of BFSI Consulting - Banking Thomas Brady Domain &

These Tech Trends Will Reshape the US Banking Industry in 2024 These Tech Trends Will Reshape the US Banking Industry in 2024 American banks are heading into 2024 with guarded optimism. If inflation continues to moderate and employment remains stable, the economy may avoid the recessionary impacts and credit market disruptions that the industry anticipated last year. Rather than managing severe macroeconomic headwinds, banks should be able to invest in the technology innovations that will drive sustainable growth through the rest of the decade. The trends below will define the direction of this year's banking technology spending. 1. A continued focus on cost and efficiency Banks have responded to the current economic environment by re-organizing/ restructuring, cutting budgets for technology and consulting, scaling back on new investments, reducing workforces, pausing hiring, and eliminating high-cost centers such as in-house operations or custom technology with inflexible fixed costs. This year, banks will explore various frontiers for cost reductions that reimagine operational expenses while creating open, agile, and flexible systems consistent with sustainable technology expenses. 2. AI goes mainstream This year, AI (particularly GenAI) will go mainstream. During the past year, banks have been focused on building their GenAI strategies, refining GenAI governance and guardrails, and validating the likely ROI of their generative AI investments. This year, banks will move beyond GenAI prototypes, first scaling internal GenAI use cases (like banker/ agent knowledge base and assistant tools) before turning to customer-facing use cases such as full-scale contact center and customer assistance transformation. (Banks should also double down on AI compliance to ensure they abide by all regulations.) Banks can reduce employee workloads, automate customer interactions, and improve customer experience through these use cases. 3. Faster, more data-rich payments From the outside, payments seem simple. Banks need to ensure that consumer and corporate customers continue to experience simplicity even as payments accelerate and the backends become more complex from a data perspective. Banks have already come a long way in terms of payment automation. The next phase of payment maturity will require reworking the front/middle/back-office approvals and reporting to accommodate ISO 20022's more structured data standards, leveraging AI to support real-time payments, and helping an expanding set of enterprise clients build out embedded banking. This next phase of payments transformation will benefit from advanced payments data lakes and analytics, microservices-based architectures, and blockchain (particularly blockchain for cross-border payments). 4. Evolving approaches to fraud identification Fraud identification is a perennial priority for banks, but the stakes are rising again, mainly because of the potential for GenAI-powered bad actors. In this context, behavioral biometrics and device intelligence will be more critical than ever, as will fraud analytics and AI. As GenAI-infused fraud comes onto the scene, AI will also be the best defense. 5. Compliance challenges on multiple fronts US banks will need to engage in multiple compliance efforts this year. CFPB's emerging Personal Financial Data Rights rule aims to set the parameters for open banking in the US. It

will require banks to reexamine their practices around customer data collection and data use. At the same time, banks will be accommodating to new reporting requirements related to the Community Reinvestment Act and must implement the final rule changes by January 2026. DFA 1071, meanwhile, means that banks will be challenged to ensure that recent consumer fairness-in-lending practices are extended to SMBs, which will require core platform updates, banker training, and expanded datasets (which must be captured, managed, and reported to regulators). As AI (including GenAI) scales, banks must ensure that governance practices promote adherence to statutes like the Equal Credit Opportunity Act, which holds AI outcomes to the same standards as human decision-making. 6. A consumer lending transformation imperative Most consumer lending technology supporting originations, servicing, collections, and loss mitigation is now ten or even 20 years old. This is true across numerous products: auto, cards, personal loans, and mortgages. Last year, we saw unprecedented inquiries and initiatives in this otherwise dormant space. Interest rates have peaked, and lenders should prepare to take advantage of this space as the lending market bounces back. With some challenger banks making great strides in streamlining lending journeys, banks need to prioritize rethinking onboarding, origination, servicing, and collections. The most successful banks will pair contemporary SaaS-based platforms with custom intelligence and UI/UX to orchestrate an enlightened customer experience. 7. A year for treasury transformations Banks have a massive opportunity to help commercial clients integrate from accounts payable through accounts receivable and interpret the data to offer better products and services. This includes KYC/AML checks, API-driven customer experience integrations, and intuitive omni-channel platforms. As commercial customers demand solutions to enhance their corporate treasury activities, banks are increasingly partnering with fintechs and software players to provide quality treasury management offerings. The advent of API-enabled solutions and fit-for-purpose fintech capabilities will likely alter the composition of treasury management products and services revenue pools. Historically, bank-provided treasury platforms have focused on core transaction execution central to their corporate relationships. However, the advent of software-as-a-service and API connectivity has made robust, multifunctional workstations far more feasible; in response, software firms and other third-party providers have grasped this opportunity to create solutions that are gaining ground with corporate clients of all sizes across various sectors. 8. Data transformation Most banks have already started their data transformation journeys, but they still need to be completed. While the initial focus was on data infrastructure modernization and the move to the cloud, data transformation will continue to expand into data consumption rationalization, bringing real-time drill-down analytics, enhanced data quality, better data definition, and due diligence. Banks now have an opportunity to harmonize this internal and external data in a unified fashion via a centralized data lake to support previously unimaginable analytics, AI, and GenAI use cases. 9. Cloud migration and transformation Most banks operate in a hybrid cloud environment, blending on-premises solutions with services from cloud hyperscalers. Cloud economics has recently emerged as a theme enabling banks to get the highest performance out of their cloud spending. The next stage in cloud maturity will lean heavily on industry clouds to build new capabilities in core banking, lending,

and decision management. 10. A turning point for small and medium business (SMB) digitalization The SMB segment brings unique challenges due to the disparate nature of the customer base, divergent product use, and small ticket sizes. Even so, in an increasingly competitive market, it's a sector that few banks can afford to overlook. This year, banks will undertake efforts to drive better SMB customer experience, improve product penetration, reduce back office and banker workload, and offer innovative products and services to SMB customers. At the same time, SMB digitalization efforts will more closely mirror recent consumer banking transformation, bringing seamless digital-first customer and product onboarding and improved loan origination. But SMBs need more than just loans: They need full partners to help them better understand their data ecosystems and make decisions to enhance their business outcomes. Banks have numerous opportunities to spin up insights-based cross-sells that improve revenue for themselves and their SMB customers. 11. Data-focused sustainability initiatives Total AUM in the ESG investing sector continues to grow, as does the focus on ESG lending and ESG-backed securities. At the same time, asset values and return models must adjust to accommodate new climate and environmental business risks. Regulatory changes will continue to pick up speed, and ESG will ascend the board-level agenda. More than anything, this means additional diligence, and diligence is all about data. Banks will need automation-heavy data strategies to ensure that they can marshal credible sustainability datapoints in real-time. While the macroeconomic environment remains uncertain, the technology imperative for banks has become quite clear: They need to invest in data, cloud, and AI because data is now the currency of the realm. The sector's emergent complexity – a dizzying ecosystem of APIs, cloud hyperscalers, fintech partners, challenger banks, service providers, and niche startups – is also where the opportunity lies. As the backend of the banking ecosystem becomes more complex, the winners will be the ones that harmonize these many partnerships into customer-facing offerings that feel clear, simple, and compelling. The Change Hub:

----- Arcticle source ----- https://www.wipro.com/consulting/the-change-hub-revolutionizing-change-management-for-organizational-success/ ----- Contact Wipro Please fill the required details to access the content The Change Hub: Revolutionizing Change Management for Organizational Success Revolutionizing Change Management for Organizational Success Imagine that you are leading a change workstream at a large bank. The weekly program board meeting will likely include 5-10 other workstream leads representing various aspects of the program, from technology to process to change management itself. The team is likely to include multiple separate contractors and consulting firms in addition to representatives from the actual client. That's challenging enough. But at the same time, everyone at the table knows that this program is only one of a dozen huge transformation program being delivered simultaneously. Everyone is silently asking themselves the same question: Given all the changes happening

throughout the company, is anything we do even going to land on the radar of the employees we're trying to reach? Most large enterprises are now running multiple change programs in parallel, creating confusion as employees receive numerous and often contradictory communications about these programs. The result feels like an orchestra without a conductor; multiple programs play their tunes simultaneously, drowning each other out in the process. To manage these organizational changes, some organizations have created central change management functions, but these small and under-resourced teams are often not equipped to service the sheer volume of change and end up being overwhelmed. As a result, they resort to contractors and consultants to manage each individual change effort. That may help on the bandwidth front, but mass confusion and mixed messages are virtually guaranteed. What is a Change Hub? A Change Hub sits at the heart of multiple transformation programs, in the same way that a global PMO does. A Change Hub revolutionizes the way enterprises manage change by tapping into external expertise and resources expressly designed to lead multiple, complex change efforts. Imagine having a dedicated support system that ensures smooth and transparent change management, reducing the risks associated with delivery. A Change Hub staffed with external experts can be brought in wherever and whenever business demand for change management is greatest, ensuring a flexible, consistent approach across all change programs. The effectiveness of a Change Hub is rooted in four critical dimensions: With these four elements in place, large organizations will find that complexity and frustration begin to be replaced by clarity and purpose. Addressing the Challenges of Change No change effort, however well-managed, is free of challenges. To improve the effectiveness of multiple, simultaneous change programs, a Change Hub confronts the following challenges: Why Enterprises Need Change Hubs As new technologies like GenAI disrupt all industries, the pace and ferocity of change is bound to increase. In times of radical change, chaos is possible but by no means inevitable. Uncoordinated change activities tend to set enterprises up for failure. A Change Hub, on the other hand, reduces delivery program risk — and at a lower cost than traditional change management methods. As an external resource, a Change Hub is also remarkably responsive. It delivers value from day one, and becomes a flexible, affordable, and effective solution over the long term. With a Change Hub, internal and external change leaders no longer worry that their efforts are being undermined by competing change efforts. Instead, every change program gets its moment in the sun, and each begins to move the enterprise forward.   About Authors Mike Essex Senior Partner Mike is the European Leader of the Talent & Change practice and has 25 years' experience of leading global, complex transformation programmes for clients across multiple sectors. Nadia Arouri Senior Manager Nadia has co-founded 2 NGO's and beings 18+ years experience in advising and transforming organisations. She holds a doctorate in organisation development and brings a strong track record of architecting, leading and managing successful large business transformation programmes including change management, communication strategies, workforce transformation, culture transformation, as well as Inclusion, Equity and Diversity transformations. Carmen Jones Principal Consultant Carmen has 9 years of experience in change management, workforce transformation and end user adoption and has led end-to-end consulting engagements for numerous enterprise clients

across Energy, Defence, Retail. ===================== ----- Arcticle source ----- https://www.wipro.com/consulting/wipro-consulting-forecasts-the-impact-of-emerging-trends/ ----- These Tech Trends Will Reshape the Global Banking Industry in 2024 These Tech Trends Will Reshape the US Banking Industry in 2024 These Tech Trends Will Reshape Healthcare in 2024 These Five Trends Are Reshaping the Energy Industry in 2024 These Tech Trends Will Reshape the Utilities Industry in 2024 These Technology Trends Will Reshape the Communications Industry in 2024 These Five Trends Will Reshape the Retail Industry in 2024 These Tech Trends Will Reshape EC&O in 2024 These Tech Trends Will Reshape Airports in 2024 Contact Wipro Please fill the required details to access the content What's Next? Wipro Consulting Forecasts 2024 Tech Trends Across all industries, strategic imperatives are deeply connected to the opportunities developing alongside emerging technologies. The companies that invest in digital transformation at the optimal pace and scale are the ones that win the market. As we enter 2024, leaders from Wipro Consulting forecast how technologies like GenAI, digital twins, and industry clouds will impact companies' growth agendas across various industries. Only by proactively seizing the initiative and taking advantage of leading-edge technologies will your company evolve and future-proof its business models. Contact Us =====================

How GenAI Is Helping to Bridge the Skills Gap

----- Arcticle source ----- https://www.wipro.com/consulting/how-gen-ai-is-helping-to-bridge-the-skills-gap/ ----- Contact Wipro Please fill the required details to access the content How GenAI Is Helping to Bridge the Skills Gap New GenAI-led strategies are impacting learning and development initiatives across numerous industries. In a 2023 World Economic Forum report, surveyed companies predicted that 44% of workers' skills would be disrupted in the following years. Demand for new skills is growing, accelerated by technology advancements, industry changes, and macroeconomic forces. Technology-related skills gaps, meanwhile, harm innovation and competitiveness. Companies may decelerate a new AI or cybersecurity program simply because their people need to gain the skills to run the program. Learning and development (L&D) teams have been experimenting with addressing these skills gaps, but traditional approaches must catch up to the growing demand. A survey from Manpower shows that 57% of employees are pursuing training outside of work because they believe "company training programs don't teach them relevant skills, don't advance their career development, or simply don't help them stay competitive in the marketplace." Embracing Generative AI can help L&D teams bridge these skills gaps more effectively and keep pace with changes across all industries. GenAI capabilities are growing day by day and are well positioned to play a significant role in developing L&D programs that are more efficient, effective, and engaging. Opportunities for GenAI in Learning and Development Opportunities to infuse GenAI into L&D programs will continue to grow. Right now, the following three use cases will be

particularly advantageous: 1. Outcome-Based Needs Analysis Training needs analysis is an essential yet time-consuming part of any learning and development program. Teams need to identify the skills gaps, build the training necessary to develop those skills and find a way to measure the success of this training. GenAI can fast-track these tasks by automating KPI analysis and market research. L&D teams can upload relevant documents — everything from standard operating procedures to company policies, design documents, guidelines, protocols, and notes from interviews and discovery sessions — and GenAI can scan these documents and generate insights based on specific queries from the team. In this way, GenAI can reduce the time required to conduct a baseline training that drastically needs analysis, which the teams can validate and enhance as required. Beyond just a faster turnaround, GenAI promises more in-depth analysis by allowing teams to spend less time gathering information and more time analyzing it. 2. Content Development Developing content is another time-intensive task. The average L&D content development cycle requires a coordinated effort from visual and instructional designers, programmers, content developers, and team leads. Each of these teams needs input to guide their content development, time to work on the project, review it, incorporate feedback, and review again. All this adds up. As organizations seek to create more personalized content, teams may need help keeping up with requests. GenAI can help with nearly all aspects of content generation, including scripts, audio, video, and assessment questions. Teams can use this GenAI-created content as starting points for their projects, refining as necessary. They can also use GenAI to translate content into other formats to accommodate the varying learning needs of different individuals — translating text to image, for example, or using more user-friendly language to describe highly technical concepts. Human involvement is still significant to ensure content is relevant, accurate, and aligned with company standards. Even if teams only use GenAI to brainstorm concepts, that support can help teams provide more varied, personalized learning materials faster. Platforms like Canva, Powtoon, and Adobe Firefly already use GenAI capabilities to generate content based on prompts. L&D teams can get more from these tools by using them to develop bite-sized content that is easy to engage with, evaluate, and adapt as needed. Other platforms like Smart Sparrow combine this rapid iteration capability with machine learning or data analytics capabilities to help teams deliver content tailored to the unique needs of teams or individual users. 3. Program Roll-Out There are two primary approaches to rolling out learning and development programs: a push approach, which is common to most traditional learning management systems (LMSs), and a pull approach, which is characteristic to learning experience platforms (LXPs) like Fuse, Edcast, and Degreed — all of which are using GenAI to enhance functionalities. The push approach "pushes" learning courses on individuals based on needs defined by the business or by another team acting on the business's behalf. Think of a company-wide training for cybersecurity best practices or workplace conduct. These programs tend to be very generalized. They may deal with a specific topic (cybersecurity or proper behavior in the workplace) but they are designed to work for many individuals across a large group. Unfortunately, this can lead to material that is less effective for many individuals than tailored content. (Think back to that earlier statistic: 57% of employees don't believe company training programs will provide them the skills they need). A pull

approach, on the other hand, analyzes an employee's daily activities and creates learning content based on those activities. What platforms is the employee using? What systems? Where is this employee succeeding and where are they struggling? Employees can then engage with the most helpful recommended content at their own pace (i.e., "pull" it toward themselves, rather than have it "pushed" on them). GenAI can support the pull approach by making it easy for L&D teams to analyze a learner's past performance along with preferences and career objectives to create customized learning paths. This is typically a time-consuming manual process done by the Learning Lead. By incorporating GenAI into that process, Learning Leads may be able to draw deeper insights faster and run different scenarios to offer more personalized content suggestions. Teams can use GenAI to administer exams and check responses, track learning progress, and suggest related content based on performance. GenAI-based LXPs can also automate various administrative and onboarding tasks for new hires, such as learning program enrolment, training/exam scheduling, and reminder prompts. About the Author Abhishek Nag Senior Manager, Global Talent and Development Abhishek is a Learning and Development Practice Leader and brings a wealth of experience in designing and implementing learning strategies that drive organizational growth and individual skill development. =====================

The Human Role in the AI-Defined Supply Chain of the Future

----- Arcticle source ----- https://www.wipro.com/consulting/the-human-role-in-the-ai-defined-supply-chain-of-the-future/ ----- Contact Wipro Please fill the required details to access the content The Human Role in the AI-Defined Supply Chain of the Future For supply chain organizations, the rules of the road are changing. A surge of data and digitization is transforming supply chain management. At the same time, new expectations for sustainability and social responsibility are soaring among consumers and business leaders alike. Supply chain stakeholders must increasingly account for these emerging value systems and associated metrics. AI will play a significant role in harmonizing data and providing strategic insights. However, AI will only partially automate supply chains, and supply chain leaders will increasingly be challenged to define their teams' roles in working with AI to make complex decisions and trade-offs. This AI revolution must be collaborative. AI's capabilities may seem boundless, but AI models and tools also require intelligent, strategy-minded human operators to observe their outputs and define the direction of travel. Functions like AI governance and decision engineering will emerge as critical operational roles in the supply chain organizations of the future. The question isn't just "How will AI capabilities transform supply chain management?" but also "What roles will humans play in AI-defined supply chains?" How Will Humans Work with AI? Beyond the current buzz around Generative AI's image and text generation capabilities, there's a paradigm shift in information management behind the scenes. While AI relies on computing, in many ways, it's a radical departure from traditional computing. When modern robots, for instance, rely on AI

models, they don't balance themselves using pre-programmed motion capabilities. Instead, a learning algorithm processes sensory inputs and iteratively improves. These new robots, much like humans, learn to climb stairs after several attempts and then retain this knowledge – a testament to the power of experiential learning. Similarly, the large language models (LLMs) that underly GenAI don't operate on set rules or instructions. Instead, they leverage vast training data to learn and apply semantic logic probabilities. With AI, we are witnessing a shift from human-made static rules (and the associated mathematics of rigid systems) to observation-based learned behaviors. The implications for human-AI collaboration are two-fold: These dynamics will impact all industries and functional roles, but they have unique implications for supply chain operations. The Future Supply Chain: AI Meets Human Intelligence Today's supply chain operations often rely on management science dating back over a hundred years. Frederick Winslow Taylor's "scientific management" was picked up by Henry Ford's assembly line revolution, and many of these founding principles are still used today to calculate inventory levels, transportation lead times, and manufacturing throughput. The focus has always been on finding the best way to approximate real-world events and building models compatible with the most advanced computing methods. These static supply chain models were highly explainable and contributed significantly to industrial efficiency throughout the 20th century. However, these static mathematical rules fail to accurately capture and manage the complexities of today's market dynamics and related supply chain behaviors. Tomorrow's supply chains will need AI because only AI can operate in this dynamic complexity and learn from large swathes of information to drive reliability and predictive and proscriptive insights in near real-time. The latest strides in visualization and virtualization are opening up new possibilities, allowing us to create digital models of real-world entities such as products, transportation vessels, entire factories, and even complex systems like social and demographic entities. Intuitive, observation-based optimization and virtualization are ushering in a new era of "augmented humans" – individuals who can instantly connect to virtual worlds, explore them through simulations and scenarios, and manipulate and optimize real-world events at a scale and impact never seen before. To illustrate some of the potential impact of these capabilities: In the agile, responsive, dynamic, data-rich, AI-driven supply chain of the future, the role of human operators is bound to change. Time-consuming and inefficient information management and consensus-building will be replaced by a new role, "boundary condition management," which is not dissimilar to driving an autonomous vehicle. Humans will guide the process towards the destination rather than actively driving and making every micro-decision. The transition from a traditional execution focus to a world where advanced technologies can learn and outperform almost any human is significant. Increasingly, thoughtful responses to the AI revolution are focusing on how AI provides an opportunity to recognize capabilities that are truly unique to humans. One of those fundamental human traits is our ability to question assumptions deeply. This suggests that, in an AI-defined supply chain, humans will always need to ask and refine the assumptions underlying AI models, continuously ensuring that enterprises are deploying this powerful tool responsibly. New Responsibilities: Striving for Value, not just Speed and Revenue Speed and cost efficiency will always be fundamental supply chain objectives. The

synthesis of deep supply chain insights, virtualization simulation, and AI-driven optimization will certainly advance those objectives. But increasingly, other supply chain imperatives will also be in the mix. Supply chain organizations' values and strategic goals will need to be realigned to meet the evolving expectations of customers, investors, and regulators regarding sustainability and responsible use of energy resources. AI may become particularly advantageous for managing this multivariable supply chain in the future. On-time delivery might be necessary, but what if it comes at a cost to other customers or the environment? What kind of arbitration or governance would we need to create to manage these situations? Supply chain organizations and regulators must also explore thorny issues around AI-driven competitive dynamics. Suppose numerous AI-driven supply chains compete for the same resources, markets, and customers. How do we ensure that AI-driven decision-making makes the right tradeoffs rather than devolving into a potentially "ruthless" optimization engine? Defining new value concepts and operating boundaries for these advanced capabilities is a task uniquely suited to humans, and it will be a regular strategic focus in the future. Navigating a Radical New Supply Chain Landscape Humans have always been explorers, and AI is simply a radically new landscape. Attempting to put AI back into the genie bottle would be futile. Recognizing this, Wipro has created a novel and innovative capability — Intelligent Supply Chain — that enables transformation pathways toward the AI-driven, human-centric supply chains of the future. Rather than scaling AI in ways that emphasize unfettered automation, we are seeking to balance AI's astounding supply chain capabilities with a vision for how human problem-solving and creativity will continue to add value in the context of supply chains. The future supply chains should be efficient and economically viable while also aligning with core principles of human-centricity, resilience, and sustainability. To get there, we will need AI's efficiency and data processing capabilities, but we also need human guides who can direct AI toward the right objectives. What training, systems, and roles best combine AI tools and human supply chain talent? Supply chain leaders should ask that question as they envision future supply chain operations. About the Author Sebastian Ennulat Senior Partner & European Head of Wipro Supply Chain Consulting Sebastian joined Wipro in 2010 and has over 25 years of experience leading digital supply chain transformations across manufacturing, hi-tech, CPG, retail, and utilities. He brings value to clients by leveraging data-driven innovations and generating rapid ROI. ======================

Leveraging AI and Digitalization for Renewable Energy Refinancing

----- Arcticle source ----- https://www.wipro.com/consulting/leveraging-ai-and-digitalization-for-renewable-energy-refinancing/ ----- Contact Wipro Please fill the required details to access the content Leveraging AI and Digitalization for Renewable Energy Refinancing The rapid growth of renewable energy projects worldwide has created a pressing need for effective refinancing strategies. Renewable energy finance supports the development, deployment, and operation of clean energy sources such as

solar, wind, hydro, and biomass. Refinancing these projects – restructuring or replacing existing debt or equity to improve the financial terms – is a complex process that involves a network of stakeholders, risks, and opportunities. Key factors that make renewable energy refinancing unique include: As the industry continues to evolve, artificial intelligence (AI) integration and digitalization present a significant opportunity to enhance the efficiency and effectiveness of renewable energy refinancing. Addressing data reliability issues, reducing costs, and improving decision-making are among the benefits AI and digitalization bring to renewable energy lenders and developers alike, enabling adaptation to market challenges and further unlocking capital to deploy toward new opportunities. Technology-Driven Renewable Energy Refinancing The need for renewable energy project refinancing arises from existing expensive short-term debt, fluctuating interest rates, expansion efforts, and sometimes even impactful regulatory changes. Current refinancing methods involve extensive manual processes that are time-consuming, error-prone, and costly. Leveraging AI technologies, such as machine learning and predictive analytics, can significantly improve the efficiency and profitability of renewable energy refinancing. AI will contribute to: For lenders, it's worth noting that AI use cases in corporate refinancing will be quite different from AI use cases in areas like consumer lending. In consumer lending and small business financing, the sheer volume of loans and the simplicity of relevant datapoints will increasingly enable AI-powered auto-decisioning. Corporate refinancing decisions present unique challenges due to the complexity of financial data, bespoke deal structures, the involvement of numerous financial experts, the need for in-depth risk assessment, and a complex regulatory environment. For corporate financing in general and renewable energy financing in particular, AI will not enable auto-decisioning for the entire project, but rather will provide clear directional guidance related to discrete aspects of the proposed refinancing effort. The Transformative Opportunity with AI The integration of artificial intelligence and digitalization presents a transformative opportunity for renewable energy refinancing. However, three critical challenges must be addressed to fully harness this potential. First, robust data privacy measures are essential to safeguard sensitive project information from unauthorized access or breaches. Ensuring data security is paramount to maintaining stakeholder trust and protecting valuable data assets. Additionally, AI and digitalization should seamlessly align with relevant regulatory frameworks governing renewable energy refinancing. Compliance with legal requirements not only mitigates potential risks but also ensures ethical practices throughout the process. Finally, while AI enhances decision-making processes, human expertise remains indispensable. Stakeholders must strike a delicate balance, leveraging AI capabilities while relying on human judgment to make informed refinancing decisions. As the renewable energy industry continues to evolve, embracing AI and digitalization will be essential in unlocking the full potential of renewable energy refinancing. The energy transition will be an extremely capital-intensive effort. AI is well poised to give renewable energy developers, asset owners, and lenders the insights required to effectively unleash capital at scale and drive sustainable growth. About the Authors Phani Solomou Senior Partner Phani is Wipro's AI Consulting leader for Europe. She has over 25 years of advisory experience on business transformation working with clients across sectors. She is a

member of Wipro's Responsible AI Taskforce. In addition to collaborating with clients, Phani is driving a number of internal initiatives to reimagine consulting for Wipro, upskilling 8,000 colleagues to deliver value for themselves and clients. Revitalizing Change Communication with GenAI

----- Arcticle source ----- https://www.wipro.com/consulting/revitalizing-change-communication-with-genai/ ----- Contact Wipro Please fill the required details to access the content Revitalizing Change Communication with GenAI GenAI is enhancing the role of communication leads in transformation programs. When intelligently integrated into change efforts, GenAI is not an intrusion but a catalyst that can supercharge the change process. Imagine a world where AI-powered tools automate routine change communication tasks and strategic ones, providing valuable insights from vast amounts of data. Envision change communication minus the process rigidity: A truly agile change experience that feels personalized to each employee. This is not a utopian dream; thanks to recent GenAI innovations, it is a reality within reach. The question now is: Are enterprises ready to embrace this evolutionary shift? Why Change Communicators Struggle All communication professionals today (including those devoted to change communication) are searching for new productivity enhancements amid time-intensive manual content creation, editing, and target audience segmentation. These tasks consume significant time and energy, leaving communications leads with little bandwidth for strategic thinking. This hinders their ability to creatively and effectively manage change. Even when the content is flawless, the overall change process can hamper its effectiveness. The traditional approach to change management involves one-way communications, where information is disseminated to employees without actively driving engagement. Without proper engagement, employees may resist the changes being implemented, ultimately hindering the success of the initiatives. By automating specific processes and providing valuable insights, GenAI can augment the role of change communication professionals and elevate their impact within organizations. In particular, GenAI can already play a significant role in accelerating communications development, fostering inclusivity and accessibility, and ensuring consistency in messaging and design. A recent study conducted at Wipro revealed that change practitioners spend 31% of their time on communication development. This persistent manual workload underscores the potential impact that emerging GenAI technologies can have on the efficiency and effectiveness of change practitioners, freeing up valuable time for more high-value activities including advisory. Communications Development With GenAI's automation and assistance,

developing communication materials can be significantly expedited. Tasks such as content creation, editing, and target audience segmentation can be streamlined. This allows communication professionals to save time and focus on more strategic activities, such as exploring user personas, meeting individually with key stakeholders, and evangelizing the change across company forums. Wipro's AscendAI framework recently demonstrated GenAI's power to accelerate communications for a prominent FTS 250 company in the UK. Working with the client, the Wipro Talent & Change team delivered a "case for change". Traditionally, a seasoned consultant invests 25 hours in this endeavour. Enter AI: a digital alchemist that condenses the same process into a mere 2 hours. This 92% time savings for a single change communications task underscores the potential for human expertise to harmonize with AI's computational capabilities.   However, it is worth noting that not all GenAI foundation models perform equally well in communications development. In comparing GenAI models across numerous attributes (understanding of prompts, rationale clarity, word count compliance, response structure, tone suitability, scenario interpretation, etc.), Wipro's Talent & Change team has encountered numerous differences across models. In our experience, some models overemphasized the shortcomings of current practices, while others delivered overly long responses or lacked coherence. This emphasizes the need for human oversight even if the model provides a strong starting point. Careful testing, or collaboration with change partners experienced with GenAI, can enable organizations to identify the optimal model for their use cases, and outcomes can be further enhanced through prompt engineering. Clear and specific prompts will guide GenAI models toward generating accurate, engaging, and persuasive content. Inclusivity and Accessibility In addition to simply developing content, GenAI-powered tools can help ensure communication materials are accessible to a broader audience. By incorporating features like language translation, voice assistants, and text-to-speech capabilities, communication professionals can effectively reach diverse audiences with change-related messages and promote inclusivity. Fostering inclusivity and accessibility is a strategic imperative. AI-powered language translation tools, for example, can dissolve the linguistic barriers that all global enterprises face, enabling instantaneous, democratized change communication. In conjunction with GenAI, natural language processing (NLP) algorithms can also scrutinize written communication for bias, advocating for language that embraces everyone and avoiding language that might strike the wrong note with particular communities. Capabilities like GenAI-enabled captioning, for example, will improve the speed and accuracy of captioning even in highly technical contexts, allowing employees with hearing differences to be more fully included in the conversation. By integrating these AI-infused inclusive technologies, businesses are opening the doors to diversity. Consistency in Messaging and Design With the assistance of GenAI, communication professionals can ensure that their messages are aligned and visually appealing across different platforms. GenAI-powered tools can provide templates, style guides, and real-time feedback to help maintain a cohesive brand image for the change effort. Maintaining consistent tone, voice, and messaging across marketing efforts reinforces brand identity and facilitates customer connection and recall. As these GenAI sentinels advance, they will become indispensable in safeguarding the integrity and continuity of change

communications. The GenAI Future of Change Communications GenAI's impact will go far beyond content development and execution (see figure below). It will also play a role in areas like stakeholder analysis, persona mapping, and measuring effectiveness. GenAI will handle routine tasks such as scheduling, content creation, and data analysis as a powerful digital assistant for change communicators. It will illuminate audience inclinations, empowering data-centric strategy formulation and personalized messaging at an unprecedented scale. Even so, human judgment and authenticity will remain irreplaceable, and experienced change communicators must continue to ensure that all messages retain a human touch. In this dance of human and machine, change communicators will be empowered to tell stories that foster transformational change. About the Author Phani Solomou Senior Partner Phani is Wipro's AI Consulting leader for Europe. Wipro Smart i-Connect™

Our Expertise Key attributes Benefits delivered Solutions Our Solutions What We Think Form Title Form Title What We Think Contact Wipro Please fill the required details to access the content Wipro Smart i-Connect™ | An Enterprise IoT Platform An Enterprise IoT Platform Wipro Smart i-Connect™ (WSiC) is an enterprise IoT platform that enables solutions for six critical objectives of IoT applications: Data acquisition, storage, processing, advanced analytics, visualization, and enterprise application integration. The disruptive and differentiated benefits created by WSiC transform businesses across various industries like transportation, retail, manufacturing, agriculture, healthcare, oil & gas, logistics & fleets management, mining, smart cities etc. giving them a market edge. The low-code, ready-to-deploy WSiC platform speeds up digital transformation through faster customization and go-to-market of cloud, on-premises, hybrid and edge use cases. It is an open, modular, scalable, and distributed architecture and provides a rich set of features like Vendor agnostic nature, visualization of operations, enhanced security, business impact analytics and live online reporting, which helps to integrate, configure, monitor and control various devices and software's. WSiC is a remedy for the complicated issues like connecting, provisioning, monitoring, managing, configuring, controlling, maintaining, upgrading, and evolving a fleet that has millions of widely different devices operated by a huge enterprise. It also provides facility to users to run the application on edge devices such as industrial PCs, PLCs, single-board computers, and specialized IoT gateways to make local monitoring, control and decision making, as well as data buffering for higher-tier server connections. Key Differentiator 1. Deployment Flexibility – On Premises, On Cloud, Hybrid and Edge 2. 100+ Communication protocols and pre-built device drivers, growing continuously 3. Integration with External Eco-Systems through any supported protocol, open-source Java/.NET/C++ APIs, as well as web services 4. Widespread Database support such as Oracle, MySQL, Microsoft SQL Server, PostgreSQL, No SQL, Cassandra, Hadoop etc. Enhance passenger's airport experience, achieve operational excellence, sustainability and contribute to non-aero revenue Rig management, along with security and HSE compliance, to create a safe operational environment Transform citizen experience by building digital and sustainable cities leveraging IoT, 5G and AI Cut energy consumption of IT equipment by one third Improve campus performance and strengthen user experience with persona- focus digital transformation Cut energy consumption of IT equipment by one third Boost customer experience and employee productivity while improving store profitability Leverage digital twin, data and analytics, to make building management and sustainability simple and effective Improve telecom site availability, utilization and optimization using AI based monitoring and management Enhance employee and visitor experience along with operational excellence and optimization. Wipro Smart i-Connect™ is a multi-domain IoT solution which is ready to deploy solution that allows clients to rapidly create new revenue streams and right shift end-customer experience while reducing cost of operations. The disruptive and differentiated benefits it creates for clients transforms their businesses and gives them the much

needed market edge to be the leaders IoT is transforming the healthcare industry by redefining the space of devices and people interaction in delivering healthcare solutions. The use of building automation is not a new phenomenon. In fact, with the rapid advancement in technology and the development of IoT making connected devices a reality, the concept of building management has undergone a paradigm shift. The use of building automation is not a new phenomenon. In fact, with the rapid advancement in technology and the development of IoT making connected devices a reality, the concept of building management has undergone a paradigm shift. Enable smarter, faster and more efficient claims processing Medical device companies weave new business models to provide value-added services This paper charts out the service opportunities enabled by industrial internet and a framework which can help manufacturers prioritize their aftermarket strategy. Digitization of processes and data across the value chain along with the emergence of Internet of Things (IoT) has transformed the Pharma industry. Although IoT is still in its nascent stages of adoption in the Life Sciences industry, the use of smart devices and machine-to-machine (M2M) communication leveraging SMAC technologies comes at a time when the industry is grappling with patent cliffs and declining R&D productivity This paper explores some of the benefi tsspecially to retailers and focuses on a pragmatic, cost-conscious approach to get retailers started on their IoT journey. ======================

Business Continuity Solution on Cloud with Wipro's VirtuaDesk™

In such circumstances, having a solution focused on business continuity and remote work is crucial. Wipro's VirtuaDeskTM Business Continuity Solution is designed to introduce desktop and application virtualization to the workplace in a quick and cost-effective manner. The solution leverages Cloud architecture principles, next-generation hardware components, and hyperscale Cloud ecosystem to create a high-performance way of delivering virtual workplace. The solution offers the assurance that your employees can access work anywhere, anytime, from any device for the safety of your employees and undisrupted operations during emergencies or unplanned events. Wipro's VirtuaDeskTM is a Desktop as a Service solution that is based on the best-of-breed components fit for business continuity requirements. Wipro also extends a 'Cloud Ecosystem' that can offer additional desktops (500 – 100,000) to scale quickly to minimize business disruption through our Business Continuity-Virtual Desktop Infrastructure solution. For any demo/POC kindly reach out to marketing.cis@wipro.com Covid-19 pandemic is impacting

people and enterprises globally. The top priority for enterprises is to keep employees, =====================

Wipro's #WANFreedom SDWAN powered by Aruba EdgeConnect

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipros-wanfreedom-sdwan-powered-by-aruba-edgeconnect/ ----- Contact Wipro Please fill the required details to access the content Wipro's #WANFreedom SDWAN powered by Aruba EdgeConnect Holistic WAN optimization solution for streamlining network operations with centralized management based on app-centric policies across locations Wipro's #WANFreedom SDWAN augmented with Aruba EdgeConnect solution streamlines customers' infrastructure, enhances connectivity and boosts operations agility with zero touch provisioning. Wipro's WANFreedom as a service model, powered by Aruba EdgeConnect SD-WAN, is a centralized and fully automated solution that reduces the WAN complexity with right set of techniques and technologies. It supports business use-cases from WAN transformation to simplify the operations and enable superior user experience with deeper visibility and control. It helps enterprises to enable anywhere/anytime secured access to corporate applications deployed in the public or private cloud. WANFreedom enables IT organizations to transform their legacy WAN architecture from a hindrance to an enabling platform. With WAN Freedom, IT can confidently adopt, deploy, and integrate cloud, SaaS, and data center applications using any transport, including MPLS, broadband and cellular. Wipro's SD-WAN radically shifts configuration and policy away from disjointed archaic networking commands and rules to a global policy that aligns with business intent encompassing performance, security, and compliance. Remote office infrastructure and management costs are reduced, while turn-up times are shortened, and visibility enhanced - allowing you to quickly solve performance and availability problems through actionable insights. Reduce WAN costs through transport independence, providing the ability to take advantage of transports that meet price and performance metrics including MPLS, broadband internet and others. Realize the benefit on futuristic cloud investments, optimize the performance of any apps and user experience. Add on to any competitor's hardware or brown field environment and optimize any apps and network. The solution offers SASE architecture for adding in firewall and you can choose an industry leading security provider for savings in your operational cost. Continue to read more about the solution, please download. =====================

Wipro AWS AI/ML Lab

However, with the rise in the adoption of new-age technologies and increasing connectivity, many retailers face several challenges with respect to building better omnichannel experience, tighter supply chains and driving data insights. To accelerate in a digital-first economy, retailers need to design a unified commerce strategy to streamline every process, drive data insights, modernize the supply chain, and elevate customer experiences. Transforming the retail landscape with RE.TALE With a legacy of strong consulting services, engineering and infrastructure background, Wipro equips retailers with strategic solutions that span across store modernization, supply chain, customer/employee experience, and hybrid cloud solutions to drive optimum ROI. Wipro's RE.TALE proposition enables retail organizations to modernize their technology landscape for the digital-driven age. Leveraging RE.TALE, retailers can embrace a unified retail commerce approach. Making retail more intelligent At Wipro, our aim is to help retailers understand customer behaviour while helping customers with a more enhanced experience. With RE.TALE, we are enabling retail organizations to move beyond technology siloes by leveraging best-of-the-breed solutions and our 25+ years of experience working with Retailers across the globe.

How an Energy giant 'virtually' transformed its workplace

----- Arcticle source ----- https://www.wipro.com/infrastructure/how-an-energy-giant-virtually-transformedits-workplace/ ----- Contact Wipro Please fill the required details to access the content How an Energy giant virtually transformed its workplace A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops Client background Client: A UK-based energy company Industry: Energy Area of operation: UK Services: Supplies electricity and gas Number of employees: Over 10,000 Challenge The energy company had a legacy environment based on Windows XP virtual desktop solution. This led to stability, performance and scalability issues with less adoption of desktop and application virtualization. The incumbent virtual desktop solution was only for 3,000 users and operations were complicated with over 75 different desktop images. The solution was going out of support from Microsoft and was being decommissioned and migrated to Windows 7. The client wanted

to implement a new Virtual Desktop Infrastructure (VDI) within a time period of 3 months and also migrate additional 1000 users (a total of 4000 users) in three months and scale up to 7,000 users in a year's time Solution Wipro implemented Wipro virtuadesk™, a complete desktop virtualization solution built on Cisco UCS servers to deliver Windows 7 and Windows 10 virtual desktops. Business impact Implementation of Wipro's desktop virtualization solution, which is designed for rapid deployment and risk management, eliminated the architecture and design phase, and minimized risk. Deployment and provisioning automation enabled the hyper-converged appliance to be factory-assembled, shipped to the datacentre and implemented within three months. The solution ensured business agility and helped create a digital workforce by securing, provisioning, and sharing applications and data. The VDI solution has an upgrade roadmap to avoid the risk of end-of-life and out-of-support infrastructure. This will help reduce the complexities involved in compatibility testing of various platforms and applications during PC refreshes in the future. "The client was facing several issues due to their legacy infrastructure and our solution helped address all these challenges. Through Wipro virtuadesk™ workplace transformation solution, we were able to enhance the stability and performance of desktops, resulting in better productivity and efficiency. We got proactive support from our partners like Cisco to deliver the solution on time and meet all customer requirements." - Seshu Kumar G.V. General Manager, Global Infrastructure Services, Wipro

Media group gets future-ready with Wipro virtuadesk™

----- Arcticle source ----- https://www.wipro.com/infrastructure/media-group-gets-future-ready-with-wipro-virtuadesk/ ----- Contact Wipro Please fill the required details to access the content Media group gets future ready with wipro virtuadesk™ A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Client background Client: A leading media group Industry: Media Area of operation: Europe Services: Publishing, distribution Number of employees: Over 15,000 Challenge The media group had multiple datacentres spread across Europe managed by Citrix farms of multiple versions. This led to poor IT management and lack of a centralized view. A complex legacy environment based on Windows 2003 server, which was being decommissioned and going out of support from Microsoft, led to stability, performance, agility and scalability issues. The client wanted to migrate multiple Citrix farms to a central location in a period of 3 months. Solution Wipro implemented Wipro virtuadesk™, a complete desktop virtualization solution built on Cisco UCS servers, software defined storage based on Datacore and virtualization platform based on Citrix.   Business impact Wipro virtuadesk™ enabled the media group to build a collaborative and mobile workforce by securing, provisioning, and sharing applications and data. Wipro's pre-architected solution, designed for fast and secure

implementation, eliminated architecture and design phase, and minimized risk. The hyper-converged appliance was factory assembled and shipped to the datacentre. Deployment and provisioning automation built by Wipro helped implement the solution within 3 months. "Through our proactive approach, we managed to deliver the new platform to the client ahead of schedule. The success of our solution was due to close collaboration with partners like Cisco and Microsoft. Our workplace transformation solution, built on Cisco's industry leading UCS servers, helped deliver high performance VDI to business users with up to 25% cost savings." - Seshu Kumar G. V. General Manager, Global Infrastructure Services, Wipro

Wipro takes key applications and data center on hyper automation drive

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-takes-key-applications-data-center-on-hyper-automation-drive/ ----- Related Articles Contact Wipro Please fill the required details to access the content Wipro takes key applications, data center on hyper automation drive Client background Client: Wipro Services: Global information technology and consulting company that harnesses the power of cognitive computing, hyper-automation, robotics, Cloud, analytics and emerging technologies. Geographies: The US, Canada, Latin America, Continental Europe, India and Middle East, and Asia Pacific. Challenges Wipro, which serves clients across six continents, had a complex IT landscape to manage. At any given time, there were more than 200 enterprise applications running on 4,500-plus servers. These were hosted on two public clouds and on-premise data centers globally. The underlying infrastructure supported an employee base of over 160,000 and all critical applications, such as Helpline, the system used by employees to log tickets powered by Wipro HOLMES, and myWipro, the digital platform for self-service that gives employees a seamless experience across various processes and workflows. Complexity and efficiency issues aside, security and compliance were also a key concern. There were multiple monitoring alert consoles for different applications and infrastructure silos that required multiple monitoring teams, leading to delays in identifying root causes of failures. Monitoring was also being done on a piecemeal manner, not covering all servers and devices. Ability to track and roll-back configuration changes was cumbersome and there was limited track of historical changes. Thus, there was a need for real-time monitoring, incident and change management, automation and self-healing for a seamless user experience. Solution The team at Wipro embarked on a hyperautomation drive to address the infrastructure, critical application and data center monitoring and management issues. This was our 4-step approach: Business impact We've gained true understanding of end-user experience in every application interaction and now have the ability to

rapidly resolve issues in real time, to ensure our employees have quick access to the services they need. - Raja Ukil, CIO & Senior Vice President, Wipro Limited A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Wipro implements centralized management using Cisco IWAN solution and APIC-EM - a network automation tool =====================

A leading Indian conglomerate deploys scalable network infrastructure to optimize operations and enhance agility

----- Arcticle source ----- https://www.wipro.com/infrastructure/a-leading-indian-conglomerate-deploys-scalable-network-infrastructure-to-optimize-operations-and-enhance-agility/ ----- Contact Wipro Please fill the required details to access the content A leading Indian conglomerate deploys scalable network infrastructure to optimize operations and enhance agility Wipro implements centralized management using Cisco IWAN solution and APIC-EM - a network automation tool Client background Challenge The client's business was hampered by aging network infrastructure that led to frequent service degradation. As a rapidly growing company, the client wanted to refresh its aging network hardware, upgrade its sub-optimal operations, and reduce the operational effort in managing its entire network infrastructure. It was looking to replace its core switches and routers that were approaching the end of their service life, and ensure mission-critical application based usage of WAN links. Additionally, the client expected Zero Touch Deployment across LAN and WAN. Solution The client chose to partner with Wipro to address the challenges based on its robust global infrastructure and SDX capabilities, and proprietary transformation framework. Wipro implemented the Cisco IWAN solution as well as NMS-Cisco Prime to centralize management of the network, while APIC-EM i.e. the network automation tool (configured on top of Cisco Prime) helped automate processes. Additionally, Wipro enabled zero touch deployment across LAN and WAN and PnP and created path visualization and architecture design. Business Impact Deploying centralized network management along with the network automation tool helped the client realize the following benefits: "Deep study of customer business objective and network challenges helped us position the best solution set. Our experience and capacities helped us not only transform customer network to meet their current business but also future growth."

How a top women's university upgraded campus security

How a top women's university upgraded campus security Client background Client: A large women's university Industry: Education Employees: Over 5000 Challenge As a women-only university, the client wanted to secure its premises for its female students by digitizing people and asset tracking and monitoring across its premises. The client also wanted to control the movement of male personnel within the restricted zones, while also check the entry of public into any unauthorized area. Solution Wipro assumed end-to-end ownership of IT and non-IT systems to deploy a customized security application for the client. Key highlights of the solution: Business Impact Wipro's end-to-end asset tracking and monitoring solution enabled the client to track the IT/non-IT assets in the campus and make the university campus more secure for students. Security and safety benefits included: "With the implementation of the end-to-end asset and personnel tracking/monitoring system, the client significantly improved premise safety and security, and also improved asset life by providing IT/non-IT asset lifecycle management." Ashish Khare, General Manager, IoT - Cloud & Infrastructure Services, Wipro A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. Township realizes smart city vision.

Here's how.

Township realizes smart city vision. Here's how. Client background Client: An Industrial Township Authority Industry: Township development Area of operation: Spanning 903 acres and 158 companies Challenges With the goal of providing improved city services and higher quality of life, the client was looking to

integrate different subsystems such as street light management, water metering, environmental monitoring, waste management, incident management and fleet management. This was critical to enable effective asset control and monitoring in near real time. In addition, the client also wanted a more connected infrastructure for CCTV surveillance, smart parking and e-toilets for enhanced user experience. Solution The client chose Wipro as their strategic IT partner to prepare solution blueprint for smart city design and architecture. Wipro leveraged its system integration expertise to help the client: Business impact Wipro adopted a phase-wise integration of various stacks, helping the client build a robust infrastructure in compliance with standards, draw insights in near real time for enhanced decision making, and drive superior user experience for township constituents. The entire smart system made control and monitoring more effective and efficient and also brought in transparency and accountability of operations. A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. US food manufacturing company makes

OS upgrades risk-free, fast, and efficient

----- Arcticle source ----- https://www.wipro.com/infrastructure/us-food-manufacturing-company-makes-os-upgradesrisk-free-fast-and-efficient/ ----- Related Articles Contact Wipro Please fill the required details to access the content US food manufacturing company makes OS upgradesrisk-free, fast, and efficient September | 2019 Client Background Challenges The client has a large infrastructure landscape that constitutes multiple operating systems (OS). The devices in the landscape were periodically upgraded to the latest OS version. These regular updates were causing security risks during transition and were also leading to considerable performance degradation issues. Patch and image testing was done manually, which was inefficient and time-consuming. Applications that were hosted needed to be tested for its correctness based on upgrades. There were multiple combinations of upgrade paths to be followed based on OEM supported architectures. Solution Wipro helped the client automate the process of testing to reduce the time spent in manually testing all the OS upgrade activities. Wipro deployed a seed team to stabilize and reduce the risk of transition. Solution Highlights Business Impact Automation of testing, the time-consuming

manual process, helped the client accelerate the efficiency of the overall process. "The client was facing the challenge of business downtime. With improved predictability post upgrade, we were able to reduce business downtime by 10% by reducing OS related tickets/cases."- Harish Krishnan, General Manager, Cloud and infrastructure services, Infrastructure Quality Assurance, Wipro A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. A leading LPG supplier takes control of its assets

with IoT. Here's how.

----- Arcticle source ----- https://www.wipro.com/infrastructure/a-leading-lpg-supplier-takes-control-of-its-assets-with-iot-heres-how/ ----- Related Articles Contact Wipro Please fill the required details to access the content A leading LPG supplier takes control of its assets with IoT. Here's how. October | 2019 Client background Client: A large supplier of liquefied petroleum gas (LPG) to homes and businesses Industry: Gas Area of operation: Global Products: LPG, LNG, Bio LPG Challenges The client was experiencing a rapid growth trajectory. This led to significant challenges in efficiently managing its gas distribution operations. The inability to track the pallets and cylinders in circulation resulted in high OpEx due to constant refurbishment of lost assets. Also, siloed operations led to lack of relevant data and insights, undermining effective decision making. The client was looking for remote identification, detection, and recording of the location of pallets to enable real time inventory and tracking of pallet entry/exit from individual locations. It also wanted the ability to integrate the type and quantity of gas bottles into each pallet and log pallet damage in real time to ensure compliance. Additional needs included increasing safety through accountability and enabling a maintenance record of all pallets. Solution Wipro collaborated with the client to design a pallet digitalization initiative. Wipro assessed the digital supply chain use cases and identified pallet tracking as the key to address immediate challenges affecting revenues. The team employed a two-pronged approach: Highlights of the automated pallet detection solution: Business impact The client saw huge improvements in operations visibility, safety, cost savings and brand reputation as a direct outcome of the pallet digitalization initiative Cost Savings Better Visibility Safe Operations Increased Security Operational efficiency   Real-time visibility and tracking of pallets provided boost to the pallet digitization program. Not only did the initiative bring in anticipated operational benefits,

but also fueled the production, resulting in increased revenues.-Ashish Khare General Manager, IoT - Cloud & Infrastructure Services, Wipro Limited. A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. Fortune 500 insurance company improves application uptime by 99%

----- Arcticle source ----- https://www.wipro.com/infrastructure/fortune-500-insurance-company-improves-application-uptime-by-99/ ----- Related Articles Contact Wipro Please fill the required details to access the content Fortune 500 insurance company improves application uptime by 99% March | 2021 Client background Client: A Fortune 500 financial services organization based in the US Industry: Insurance and financial services Products/ Services: Insurance and investment advisory services, insurance products Number of employees: Over 7000 Area of operations: Global Challenge With over 300 field offices spread across the world and multiple internet links, the client faced challenges in their network infrastructure. The legacy infrastructure ran a number of key applications - including internet-based telephony and collaboration apps - both in-house and partner applications - and was unable to sustain and enhance the end-customer experience. The client was looking for an experienced partner who could transform their legacy WAN and help them upgrade their end-user experience with internet bandwidth. Solution The client conducted a thorough evaluation of the available SD-WAN products. After extensive market research, the client selected Wipro as their vendor of choice to address their requirements. Wipro's proven track record in SD-WAN implementation and dedicated SD-WAN CoE that houses multiple OEM products to collaborate with the client to resolve existing challenges Business Impact With Wipro bringing in decades of knowledge and experience of WAN management, and Palo Alto Networks revolutionary Prisma SD-WAN, the client could now improve customer experience. The Wipro team transformed the network with SD-WAN, delivering application-aware network, faster visual troubleshooting and application-based link quality and auto load balance. SPOG and API integration enabled network and security policies in a single console with auto ticketing options. Some of the key benefits of the SD-WAN implementation were: A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro

virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. Wipro empowers its mobile workforce with a smart network

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-empowers-its-mobile-workforce-with-a-smart-network/ ----- Contact Wipro Please fill the required details to access the content Wipro empowers its mobile workforce with a smart network February | 2020 Client background Challenge Wipro wanted to leverage digital technologies such as cloud and analytics to meet its operational priorities that included: Solution Wipro leveraged four key solutions from Cisco to build an intelligent networking platform that was easy to configure and completely secure in order to deliver a unified experience to its mobile employee base: Business Impact The highly advanced solution enabled secure and seamless user experience to Wipro's 170,000 employees while providing important insights into user behavior as well as analytics on malware and threats. Some key benefits included: "With Cisco DNA™, we have moved to a true intent based network which is secure, and enables user mobility without losing the access with much simplified operations." Rohit Adlakha, Senior Vice President and Chief Information Officer, Wipro Limited. ======================

Minerals company designs a State-of-the-art data center

----- Arcticle source ----- https://www.wipro.com/infrastructure/minerals-company-designs-a-state-of-the-art-data-center/ ----- Contact Wipro Please fill the required details to access the content Minerals company designs a State-of-the-art data center February | 2020 Client background Client: A global material solutions company Industry: Materials Area of operations: APAC, Europe, Middle East, Africa and America Products: An extensive portfolio of specialty industrial minerals Number of employees: Over 10,000 Challenges The client had a disparate setup, which included multiple technologies, processes and vendors across geographies. The resultant challenges included lack of comprehensive security solution, heterogeneous LAN switching environment and decentralized vendor management, which led to operational issues. The network architecture was prone to production outage due to lack of redundancy in LAN design in critical remote sites. The client was experiencing performance issues in accessing public clouds (Azure and SAP). In addition, end of support devices for network in remote sites needed proper inventory, manufacturer support services and a common monitoring and management platform. Solution Wipro built a state-of-the-art data center leveraging Cisco Nexus 9000 switches with spine and leaf

architecture. Wipro's team of experts extended the network to Azure and SAP Cloud by leveraging express route to access resources in the cloud. Business impact The new architecture helped the client achieve complete LAN resiliency and aggregation links, and enabled multi-tenancy capability. It helped protect the client from external threats as it could easily integrate with multiple security solutions. The architecture design helped the client achieve better application performance and network reliability. Highlights: The client was running a disparate setup with multiple technologies, multiple processes and a multi-vendor set up across geos. Through Wipro's solution, the client now has a seamless single operating model across 34 countries, a modern datacenter that is hybrid cloud-ready and remote sites that are standardized on the Wipro-Cisco Office-in-a-Box solution. Anand Jayaraman, General Manager, Continental Europe, Wipro

Europe's leading Electric Utility makes the Lean IT journey

----- Arcticle source ----- https://www.wipro.com/infrastructure/europes-leading-electric-utility-makes-the-lean-it-journey/ ----- Related Articles Contact Wipro Please fill the required details to access the content Europe's leading Electric Utility makes the Lean IT journey April | 2020 Client background Client: A leading electric utility company based in Europe Industry: Electric Utility Area of operations: Europe Products: Electricity, renewable energy, natural gas Number of employees: Over 15,000 Challenge The client had a disparate estate of over 3,000 servers, 5.5 million batch job instances, and more than 230 critical applications in a diverse landscape containing a mix of applications hosted on premise and public cloud. Transforming the legacy data center to private cloud with consistent improvement and automation initiatives was a challenge, as there was limited transparency on operational performance parameters. The client wanted to build a lean IT organization by simplifying all IT services and offerings. This required changing the overall mindset as well as skill set from "make IT" to "manage IT" and choosing to "make" only if it added measurable additional value. The overall aim was to derive maximum value from IT offerings, and enable cost transparency and long-term customer satisfaction. Solution Wipro stepped in as the client's preferred partner to revamp IT infrastructure services and optimize operations. Wipro provided the client services like DC Hosting, Compute Services (Wintel, VMware, Unix), Database (Oracle, SQL, Middleware, Mongo DB), Storage and Backup, Network (DC LAN), Output Management Systems, Job Supervision, SAP (SAP Basis and Solutions), Managed File Service, Monitoring / Automation, and Cloud Services. Wipro leveraged its knowledge and solutions such as Virtual desktop infrastructure, Knowledge Management, Reporting, Automation, and Cloud Portal to build a lean IT organization for the client. The highlights of the solution included: Business Impact Leveraging Wipro's expertise in data center hosting and hybrid cloud services, the client was able to: "Wipro's expertise in data center services

and best-of-breed solutions ensured the client maximum worth from its existing IT investments and helped establish a lean IT organization." - Ralf Georg Mueller, Account Delivery Head, ENU-Utilities, Wipro A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation Single-pane of glass for incident management improves incident response and enhances end-user satisfaction. How a Semiconductor Manufacturer

Built a Smart Warehouse

----- Arcticle source ----- https://www.wipro.com/infrastructure/how-a-semiconductor-manufacturer-built-a-smart-warehouse/ ----- Contact Wipro Please fill the required details to access the content How a Semiconductor Manufacturer Built a Smart Warehouse May | 2020 The company reimagined warehouse management with IoT-powered man, machine and material tracking, enabling 20% increase in operational efficiency Client background Client: A top American manufacturer of semiconductor products Industry: Manufacturing Area of operations: Worldwide Products: Semiconductor and infrastructure software products Employees: Over 11,000 Challenge The manufacturer's productivity was challenged due to warehousing inefficiencies. Lack of visibility into inventory, asset and manpower as well as inefficient warehouse processes like picking and put-away were resulting in lesser throughput, thus impacting their overall operational efficiency. The client identified key areas where they wanted to make changes to transform their warehouse operations. Solution The manufacturer needed a partner with the expertise to manage end-to-end transformation of their warehouse. Wipro's knowledge of the client's business and decades of experience meeting similar needs of clients enabled a quick and seamless transformation. The Wipro team came up with an Integrated Smart Warehouse solution using IoT technology for Man, Machine and Materials tracking. Standard Operating Procedures were defined to reduce event/issue times. Some of the key features of the solution were: Business Impact The new warehousing solution secured many firsts for the client. With ready information at their fingertips, the client had real-time access to inventory, asset, and manpower, and could easily measure the efficiency and productivity of resources engaged in picking, packing and shipping processes. The integration with the existing systems ensured that there were no sudden changes. Some of the key benefits realized were: "Our team took complete responsibility of the client's warehouse operations, integrating old with the new. And while we helped them re-imagine their

warehouse processes, our client was able to focus on their end customer experiences driving customer successes and living up to their name in innovation, collaboration and engineering excellence." Ashish Khare, General Manager, Cloud Infrastructure Services - IoT, Wipro

A Leading Airport Enhanced Customer

Experience by 45%. Here's How.

Related Articles Contact Wipro Please fill the required details to access the content A Leading Airport Enhanced Customer Experience by 45%. Here's How. May | 2020 Client Background Client: A leading airport Industry: Air transport Area of operations: North America Customers: Connects over 50 million passengers Challenge The client was struggling to enhance passenger experience at the boarding and transit gates. Lack of real time visibility into shuttle movement impacted the airport's ability to optimize ground operations, resulting in longer wait times at the gates. It was a challenge to keep terminal facilities clean given the irregular maintenance schedule and lack of real time view of facilities. At the same time, operational maintenance of equipment was not easy as terminal assets were not traceable. This resulted in excess equipment leases and purchases, putting equipment at risk of loss, theft or non-utilization. In addition, manual loading of bags on conveyor belts delayed the un-loading process, increasing passenger wait time. Solution Wipro implemented an Automated Vehicle Identification and Tracking solution on the Wipro Smart i-Connect™ platform for the airport. This enabled real time location tracking of vehicles with geo mapping, geo fencing, route optimization, and integration with other airport applications – Airport/Airline Customer Relationship Management systems, Google Maps, etc. Wipro Smart i-Connect™ is a ready-to-deploy Internet-of-Things (IoT) based enterprise use case solution with open standard architecture which supports multiple protocols and helps realize advanced analytics. Solution highlights: Business Impact Wipro Smart i-Connect™ platform allowed the airport to enhance customer experience while reducing cost of operations. Impact highlights: "Passenger experience is integral to the success of an airport besides other operational parameters. Our solution helped in boosting passenger experience significantly. Wipro Smart i-Connect™ provides the opportunity to scale IoT requirements of an airport on the same platform." Ashish Khare, General Manager & Global Practice Head – Smart i-connect™, Cloud and Infrastructure Services, Wipro Limited. The AWS Partner Network (APN) includes thousands of systems integrators that specialize in AWS services, and tens of thousands of independent software vendors (ISVs) that adapt their technology to work with AWS. AWS adds value to customers with cross-industry capabilities such as app modernization and migration to the cloud. From startups to enterprises, to public sector organizations, every imaginable use case is running on AWS. AWS is architected to be the world's

most flexible and secure cloud computing environment. AWS supports 90 security standards and compliance certifications. And our robust cloud security tools with comprehensive security, compliance, and governance features satisfy requirements for militaries, global banks, and other high-sensitivity organizations. All 117 AWS services that store customer data offer the ability to encrypt that data. Use the latest technology to experiment and innovate quickly, taking advantage of highly scalable, elastic cloud services. At AWS, we continually accelerate our pace of innovation so that you have new technologies for transforming your business. Whether your sector is public, retail, healthcare, or something else, we have you covered with the most extensive global cloud infrastructure available, including more than 75 Availability Zones within 24 geographic regions. AWS has the operational experience, at greater scale, of any cloud provider. Functionality Community Security Innovation Incorporate new technology to improve care delivery and product development Manage your data more effectively Reduce risks and support regulatory compliance 1. Smartance 2. Collaborative Care Platform Serving over 200 customers across more than 50 countries. Cloud-based technology is becoming the new normal in healthcare and life sciences –and with good reason. Two-thirds of the average healthcare IT budget is currently dedicated just to keeping the lights on. That amount of spending should reap bigger rewards, and cloud technology offers just that. Healthcare and life sciences companies around the world are using Amazon Web Services (AWS) to create better experiences and outcomes for patients. Using AWS saves money with affordable archiving, saves physical space with backup servers in the cloud, and offers new ways to manage patient information. AWS cloud computing also provides access to powerful new analytics capabilities and machine learning, all while meeting the most stringent security and privacy requirements. It's time to rethink IT in healthcare and life sciences – and reduce complexity, inefficiency, and costs by optimizing your investment in data management. Here are three specific ways AWS can help. AWS is collaborating with healthcare providers, public health organizations, government agencies, and life science businesses around the globe to support their efforts to cope with the effects of COVID-19. Our AWS Healthcare & Life Sciences COVID-19 Resources page provides up-to-date information and resources for COVID-19 researchers and diagnostics developers. You're in the health and wellness business, so it's important to allow your organization to focus more on delivering optimal patient experiences and outcomes, and less on building and maintaining your data infrastructure. The managed features of AWS provide new ways for life sciences and healthcare customers to connect with patients, providers, suppliers, and distributors. Capabilities such as code-triggered functionality enable customizable reports and personalized notifications, transforming the value chain to help more patients get better, faster. Data analytics empowers researchers, clinicians, and operations and manufacturing teams to make better-informed decisions. Machine learning can support clinical forecasting, personalized engagement, and advanced clinical and product research. Customizable reports and personalized notifications Make better-informed decisions Clinical forecasting, personalized engagement, and advanced research. Propeller Health has developed a digital health platform that improves outcomes for people with chronic respiratory disease. The company applies machine learning with solutions such as Amazon

SageMaker and Amazon Redshift, along with its infrastructure built on AWS, to give patients a forecast of their health based on local weather conditions, recent medication use, and other factors. It's not about the data you have; it's what you do with it. AWS offers myriad ways to gain insights from the data you gather and store. That starts with the ability to get data into the cloud quickly and seamlessly. AWS offers hybrid and customized configurations, so your data-management system does exactly what you need it to. That means easy and secure access for users, with safeguards that ensure secure data and user identities. You can search metadata easily, using tools such as predictive and prescriptive analytics to identify trends and develop new insights. You can also segment your data, creating separate storage for active, infrequently accessed, and archived data. AWS supports HIPAA, HITRUST, FedRAMP, and other compliance requirements, with services designed to conform to global industry standards. A major cancer research center uses Amazon Comprehend Medical to identify patients for clinical trials who may benefit from specific cancer therapies, reducing the time to process millions of document from hours to seconds. AWS delivers an environment built for the world's most secure organizations. Our infrastructure meets stringent security standards for banking and the military, with a robust set of tools for networking, encryption, identity management, and regulatory compliance. Insufficient data security, compliance and availability can open the door to sophisticated, hard-to-identify attacks. To stay in front of the latest threats, we continually refine our security measures based on our customers' experiences. And the AWS security team is always available to help. The healthcare industry is rapidly moving to the cloud, and AWS gives you the best resources to accelerate your journey. In addition to direct support, our AWS Partner Network (APN) connects you with technology and consulting partners who are experts in a wide range of applications. And the AWS Marketplace offers industry-specific software you can deploy with one click. Wipro's fast-growing health industry vertical serves over 200 customers across more than 50 countries. Wipro on AWS helps health providers coordinate care teams, increase patient engagement, and improve internal processes, and also offers extensive experience providing solutions for critical functions along the pharmacy value chain – from research and development to manufacturing, distribution, and sales. AWS service integration assists Wipro in building products that deliver unprecedented efficiency, cost savings, and customer satisfaction. Wipro Smartance is an end-to-end platform that automates pharmacovigilance (PV) processes by harnessing the power of AWS native artificial intelligence (AI) capabilities. Smartance collects and analyzes adverse event and complaint data from intake channels to reduce processing time and improve consistency and accuracy. Learn more Pharmacovigilance: Smarter approach to drug safety Wipro Smartance: Bringing a revolution in patient safety with Artificial Intelligence How Pharma is Adapting to Digital Interventions and Driving Healthcare Integrating patient care among providers improves patient outcomes while conserving resources. Wipro's Collaborative Care Platform is built on AWS native architecture. It integrates care teams and leverages AI and IoT tools to provide superior patient experiences and deepen engagement across the health care spectrum, from preventative to acute care. Customer references A leading pharmaceutical company used Collaborative Care Platform to bring together patients, physicians, and sponsors. Wipro helped a top healthcare system

streamline breast screening and blood donation processes. Learn more Collaborative Care Platform: Enabling a superior patient experience Wipro Digital Experience Platform: Collaborative Care Platform Patient Centricity Connect with Wipro To get started transforming your business, innovating faster, and growing ahead of the curve. Improve product and production process design Get smart with your data Enhance security and streamline operations 1. Condition-Based Monitoring 2. Smart Track and Trace 3. Production Monitoring and Process Automation Helping manufacturers achieve digital transformation quickly and seamlessly. Manufacturers are embracing digital technologies to transform and are looking to leverage data to make data-driven decisions, further automate processes, and leverage innovations like machine learning, computer vision, and robotics. Manufacturers are challenged to squeeze out additional productivity, maximize their asset availability, and improve quality all while lowering costs. They are also looking to move away from manual inputs into their production processes with digitally executed manufacturing for production and quality optimization, and flexible product changeovers. Additionally, they are looking to reduce consumption of water, compressed air, gas, electricity and steam to lighten their energy footprint to meet corporate sustainability objectives. The cloud plays a key role in all these optimization trends. For more than 20 years, Amazon has been designing and manufacturing smart products. We also distribute billions of products through our globally connected distribution network using cutting-edge automation, machine learning services, and robotics, with Amazon Web Services, AWS at the core. AWS was literally born from our industrial operations at Amazon, and we understand the needs of factory operations. AWS helps you transform manufacturing operations with the most comprehensive and advanced set of cloud solutions available today. Instead of focusing on building and maintaining your data center infrastructure, concentrate your resources on creating innovative new products, improving operational efficiencies across the value chain, and optimizing production. AWS delivers virtually unlimited compute and storage capacity, along with one of the most comprehensive set of edge-to-cloud solutions available today. Reduce time to results and time to market by running more parallel tasks than most on-premises environments would allow. Innovate faster without the worry about scaling your data center infrastructure. When they run HPC workloads in the cloud, designers, scientists, and engineers can use model-based design and large-scale parallel simulations to quickly solve complex computing challenges and collaborate more effectively with secure file sharing, and access to AWS resources worldwide. Unlimited compute and storage capacity Edge-to-cloud solutions Reduce time to results and market Innovate faster Leading Semiconductor companies today use AWS to take advantage of a more rapid, flexible deployment of CAE and EDA infrastructure, from the complete IC design workflow, to register-transfer-level (RTL) design, to the delivery of GDSII files to a foundry for chip fabrication. AWS compute, storage, and higher-level services are available on a dynamic, as-needed basis without the significant upfront capital expenditure that is typically required for performance-critical electronic design automation (EDA) workloads. Amazon Web Services (AWS) offers a secure, agile, and scalable platform with a comprehensive set of services and solutions for high performance design, verification, and smart manufacturing, supporting EDA and rapid semiconductor innovation in the

cloud. Semiconductor design simulation, verification, lithography, metrology, yield analysis, and many other workloads benefit from the scalability and performance of the AWS Cloud. For example, compute performance for these applications is enhanced by latest generation EC2 instance types, including the z1d. Run more jobs per core with z1d, the fastest single thread performance of any cloud instance, delivering 4GHz sustained CPU, 16 GiB RAM per core, and local NVMe storage. Manufacturing is dependent on data – not just gathering it, but using it effectively. Data from design teams, the factory floor, and finished product behavior in the field can help optimize operations, improve the quality and usability of products sent to customer, and provide feedback to design and engineering teams to create better products. To get more out of valuable data in your factory it needs to be extracted from disparate sources and production systems, structured for context and stored, and then analyzed to optimize production, machine availability, and quality. AWS Cloud services address these use cases by helping manufacturers extract, structure and store data from a variety of current and legacy equipment into a data lake for a combined, single source of truth. A data lake is a centralized repository that allows you to store all your structured and unstructured data at any scale. An Aberdeen survey saw organizations who implemented a data lake outperforming similar companies by 9% in organic revenue growth.1 This data allows for detailed analysis and consumption to digitally transform to improve business operations. Data extraction and structuring tools, edge computing, storage, and machine learning services are making smart factories even smarter to optimize Overall Equipment Effectiveness, or OEE. 1 Aberdeen Research: Angling for Insight in Today's Data Lake (pdf) Data gathered from disparate sources, even from different systems, can benefit from advanced data analytics. For example, using machine learning services like Amazon SageMaker which is a fully managed service that gives your teams the ability to build, train, and deploy machine learning (ML) models quickly. SageMaker removes the heavy lifting from each step of the machine learning process to make it easier to develop high quality models. This allows analysis and comparison of a huge number of production variables to glean insights into your process to optimize overall equipment effectiveness. Protecting your intellectual property and the integrity of your production processes is vital in today's business environment, where operational technology (OT) infrastructure cyberattacks are on the rise. At AWS, cloud security is our highest priority. When you work with us, you'll benefit from a data center and network architecture that's built to meet the requirements of the most security-sensitive industries and organizations. As a manufacturer, you want to focus on innovation and improving business operations, not on technology infrastructure. AWS, together with our GSI partners can help start your cloud journey today to optimize your business operations. Innovate faster, maximize your factory OEE, and lower costs with the help of AWS and our vast partner network. Wipro offers its own specialized platforms, along with AWS tools and partner solutions, to help manufacturers achieve digital transformation quickly and seamlessly. Wipro's products on AWS provide smart monitoring technologies, data collection and analysis, product development, supply chain modernization, and maintenance recommendations that revolutionize manufacturing efforts. These offerings take factories from reactive to proactive while unifying infrastructure, saving money, increasing productivity and efficiency, and

keeping workers and equipment safe. No factory is quite like yours, which is why Wipro created its Condition Based Monitoring solution to be highly scalable and customizable. AWS Internet of Things (IoT) sensors and analytics apps give factories total and continuous visibility into asset performance to optimize equipment usage and increase factory efficiency. As today's industrial environments and supply chains increase in size and complexity, manufacturers can leverage intelligent technologies to gain visibility into their operations. Wipro's Smart Track and Trace solution uses AWS AI/ML, analytics, and blockchain to monitor asset locations, track time-series data, and perform real-time analysis. Wipro's Production Monitoring and Process Automation offering provides installed base management and real-time production monitoring for discrete manufacturing companies. This solution combines Wipro's Looking Glass Industrial Internet Platform and a multi-protocol gateway software stack (MPIOTG), along with AWS IoT services. Customer references Precision Group enhances operational efficiency on factory A construction equipment OEM decreases cost of service operations Learn more IoT solutions: Stitch the complete IoT Looking Glass: Industrial Internet Platform Wipro Looking Glass - A hierarchical asset management platform Connect with Wipro To get started transforming your business, innovating faster, and growing ahead of the curve. Versatile tools and easy integration Delivering more value to your customers Build with confidence on the most secure, compliant, and resilient cloud 1. Lab Bank on AWS Cloud 2. Banking Services on Cloud 3. ML for Accounts Payable Auditor 4. HOLMES E-KYC Building products that transform processes for businesses and consumers. Financial services institutions across banking, payments, capital markets, and insurance rely on AWS for the secure, resilient, global cloud infrastructure and services they need to differentiate themselves today and adapt to the needs of tomorrow. As a result of today's challenging business environment, these institutions are redefining their business models to modernize disparate legacy systems for improved agility and scale, meet rapidly changing consumer behaviors and expectations, drive business growth by harnessing data and innovation, and build with confidence on the most secure and resilient cloud. AWS meets the most stringent security requirements while delivering the greatest breadth and depth of services, deepest industry expertise, and most expansive partner network. Building on AWS empowers organizations to modernize their infrastructure, meet rapidly changing consumer behaviors and expectations, and drive business growth. Running old financial systems consumes valuable resources you could be using for innovation. With the broadest set of migration services and tools, AWS lets you modernize legacy accounting and storage systems for improved agility and scale. Integrating AWS software into your existing financial systems is easy and enables you to maintain your business workflows with minimal technical issues. And you can add custom software modifications designed for the financial industry. Analyzing data is crucial to the industry's business growth and innovation. AWS facilitates effective use of data, so you can explore new ideas within a secure data lake, build quickly using a microservices-based platform, and engage partners for new products and capabilities. With AWS cloud-based technologies you get easy, real-time access to your data across multiple geographic regions and markets. Modernize legacy accounting and storage systems Maintain your business workflows Add custom software for the financial industry Today's financial-

sector customers want instant access to information – from any device, at any location, at any time. Using AWS lets you meet those rapidly advancing expectations. You can offer customers easy-to-use services to track transactions and accounts and help them analyze investment data to uncover what's important. AWS offers the largest global footprint in the market, with dozens of Availability Zones (AZs) across more than 20 AWS Regions, so your customer services can truly be global – with more and better data for an enhanced customer experience. You can offer customers a variety of local or global payment methods, in multiple currencies and languages, plus rapid dispute resolution for failed payments. Backed by more than 20 years of Amazon's investment in artificial intelligence (AI), AWS offers the broadest and deepest set of machine learning (ML) and AI services for all skill levels. Your developers can create rich, personalized experiences that meet customer expectations without needing ML experience or the assistance of data scientists. A leading financial institution was the first U.S. bank to move its core banking systems to AWS – beating larger banks and fintech startups. Its retail line of business runs core banking systems for ten million customer accounts on AWS. Along with moving traditional workloads, the bank was able to retire its on-premises call center by moving to Amazon Connect. The financial industry is one of the most strictly regulated sectors, with strict rules concerning data privacy and reporting. With AWS, you're able to connect directly to financial services experts who will help you ensure data integrity with the most secure infrastructure – which includes the elements you need to protect cardholder data, maintain a vulnerability management program, implement strong access-control measures, regularly monitor and test networks, and maintain an information security policy. AWS supports 93 security standards and compliance certifications, more than any other cloud provider, and is actively acquiring more to help customers stay current (for example, PCI-DSS, SEC Rule 17a-4, Regulation SCI, EU Data Protection Directive, and FISMA). Our cloud data services safeguard the integrity of your IT infrastructure, for both customer protection and regulatory compliance. Having physical separation of data eliminates the vulnerability of a single point of attack, and our compliance security extends globally. Wipro has strong financial industry expertise, plus experience building products that transform processes for businesses and consumers. With more than 55 Centers of Excellence for emerging technologies, Wipro is an innovation-led cloud partner on AWS. AWS provides the extensive and flexible cloud and AI/ML capabilities that Wipro employs in its end-to-end solutions. Wipro solutions on AWS transform businesses and produce improvements in efficiency, worker effort, and cost savings for banks, insurers, and other financial professionals. Wipro's industry-specific innovation labs support companies as they digitize their services and organizational structures. For the financial services industry, Wipro created miliu, a futuristic-concept lab bank powered by advanced technologies, extensible architecture, and innovative engineered solutions from Wipro and its partners. Customer references Share money with family and friends on social media Enjoy frictionless registration with blockchain-based digital identity Purchase a car using virtual reality Learn more miliu: Banking contextual to life The journey toward open banking: What banks need to do Digital identity ecosystem: The opportunity for banks to be identity brokers in the open banking era Digital channels for banking are evolving lightning fast.

Reaching customers via remote, secured multichannel avenues creates unprecedented differentiation for today's banks. Wipro has architected a seamless bouquet of channels to give customers personalized access to innovative banking services, enhancing the banking experience without compromising security. Customer references Share money with family and friends on social media Enjoy frictionless registration with blockchain-based digital identity Purchase a car using virtual reality Learn more miliu: Banking contextual to life Is your bank ready to team up with chatbots? The journey toward open banking: What banks need to do Wipro's HOLMES™ Machine Learning for Accounts Payable Auditor solution uses the Wipro HOLMES AI and automation platform to deliver machine learning capabilities for finance departments. The solution uses AI to perform proactive monitoring of accounts payable and helps to identify recurring leakages, compliance violations, and fraud – in near real time. Learn more Machine Learning for Accounts Payable Auditor Procure to Pay anomaly protection: Detect frauds, plug fund leakage Procure to Pay anomaly protection: Need for a pre-emptive, big data system Wipro's enterprise know-your-customer solution, HOLMES™ E-KYC, automates customer onboarding by performing necessary due diligence for selected vendors. It aggregates information and vets vendors for financial stability, supply capabilities, compliance standards, and market reputation, plus produces reports required for anti-money laundering (AML) requirements. Customer references A large universal bank reduces KYC lifecycle by up to 50% A global investment bank saves effort and data costs with E-KYC Learn more Enterprise Know Your Customer Wipro HOLMES E-KYC Unlocking automation opportunities for superior due diligence in KYC operations Connect with Wipro To get started transforming your business, innovating faster, and growing ahead of the curve. ======================

Transform your Data Center to achieve agility, security, scalability and sustainability with cloud

----- Arcticle source ----- https://www.wipro.com/cloud/transform-your-data-center/ ----- More from Wipro FullStride Cloud Services on Data Center Exit Contact Wipro Please fill the required details to access the content Data Center Transformation with Wipro FullStride Cloud Wipro FullStride Cloud offers a seamless data center exit strategy In today's digital landscape, data centers have played a crucial role in companies' IT ecosystems. However, the imperative for digital transformation and cost optimization is driving a fundamental re-evaluation. Many businesses are choosing to exit their data centers, seeking faster response times, accelerated time to market, and enhanced accessibility to deploy cutting-edge technologies. These strategic moves enable organizations to gain a competitive edge, foster agility, and embrace sustainability. Wipro FullStride Cloud offers an accelerated solution to revolutionize your data center transformation. We understand the

criticality of a seamless and secure transition, particularly with mission-critical legacy applications housed within data centers. Leveraging our extensive cloud portfolio, partner network, and innovative FullStride Cloud Studio, Wipro provides a comprehensive data center exit strategy. This encompasses meticulous design, efficient migration, and effective ongoing operations. Our approach goes beyond technical expertise, as we tailor innovative strategies to meet your specific objectives, scalability requirements, timelines, sustainability standards, incumbent contract exit obligations, regulatory constraints, and more. With Wipro FullStride Cloud, you can confidently embark on your data center transformation journey, unlocking the full potential of agility, efficiency, and sustainability for your organization. From data centre to cloud How to Migrate Data Center Infrastructure to an XaaS Model Wipro FullStride Cloud partners with the world's leading cosmetics brand Wipro and Evanta CIO Community Discuss Cloud Strategies Wipro and Microsoft to accelerate EON's digital transformation Monetizing Your Data Center Exit Strategy Contact Us ===================== ----- Arcticle source ----- https://www.wipro.com/cloud/migrate-your-data-center/ ----- Contact Wipro Please fill the required details to access the content How to Migrate Data Center Infrastructure to an XaaS Model Many businesses haven't fully migrated their operations to the cloud, resulting in hybrid environments that are complex, rife with technical debt, and prevent the enterprise from realizing the anticipated flexibility and agility gains. Embracing an everything-as-a-service (XaaS) model solves these challenges by shifting the responsibility of asset ownership and maintenance from businesses to service providers, increasing the business' control over its applications. Gartner® report: "How Do I Plan for Migrating My Data Center Infrastructure into an XaaS Model?" highlights the benefits of XaaS for data center exits and provides key considerations to help businesses make the shift. "Many organizations do not have the internal skill sets to effectively manage a cloud migration or complete hardware refresh," the report states. "Relying on service providers is a way to partially mitigate the problem of skills gaps. Service vendors retain personnel with the expertise to help design and deploy a solution that meets business needs without requiring the client to upskill, reskill or hire." Traditionally, businesses have opted for the simplest "lift-and-shift" approach to move their workloads to the cloud. But because these approaches often stop short of modernization, they tend to deliver less value to the business and can even lead to additional costs. Wipro FullStride Cloud's application migration services and modernization services help enterprises quickly realize the full potential of the cloud with end-to-end strategic support and advanced digital offerings. Cloud experts work closely with clients to develop a robust transformation strategy, incorporating cloud

economics and FinOps to align with business goals and generate greater returns on cloud investments. Wipro's full suite of application modernization services, combined with the capabilities of a vast partner network, help clients erase technical debt by modernizing and remediating to the cloud. Through rehosting, re-platforming, refactoring, and rearchitecting applications, enterprises adopt a nimble, intelligent approach that allows them to solve business challenges and develop a stronger cloud program going forward. Our Offerings An integrated cutting-edge platform that accelerates the transformation journey from legacy applications to cloud based applications with minimized risks. Ensure a seamless, secure data center transition to accelerate your journey to the cloud. Build stronger, more efficient workplaces with cloud-based applications and employee services. Keep pace with innovation and competition by optimizing your cloud infrastructure. Get the best out of systems data through data and DB modernization themes like, data virtualization and offload, legacy to modern datastore. Increase agility by updating infrastructures and employing a tailored hybrid cloud approach. Exit from your existing state to a target state through rewriting, re engineering, transcoding, re hosting, replacing, and retiring with Wipro and its partners who specialize in Legacy Modernization tools and solutions. Empower organizations to reimagine and rearchitect their business and unlock the full potential of cloud. Modernization solution owners only think about application code, databases, and data, but they don't plan for the entire platform ecosystem. Modernizing legacy applications building a roadmap for success. Engage with our cloud experts as they share insights on new technologies, innovation and game changing solutions that are driving the more intelligent, hyperconnected cloud By modernizing cloud infrastructures, energy enterprises can reimagine their service delivery and business models through a series of cloud-based advantages. Master the art of cloud strategy in 2023. Learn from a life insurance companys journey, avoiding pitfalls. Elevate business with a proactive, business-driven approach. GenAI: Powering Mainframe Modernization

----- Arcticle source ----- https://www.wipro.com/cloud/migration-and-modernization/genai-powering-mainframe-modernization/ ----- Contact Wipro Please fill the required details to access the content GenAI Powering Mainframe Modernization The Importance of Mainframes In an era where mainframes continue to be the backbone of global enterprises, the challenges of maintaining, optimizing, and modernizing outdated legacy systems have become paramount. These systems, often burdened with technical debt and fragile from years of quick fixes, are not only costly to maintain but also hinder business agility. The scenario is further complicated by the impending retirement of a significant portion of the skilled workforce that has the knowledge to maintain these systems, as well as the often-inadequate technical documentation that makes knowledge transfer, mostly through person-to-person, expensive and inefficient. At the same time, demand for mainframe modernization is growing, driven by the need for streamlined applications that enhance agility and mitigate continuity risks. However, these projects are notoriously complex, with a 74% failure rate among organizations attempting them1. Recent advances in technology, partnerships with Cloud Service Providers, usage of hybrid cloud environments, as well as incremental modernization strategies, offer more viable and less risky pathways to modernization. Despite this, COBOL modernization continues to pose significant challenges. Decades of business logic encoded in COBOL make it difficult to extract, document, and translate to modern languages. Automated code conversion often yields Java that is correct but hard to maintain and extend, failing to utilize modern programming practices. Moreover, traditional one-size-fits-all tools don't fully address the nuances of different legacy systems, necessitating extensive manual effort in debugging, testing, and refactoring. There's a growing recognition of AI's potential to address these challenges, offering promising solutions for automated code conversion, retro-documentation, and testing processes in mainframe modernization. Can Artificial Intelligence and Generative AI address the challenges? Generative AI

(GenAI) represents a leap beyond traditional mainframe technology and AI applications. It's not just transforming business and societal problem-solving with new, human-like content; it also has tremendous potential for accelerating mainframe modernization. GenAI's deep understanding of legacy code semantics as well as heuristic interpretation of enterprise engineering standards allow for more effective capture of business logic and intent, enabling precise code transformation and knowledge encapsulation. Several consulting firms, IT services, and Cloud Service Providers are exploring AI applications for code refactoring, generating visuals to demystify complex systems, and improving data migration. These innovations aim to bridge legacy systems with modern technologies, though many are still under development. How are Wipro FullStride Cloud and Capco leveraging GenAI capabilities to accelerate mainframe maintenance and modernization? Wipro FullStride Cloud and Capco has adopted a ground-breaking approach to tackle our customers' most pressing challenges with innovation and pragmatism. This approach has been developed through Capco's extensive management consulting and industry experience together with Wipro FullStride Cloud's industry leading cloud and infrastructure expertise. At the heart of our vision is the synergy of knowledge management (one of the most important business critical and continuation risks for our clients in all industry domains), existing COBOL code optimization, and the transformation of legacy COBOL applications to sustainable, modern systems. Note that we are not advocating mainframe exit using GenAI: Rather, by harnessing GenAI for a more systematic and controlled modernization process, we simplify legacy applications and prepare them for a future where flexibility, performance, and maintainability are paramount. Wipro FullStride Cloud and Capco's proprietary set of accelerators creates virtual replicas of legacy applications by analysing millions of lines of legacy code. Feeding GenAI extracts of these virtual replicas allows it to accelerate modernization outcomes across knowledge management & code optimization, application modernization & testing, and application maintenance & support. Note that we do not promote one LLM (Large Language Model) over another. Generative AI models are becoming more sophisticated at an unprecedented pace, and many of the proprietary as well as open-source models perform exceptionally well for our stated purposes. 1. Knowledge Management and Code Optimization 2. Application Modernization & Testing 3. Application Maintenance & Support At a broader level, Wipro FullStride Cloud and Capco implement GenAI to manage complex dependencies in legacy systems, ensuring that updates or migrations do not break functionality and reducing integration issues in the process. Finally, it's important to acknowledge that integrating our tool into your DevOps pipeline allows for dynamic updates of knowledge, ensuring that system documentation remains current with the production code. As we embrace a new era of mainframe optimization and modernization enhanced by GenAI, it's time to move beyond outdated modes of working to thriving in the modern digital landscape. Leverage Wipro FullStride Cloud and Capco's proprietary accelerators to transform your legacy systems and propel your business to the forefront of agility and innovation. With our GenAI-assisted knowledge management, code maintenance, optimization, and modernization, as well as testing solutions, we are confident your systems are not only robust and maintainable but also cost-effective and fully compliant with your enterprise standards. Managed Testing Services Powered by AI & GenAI

----- Arcticle source ----- https://www.wipro.com/cloud/quality-engineering-and-testing/managed-testing-services-powered-by-ai-and-genai/ ----- Contact Wipro Please fill the required details to access the content Managed Testing Services Powered by AI & GenAI In today's rapidly evolving digital landscape, ensuring resilience and reliability of software applications is crucial for organizations to stay competitive. However, the complexity of modern software systems coupled with the need for rapid deployment often poses significant challenges for traditional testing approaches. Additionally, the strategic shift towards agile, specialized testing solutions is leading businesses to turn towards a strategic partner who can consult, own and implement Quality Engineering transformation so that Quality can become a competitive advantage. This is where Wipro's Managed Testing Services steps in. This approach allows businesses to harness dedicated teams tailored to their unique needs, providing scalable and cost-effective solutions. By embracing managed testing services, organizations not only accelerate time-to-market and improve software quality but also democratize testing resources, empowering teams to focus on innovation (rather than correct utilization of efforts). Managed Testing Services also leads to significant cost savings of up to 30%, 99% defect removal efficiency and higher adoption/ maturity of AI/ GenAI. We enable scalability and flexibility, we offer multiple innovative operating and financial models that can seamlessly scale up or down to accommodate varying testing needs,

optimizing cost efficiency without compromising quality. Our suite of services are powered by our 30+ Centres of Excellence which encompass apps, products, hardware and infra. At the core of all our services is an automation first approach powered by our Intelliassure intelligent quality platform in conjunction with partners and Wipro Venture portfolio organizations which bring to the table cutting edge capabilities powered by AI and GenAI. Partner with Wipro to unlock unparalleled efficiency, agility, and innovation in software testing, enabling your organization to stay ahead in today's competitive industry landscape.

===================== ----- Arcticle source ----- https://www.wipro.com/cloud/financial-services-report/ ----- Contact Wipro Please fill the required details to access the content The financial services sector is undergoing unprecedented disruption, a wild ride created by the digital revolution smashing up against COVID-19's social and business upheavals. The collision of these two forces in 2020 and 2021 quickly altered the competitive landscape. Financial services institutions (FSIs) had to become smarter and nimbler, working in new ways with unfamiliar technologies at an unparalleled pace to meet clients' escalating digital demands. Firms also had to deal with increased competition as fintechs and technology giants looked to take advantage of uncertain macro and micro economic environments. In this paper, Capco and Wipro FullStride Cloud Services lay out the industry's current state as seen through the eyes of practitioners, how cloud technologies are being used as an accelerant to drive growth and return on investment (ROI), and what lies ahead for our clients during the next few years. Key findings include: …and many more Download your personal copy here ===================== ----- Arcticle source ----- https://www.wipro.com/cloud/the-cloud-growth-strategy-for-cmi/ ----- Contact Wipro Please fill the required details to access the content The Cloud Growth Strategy for CMI Companies worldwide are driving growth through the cloud, some more quickly and successfully than others. Early cloud leaders have found that their investments boost resilience and efficiency, and enable long-term gains. Among the most diligent early adopters are communications, media and information services (CMI) companies. As a sector, CMI embraces cloud as the growth strategy according to Wipro FullStride Cloud Services research. Operating from a single, cloud-based platform "quickly saves costs, sharpens predictions, and allows us to innovate more," said the CEO of one Australian CMI company included in our survey. Although they see some cloud ROI today, CMI companies are reinvesting their returns into long-term ventures to position

themselves for bigger growth in the future. Compared to other sectors, CMI companies: Download your personal copy here ===================== ----- Arcticle source ----- https://www.wipro.com/cloud/redefining-manufacturing-for-the-digital-era/ ----- Contact Wipro Please fill the required details to access the content Cloud innovations are providing the manufacturing industry with newfound business opportunities through valuable customer insights, greater agility, and reduced costs. Within the industry, the businesses that have established themselves as cloud leaders have adopted multifaceted strategies to achieve these kinds of benefits. By examining their investments and tactics, organizations that are new to cloud computing can develop effective pathways to improve their maturity and fuel ways to redefine their business models. The Wipro FullStride Cloud Service report, Redefining Manufacturing for the Digital Era, examines both how cloud leaders are using cloud as an innovation platform to their advantage and how beginners and intermediate users can strengthen their cloud operations. How a top telco launched its business in the US market on Cloud

----- Arcticle source ----- https://www.wipro.com/cybersecurity/how-a-top-telco-launched-its-business-in-the-us-market-on-cloud/ ----- Related Articles Contact Wipro Please fill the required details to access the content How a top telco launched its business in the US market on Cloud Client Background Client: Global Telecom Company Industry: Telecommunications Products/Services: Telecommunications providers to the world's largest MNCs covering fixed, unified communications solutions, hosting-based services Area of Operation: Worldwide Challenge The telecommunications company crafted a business plan to enter the US market for the first time as an MNVO (Mobile Virtual Network Operator) for enterprise customers. The service was planned to be launched in less than nine months. This required low upfront investment and increased subscriber base over a period of three years. The company wanted a partner that would help architecture design and implement the MNVO IT solution in a stipulated timeframe, at the same time the environment had to be designed securely. The entire AWS based environment needed to be secured with security controls and assurance levels that were similar or equivalent to that of datacentre deployments. The client had concerns and anxiety over data confidentiality, integrity and authenticity on account of moving to the cloud. Native/built-in security controls were inadequate to meet the client's information security requirements. Solution The company selected Wipro as it's IT and BPO solutions and services partner. Wipro leveraged its CloudTrust framework, which provides Defense in Depth approach covering governance, risk and compliance, security of infrastructure, and data and application on the cloud. A requisite resiliency was built in the client's AWS environment. Wipro deliveredthese key components as part of the solution: Business Impact Wipro supported the client in launching their business plan in the US market within nine months and with required quality deliverables, on the AWS cloud. Custom parsers built by Wipro for security monitoring helped the client monitor their AWS environment for native and third party security controls. Wipro helped the company achieve 23% reduction in their operating expenditure in the first year of engagement. Specific areas of business impact included: "Wipro delivered best in class AWS cloud based security solution comprising of native and third party security controls to meet customer's business needs and controls requirements. Wipro built custom integrations between AWS and SIEM solution to meet specific security requirements for customer and helped in reducing the operational cost of security management" - Sudheesh Babu, General Manager & Head of Strategy and M&A, Cybersecurity & Risk Services, Wipro Ltd. Wipro enables compliance to regulatory bodies through 150% faster onboarding of critical applications and removal of open business sensitive risks for a leading

Application Onboarding Streamlined

----- Arcticle source ----- https://www.wipro.com/cybersecurity/application-onboarding-streamlined/ ----- Related Articles Contact Wipro Please fill the required details to access the content Application Onboarding Streamlined Wipro enables compliance to regulatory bodies through 150% faster onboarding of critical applications and removal of open business sensitive risks for a leading banking organization Industry Landscape Banking Sector in the Asia Pacific region has been undergoing significant change with increasing mandates from regulatory authorities. For instance, Monitoring for security threat scenarios has been made mandatory in order to be in compliance with regulations from authorities Hong Kong Monetary Authority (HKMA), Monetary Authority of Singapore (MAS) etc. But a number of factors like high costs of application on boarding, slow speeds of on-boarding, lack of skilled resources in this area have been posing serious hindrance to this initiative The Opportunity Being one of the largest banks in the APAC region, the client wanted to meet the regulations by quickly on boarding critical log sources to be monitored and remove open risks due to in-ability to monitor for business sensitive risks. However the client was facing the following challenges (a) Slow on-boarding of log sources onto the Security event monitoring platform (b) Identifying skilled resources and their retention (c) Higher costs for on-boarding. The delay in on boarding of critical log sources to be monitored was resulting in open risks due to inability to monitor for business sensitive risks. Initial efforts with a different vendor to address these issues were not successful for the client since it resulted in high costs and speed of on boarding was also an issue. Solution Wipro adopted a factory-based approach for on-boarding assets for the client. The method employs a rigorous process to ensure alignment with existing use-cases and Compliance requirements and also has a structured capacity monitoring processes to highlight bottlenecks in advance. Business Impact 150% - Improvement in time savings for onboarding 50% - Operational Cost Reduction as a result of the implementation 45 days - Short time span for structured on-boarding Wipro delivered best in class AWS cloud based security solution comprising of native and third party security controls to meet customer's business needs.. Wipro enabled the road and public infrastructure safety agency... =====================

How a Leading Government Agency Ensured Fast and Secure Migration to AWS Cloud

----- Arcticle source ----- https://www.wipro.com/cybersecurity/how-a-leading-government-agency-ensured-fast-and-secure-migration-to-aws-cloud/ ----- Related Articles Contact Wipro Please fill the required details to access the content How a Leading Government Agency Ensured Fast and Secure Migration to AWS Cloud Client Background Challenge The client wanted to securely migrate its 150+ sensitive business applications spread across different technology stacks including COTs, Java and Microsoft .net applications to the AWS cloud. They needed a trusted advisor to help build a strategy to securely migrate and operationalize business applications and associated workloads. While the client wanted to move its workloads to AWS cloud, one of the outcomes to be achieved was to reduce administrative overheads with centralized management of policies and compliance reporting. The need was to realize benefits of cloud at reduced costs with optimal efficiency. The client also wanted to quick-start on AWS by ensuring AWS-ready security monitoring and incident response capabilities with latest use cases. They wanted to extend their capability to identify application security vulnerabilities and identify risks before go-live while managing the evolving need of stringent compliance and regulatory requirements. Solution Wipro, as a trusted advisor, enabled the client on their cloud journey by performing end-to-end AWS security strategy and architecture design for hosting modernized business applications. Wipro established and operationalized Security Operations Centre (SOC) and vulnerability management capabilities on AWS. The key aspects of the solution include: Business Impact Wipro's security solution and advisory enabled shift-left approach for secure application migration to AWS in a short time frame. Wipro's security strategy and solutions enhanced security posture and enabled reduction in the threat landscape. Some of the other benefits were: Wipro delivered best in class AWS cloud based security solution comprising of native and third party security controls to meet customer's business needs.. Wipro enables compliance to regulatory bodies through 150% faster onboarding of critical applications and removal of open business sensitive risks for a leading banking organization ======================

Elevating multi-cloud security for a leading American bank

----- Arcticle source ----- https://www.wipro.com/cybersecurity/elevating-multi-cloud-security-for-a-leading-american-bank/ ----- Contact Wipro Please fill the required details to access the content Elevating multi-cloud security for a leading American bank Ambition For many companies, a lack of in-

house cybersecurity talent threatens to turn well-intentioned technology innovation into a liability. A leading bank based in the United States sought to avoid falling into this all-too-common cybersecurity capability gap. The bank recognized the potential for several critical security risks in its multi-cloud infrastructure, including misconfigurations, manual security management practices, and regulatory compliance issues. Existing security guardrails and compliance controls were leaving sensitive data vulnerable and presented a risk of unauthorized access. The bank's AWS and Microsoft Azure cloud platforms were delivering measurable business benefits. However, to keep pace with ever-changing policy developments and avoid non-compliance penalties, the bank's IT organization needed to improve security configurations, remediate complex legacy code, strengthen governance, and introduce security automation.   Action The bank partnered with Wipro to implement security automation across the AWS and Azure platforms. By transitioning to an Infrastructure-as-Code (IaC) approach, the client was able to codify infrastructure configurations, ensuring consistency, repeatability, and efficient version control. Custom and contextualised guardrails acted as proactive checks, preventing security misconfigurations and further ensuring compliance. Wipro developed Policy-as-Code (PaC) and Security-as-Code (SaC) tailored to client's Azure and AWS environment, enabling automated cyber policy enforcement. Automated image scanning brought container security and custom modules covering various aspects of the multi-cloud environment to enforce third-party security controls. Ambitions Realized Through close collaboration with the bank's security leaders, Wipro's implementation of third-party security controls and automation for AWS and Azure delivered across-the-board security, compliance, and productivity improvements. The bank achieved a 25% increase in regulatory compliance by automating security controls and enforcing consistent policies. Additionally, streamlined security practices led to a 30% increase in user productivity, allowing employees to focus on core tasks without disruptions. Custom guardrails, automated security scanning, and proactive measures contributed to a 40% improvement in overall security posture. Furthermore, operational disruptions decreased by 20% due to faster and more secure workload deployment and migration, enabling seamless adaptation to changing business needs while maintaining security. The bank is now more prepared than ever to achieve a secure and agile future in the cloud. ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/cyber-security-in-the-communication-sector/ ----- Contact Wipro Please fill the required details to access the content Cybersecurity in the Communications Sector January | 2020 Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Digital transformation has taken center stage and new technologies like cloud and IoT are increasing the attack surface of an organization's digital assets. As a result, attackers around the world are arming themselves with innovative tool sets. In order to provide resistance to impending attacks, it is crucial for organizations to heighten their level of preparedness and strive to achieve proactive resilience. What makes the communications industry so vulnerable? Communications carriers are in the middle of a technological evolution. Software Defined Networks (SDNs) are transforming network management and cloud computing is helping telcos scale for growth. But

with these opportunities come risks. Telcos often open themselves up to cyber threats since they are responsible for the construction and operation of crucial infrastructure needed to communicate and store sensitive data. Skilled hackers and government agencies employ advanced persistent threats that can operate undetected. Communication channel components like edge devices, core network elements, and end user services that run on them are often targeted. Customer data and leased infrastructure equipment are other common targets. Telcos store personal, highly sensitive customer information like names, addresses and financial data. Cybercriminals also target house routers from internet service providers to steal or store data. Telcos are restructuring their security governance processes, functions and structures to address these new threats. Download your personal copy here The World Economic Forum's (WEF) Global Risk Report 2019 has rated cyberattacks amongst the top four global risks, only behind climate change, extreme weather events and natural disasters. Adopting a cyber-resilience framework that can propel the maturity of security processes and technology in the new-age communications enterprise will help mitigate new emerging risks. User security awareness, consumer identity management, third-party risk management, and good patch management is expected to aid in reducing cybersecurity risks across both the carrier network and organizations attached to it. =====================

Asymmetric uncertainty for Cyber Threats & its potential

----- Arcticle source ----- https://www.wipro.com/cybersecurity/asymmetric-uncertainty-for-cyber-threats-and-its-potential/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Asymmetric uncertainty for Cyber Threats & its potential December | 2019 This article discusses: Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. Asymmetric uncertainty / Moving Target Defense (MTD) introduces a shift in paradigm by imposing asymmetric disadvantages against cyber-adversaries. The cyber-adversaries face an increase in uncertainty and complexity as the target systems are induced with multi-faceted changes. Higher level of uncertainties and complexities increase the cost of malicious probing and attack efforts preventing and limiting system intrusion. The common means through which MTD can be introduced are virtualization and workload migration, widespread and redundant network connectivity, instruction set and address space layout randomization, just-in-time compilers etc. This is an upcoming area that is yet to see more adoption within enterprises. MTD techniques are often evaluated against system performance and increased ongoing management effort. This document describes in general about MTD and puts forward a point of view towards its current adoption within security product vendors and enterprises. Data breaches have been all over the news for a while now. Early September 2017 witnessed the Equifax cyber-attack. The attack vector used at Equifax was based upon the Apache

Struts web application. The specific vulnerability in Apache Struts allowed the use of file uploads and the attackers were able to send malicious code and commands directly to the targeted server. 1 Year 2019 witnessed major breach at Blur where unsecured server exposed a file containing 2.4 million user names, email addresses, password hints, IP addresses, and encrypted passwords. Numerous breaches have been reported since the start of year 2019 with notable ones involving tech giants, such as Microsoft email service, Citrix, Wyzant, WhatsApp and Instagram. The message is very clear. Enterprise CXOs are aware that this is a running war. Every day, new exploits, new tools are developed to breach the networks. The techniques are sophisticated and operated by determined cyber criminals. Current cyber defense strategies within enterprise are insufficient to detect and prevent such attacks, as these attacks proliferate in possible directions within the network, conducting inspection, identifying resources and exfiltrating valuable data. It is an attacker's world The core of current malware attacks and corresponding defense are focused into the utilization of network and systems vulnerabilities. The root cause of MTD is derived from the current defensive techniques used in Cyber-attack prevention. At a high level, Cyber kill-chain is a multistage segmental type intrusive model: The current defense mechanism is stationary with obstruction and system remodeling as two categories. Obstructions are physical and logical isolation, access rules, segmentations etc. Obstruction method is oblivious to side channel attackers and suffers from complexity of rules and storage constraints. System remodeling involves modification to existing system structure via patching and upgrades to cope with inherent flaws. System remodeling is limited to partial changes and known flaws. Hence, existing defensive methods are ineffective to resist continuous reconnaissance and analysis in the attack phase. The situation is further complicated by interconnectivity and vulnerable environments like missing software updates and patches, networks with internet of things (IoT) devices, end of support and end of live processors in turnkey systems. The static nature of network and systems, homogenous network elements and certainty of composition often work in the attackers' favor. For example, zero down to a target system by collecting information about the network and remaining knowledge gaps can this knowledge with zero day and known vulnerabilities to reach assault collection. Defense mechanisms that are based on prior knowledge will grapple to enumerate all possible attack scenarios and sources of vulnerabilities. Therefore, the gap between attackers' ability to comprehend target systems and their vulnerabilities versus defenders' little knowledge of security threats leaves an information advantage for attackers. Asymmetric Uncertainty Constructs "Shell Game /Thimblerig/Three Shells and a Pea," ages back to ancient Greece in which a target (usually a pea or ball) is hidden under one of three shells or cups. The object of the game is to find the target after the shells have been moved. The same analogy can be drawn to the concept of asymmetric uncertainty. The premise of defense is based on dynamic or continuous changing of system, network attributes with respect to configurations. The change increases difficulty of an attacker's intrusion and capability of acquiring and maintaining system privileges. This concept is still developing and currently we can see the following types of constructs to change the attack surface: Defense Measure Ratio Vulnerability Transformed / Vulnerability set exploited Higher coverage Degree of uncertainty to the attack surface Higher randomness In

time transformation before intrusive actions. Change frequency In time transformation ahead of attack Performance and availability of the system Less/No impact Variation MTD mechanisms, and ability to synergize with existing defense mechanism Integration capability Current state of adoption in the enterprise While asymmetric uncertainty/MTD is a new concept with tools, techniques and processes emerging, US federal government has funded and made significant efforts in this area. Organizations like Polyverse offer services and solutions by leveraging the concept of asymmetric uncertainty. For example, compiler-based scrambling (polymorphic Linux) intended to recycle containers offers full suite of MTD functionality. These innovations have made it easier for much smaller enterprises to integrate MTD into their existing security suite. Similar to Polyverse other organizations, such as Morphisec are also involved with MTD strategies and related products/solution/services. Several other private organizations like Cylance, SentinelOne, Bromium, and Cybereason have their respective products and solutions in this space. The National Institute of Standards and Technologies has also been involved with various initiatives related to asymmetric uncertainty. Conclusion Moving Target Defense initiatives have been going very well since 2015. Next few years should be exciting for MTD in terms of commercialization of its concepts and integration with existing security infrastructure. Early products in the market will continue to solidify, mature and much innovation is expected in this space among end user organizations with respect to application and integration of MTD product. Attackers are operating in stealth mode, making attribution of attacks more difficult. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. With increasing willingness to use wearable and share personal information over the web, patients want healthcare to be delivered as a service. =====================

Cloud Security

----- Arcticle source ----- https://www.wipro.com/cybersecurity/cloud-security-compliance-assurance-program/ ----- Related Articles Contact Wipro Please fill the required details to access the content Cloud Security Compliance Assurance Program The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. Healthcare providers are catering to these expectations by building their digital ecosystem, with around 60% of them having made this a top priority. Due to this, Protected Health Information (PHI) & Personally Identifiable Information (PII) over the Cloud has proliferated, leading to innumerable Cybersecurity challenges. For instance, The Wannacry ransomware attacks on healthcare institutions resulted in $100s of millions in losses. Compliance requirements like Health Information Portability & Accountability Act (HIPAA), General Data Protection Regulation (GDPR) etc. have increased CISO/Privacy Officers' focus towards protecting PHI & PII data. Healthcare organizations in reality

are finding it difficult to protect patient data due to a lack of single source of truth on personal data in the cloud ecosystem. Proliferation of IoT and mobile devices in healthcare has increased the attack surface several fold. The rise of highly innovative and sophisticated fraudsters coupled with non-availability of skilled talent to counter new types of attacks has amplified the challenges associated with ensuring a secure digital ecosystem. Healthcare companies have to ensure secure storage and usage of sensitive patient data. Added to this are complexities related to multiple cloud systems connecting with each other within the healthcare ecosystem and advanced threats targeting them. The compliance requirement are innumerable – HIPAA, HITECH, FDA regulations, GDPR, CCPA, PCI DSS etc. just to name a few. Given these complex compliance requirements, it is best to adopt Wipro's Common Control Framework incorporating the various regulations and standards governing the healthcare industry. We use a risk-based approach to decide on appropriate controls as per business needs, as a blanket enforcement of all controls will be cost prohibitive.   Wipro's Cloud Security Compliance Assurance Program provides a holistic approach for Cloud Risk Assessment. It uses an effective strategy to treat and mitigate risks, utilizing Wipro's Common Control Framework and best practices to proceed with recommendations and implement appropriate controls. This service is delivered using our Cyber Defense Platform, which uses a top down questionnaire based threat assessment method by leveraging MITRE attack framework, SANS threat vectors and SANS top 20 critical security controls. The platform also uses best of breed technologies like QualysGuard for vulnerability assessment and provides a real time assessment of regulatory compliance posture and efficacy of controls adopted. We provide quantified predictive risks obtained by Monte Carlo simulation of business criticality and associated risks of respective assets. We also provide qualitative inputs on risks derived at organization level, control level and asset level. Automation of the continuous compliance process can be achieved using appropriate tools, such as RSA Archer, MetricStream etc. This will help perform complex multi object validations, provide comparisons and appropriate benchmarks, provide actionable path to improvement and prioritize the remediation process. Continuous Compliance - A Holistic Approach Summary of the key benefits delivered by Wipro's Cloud Security Compliance Assurance Program : Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. With increasing willingness to use wearable and share personal information over the web, patients want healthcare to be delivered as a service.
=====================

Improving digital trust in the healthcare industry

Improving digital trust in the healthcare industry September | 2019 With increasing willingness to use wearables and share personal information over the web, patients want healthcare to be delivered as a service. Healthcare providers are catering to these expectations by building their digital ecosystem, with around 60% of them having made this a top priority. Availability of Protected Health Information (PHI) and Personally Identifiable Information (PII) over the Cloud has proliferated leading to innumerable cybersecurity challenges. Compliance requirements like Health Information Portability & Accountability Act (HIPAA), General Data Protection Regulation (GDPR) etc. have increased CISO/Privacy Officers' focus towards protecting PHI & PII data. Proliferation of Internet-of-Things (IoT) and mobile devices in healthcare has expanded the attack surface several fold. The rise of highly innovative and sophisticated fraudsters coupled with non-availability of skilled talent to counter new types of attacks has amplified the challenges associated with ensuring a secure digital ecosystem. Two examples to illustrate the extreme damage that can be caused by hackers are: Some key practices that healthcare companies should adopt to enhance digital trust are: Cloud security compliance assurance program Healthcare companies have to ensure secure storage and usage of sensitive patient data. Added to this are complexities related to multiple cloud systems connecting with each other within the healthcare ecosystem and advanced threats targeting them. It is best to adopt a common control framework incorporating the various regulations and standards governing the healthcare industry. A risk based approach is needed to decide on appropriate controls as required by the business. Blanket enforcement of all controls will be cost prohibitive. The risk assessment model used needs to use adequate change controls, traceability and auditable configuration controls. After the initial assessment and remediation, healthcare organizations must adopt automation methods to make continuous compliance to industry regulations and standards a painless process. Doing this can help healthcare companies improve their cybersecurity preparedness in an ongoing manner. 3rd party risk assessment and compliance program Changing patient expectations to deliver healthcare as a service has resulted in digital mobile engagement between the patient, hospital, doctor, insurance company and the pharmaceutical company. Such a distributed and seamlessly connected ecosystem has enhanced the chances of cyber breaches. Studies have repeatedly thrown up the fact that 41-63% of the breaches involved 3rd parties. Therefore healthcare companies need to adopt an integrated 3rd party risk assessment and compliance program. A robust 3rd party risk assessment and compliance program should classify vendors according to their criticality based on business impact and use different risk assessment questions and controls

depending on their criticality. Typical domains based on which the risk assessment is done are digital, cloud, financial, geo political, information security, human rights, privacy laws, health and safety and environment. A custom made risk scoring methodology is used based on the specific vertical the healthcare company belongs to and a weighted scoring method is used based on the responses across each of the domains. Threat feed information from external sources can be used to arrive at the overall risk score. Both domain based scores and the overall score should be factored while taking remediation decisions. Finally automation of this process will ensure repeatability and smooth functioning of the process on a continuous basis. Secure by design Medical device manufacturers and pharmaceutical companies operate in a highly regulated environment. The proliferation of IoT usage in this industry has underlined the need for ensuring continuous operational security. The usage of over the shelf software with a different lifecycle compared to the underlying device and the ever changing threat landscape during the lifecycle of the equipment has made 'secure by design' an imperative process rather than a nice to have process. Secure by design process involves the implementation of Secure Software Development Lifecycle (SSDLC) principles in the manufacture of medical devices and pharmaceutical manufacturing equipment. Food and Drug Administration (FDA) and European Union (EU) regulations and laws are applicable in this industry. During the software design stage STRIDE threat modeling framework is used to ensure a secure design. STRIDE checks for security threats around six categories of security threats – Spoofing of user identity, Tampering, Repudiation, Information disclosure (privacy disclosure or data leak), Denial of service and Escalation of privilege. Continuous vulnerability assessment and penetration testing using FDA & EU medical device and pharmaceutical industry regulatory controls and the popular OWASP top 10 and SANS top 25 vulnerabilities library ensures comprehensive security testing of the software under development. Immediate remediation of the identified vulnerabilities will ensure the software, when it is fully developed, is almost vulnerabilities free. This will make it almost impossible for hackers to gain access to the medical devices and pharmaceuticals manufacturing equipment to perpetrate their malicious acts. 24/7 managed detection & response services With innovative hackers on the rise and potential financial losses due to cyberattacks touching 100s of millions of dollars, it is important for healthcare companies to put in place 24/7 threat intelligence and detections systems. Security Information and Event Management (SIEM) tools are typically used to keep track of network traffic and provide real time analysis of potential threats and trigger security alerts for taking appropriate action. These tools are programmed to look for use cases developed based on typical cyberattacks. Some typical examples of use cases are – repeated failure of login attempts, repeated scanning of firewall ports from a single IP, malware check and detection of insider threat. Nowadays anomalous behavior based SIEM tools that look for potentially malicious behavior, identified using continuous threat feeds, are gaining ground. This is an improvement from the purely use cases based methodology as it can lag behind creative hackers who develop new techniques on a continuous basis. This uses threat hunting techniques in which humans based on information provided by continuous intelligence feeds actively chase down hackers by identifying malicious behavior early in the attack cycle. They then take evasive action to prevent such cyberattacks

from progressing. threat hunting uses a cyber kill chain model which systematically tracks down potential attacks through its different stages. Healthcare companies using managed detection and response services can ensure they are one step ahead of fraudsters and thereby keep their data, IT infrastructure and operations safe. Regular cyber resilience assessment Major cyber breaches can result in damage to reputation of the enterprise, disruption in business operations, financial losses and erosion of trust placed by customers. This necessitates adequate organizational preparedness to handle such breaches and recover from them quickly. An ideal cyber resilience framework should use a six stage approach: Prepare – Understand the organization and its cyber risk landscape Protect – Develop appropriate strategies and controls to effectively manage them Detect – Put in place processes to identify anomalies and breaches. Conduct regular control testing to identify control breaks Respond – Once a breach is identified the organization should deploy an incident response process. For major incidents an appropriate crisis management process involving C level management should be deployed Recover – Business continuity and disaster recovery processes should be invoked to move to business as usual once the situation has been stabilized Improve – Once the organization recovers and moves to normal business operations it needs to do a root cause analysis to identify what went wrong and derive learnings from it. The cybersecurity practices listed above are reasonably comprehensive and will help healthcare companies improve digital trust. Thereby the digital ecosystem can be leveraged to provide better and safe patient care. Kannan SBU Practice Director and Head -Health and Communications, Wipro Limited. Kannan has 17 years of experience in the cybersecurity domain as a business leader and has rich experience in starting and building the cybersecurity business in several companies. He has experience in starting and building the cybersecurity business into a multi Practice business stream consisting of Identity & Access Management Services, Application Security & Infrastructure Security Testing Services, Governance, Risk & Compliance Services and Global Security Operations Services including Managed Detection & Response Services. Kannan has a Bachelor of Engineering degree and a MBA in marketing. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

The need for secure-by-design approach to business process controls

About The Author Related Articles Contact Wipro Please fill the required details to access the content The need for secure-by-design approach to business process controls The ERP landscape is changing fast. Currently, most organizations use hybrid models of on premise and cloud (SaaS, private, etc.). This brings new inherent risks that have to be addressed by the controls framework. The business process controls framework has to be standardized across the organization, irrespective of the geography, and yet help achieve compliance with legislations like GDPR, SOX, etc. In most ERP projects, implementation or upgrade focus is on access controls, i.e. segregation of duties and business process controls are left for design and implementation post go-live of the ERP system. This means that go-live happens without identifying the risks and controls from a business process perspective. Organizations that want a robust ERP business process controls framework that is proactive and resilient rather than reactive before go-live, should think of security by design across the ERP from the blueprinting/ requirements gathering phase to ensure that controls are designed in a timely and effective manner at lower costs. Security by design in ERP needs to focus on continuous controls that are inline, real-time, detective and preventive across all transactional systems to ensure that the ERP is designed to achieve internal controls, regulatory compliance, and accounting standards. The business process control journey In an integrated business applications environment where transactions flow seamlessly across in-house and third party applications, platforms, ERPs, modules, cross-functions, and departments, the controls need to be embedded in the business processes. The suggested steps to identify the risks and controls across the business should be as follows: In brief, the need is to identify the risks, and propose controls across below-given activities in the ERP project to achieve a robust business process control framework across an ERP landscape: Best approach to business process control Security by design for business process controls across an ERP should begin in phase one of the project when a business process like procure to pay order to cash is being designed. These business process controls will ensure that risks at both the entity/business-process level are identified, and controls options i.e. configuration, customization or compensating controls are evaluated during business process design itself. This will lead to a one-time effort with little need to redesign business processes and controls later, after go live. Below are the key business process control focus areas during various phases of the ERP project to ensure security by design: Before the upgrade or implementation During the upgrade or implementation Design and build

technical controls as per the L1 to L6 design during this phase. During the build and test, look at proactively identifying additional risks at both the entity and business-process level, which might be product specific, so that additional controls can be designed accordingly. This is an iterative process until the risks are mitigated or are down to an acceptable level. After the upgrade or implementation Go live with all critical risks already addressed in the 'to be ERP system' using the security by design approach. Look at building best practices for monitoring transactions to identify additional risks and build new controls if required. Conclusion The secure by design approach for business process controls helps the organization with cost savings and business benefits. Any other approach would mean revisiting entire project lifecycle, beginning with business process controls design, build, test, and migration to production. Rajesh Udayamurthy Practice Head - ERP GRC, Consulting & Advisory Services -Cybersecurity & Risk, Wipro Limited. Rajesh is a qualified CPA and certified CISA with 20+ years of experience in the domain of finance, auditing, and ERP implementation and security. He has extensive experience in security design and implementation across ERP landscapes. He provides consulting and advisory services for Design of Access and Business Process Controls across ERP in greenfield and business transformation projects. He can be reached at rajesh.udayamurthy@wipro.com Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.
=======================

Combating Cyber Threats:

A how to for the CISO

----- Arcticle source ----- https://www.wipro.com/cybersecurity/combating-cyber-threats--a-how-to-for-the-ciso/ ----- Contact Wipro Please fill the required details to access the content Combating Cyber Threats: A how to for the CISO Abstract Digitization and the consumerization of IT have resulted in an increasingly connected world with enterprises adopting mobility to enhance collaboration, productivity and retain talent. Enterprise IT, however, is struggling to ensure the security of sensitive data in an environment where employees seek anytime, anywhere and any device access to corporate networks and applications. This is further compounded by the continually evolving threat landscape with hackers developing sophisticated tools to launch targeted attacks that the existing security tools are powerless to detect or prevent. Moreover, enterprise IT lacks complete visibility over end-user activities on unsecure mobile devices and organizations are not equipped with the necessary expertise or resources to manage end-to-end security in-house. To address these challenges and

improve their response to security incidents, organizations are partnering with strategic security service providers. This paper takes a look at the emerging security and threat landscape, the evolving role of the information security officer and the approach organizations need to adopt to overcome their security limitations. Introduction Today, enterprises operate under the looming threat of online attacks that can occur at any time. Successful attacks can wreak havoc with an enterprise's reputation, adversely impact business and employee productivity underscoring the need for adopting a strategic approach towards enterprise security. However, the in-house security function of enterprises often lack the requisite resources to detect and effectively respond to emerging and advanced threats forcing IT teams into reactive postures. As a result, several enterprises are outsourcing the management and implementation of their security programs to Managed Security Service Providers (MSPPs) equipped with advanced technologies, expertise, processes and tools. Enterprises can enhance security without investing heavily by partnering with MSSPs. Cyber Crime Reaches a New High Cyber criminals are successfully infiltrating numerous government and corporate networks and the range of attacks is expanding to include government-sponsored spying, watering hole attacks and zero day threats. Organizations are therefore finding it increasingly difficult to protect critical, proprietary and sensitive data. Going forward, the frequency and magnitude of security attacks is only set to increase. Also, the attacks will target a variety of components making their detection almost impossible. Given the advanced nature of security attacks, organizations will find it challenging to combat them effectively. Cyber criminals invest in developing sophisticated hacking tools to exploit security vulnerabilities and have successfully developed robust tools with advanced features such as anti-forensics, easy to customize application programming interfaces (APIs), etc. Cyber criminals use advanced exploit kits that take advantage of vulnerabilities in the browsers and their plug-in features, email spams, operating systems, infrastructure and applications. Traditional security solutions such as intrusion detection systems/intrusion prevention systems, firewalls, content filtering and anti-spam products are powerless to detect these attacks. Security Demands Are Growing As enterprises increasingly rely on security technologies to help alleviate risks and reduce vulnerabilities, security naturally is slated to become a top priority for enterprises by 2020. Organizations are facing cyber security threats such as data breaches that steal user/organization data, attacks on social media that exploit the trust of the brand, mobile malware attacks, sophisticated Distributed Denial of Service attacks particularly those on targeted host, and denial of service attacks. In most cases, security vulnerabilities are identified only after the organization has suffered the consequences of a security incident or attack with substantial impact on business. Such incidents are primarily due to improper assessment of business risk, poor security incident detection, inadequate monitoring and weak response mechanism/controls. Cyber Threat and Risk Landscape Malicious entities use a variety of methods to infiltrate corporate networks thereby eroding customer confidence. Figure 1:Depicts the different types of tools Enterprises need to "Gear Up" Enterprises need to change the way security operations are managed to handle the complex cyber threat landscape, its sophistication and the havoc it can create. They should invest to build the necessary infrastructure and hire skilled resources to proactively gain

intelligence on threats, traffic behaviors and risk that cannot be detected by traditional means. They should therefore hire threat intelligence analysts to proactively detect suspicious/malicious behavior. While some entities in the government and financial sectors have integrated this function into their organizational setup, a majority of the enterprises have not taken this step. Leveraging and seamlessly integrating existing physical and IT security systems with unified communications and flexible command and control systems is essential to enhance an organization's ability to foresee and protect itself from potential threats. Changing Role of Today's CISO In today's increasingly connected world, the role of the Chief Information Security Officer (CISO) has evolved into the role of a chief security officer encompassing physical and technical aspects of organizational security. Additionally, the CISO is expected to: Handling these responsibilities efficiently and implementing a comprehensive security program demand specific skills and expertise that may not be available in-house. As a result, despite investing substantially in security technologies, organizations continue to face data breaches due to improper implementation of security programs. In this scenario, CISOs should consider engaging with a service provider equipped with the expertise to provide the support that enables them to fulfill their responsibilities without compromising quality. While outsourcing will relieve the CISO from managing security systems in-house, lower total cost of ownership and capital expenditure besides providing better security expertise, the responsibility of a data breach will lie within the organization. Hence, CISOs should conduct a thorough investigation of the Managed Security Services Provider (MSSP) before entering into an agreement. CISOs should carefully examine the following criteria while selecting the MSSP: An MSSP's Role in the Current Landscape Several industry sources have predicted that the global managed security services market will grow at over 16 percent in the coming few years. It is evident from this data that organizations no longer believe that they are equipped to handle the evolving needs of information security. As a result, MSSPs will play a greater role in the security landscape and offer the following benefits: Conclusion The continual occurrence of security breaches has underlined the inadequacy of enterprise IT to protect confidential information and manage the security needs of the organization effectively. Enterprises can, however, engage with an MSSP and leverage their superior technologies, processes, tools and expertise to enhance security which is essential for protecting data as well as ensuring regulatory compliance.

Integration of security in devops-a

bigger picture

----- Arcticle source ----- https://www.wipro.com/cybersecurity/integration-of-security-in-devops-a-bigger-picture/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content

Integration of security in devops- a bigger picture The global paradox Software is the king and developers are the kingmakers. This statement indicates the growing demand for software, as the current business transformation requires interaction with computers or computer-assisted objects. This omnipresent computing has the potential to uptrend the incentives for misuse, thereby increasing the risk portfolio especially towards software. In the thick of things lies agile software development, a methodology rapidly adopted by organizations developing software. Being responsive to change, and delivering software at speed is the main essence of agile methodology. Security both as a process and as a technology requires intense planning and detailed analysis in order to arrive at the desired result. Even some of the best practices and frameworks encourage security testers to adopt manual intrusive approach for the best outcome. This brings us to the global paradox - whether to deliver software at high velocity, which propelled the need for competitiveness in the current marketplace, or focus on imperative security challenge to deliver secure software, perceived to have negative influence on the velocity. Defining new approach We should understand that the state of security today is similar to the state of operations back when DevOps was at its nascent phase. The velocity of change does create a major challenge and requires a new way of thinking about security. To ensure seamless alignment to agile methodology and integration with DevOps, a change in approach is required in the following aspects: DevSecOps framework Approach security as a journey, not a destination - this means developing a progressive security program. The program should not only focus on the technical aspects but also create the right framework that fits the business objective of the organization. To create such a framework, it is important to understand the eco-system governing the organization in terms of people, process, and technology. The below section enumerates best practices to adopt for building an effective and robust DevSecOps framework encompassing the golden triad: Fig. 1: Framework People The get-go for any successful implementation of a program are people – they are the starting point. The idea is to create a common goal among development, security, and operations by building the right culture and developing the required skillset to achieve the collective objective. Process

Organizations have to create acceptable and repeatable process to facilitate secure development and deployment without comprising the objective of faster delivery. Technology DevSecOps provides a new spin to technology driving more automation and innovation. There is a demand to both create new and extend the existing tool sets to cater not only to the security professional but also the developers. Conclusion DevSecOps as a practice is getting increasing popular as organizations look to tackle ever-evolving challenges in security. Imparting the agile mindset in security is challenging as it conflicts the well-known and agreed methodical approach. However, the transformation is dependent on how people, process, and technology can be brought together to achieve overall business objectives in this new paradigm. This calls for defining a new philosophy towards security thereby bringing an inclusive culture and building the right set of process and technology. In this era of digital transformation, security should be an influencing factor along with agility, availability, and scalability. Sriram Krishnan - Practice head, Cybersecurity & Risk Services, Wipro Ltd. Sriram Krishnan is currently the Practice Head for Security Assurance Services

within Wipro's Cybersecurity and Risk Services (CRS) division. He has over 13 years of experience in strategizing, leading, and implementing cyber security initiatives in organizations across product development, banking and big 4 consulting. He has worked and managed projects relating to Secure SDLC, threat modelling, secure coding, and penetration testing, and has advised on security best practices for global clients in telecom, technology, banking and financial services, and public sector. Sriram holds a Master's degree in Computer Application from Anna University and has completed the Chief Information Security Officer (CISO) Executive Education Program from the Carnegie Mellon University. He can be reached at sriram.07@wipro.com Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

=======================

How to fortify security in the era of Internet of Things

----- Arcticle source ----- https://www.wipro.com/cybersecurity/how-to-fortify-security-in-the-era-of-internet-of-things/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content How to fortify security in the era of Internet of Things There is an increasing pace in adoption of Internet of Things (IoT) by businesses globally as it has proven to open new revenue streams through new smart offerings. The rising phenomenon of IoT in conjunction with the expanding cyber-threat landscape opens new avenues for attackers to go beyond the enterprise boundaries. There is much concern about the edge platform, which is often regarded as one of the weakest links in the IoT chain. Understandably, this link is attracting much traction from the hacker community. For example, in the case of connected medical devices, security researchers have demonstrated how a hacker can gain unauthorized access and hijack an insulin pump to deliver fatal doses to diabetic patients. Hence, in an IoT ecosystem, it becomes imperative to secure device authentication to ensure that only trusted devices connect to the IoT infrastructure cloud. For enterprises, the common approach for securing communication between different systems today involves authentication by a password/certificate/key and secure network protocols. This approach has been derived from traditional Identity Management solutions, which are equipped for user/ human identity and access. In this traditional approach, user identity lifecycle has achieved maturity in terms of alignment with business to follow business logic and to provide need-based access. But, in the case of IoT, device identity lifecycle is blurred with too many supply chain entities, device ownership issues, data ownership on device, device authentication

and privilege access management on device. Hence, implementing a traditional approach is not feasible in the IoT model. Combating the IoT threats By being cognizant of a few key design principles while building the IoT solution, organizations can strengthen their cyber resilience controls to square up to any future IoT attacks. The design principles are as listed below: Device ownership: The Original Device Manufacturer's (ODM) responsibility for secure design should be limited to firsttime infusion of security keys. The ODM security key must be used for first-time connection and be replaced with another key while registering the device. This will ensure transfer of ownership from ODM to business owner. Privilege access: Common pitfalls of using either default passwords or even storage of passwords must be omitted while onboarding. Agent-based software can be used to generate a random key which can be time/location-based to access devices. That will ensure that there is no exchange of password data across the wire to mitigate any packet sniffing over the wire. Each device needs to carry its own unique token-based privilege access. Data security: Encryption should be on by default and wherever possible from edge to application interface over secure channels. IoT edge devices are constrained and may not have the necessary computing power to support secure communication. In such scenarios, random keys can be used to encrypt the data and decrypt at application end. So, even in the case of unsecure communication, data will stay protected. Data privacy: With stringent data privacy laws, it becomes important to manage privacy data right from the source/edge. Privacy data components must be masked/hashed before they become part of the data stream that flows over the wire. This will save costs to protect the privacy data across all upstream components. The same key can be used to decrypt the data for legitimate use for authorized entities. Automation: Considering the scale of IoT deployment where device volume is huge, it is not possible to manage operations manually. This is one of the practical challenges which drives IoT deployments to either use static keys/ certificates or extend the expiry times to higher limits to balance operational overheads (renewal, expiry) - eventually lowering the security. Certificate renewal/expiry should be automated to initiate the change whenever device connects or initiates (push/pull) action within the renewal time window. Integration capabilities: Having no common standards for IoT solutions during integration with underlying components, is a challenge. To overcome this challenge, the solution should have tighter integration capabilities with major cloud service providers (CSPs), device protocols, devices and internal/ external certificate authorities. Logs/events should be integrated with event management platform sufficing audit and security event correlation capabilities. The scope the Computer Emergency Response Team (CERT) and incident response team must be extended to cover edge layer. Device lifecycle: The device lifecycle must be maintained either physically or logically. If a device gets compromised, it should be blacklisted and keys should be revoked immediately, ceasing all access from this device. The hardware/software root of trust must be maintained within the device so that any anomaly should either encrypt or hash the entire device data. Approach to a secure future Businesses need to realize the urgent need for looking at security through the IoT lens, which will guide them towards the path of integration with their existing IT security systems. Unlike traditional user identity management, a combination of dynamic key algorithms and unique properties of device must be leveraged for any authenticated

operation or secure data transfer in an IoT environment. Also, a combination of security principles, as discussed above, will ensure defense in depth and tighter integration with CERT, paving the way for digital cyber resilient response mechanisms. Pankaj Anand - Cyber Security & Risk Services, Wipro Ltd. Pankaj, a certified security practitioner, has been associated with Cyber Security & Risk Services practice for more than 20 years. During this period, he played various roles across multiple domains of cyber security, traversing through consulting, delivery, system integration, advisor and practice development. In his current role, he is responsible for developing IoT security solutions within Wipro. He engages with various Wipro teams/ clients to ensure security in IoT solutions. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.
=======================

Quantum cryptography for data heliocentric world

----- Arcticle source ----- https://www.wipro.com/cybersecurity/quantum-cryptography-for-data-heliocentric-world/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Quantum cryptography for data heliocentric world The heliocentrism of digital world is data and everything whirls around data. Data-driven strategy is taking center stage and has transformed the traditional technology. Data is ubiquitous and many successful businesses have realized, data is a vital asset they possess. They rely extensively on data, for designing new business model, pricing, predicting the market, competitive insights. Today, sole existence of several global businesses is on data; for making complex decisions businesses rely on data for making meaningful intelligence. As more and more organizations are becoming data driven, securing the data is becoming the number one priority. Recent mega-breaches have demonstrated one commonality; data is the ultimate target which attackers are behindi,ii. They will get there irrespective of enterprises fortified network security. As the traditional approach of network security is failing, it is wise to protect the core (data) with reinforced data layer. Cryptography, one of the oldest domain in security, can be the most apt companion for data security. Perfectly designed cryptography with a robust algorithm and strong master key would deter attacker against all types of cryptanalysis attack. While, cryptography is prevalent as a network layer security, but is least adopted at data layer. This is due two main challenges in cryptography key management process: i. In multiple data breachesiii, it was found that data was encrypted, but due to improper implementation of crucial key management process, attackers were able to decrypt into plaintext data. Key

generation and distribution is an extremely intricate process to design, implement and sustain. ii.Inherent risks in traditional key generation and distribution process These inherent initial implementation challenges and operational issues in key management process have refrained IT and application teams from adopting as data-layer security. These limitations have weakened the case for security practitioners to strongly pursue with application team for implementing data-layer cryptography. Global technology giants and several start-ups are in a race to design and develop the fastest quantum computer, using quantum physics. As of the writing of this article, IBM had developed 50-qubitiv and Google announced a 72-qubitv system. With this speed not very far, quantum computers will be commercialized and becomes a commodity. The day this happens, attackers get access and start using the power of quantum compute and target traditional cryptography keys. Is there an elegant solution to this present and future problem? The answer is in quantum physics. The discovery of "uncertainty principle", in quantum mechanics, lead to innovation of "Quantum Key Distribution" (QKD) which can be the driver for exchanging secret key used in the process of encryption/decryption. QKD can transform the way cryptography is used in data encryption and decryption. Figure: Benefits of quantum key distribution Today commercial quantum security solution is available in the market, which is capable of secure quantum random number generator and quantum key generation and distribution. Quantum cryptography when applied to protect at the data layer, can defend data when in-rest, in-motion and in-use. Quantum random number generator (RNG) can be adopted for delivering true randomness in one-time pad encryption, the resultant ciphertext will be unyielding to cryptanalysis. Quantum cryptography has numerous application in various business, government and industries. Banking & finance - Core banking database Government - Citizens unique identifier database, classified data Defense - Voice and data communication Critical infrastructure - Authentication records Healthcare - Health records IP protection - Research and development documents The quantum technology will penetrate cloud, artificial intelligence and automation. This proliferation could have a destructive impact to traditional cryptography technologies. Enterprises opting for first-mover adoption will benefit from adequate time for planning and migration from traditional to quantum cryptography. Those who choose to wait and watch will have very less time for planning and implementation, which can lead to major business disruption. Let us proactively secure the core of digital world "Data" and leap into the quantum era. References

Eliminating the complexity in cybersecurity with Artificial Intelligence

----- Arcticle source ----- https://www.wipro.com/cybersecurity/eliminating-the-complexity-in-cybersecurity-with-artificial-intelligence/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Eliminating the complexity in cybersecurity with Artificial Intelligence Proliferation of mobility combined with faster internet has increased the scope of connected systems. What was once on-premise applications, with access restricted to corporate-approved devices, are now 'Appified' and 'Cloudified' for anywhere, anytime and any device access. This transformation has reduced the enterprise boundary and moved users, data and device out from within the enterprise perimeter. The threat landscape, as a result, has changed. Fraudsters have developed sophisticated skills and capabilities, and the lack of cybersecurity professionals-with the requisite skills and knowledge to counteract cyber-attacks-poses a challenge. Cybersecurity involves multiple issues related to people, process and technology (see figure 1). Cyber defenders are grappling with traditional, commercial off-the-shelf (COTS) security solutions that are built as one-size-fits-all, for all industries and segments. These security solutions heavily rely on predefined signatures for detection and prevention, and totally lack the context for human behavior. Fraudsters have found sophisticated ways to evade signature-based technology and are exploiting humans to gain access to the enterprise. Disruptions in traditional industries, and proliferation of pay-as-you-go models, are leading enterprises to enable 'Change' initiatives in addition to optimizing 'Run' investment. This, combined with the fact that government and regulators have placed priority on data security and privacy, is forcing CISOs to look at the most recent security technologies to develop, implement, continually monitor and report compliance. Artificial Intelligence: The future of cybersecurity Cybersecurity is crucial, as any failure affects the entire enterprise ecosystem and its stakeholders. Artificial Intelligence (AI), which is driving a revolution in almost every industry, can be the catalyst in increasing the effectiveness of cybersecurity. Human

intervention is significant in cybersecurity. Benefits of adopting AI are obvious in use cases involving voluminous event reviews and real-time monitoring. AI complements security efforts by providing persistent monitoring, and enabling a contextualized view. It can automate to learn and adapt instantly, and enable synchronous actions across security technologies. Properly designed and implemented, AI technology can: Bridging security technology gaps: Enterprises are constantly looking at adopting the latest and more innovative technologies that enable business growth. The fact that these emerging technologies may only have basic inbuilt security features need not be a hindrance to early adoption. AI can provide contextualized security, which augments the built-in security in niche products. Security teams can leverage AI to build adequate monitoring capabilities using the context of the solution deployed. Multiple real-time monitoring and reporting capabilities can be built using AI algorithms. For instance - AI integrates with the enterprise ecosystem and provides real-time contextualized alerts when data is uploaded to cloud storage, subsequently followed by download, and deletes the action when using a different environment. It can monitor upload/download files to cloud storage and for access by employees. Build next generation security teams: Producing actionable intelligence from Threat Intelligence (TI) is a subjective and humongous effort for security analysts, due to the volume and variety of intelligence. AI technology can assist their human counterparts by gathering TI, perform initial impact assessment of the intelligence by factoring in the enterprise landscape and then map the intelligence for action. AI plays the first and second responder roles and helps the security analysts with the required information for decision-making. Instill security culture in the enterprise: As per the Verizon data breach report1 43% of breaches begin with a social engineering attack. The axiom "employees are the weakest link in the security chain" is truer in today's context than ever before. Enterprises confront this challenge by raising awareness amongst employees via emails, posters and mandatory training. But the effectiveness of any training diminishes with time, if not practiced frequently. A successfully defended security threat by using the right technology is a point-in-time success for the security team. Fraudsters will target again with enhanced customized attacks to circumvent the controls. This puts employees as the last line of defense to detect the threat. AI can deliver continuous lessons for enterprise users. It will enable customized cybersecurity learning experiences. focused on user based on their behavior, contextualized to the user, enabling insights into attack type and the focus of the attack. AI has the inbuilt capability to learn and provide custom training to users. It sensitizes employees on security through visualizing the security posture of the systems used by employees via scoring; For instance AI bots connect email security gateways, collate all relevant information of blocked emails belonging to the phishing category, and do pattern recognition. Handle large and repetitive events: As anywhere, anytime and any device access increases, the attack surface also grows exponentially. This generates additional security events, forcing the enterprise to deploy additional resources for triaging, analysis, reporting and mitigation. A large volume of events at the Security Operations Center is commodity malware infections. AI technology can identify the class of malware, and its criticality. Based on the infection observed, AI can intelligently build contextualized remediation steps for the user as self-help.

This way a sizable chunk of the manual process is hyper-automated using AI. Bridge human and operating environment context gap in cybersecurity: Today's security problem is complex and involves human actions and the surrounding environment (location, device, user privilege and role). A properly designed and deployed AI, can observe, learn and add the required context to the event, providing accurate information for analysis. This will ensure the incident is escalated for further analysis, if the AI added context raises a red flag. For instance: A laptop loss is reported stolen, the security team and IT are notified - this could be a regular incident in many organizations. AI can contextualize this event with information: does it belong to a senior executive, sales, or an R&D employee? Is the laptop HDD encrypted? Another instance: A large firewall deny event, the security team is notified: a typical analysis will lead to the identification of the end system trying to connect. AI can contextualize the event with malicious traffic, malware infection history, and server sensitivity. Continuous monitoring and reporting: Data and privacy regulations have become high priority action areas for management. Enterprises are mandated to define, implement and continuously monitor the effectiveness of the controls, and report compliance to the competent authorities. Companies have dedicated in-house staff or have outsourced compliance management, leading to a significant increase in the cost of security. AI is an efficient and cost-effective way to achieve compliance. AI can continuously monitor all the deployed controls and alert compliance in case of irregularities. After achieving a mature stage, AI can be trained for auto-remediation, so that the control status is automatically reinstated. An army of AI bots can provide a unified, layered security for the enterprise - sufficient to counter the capabilities of advanced cyber-attacks and enhance the overall security position of the enterprise. Dealing with APIs Threats:

Are you ready?

----- Arcticle source ----- https://www.wipro.com/cybersecurity/dealing-with-apis-threats--are-you-ready-/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Dealing with APIs Threats: Are you ready? Protect your API from Internet threat Last couple of years, APIs have established themselves as an essential part of an enterprise architecture. Security plays a tremendous role in API management as the APIs expose enterprise assets directly to the Internet. However, there is a problem with the common approach to API security. It is highly focused on implementing OAuth and Op and tends to neglect other important aspects of a complete API security solution. This fictional story illustrates what happens when an individual decides to hack or exploit your APIs and how the IT security manager can counteract such a threat. Two fictitious characters, John (the hacker) and Michael (the security manager) will help us to shape up our simplified storyline. Multi-faceted aspects of API security While focusing on threat protection, it is equally important to understand that API security is a much broader topic. The table below summarizes all areas which should be considered as part of an end-to-end API security solution: The background John (hacker) has heard that the company Acme Corp based out of HackMeLand, where Michael (Security Manager) works, has recently deployed the Application Programming Interface (API) version of some geo location services they used to sell as a stand-alone application. As many other Internet companies, such as Google, they realized that they can monetize the usage of their core service by making it available to developers for a fee as public API. John's guess (and hope!) is that, as they are new to APIs, this first version of their API will be buggy and/or possibly not very well protected. Although Michael is not an amateur in his business he is relatively new to API security. He understands that while it has much in common with Web applications security, it also has its peculiarities. Michael asks his trusted partner, ApiAcmeConsulting to help. The battlefield To begin with ApiAcmeConsulting provides Michael with the 'whole picture'. To protect something, it is important to understand the different layers between the hacker and the valuable assets (in the case of Acme Corp., their geo location database) and from where the attack can arrive. The diagram below reproduces a common scenario. The hacker's weapons John has a long and despicable record of Web application hacking during which he has developed a few techniques. The OWASP (Open Web Application Security Project) organization is the established authority in Web application security related matters. It keeps track of the vulnerabilities and attacks occurring on the Internet on their website. The list of top 10 Internet threats can be found here1. Let us give a closer look to the most common ones. The security manager's ammunitions Michael and ApiAcmeConsulting decide to sit together to elaborate a strategy to counter internet threats. ApiAcmeConsulting suggested to work on the gateway configuration, to enforce physical security and to activate all security policies designed to

address the threats described in the previous section. The API gateways implement the gateway architectural pattern . The objective is to avoid direct access to the Web services and rather have a mediation layer: the gateway. From a security point of view this makes much sense, as with the gateway we have a single point of security policy enforcement, another common security pattern. As per the mentioned security pattern the gateway is policy enforcement point (PEP), policy administration point (PAP) and policy decision point (PDP) in one single compon-ent (although different vendors might have different modules for those logical blocks). API Gateways security rules called policies. Policies can be activated on proxies and implement specific controls to address the different threats. Proxies are logical containers for all the pre and post processing of client requests and might be required before they reach the service itself. As per ApiAcmeConsulting's suggestion Michael also instructs his team to integrate the API gateway with their SOC (Security Operating Center) incident management tool. This will ensure that anomalous behaviour is detected and (depending on the gravity) an alarm is triggered. The battle Assuming he has previously managed to get some valid API keys, John sends a malicious request with recurring XML structures. The gateway checks the request before passing it over to the background geo-location service as part of the normal in-transit policy processing. One of the configured security policies detects that the request is malformed, drops the call and sends an alarm to the incident management tool, which in turn alerts the SOC team. As first measure, the team can deactivate those keys, block the requestor. Off-line Michael will work with the API business manager to investigate the case further. Some of the improvements and best practices ApiConsultingAcme could recommend to their customers are: The way ahead APIs give businesses a wealth of new and unforseen opportunities to amplify their reach by empowering the larger community of application developers. API security however is not an option, neither should it be treated as stand-alone. Rather the security team has to own it and make sure that API security is aligned, in terms of policies and controls, to the company's overall security strategy. References Vamshidhar Babu Seetha is a Cloud Security Architect at Wipro. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.
=====================

Harnessing Risk Intelligence for Effective Business Decisions

Harnessing Risk Intelligence for Effective Business Decisions An effective Risk Intelligence Solution framework can help businesses identify risks near real-time, enabling stakeholders to take actions and decisions based on priority. One of the largest financial services organizations in US had as many as 29+ risk management applications in different business units to address their risk and compliance needs. The organization had established a Policy & Control Framework to meet the regulatory and internal policy mandates. Each business unit had maintained different risk taxonomy and carried out risk and control assessments. Though several initiatives were undertaken, the Governance, Risk and Compliance Management activities were driven by stakeholders with different objectives. The organization lacked an integrated view of risks, vulnerabilities, and non-compliances to policies and controls. The organization struggled to standardize its risk functional organization structure, business processes, risk taxonomy, reports and dashboards. Multiple frameworks and overlapping compliance requirements that were managed in silos caused duplication of effort and inefficiency in compliance management processes. Understanding effective risk management Risk intelligence is the ability of an organization to gather information or events that will help to identify the uncertainties; present them in the business context; enable the organization to make more informed business and security decisions in a proactive manner. To manage risk effectively, the criticalities of business processes and enterprise infrastructure including applications, servers, network devices, data centers and mobile devices, the key is to have a solution that will bring the business context to the systems. With the process and system profiling performed, having known which are the critical business processes and systems to be protected, half the battle is won. The other aspect is to understand the enemy. What different risk events are causing uncertainty to the processes, people and systems? How to collect them and present them with the business context? How to prioritize the remediation? How to get a multi-dimensional view from different stakeholders' perspective - business perspective, asset perspective risk/-threat perspective, compliance and control perspective. How to perform all these in a proactive manner and at the same time not get bogged down with innumerable battles? Risk Intelligence Solution Many organizations do not leverage proactive data monitoring and risk analytics in their risk and compliance initiatives. Traditional methods and siloed risk assessments, control monitoring efforts of the enterprises are unsuccessful. Hence, there is a need to approach governance, risk and compliance processes differently

by organizations. Risk Intelligence Framework leverages risk data analytics, artificial intelligence, machine learning techniques and uses past incident data, abnormal events, internal and external risk information, audit findings, control test results, threat feeds, feeds from anomaly detection platforms, security management tools and ERP based risk tools . The impact of various events, incidents and control failures are analyzed to provide the organization a view of risk and changes in risk scores, which in turn help to take the right decisions. The Risk Intelligent Solution integrates different risk domains (including business strategic risks, business process risks, functional/ operational risks and information technology risks, cyber risks) to provide a holistic view of the risk posture to relevant stakeholders. The solution is built by leveraging big data anomaly detection platform, risk analytics engine and integrating into the Governance, Risk and Compliance (GRC) platform. The solution architecture, driven by industry best practices and frameworks, help the GRC process owners to address their ROI goals as well. Solution implementation approach The Risk Intelligence framework and solution architecture can be implemented using any leading GRC tool available in the market. It is tool agnostic, and can be rolled out using the Assess - Design - Deploy methodology with a GRC tool. It would be fundamental to understand the current state of GRC process in any organization. Organizations should have clarity and a well-defined roadmap in terms of their GRC maturity roadmap. GRC benchmark study and maturity roadmap would help organizations to assess where they stand and where they intend to reach. This would help to drive and strategize the whole GRC journey. It's a consultative approach to design and conceptualize the Risk Intelligence framework and solution by understanding the organization's business goals, GRC priorities, level of GRC maturity, resource availability, compliance requirements, etc. The blueprint must be prepared based on the requirement gathering inputs and signed off by the process owners. GRC processes have to be standardized across the organization and a common framework has to be implemented across business units. Organizations have to choose the right and best suited GRC tool for automating the whole GRC process. In this phase, functional and technical consultants have to work together to develop and deploy the framework and solution. Based on the selected GRC tool, the organization has to invest its resources in development and deployment of the solution, which has to be tested and transported to production by adhering to the SDLC processes. Key value proposition An effective Risk Intelligence Solution framework will help organizations to identify risks on near real-time basis, which will enable stakeholders to take required actions and decisions based on priority. The solution framework will enable proactive risk and compliance management through data analytics and near real-time risk dashboards. This will give the senior management better control and visibility on governance initiatives. Looking beyond GRC automation As disruptive technologies are changing the landscape of business models, risk managers would need to strategize approaches for addressing digital risks due to large scale adoption of Cloud, Mobile, Internet of Things (IoT), etc. Figure 1: Risk Intelligence Framework The Risk Intelligence Solution framework also has elements to extend and leverage cognitive technologies such as artificial intelligence and machine learning techniques in risk management space, which can transform organization's GRC initiatives and the way they manage their risk and compliance programs today. With

cognitive technologies being explored and adopted by GRC programs, they can generate deeper risk insights, limit exposure and reduce the impact of issues/ events.   Anitha Selvaraj is a Senior Practice Manager, Cybersecurity and Risk Services, at Wipro. She is currently responsible for solution development, leveraging industry leading GRC automation platforms and tools like Archer GRC, MetricStream GRC, OpenPages GRC. She can be reached at selvaraj.anitha@wipro.com Kiran Kumar Gudekota is a Senior Practice Manager, Cyber Security & Risk Services (CRS) at Wipro. He is currently responsible for Risk & Compliance solution conceptualization and transformation. He has over 15 years of experience in GRC Consulting, Internal Audit, Fraud Examination, managing large Compliance programs and implementing Risk Management programs. He can be reached at kiran.gudekota@wipro.com. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.
=======================

Hyper-Automation Candidates in Security Operations Center

----- Arcticle source ----- https://www.wipro.com/cybersecurity/hyper-automation-candidates-in-security-operations-center/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Hyper-automation Candidates in Security Operations Center Remember the days when customers would call their banks or customer care to find the status of money debited/credited, credit limit, billing dates etc.? The calls were answered by customer care associates. Over the years, we have seen that all of this information is rendered by an Interactive Voice Recording system and there is very little-to-no human interaction for most of the simple queries you may have for a service provider. There has been a drastic change in the back ground where a machine is doing the job that, who knows, how many customer care associates were doing. The changes behind the screen is not visible to the customer, however the customer still gets the requested information. Let's now try to relate that to our cyber security life and draw a parallel. Based on the survey conducted by Black Hat in Aug 2016 "Nearly three-quarters (72%) of respondents felt it is likely that their organizations would have to deal with a major data breach in the year ahead. Approximately two-thirds of respondents said they did not have enough staff, budget, or training to meet those challenges". The gap between what we expect will happen and what we need to do is widening. A team from Wipro participated in Black Hat and DefCon conferences. Reputed and established vendors were showcasing their capabilities and were vying against each other to tell how their product fares better than

others in the market. Stall after stall, more and more jargons, dashboards and survey results were thrown at us. A portion of the estate at the Black Hat business hall was allocated to "Innovation City", where little known organizations were bustling with people. We ran into two vendor booths, Phantom and Demisto. Phantom and Demisto, call themselves Security Orchestration / Incident Response Platform and they both functionally do the same thing. They automate tasks that are simple, flow based and repeatable. Tasks that rely on standard operating procedures or on playbooks can be digitized and can be accomplished by running scripts. Let's consider an example of a phishing email which keeps the security team busy. Once there is a trigger on a phishing email, we can have the platform perform the following tasks automagically: All of this happens with the existing environment in a non-disruptive manner. It thus relieves an analyst of mundane jobs and gives more elbow space for the analyst to contribute higher up in the value chain. So, do these Security Orchestration / Incident Response Platforms address the challenge of shortage of resources and having to deal with an incident or a breach in the near future? To a great extent, yes! Efforts and tasks accomplished with a tool are more measurable than tasks accomplished manually. Hence usage of these tools in an organizations would make tasks accountable, auditable and because it is automated, it becomes efficient in terms of time. Apparel and merchandise is delivered to customers via drones, driverless cars, robotic and remote surgery are all a reality today. There is no reason why Security Incident Response should not take the next big step, automation! Prasanna Prabhakara - Lead Consultant, Information Security, Wipro, Ltd. Prasanna Prabhakara (GCFA, GREM) has 12 years' experience in Information Security and has worked in various capacities such as Security Analyst, Lead Security Analyst, Trainer in Incident Response, Intrusion Analysis and as a Senior Incident Responder. Prasanna has rich experience in End-point Malware Detection and Response, Forensic Analysis, Malware Analysis and has worked on investigation of some very sophisticated cyber-attacks during his stint as an Incident Responder. He is currently working as a Lead Consultant in the Security Intelligence Analytics and Assurance practice under the CRS in Wipro. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. =====================

Resilience Against Cyber Attacks

----- Arcticle source ----- https://www.wipro.com/cybersecurity/resilience-against-cyber-attacks/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Resilience Against Cyber Attacks Protecting Critical Infrastructure Information The recent increase in the frequency and impact of cyber-attacks have kept Critical Infrastructure companies on their toes, fearing the worst for their

organizations if an attack occurs on their critical infrastructure. A recent news article published by the New York Times states that cyber attacks are on the rise against corporations in the United States, with a particular focus on Energy companies. Reports of an attack similar to the Shamoon – Saudi Aramco attack are expected but the impact of such an attack in the United States would be of a magnitude much greater than Shamoon. These threats have made governments across the world wake up and take notice of Critical Infrastructure Protection as one of their highest priorities. Why is Infrastructure Critical? An infrastructure becomes critical when a disruption to this infrastructure results in irreversible and enormous loss (e.g. loss of life, environment etc.). The growing threat of international terrorism led policy makers to reconsider the definition of "infrastructure" in the context of specific non-functional requirements (NFR) of the business. These NFRs included Security, Performance, Availability, Integrity and Confidentiality (SPAIC). Each business has its own definition of SPAIC based on the regulatory requirements and country specific policies. Critical Infrastructure is always associated with regulatory requirements and key resources who are directly handling the critical infrastructure. As such, any intentional or unintentional disruption to these will have a significant impact on the environment and life. The following areas are considered to be a part of Critical Infrastructure: There is an impending need for countries to develop a national critical infrastructure strategy which will provide a comprehensive and collaborative approach to enhance the resiliency of critical infrastructure. This common approach will enable partners to respond collectively to risks and target resources to the most vulnerable areas of critical infrastructure. Guidelines to Defining a Successful Critical Infrastructure Protection (CIP) Strategy Industry leaders suggest that the government and the private sector should collaborate to protect a nation's critical infrastructure. This collaboration calls for the development of trusted partnerships to build regulatory requirements, governance processes, and resilience options jointly based on the existing mandates and responsibilities. The strategy should outline mechanisms to: 1. Create a government owned CIP Forum to share information about potential threats and disruptions through a highly confidential government owned body. Discussions in this forum should: 2. Create guidelines to protect critical assets and information 3. Build country specific risk frameworks for each critical infrastructure with guidelines to define asset criticality 4. Build a RACI (responsibility, accountability, consulted, informed) matrix The Strategy should: Actionizing the Strategy for a Safer Future Level 1: Define Critical Infrastructure and Assets Level 2: Build Partnerships Level 3: Risk Management Level 4: Regulate and Standardize the CIP Security Cyber Security and Critical Infrastructure Cyber security for critical infrastructure depends a lot on the sector to which the critical infrastructure belongs. Its objectives are: Broadly, cyber security can be classified into the following components for all Sectors: Illustration: Example of Industrial Control Systems Networks Cyber security is becoming important for critical infrastructure due to the latest technology implementations like IP communications, BYOD policies etc. Similar to IT Infrastructure, Critical Infrastructure has its share of vulnerabilities that can't be addressed due to the proprietary nature of the OS and hardware. These devices are not regularly patched as the hardware patch release cycle is adhoc or longer than software patches. This being the problem statement, the critical

infrastructure component becomes vulnerable to malwares, advanced persistent threats and service disruption. In general, ICS networks lack features like monitoring, metrics, analytics and intelligence to predict threats. The solution should be capable of handling known problems and zero day vulnerabilities. Solution for securing Industrial Control Systems Networks The solution platform should address the issues mapping the solution-to-sector specific value chain, applying global regulatory requirements and defining points of vulnerability to address known and unknown threat vectors. Cyber Security Solution Roadmap Cyber security for critical infrastructure should be broadly developed as per the roadmap shown in the illustration below The level of maturity of a Cyber Security solution for CIP needs to progress through the stages shown in the illustration, gradually making the transformation from Core Security Services to Security Convergence and finally to Integrated Security Solutions – which involve predictive analytics and intelligence spanning business processes and architecture. Conclusion The implications of a Critical Infrastructure collapse are huge and need to be looked at from a long-term perspective. Close synergies between the government and the private sector need to be present to develop a comprehensive and robust strategy for thwarting off impending threats from politically motivated groups, cyber criminals and other such rogues. Steps should be taken to ensure CIP across all layers of CI Architecture, with components addressing business and operational processes, applications, data, communication, network and perimeter for IT and Operations Technology Network. Saritha Auti, Practice Head - Enterprise Security Solutions, Wipro Saritha has over 17 years of experience in Enterprise Security & Architecture, spanning a wide gamut across product development, application security, systems integration, Enterprise Architecture and security architecture consulting. She heads Enterprise Security Architecture and Industrial Security Practice for Wipro with specific focus on Critical Infrastructure Security. She has devised several security solutions and architecture strategy for Oil & Gas, Telecom, Financial Sectors, Utilities, Defense, and has lead Security Architecture transformation programs. Apart from technology she is an ardent trekker, culture enthusiast and loves connecting with people. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. =====================

Data Privacy for Cloud Based Analytics

----- Arcticle source ----- https://www.wipro.com/cybersecurity/--data-privacy-for--cloud-based-analytics/ ----- About the Author Related Articles Contact

Wipro Please fill the required details to access the content Data Privacy for Cloud Based Analytics Data security and privacy in cloud based analytics platform While a cloud based solution has its own set of security and privacy challenges, data analytics also brings in the stringent aspects of data privacy. As data privacy deals with the personal/customer data, it enhances customer experience and anticipates an increase in top line/bottom line. To address cloud security, the (privacy) controls are implemented at different layers such as infrastructure, network, application and data (at rest, in motion). However, with a cloud based analytics platform, we need to adhere to data privacy regulations and also provide the required outcome for the organization to make informed decisions. Data privacy applies to the processing of personal data, namely any information relating to an identified or identifiable natural person. In the context of Big Data, the focus is more on indirect identification of personal data by following data privacy regulation, such as GDPR principles, notice, choice, consent, purpose of processing, privacy by design, etc. Risk based proactive approach to data privacy Organizations must take a risk based proactive approach to data privacy by creating data privacy standards and privacy control frameworks which can be applied consistently across all geographies and solution(s). This would minimize complexities and maximize data protection. Such a framework must provide guidance on what constitutes personal data, what are the requirements for personal data collection, process of managing consent, rules for accessing and using personal data, how to classify and protect personal data, implement the right set of processes and controls, based on the risk. Also, guidelines must be created in a way that integrates privacy as a key component from design to delivery of the products and services. In addition, privacy requirements into the initial phase of the software development life cycle, which will then decrease compliance risks and improve customer confidence in the product or services, will need to be incorporated. Key design principles in data privacy in the Data Analytics platform Data Minimization Collects data that is necessary to provide a feature or service. Conduct a Privacy Impact Assessment to define the exact data processing needs thereby limiting data to what is essential. Data Hiding Hides personal data and its interrelationship from plain view. Leverages data anonymization solutions to anonymize the data at source. Data Separation Personal data will be processed in a distributed fashion in separate compartments whenever possible. The data separation controls will be implemented at the data center level, to meet the data privacy regulations in different countries. Data Aggregation Processes personal data at the highest level of aggregation, and with the least possible detail, yet is still useful. Consent and Notice Informs data subjects about the data being collected and takes consent from individuals at the time of data collection. Data with customer consent should be used for data processing in Aata Analytics. Security Controls Implements proper security controls such as firewalls, anti-virus, access controls, authorizations, audit logs, data encryption motion and rest, masking, anonymization, etc. Ways to approach data privacy in Cloud Analytics platform To secure sensitive data within the analytics ecosystem on the cloud, data protection is applied to sensitive data close to the source, i.e. up-stream application by integrating the application/ job with Formation Preserving Encryption. The data flows in an encrypted format to the cloud and is made available for processing and analytical purposes without the risk of exposure. Applications/tools running on the

cloud works on the encrypted data for reporting or analytical purposes. Format Preserving Encryption (FPE) preserves the format of the sensitive data fields, while providing AES level of encryption strength. Here is a typical example of FPE: Figure 1: Data Privacy in Cloud Analytics Platform All the data, collected from different data sources, needs to be classified to create thePersonally Identified Information (PII) inventory and define which data elements need to be anonymized and de-identified with the appropriate risk level and consent details while capturing the data. The data, before being sent to the Cloud Analytics platform, needs to be encrypted with de-identification techniques such as format preserving encryption, tokenization, and masking. It can then be sent to the Cloud Analytics platform for data mining and analysis over the encrypted communication mechanism. All data mining, correlation and reporting is performed by the analytics platform. For consumption of the data by other on premise applications, the data re-identification techniques need to be applied on need based. While dealing with data privacy issues, the solution needs to address data security controls (data at rest and data in motion), cloud infrastructure security controls (Firewall, Anti-virus, IDS, IPS, DDOS, etc.), technical tools (for example, authentication and access control) and security assurance (penetration testing, vulnerability assessment, etc.). Along with technical security controls, the solution needs to address governance controls at process (for example, approvals for access) and people (for example, training, background checks, etc.). This approach holistically addresses data privacy challenges while adhering to data privacy regulations, along with other security controls, making the security solution robust and scalable. Srinivas Morishetti Cybersecurity & Risk Services- Srinivas Morishetti has 16 years of experience in the IT industry and 14 years in Cybersecurity & Risk Services. As the principal consultant, he is responsible for thought leadership, solution strategy and transformation in application security services. He can be reached at srinivas.morishetti@wipro.com Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.
=======================

Risk based approach

to data privacy

----- Arcticle source ----- https://www.wipro.com/cybersecurity/risk-based--approach-to--data-privacy/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Risk based

approach to data privacy Risk based approach to data privacy can help businesses manage global data privacy risks, apply, calibrate and enforce controls based on the risk exposure, in a manner that is flexible and more agile. Personal information has huge potential to create economic and social value for both the customers and the organizations who serve them. The ability of the organizations to acquire and use personal information to launch new products, services and enhancing customer experience has increased immensely with innovative use of technology; however, it also increases the risk to the privacy of personal information. Ensuring data privacy through every stage of information life cycle (collection, storage, processing, retention, sharing and disposal) has become very critical for organizations to stay relevant. Evidently there is a need for organizations to take a risk based approach to data privacy and protect personal information to maintain business competitive edge. Risk based approach to privacy is a process that allows organizations to identify potential high risks and focus their efforts towards high risk areas. This white paper explores a risk based approach to privacy with the intention of helping the organizations to manage data privacy effectively. New horizons – new risks Technology is growing in a rapid manner to enable business growth and the amount of data is proliferating at an exponential rate. The risks to privacy of personal information has been and will continue to be affected by automation and adoption of new technologies in every industry and every geography and across all functions. Figure 1 : New Technology Adoption & New Business Models Bring Privacy Risks The key trends that are altering the threat landscape include adoption of Cloud, expanding usage of mobile applications, social media, location based services, machine to machine communications, Internet of Things, mobile advertising, wearable devices, etc. With the privacy regulations enforcing principles like 'Right to be forgotten', 'Privacy by Design', 'Data Portability,' etc., a checkbox approach to data privacy is not sustainable. A paradigm shift in privacy mindset is necessary to mitigate these risks arising due to usage of these disruptive technologies. Data privacy challenges All the data privacy acts provide only guidelines for privacy compliance and do not contain any control framework or standards for ensuring compliance. The privacy laws are based on principles; hence, they are subject to interpretation, leaving it both to organizations to decide on how to implement these principles, and to regulators on how to interpret and impose the law. Figure 2 : Current State of Data Privacy in a Hyper Connected Ecosystem Data privacy challenges Today there is no standard methodology to implement privacy controls and comply with the privacy principles obligations that are imposed by the regulators. To comply with the privacy principles, each organization has to derive their own methodology for achieving compliance. The privacy compliance becomes complicated when an organization services customers across multiple geographies where multiple country regulations come into the picture. Risk based approach would bridge the gap between the privacy principles on one hand, and privacy controls on the other, using a methodology that would help organizations to apply, calibrate and implement privacy requirements appropriately and effectively. A risk based approach to data privacy can help organizations enforce controls based on the risk exposure, in a manner that is flexible and more agile. Proactive approach to data privacy Organizations must take a proactive approach to data privacy by creating a data privacy standard and privacy control

framework, which can be applied consistently across all functions and geographies to minimize complexity and maximize data protection. Such a framework must provide guidance on what constitutes personal data, what are the requirements for personal data collection, process of managing consent, rules for accessing and using personal data, how to classify and protect personal data, implement the right set of processes and controls based on the risk. This should be followed by creating a data privacy strategy that would help the organizations to manage the privacy of data life cycle right from data collection, storage to disposal. The road ahead Data is becoming a fundamental asset in the digital transformation of economies. The increasing use of disruptive technologies has created an unprecedented flow of personal information. Data subjects are becoming increasingly aware of their privacy rights and are rightfully demanding more control over how their personal information is used, shared, and assurances that the privacy of their personal data will be protected. Organizations across industries and geographies continue to be challenged by disruptive technologies. The boundaries of the digital world are not fully established. The data breaches continue to make headlines and data privacy has become a focal point of discussions in boardroom. Data breaches can do irreparable harm to the organizations brand equity, credibility, trust and customer relationship. It is apparent that there is no one-size-fits-all solution that is available to comply with the ever evolving data privacy regulations. There is a need for organizations to take a comprehensive risk based approach to privacy where globally defined privacy risks are identified and countermeasures are built. This would be far more effective and more likely to respond to cross-border requirements. Ramkumar Narayanan is a Senior Practice Manager for Wipro's Cybersecurity & Risk Services (CRS) business. He heads the data privacy and data security governance practice within CRS, and is currently responsible for making Wipro's customers succeed in their data privacy and security journey. He can be reached at ramkumar.narayanan@wipro.com Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. ======================

Demystifying machine learning for threat detection

----- Arcticle source ----- https://www.wipro.com/cybersecurity/demystifying-machine-learning-for-threat-detection/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content Demystifying Machine learning for threat detection Defending organizations against cyber threats is becoming an increasingly sophisticated science. Detailed analysis of the high profile data breaches at second largest retailer

in the US or the more recent bank heist confirm that determined attackers breach into organizations months before they finally carry out their objective and are able to evade detection. Further to this, as a growing number of systems and devices across the world get connected to the Internet of Things, attack surfaces have expanded, leading organizations to examine new ways to protect their assets. There is an ever-growing acceptance among the Information Security Officers (ISOs) to the fact that it is just a matter of time before their organizations experience a significant IT security breach. This paradigm change in the drivers influencing information security strategy of organizations has also influenced the shift in focus from protection against threats to timely detection and effective response to these threats. Challenges in identifying 'low and slow' breaches Protection and detection security controls from the past decade have primarily used signature based approaches to detect threats. However, this approach has a few downsides: • Controls could only detect previously known threat vectors and actors; • Controls including security information and event management solutions (SIEM) could only review and assimilate information over a short period of time; • Mature SIEM threat detection use-cases reflected the organization's collective knowledge of previously known (or well researched) threat scenarios. These solutions are ineffective when indicators of compromise of a 'low and slow' breach have to be accumulated over a long period. Leveraging machine learning Detection of these 'low and slow' threats primarily require: Over the past 18 months, the security controls domain has been abuzz with commercial solutions using machine learning capability to detect these previously unknown threats. Machine learning is a type of artificial intelligence (AI) that provides computers with the ability to learn without being explicitly programmed. Such algorithms are often categorized as being supervised or unsupervised1 . Supervised algorithms can apply what has been learned in the past, to new data. In the context of threat detection, it manifests in the form of: For example, by analyzing large numbers of remote access tools RATs, a supervised machine learning model can learn how traffic from these tools differ from normal traffic. Supervised learning algorithms support detection of threats on 'day one' of their use within the organization's network and do not have an organization specific learning phase. Unsupervised learning models augment their intelligence specific to the customer's environment. While supervised learning models are useful to provide day one benefits, detection of some threat scenarios can only be learned specific to each customer's environment. For example, to determine anonymous employee access behavior. Unsupervised learning algorithms focus on understanding what makes the customer's IT usage pattern unique and identifies abnormalities when they occur. The risk carried by unsupervised learning algorithms is, that it may learn bad behavior as the baseline if it is exposed to bad usage. In general, this category of algorithms has a higher degree of being associated with false positives. Adoption of machine learning capabilities According to me, the selection of machine learning capabilities is underpinned by the following belief: Given the above belief, the endpoint is the best pivot point to start the journey towards adopting machine learning capabilities for threat detection. The class of solutions generally categorized as Endpoint Threat Detection and Response (ETDR) offers considerable promise. Beyond threat detection, these solutions also provide extensive threat containment and forensics capabilities on the endpoints. While the ETDR solutions provide a granular

visibility to the endpoint threat surface, organizations do have the challenges with the roll-out and lifecycle management of their agents on the endpoints. Further to this, with the disruptions such as BYOD and IoT, the form factor of the endpoint is constantly changing and the agent based approach may not be scalable in-time. For such organizations, the network provides the best pivot point to detect these 'low and slow' threats. It is said that 'the network never lies'. An interesting category of solution is Network Traffic Analysis (NTA). Through the intelligent use of supervised and unsupervised learning algorithms coupled with host and asset context as well as tracking the threat progression over time, NTA solutions offers a quick way to gauge the organization's security posture from the perspective of these 'low and slow' threats. Given such solutions can be introduced in the organization's network with least amount of intrusive changes, organizations find it very easy to adopt them. Finally, pivoting around the usage of user's access credentials is another approach to leverage machine learning capabilities to detect these 'low and slow' threats. This segment of solutions is classified as User and Entity Behavior (UEBA). While it offers an alternate approach towards leveraging machine learning threat detection capabilities; it primarily leverages unsupervised learning algorithms for threat detection. Key use-cases covered by this segment of solution include privileged account usage analytics, insider threats, data exfiltration, account sharing, etc. Finally... While the selection of the solution is specific to each organization's context, the following recommendations can help in the selection of the right solution. It would be an overstatement to suggest that machine learning can effectively solve any cybersecurity problem. However, machine learning does offer a chance to use the vast amount of data being created by organizations to weed out the 'low and slow' threats better than human experts. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.
=====================

Behind the Scenes :

Hollywood Encounters

Cyber Security

----- Arcticle source ----- https://www.wipro.com/cybersecurity/behind-the-scenes--hollywood-encounters-cyber-security1/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Behind the Scenes: Hollywood Encounters Cyber Security Whenever you read the words 'Hollywood' and 'Security' in the same sentence, your

mind probably wanders of in the direction of movies likeDie Hard 4.0 or Swordfish where uber-cool and suave hackers like Hugh Jackman trying to hack $9.5 Billion off the government from a computer with seven screens. Or if you are in the security business (or have the slightest interest in world news and technology) you would be aware of the Sony Pictures hack which sent the entire world into a tizzy and this according to some was the primary reason why Sony Pictures Co-Chairman Amy Pascal stepped down. But the relationship between Hollywood and Cyber Security these days has far transcended the traditional connotation of blockbuster sensationalism. Hollywood is getting far more serious about cyber security and its impact – both on the global landscape and within the film industry in itself. It is not just about the movies Hollywood makes; cyber threats have impacted the very foundations of how the industry works. Movie production houses have now woken up and are becoming highly cognizant of the dangers posed by confidential/ sensitive information falling into the wrong hands. Even till a couple of years ago, movie scripts were protected by watermarks or printed on specialty papers and all that production houses had to worry about was physical photocopies being taken of the script or similar sensitive documents. However, the shift to digitization and the advent of smart phones has exposed these production houses to internal as well as external threats. Cyber hackers are constantly knocking at their doors in search of the slightest security loophole which could be leveraged to breach the network. Either motivated by curiosity about how their next movie will pan out (James Bond Spectre script leaked) or sometimes politically motivated (like the Sony Pictures Hack), these hackers are not looking for financial gains. Nevertheless, the resulting financial impact on the movie industry is huge. Today, hackers are not the biggest security challenge the industry faces – they are the internal employees or crew. Every document and communication pertaining to the movie is now in digital format and a large chunk of the movie crew has the movie script either on their iPads or smartphones. While companies cannot really avoid any of the above mentioned changes, they can surely implement controls which can ensure proper security So what measures can the industry adopt to thwart off these attacks and ensure complete protection of sensitive information? An 'Air-Gap' Network – Taking a cue from the critical infrastructure industry, production houses could adopt the concept of air-gaps to protect their sensitive data. Air-Gap is a concept in which sensitive information resides on a network which is physically isolated from the larger network so that even if that network is compromised, the sensitive data is still safe. The script of The Interview or James Bond's Spectre would have been untouched had Sony Pictures used air-gaps. Suitable Access Governance – Determining who can access, edit, download, and print documents pertaining to the movie script or budget details is extremely important. Role-Based Access and Context-Aware Access Governance would go a long way in protecting unauthorized usage and data being accessed by adversaries. The controls should be such that if the movie script is accessed by the spot-boy (role-based) or by someone from Romania (context-aware), it immediately sends out alerts and ask for additional authentication requirements. Data Encryption – This is a tried and tested way of protecting sensitive information. In this method, data is encrypted so that people who do not have the proper access rights or the correct password will only be able to see gibberish. This is relevant because generally movie scripts are shared

with the key actors and crew members and there are high chances of it falling in the wrong hands. However an encrypted file can only be accessed by people having the right passwords and those without the password will see gibberish. Security Awareness – In most cases, breaches happen due to the lack of awareness and carelessness of employees. Employees need to be properly trained about the basic security processes and controls they need to adopt at an individual level. Elementary do's and dont's like not clicking on email links or setting strong passwords should be mandated across the organization. It is surprising to note how many networks have been breached due to employees not following security fundamentals. Cyber-attacks are constantly evolving and we need to ensure that we evolve at a faster pace. Even the movie industry, which definitely is not the primary target of the hacker community is gearing up in anticipation of further cyber-attacks and it is time that we, irrespective of which industry we belong to, gear up too. We need to be alert and be aware that the reason for a breach could either be a highly skilled hacker on the outside or your friendly innocent colleague from the inside "Tell me, is something eluding you, sunshine? Is this not what you expected to see? If you wanna find out what's behind these cold eyes You'll just have to claw your way through this disguise" Promit Sanyal- Marketing Manager, Enterprise Security Solutions Promit handles global marketing for the Enterprise Security Solutions business in Wipro. He has 7+ years of experience in the IT marketing domain and brings extensive knowledge across product & services marketing spanning product launch, go-to-market strategy, digital & offline marketing campaigns, and last but not the least brand building. In his current role Promit is responsible for enhancing brand value and positioning for Wipro's security business across the globe. Apart from being a music and sports enthusiast, Promit loves reading and learning new languages Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. =====================

In the cross-hairs of IoT security threats? Here's how you can tool up.

----- Arcticle source ----- https://www.wipro.com/cybersecurity/iot-security-monitoring/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content In the cross-hairs of IoT security threats? Here's how you can tool up. Security monitoring has always been critical to protecting IT ecosystems but with the rise in IoT-enabled devices and connected systems, the fear of cyberattacks has grown exponentially.

No business today, no matter what its nature, can afford to compromise on the spend for security monitoring. Pre-empting security breaches and mitigating chances of cybersecurity attacks is, therefore, an imperative. So, can a traditional IT security framework work in an IoT environment as well? Well, not really. Where's the chink in the armor? The IoT environment, unlike an IT one, has three layers to it: edge, platform/cloud and enterprise. Most edge devices work in constrained environments, that is, they have low compute, memory and storage capabilities. Gateway devices can still hold some power, but that deteriorates with the growing volume of devices connecting to it. The sheer volume of connected devices in geo-dispersed clusters makes it impossible to work-unlike in an IT environment. Also, the edge layer is not equipped with any logging framework and, even if it were present, it may not have any standard logging format and the ability to capture all events. What makes the edge layer most vulnerable to attacks is its lack of physical and logical controls. This layer could be porous, allowing spurious data to creep in and lead to flawed analytics, thereby impacting business decision-making. These devices can be used for PDOS (permanent denial of service) and DDOS attacks, causing major disruptions. Even though these are low powered, the volume makes a huge difference. Hence, it is crucial to have rules for these scenarios in security monitoring solutions. The edge layer, in an IoT environment, must be firmly integrated with the IT security framework and should have standards and policies in place. In the platform/cloud layer, there are the CSPs, software service providers and multiple parties involved, who take care of core capabilities for IaaS, PaaS and SaaS. All these, which together define the IoT suite, are physically dispersed and loosely coupled when compared with a traditional IT application. At an enterprise level, effectiveness of incident response relies heavily on synergy among different IT teams and how well these teams are connected. However, that's not what happens in an IoT environment, where responsibility lies with the engineering staff rather than the IT staff. One other important area, at the level of enterprise, is "policy and governance," which constitutes one of the basic hygiene factors for security maturity. However, in an IoT environment, where multiple stakeholders are involved (including consumers), the ownership is dispersed. Hence, in an IoT environment, policies must be redefined to factor in these aspects so that there's wider adaptability and compliance. Looking at a holistic approach We have seen security monitoring tightening around IT infrastructure, moving from reactive to proactive threat hunting. Threat intelligence, analytics and hyper automation have fortified that landscape today. How can we adopt the same for IoT environments? What can be done to bring in the cybersecurity maturity of an IT environment to an IoT environment, to make its processes and technologies effectively threat-ready? IoT, a critical business driver today, is more in the discovery phase of the security monitoring journey. It is imperative to build a solution where IT and IoT frameworks can co-exist. The traditional approach can no longer work in an IoT format. IoT security monitoring must embrace all tiers, along with security monitoring tools, such as the SIEM (Security Incident and Event Monitoring) tool. One way can be for organizations to establish standards in IoT, so they can put in their own policies and standards as an extension of the IT landscape. This, however, is unlikely to happen in the short term because it adds to the complexity of the situation as IoT technology is at a different level of maturity and is much more

diverse. The other way can be to "innovate" a model that encompasses the needs of both IT and IoT environments, thereby bridging existing gaps. Agent-less tools need to be used at the edge layer to ensure that it doesn't impact any device functionality while cloud-based solutions need to excel on PaaS capabilities. So, the idea here is to initially segment the solution and then add specific security monitoring layers before we capture the context/behavior of each segment. We close the loop by building an integration layer, encompassing all segments-edge, platform/cloud and enterprise. Finally, by being cognizant of the threat intelligence feed generated post integration of all segmented components, organizations can be prepared for likely IoT attacks. Pankaj Anand Practice Head for Wipro's IoT security, Pankaj works closely with clients to ensure security is embedded into their IoT solutions. He is a certified security practitioner and has been associated with the cybersecurity and risk services practice for the past 20 years. In cybersecurity, Pankaj has been working in the areas of consulting, delivery, system integration and practice development. He can be reached at pankaj.anand@wipro.com. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.
======================

Resilience Against Cyber Attacks

----- Arcticle source ----- https://www.wipro.com/cybersecurity/resilience-against-cyber-attacks1/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Protecting Critical Infrastructure Information Protecting Critical Infrastructure Information Why is Infrastructure Critical? An infrastructure becomes critical when a disruption to this infrastructure results in irreversible and enormous loss (e.g. loss of life, environment etc.). The growing threat of international terrorism led policy makers to reconsider the definition of "infrastructure" in the context of specific non-functional requirements (NFR) of the business. These NFRs included Security, Performance, Availability, Integrity and Confidentiality (SPAIC). Each business has its own definition of SPAIC based on the regulatory requirements and country specific policies. Critical Infrastructure is always associated with regulatory requirements and key resources who are directly handling the critical infrastructure. As such, any intentional or unintentional disruption to these will have a significant impact on the environment and life. The following areas are considered to be a part of Critical Infrastructure: There is an impending need for countries to develop a national critical infrastructure strategy which will provide a comprehensive and collaborative approach to enhance the resiliency of critical infrastructure. This common approach will enable partners to respond collectively to risks and target resources to the most vulnerable areas of critical infrastructure. Guidelines to Defining a Successful Critical

Infrastructure Protection (CIP) Strategy Industry leaders suggest that the government and the private sector should collaborate to protect a nation's critical infrastructure. This collaboration calls for the development of trusted partnerships to build regulatory requirements, governance processes, and resilience options jointly based on the existing mandates and responsibilities. The strategy should outline mechanisms to: The Strategy should: Actionizing the Strategy for a Safer Future Level 1: Define Critical Infrastructure and Assets Level 2: Build Partnerships Level 3: Risk Management Level 4: Regulate and Standardize the CIP Security Cyber Security and Critical Infrastructure Cyber security for critical infrastructure depends a lot on the sector to which the critical infrastructure belongs. Its objectives are: Broadly, cyber security can be classified into the following components for all Sectors: Illustration: Example of Industrial Control Systems Networks Cyber security is becoming important for critical infrastructure due to the latest technology implementations like IP communications, BYOD policies etc. Similar to IT Infrastructure, Critical Infrastructure has its share of vulnerabilities that can't be addressed due to the proprietary nature of the OS and hardware. These devices are not regularly patched as the hardware patch release cycle is adhoc or longer than software patches. This being the problem statement, the critical infrastructure component becomes vulnerable to malwares, advanced persistent threats and service disruption. In general, ICS networks lack features like monitoring, metrics, analytics and intelligence to predict threats. The solution should be capable of handling known problems and zero day vulnerabilities. Solution for securing Industrial Control Systems Networks The solution platform should address the issues mapping the solution-to-sector specific value chain, applying global regulatory requirements and defining points of vulnerability to address known and unknown threat vectors. Cyber Security Solution Roadmap Cyber security for critical infrastructure should be broadly developed as per the roadmap shown in the illustration below The level of maturity of a Cyber Security solution for CIP needs to progress through the stages shown in the illustration, gradually making the transformation from Core Security Services to Security Convergence and finally to Integrated Security Solutions – which involve predictive analytics and intelligence spanning business processes and architecture. Conclusion The implications of a Critical Infrastructure collapse are huge and need to be looked at from a long-term perspective. Close synergies between the government and the private sector need to be present to develop a comprehensive and robust strategy for thwarting off impending threats from politically motivated groups, cyber criminals and other such rogues. Steps should be taken to ensure CIP across all layers of CI Architecture, with components addressing business and operational processes, applications, data, communication, network and perimeter for IT and Operations Technology Network. Saritha Auti - Practice Head, Enterprise Security Solutions, Wipro Saritha has over 17 years of experience in Enterprise Security & Architecture, spanning a wide gamut across product development, application security, systems integration, Enterprise Architecture and security architecture consulting. She heads Enterprise Security Architecture and Industrial Security Practice for Wipro with specific focus on Critical Infrastructure Security. She has devised several security solutions and architecture strategy for Oil & Gas, Telecom, Financial Sectors, Utilities, Defense, and has lead Security

Architecture transformation programs. Apart from technology she is an ardent trekker, culture enthusiast and loves connecting with people. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. ======================

OT security – The need of the hour for Industry 4.0

----- Arcticle source ----- https://www.wipro.com/cybersecurity/ot-security-the-need-of-the-hour-for-industry-4-0/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content OT security – The need of the hour for Industry 4.0 Traditionally, most manufacturing industries, whether process manufacturing or discrete manufacturing, rely on OT (Operational Technology) systems, such as Industrial Control Systems (ICS) and Supervisory Control and Data Acquisition systems (SCADA) to ensure efficient manufacturing processes, so that the resulting end products are of the highest quality, at cheaper cost and ease of operations. OT systems by definition are the computer systems that control the physical state of a system or processes. Threats to OT systems ranges from malware to sabotage to data theft or data manipulation, with serious consequences. Industrial Control Systems (ICS) and SCADA and such broad category of systems are generally known as OT (Operational Technology) systems and OT Security implies implementing security controls around these systems. The impact of breaches to OT Security is felt on Personnel Safety, Availability of critical manufacturing processes, loss of data integrity, data confidentiality and data theft particularly of IP (Intellectual property). Hence, the threats which are constantly attempting to breach these controls need to be constantly monitored and managed on a 24X7 basis from an OT-SOC (Operational Technology Security Operations Center). OT-IT Convergence Earlier, OT systems were mostly stand-alone systems, operated by trained humans to control various elements of the manufacturing processes. However the scenario is changing fast as a run up to Industry 4.0. With the proliferation of Information Technology (IT) and networked OT systems, many of these systems need to be connected online to make optimal use of the new technologies, such as Big Data, Machine learning, Artificial Intelligence and 3D printing that results in efficient productivity. Broadly categorized as Industry 4.0, these new technologies bring in added risks which were earlier associated only with IT systems. This changes the dynamics of managing cyber security risks in these industrial control systems. This becomes all the more critical because, impact of security breaches in these OT systems affects reliability and safety of both personnel, plant and material. With the

advance in OT systems and the advantage of analytics and data mining capabilities of IT, IT-OT Convergence is a natural progression. While on the one hand we need to segregate the IT-OT systems and their networks, in order to prevent the threats and malicious activities spreading from one to the other, on the other hand for the sake of taking advantage of newer capabilities of IT, such as data mining, data analytics and cloud storage, unified processing of OT and IT data at the logical layer and the need to integrate the processing of real-time threat data, the solution is to integrate OT and IT Cyber security operations. The integration brings in its own challenges – technical, operational and cultural. Technical challenges are mostly in terms of the diversity of data formats, the communications protocols and the difficulty of parsing and normalizing diverse types of data in a unified, normalized form. The operational challenges may manifest in modifying operational processes and changes to organizational structures. The cultural challenges may come in the form of reluctance of the traditional OT personnel sharing their data with the IT teams and the results of analysis which may point out to flaws and weaknesses hitherto not known and the need for the OT personnel to learn and adapt to new technologies and processes. Overcoming these challenges can be eased by the adoption of OT-IT integration by means of an integrated OT-IT SOC, whereby all the threats are monitored and systems are managed by single, well trained experts of the OT-IT SOC. Vijayakumar A J Practice Director in Cyber Security & Risk Services (CRS) Currently a Practice Director in Cyber Security & Risk Services (CRS) team, is leading the CRS focus on Manufacturing Business Unit of Wipro. He is a Cyber Security professional with over 20 years of experience in conceptualizing and implementing security controls in Embedded Systems, Enterprise Networks, Applications and Global Telecom Networks. He has been a Chief Information Security Officer (CISO) of a Global Telecom Service Provider for over eight years. He holds a Master's degree in Computer Science from the Indian Institute of Technology (IIT) Madras and is a speaker in many forums and conferences on Cyber Security. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/cybersecurity-in-the-manufacturing-industry/ ----- Contact Wipro Please fill the required details to access the content Cybersecurity in the Manufacturing Industry In 2018, there were 52 significant, publicly reported breaches in the manufacturing sector, in which attackers targeted information pertaining to intellectual property. The global manufacturing industry is being shaken by a revolution in technology. Cyberattacks are actively targeting the sector, yet the maturity of cyber defense responses is lagging compared to other highly targeted sectors, like healthcare and banking. This technological sea change—driven by Industry 4.0, the industrial internet of things (IIoT) and the need to address operational technology (OT) security—is putting significant pressure on chief information security officers (CISOs) to rapidly assess risks and put in place strategic programs to defend against ever-increasing threats. We

surveyed 211 organizations across six industries and 27 countries for our State of Cybersecurity 2019 report—to get a thorough understanding of the current state of cybersecurity worldwide. This article focuses on the data we gathered from organizations in the manufacturing space, and highlights trends in cybersecurity throughout the industry. Download your personal copy here Summary The manufacturing sector is at an inflection point as it responds to the revolution in technology, and its impacts on the industry's previous modus operandi. Industry 4.0 and Smart Factory production, alongside the development of IIoT solutions, will shape the future of the manufacturing sector. Success for these new business operating models is underpinned by effective cybersecurity and data privacy. Establishing an accelerated and sustainable approach to delivering the fundamentals of cyber hygiene is necessary to protect core business. Failure to do so will negatively impact consumer and institutional confidence, and fundamentally weaken future trading capability and position in the marketplace. 2019/2020 is likely to see an era of unprecedented cybersecurity investments across the manufacturing sector as organizations play catch-up, and seek to rapidly address current shortcomings and future risks. To learn more about cybersecurity trends across this and other industries, read our full report. ===================== ----- Arcticle source ----- https:// www.wipro.com/cybersecurity/cybersecurity-in-the-healthcare-and-life-sciences-industry/ ----- Contact Wipro Please fill the required details to access the content Cybersecurity in the Healthcare and Life Sciences Industry January | 2020 2018 saw 485 significant, publicly reported breaches in the healthcare and life sciences sector. Attackers were after personally identifiable information (PII) and medical records, along with valuable pharmaceutical intellectual property. The healthcare industry has consistently been the most targeted sector for cyberattacks over the last few years. Many organizations, especially in the provider space, are known to operate on insecure legacy IT infrastructures, which are weak from a security perspective. This problem has been compounded by the arrival of the internet of medical things (IoMT), which is connecting more devices and making them difficult to secure. As a result, cybersecurity risks are no longer confined to IT assets and data breaches; they are now directly impacting patient safety. We surveyed 211 organizations across six industries and 27 countries for our State of Cybersecurity 2019 report—to get a thorough understanding of the current state of cybersecurity worldwide. This article focuses on the data we gathered from organizations in the healthcare and life sciences space, and highlights trends in cybersecurity throughout the industry. Download your personal copy here Summary The healthcare industry is witnessing a transformation in cybersecurity strategy—from a narrow compliance and HIPAA-focused approach, to a more comprehensive and security-centric approach. As regulations around the world start to address the safety and security of IoMT devices, healthcare providers will have to step up their game to ensure greater cyber resilience for their practices and their clients. To learn more about cybersecurity trends across this and other industries, read our full report. ===================== ----- Arcticle source ----- https:// www.wipro.com/cybersecurity/cybersecurity-in-the-consumer-sector/ ----- Contact Wipro Please fill the required details to access the content Cybersecurity in the Consumer Sector January | 2020 Cybersecurity in the Retail & Consumer Goods industry In 2018, the retail and consumer goods

industry faced 198 significant, publicly reported breaches. The most sought-after data in these breaches was customer card data and personally identifiable information (PII). Despite many dissimilarities in the consumer industry—which includes markets ranging from retail, media and food, to consumer products, travel and hospitality—companies in this sector have a lot in common when it comes to cybersecurity. We surveyed 211 organizations across six industries and 27 countries for our State of Cybersecurity 2019 report—to get a thorough understanding of the current state of cybersecurity worldwide. This article focuses on the data we gathered from organizations in the retail and consumer goods space, and highlights trends in cybersecurity throughout the industry. For example, across the sector, digital transformation is being expedited by the adoption of connected technologies, while budgets for chief information security officers (CISOs), as a percentage of IT budgets, are still low compared to other industries. As regulatory pressure for greater security increases, this will change, but the struggle represents one of the most significant cybersecurity challenges for the consumer industry: Promoting data protection at the core of the business culture. Download your personal copy here Summary Consumer organizations riding the digital wave have the added pressure of protecting customer data. CISOs are playing catch-up with their security strategies and have a huge responsibility of adopting more mature security practices to ensure digital resilience. To learn more about cybersecurity trends across this and other industries, read our full report. =======================

Embedding security into new ways of working

----- Arcticle source ----- https://www.wipro.com/cybersecurity/embedding-security-into-new-ways-of-working/ ----- About the Authors Related Articles Contact Wipro Please fill the required details to access the content Embedding security into new ways of working March | 2020 Figure 1: Application Security Vulnerability trend by Industry since 2019-20i This brings us to Enterprise IT paradox, how to go faster and innovate and yet stay secure delivering competitive software at high velocity maneuvering the imperative security challenges to deliver secure software. Organizations adopted DevOps, the principle of integrating software development and IT operations under a single automated umbrella, achieving frequent releases and stable application. Security in large is regarded as the main obstacle to rapid development; resulting in application security suffering in DevOps ecosystem. Shifting Focus to DevSecOps – the bigger picture A holistic and proactive approach embracing DevSecOps, envisioning long term gains for customer. Application with built-in security from inception phase will resist attacks and avoid potential devastation to daily operations. To ensure seamless alignment to agile methodology and integration with DevSecOps, a change in below approach is required around people, process and technology aspects: Figure 2: Approach on Shifting from DevOps to DevSecOps DevSecOps Reference Architecture DevSecOps architecture aims at improving the security DNA envisioning it as a journey, not a

destination. The below reference architecture helps deliver an ecosystem that is tool agnostic, platform independent, allowing out-of-box integration offering defense-in-depth capabilities to the SDLC supply chain. Wipro's DevSecOps ecosystem overcomes the fundamental challenges of stitching security into DevOps, harnessing security into each phase of software development lifecycle. The below diagram is an outcome from varying implementation across customer base to be leveraged as reference and not a takeaway recipe. Figure3: DevSecOps Reference Architecture The below section enumerates the application security capability while leveraging the above DevSecOps architecture. One of the prominent reasons why any architecture is not meant to be consumed as a copy-paste template for DevSec- Ops adoption is due to the eco-system governing the organization in terms of people, technology and process. The reference architecture addresses the people, process and technology aspects as part of implementation approach followed by integrating Continuous Identification, Continuous Integration & Deployment, Continuous Monitoring & Auditing and Continuous Security Governance & Compliance. a) Continuous Identification empowers the planning phase of SDLC with security offering of conducting Threat Model for business requirements creating a risk profile followed by security control recommendations. Introducing security controls at the right place and time decides the effectiveness of the control with minimal impact on the CI/CD pipeline. A risk-based approach towards security requirements and design goes long way allowing business to prioritize strategic goals in the inception phase of SDLC. b) Continuous Integration & Deployment empowers the code, build, test, release and deploy phase of SDLC with security capability, conducting verification and validation on proactive security recommendations from Continuous Identification phase. Security Verification entails development team to continuously discover and fix issue on daily basis prior to deploy phase performing Static Application Security Testing (SAST), while Security Validation allows developer to discover and fix issues post deploy phase performing Dynamic Application Security Testing. A risk-based approach towards implementing of security requirement & design reaps cascading returns allowing delivery teams priorities tactical goals. c) Continuous Monitoring & Audit empowers the operational phase of SDLC with security capability, performing vulnerability confirmation and exploit prevention leveraging agent-based monitoring for application in production and during implementation. Interactive Application Security Testing (IAST) entails continuous monitoring into maintenance code while baking continuous compliance and remediation. Runtime application Self Protection allows to discover and protect live attacks for applications deployed in production environment. A risk-based approach to monitor and audit applications allows operations team to prioritize daily operational objectives. d) Continuous Security Governance and Compliance empowers all phases of SDLC with automated correlation of vulnerability result, smart vulnerability management and remediation; integrated with leading Governance, Risk and Compliance (GRC) tools for better application security risk management. Placing application security squarely in front of management decision makers for analysis and comparison to arrive at risk-based decisions. Reference above aims at helping adopter to strategize and implement best practices to deliver continuous security across software development supply chain delivering value to customer. Conclusion Wipro's

DevSecOps ecosystem aims at evolving maturity levels rather than an end state. DevSecOps has become a popular buzz word for organizations tackling the ever-evolving security challenge in the digital era. Adopting security into DevOps means incorporating security culture, practice and tooling into all phases of SDLC supply chain. DevSecOps success depends on how an organization can marry culture, automation, measurement and sharing into the golden triad of people, process and technology achieving the business objectives thus making security an influencing factor alongside agility and innovation. Arun Pillai Security Architect who champions DevSecOps for Security Assurance Service within Wipro's Cybersecurity and Risk Services (CRS) division. He has over 14 years of experience, with specilization in the security domain and is responsible for evangelising DevSecOps across Wipro. He has worked and managed projects related to Security Architecture, Secure SDLC, Threat Modelling, Secure Coding, Penetration Testing and Security Consulting. Arun is ISC2 Certified Information Systems Security Professional (CISSP) and ISACA's Certified in Risk and Information Systems Control (CRISC). Arun holds a Master's degree in Information Technology from Sikkim Manipal University of Science & Technology and TOGAF certified Enterprise Architect from The OpenGroup. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. =======================

Next Generation Digital Retail & Cyberdefence

----- Arcticle source ----- https://www.wipro.com/cybersecurity/next-generation-digital-retail-and-cyberdefence/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Next Generation Digital Retail & Cyberdefence March | 2020 The retail sector is currently witnessing an intense technological disruption. The proliferation of online shopping, social media and ever-changing expectations of consumers are the key forces driving the change. The future of retail players would highly depend on how effectively they use technology to interact with their customers. The stores of the future are very likely to have no queues for checkout and will enable hassle free payments. Payments would be simplified using connected devices, such as wearables. Key

features that next generation digital retail will exhibit are the following: The variety of wearable gadgets available on the market is rapidly growing and envisioned to reach roughly 600 million through 2020. This means that a growing number of people will be carrying smartwatches, activity trackers and other wearables that will help track data of their personal identity details, banking and payment transactions, as well as their buying behaviour. We are also seeing a boom in tap-and-go mobile payments, with biometric technologies, such as facial recognition, eliminating the need for credit scorecards, pin codes and signatures. Thus permitting a consumer to walk into a shop, take what she or he desires and then without a doubt walk out. Imagine a future of hands-free purchasing wherein the complete purchasing experience – from browsing to buying, are completed digitally. The reality of Digital Retail: Virtual reality (VR) and augmented reality (AR) enable retail stores to personalise the delight of the purchasers. The sector is gaining momentum with VR, and AR funding in retail estimated to attain around $30 billion with the aid of 2020. Virtual reality immerses the person in a simulated environment, while augmented reality overlays digital records onto the real world experienced through a tab or smartphone. Both VR and AR offer offline and online retailers the opportunity to revolutionise the way their customers shop. Whether a customer wants to try on an outfit or see if a piece of furniture fits in their living room, virtual reality and augmented reality are making it all possible. With online VR applications, customers can engage with retail stores anytime, anywhere. For instance, an e-commerce apparel retailer could create 3D surroundings that offers customers the experience of being in a brick-and-mortar shop and allow them to try apparels at the convenience of their homes. Cyber and Privacy Risks of AR / VR a. Ransomwares – recording of consumer behaviour in a personal immersive environment and later misusing the information for extracting ransom b. Device control compromised – hackers gaining control of the consumer's device / store devices with destructive intent c. Privacy breach – compromised AR/VR devices can lead to personal data breach of the consumer's personal information d. Device damage – compromised AR/VR devices can enable hacker to damage the firmware and inturn the device too The hyperconnected Retail: In a hyperconnected world 'Everything' might be communicating with 'everything'. In the retail sector this means that indoor and outdoor digital signage, show cabinets, sensors, smart product tags, wearables, smartphones and other devices will monitor, track, analyse, report, endorse and advise. Retailers' stocks get tracked and replenished mechanically and clients will receive automated updates on new arrivals and special personalised offers while they are in near proximity of a store they have formerly shopped at or had proven interest. Advertising and content streamed to connected digital or digital presentations can expect and address the demands of customers based on time of day, month, season, region and weather. By using a drone, groceries can probably be delivered to your house routinely. Hyperconnectivity allows products, gadgets and appliances to form multidimensional layers, streamlining operations in stores, offices and homes in addition to enriching client experiences. Cyber Risks of IOT Devices a. Device discovery - You can't protect what you can't see. ... b. Authentication and authorization – unauthorized connected devices for attack surfaces c. Device updates – illegitimate OTA updates d. Disruption, DDoS attacks and IoT botnets – sophisticated automated attacks e. IoT passwords – weak passwords including no password f. Weak

Encryption – weak encryption algorithms leading to decrypting of the information and compromising the communication channel A Hi-Tech shopping arcade: The automated shopping experience is made possible by a system of sensors, computer vision and deep learning, what we call artificial intelligence and deep machine learning. This enables the sophisticated virtual shopping cart system to keep track of what is taken off and/or placed (back) on the shelves. When the consumer is done with shopping, he or she can just walk out of the store, after which the amount is debited from his or her shopping account. Consumers are now seeking to fulfil their specific needs with services and products. For retail to thrive and remain vibrant, embracing new technological innovations will be crucial. Cyber Risks associated to Technology a. Vulnerable libraries used within the software package, exposing attack surfaces b. API integrations over unsecured protocols leading information disclosure while parsing c. Open source stack used as-is without undergoing security sanitization d. Inadequate skilled workforce to support the technology stack e. Functional and Operational behaviour anomaly – the technology stack does not function or operate as intended Cyberdefence Measure for the Next Generation Digital Retail: With the massive scale of digital transformation within the retail sector, shopping experiences with wearables (IOT), smart devices for AR and VR and hyper data personalisation will definitely enrich the end consumer experience. However, as the data grows to drive analytics-based business, so will the exposure to the various cyber threats, such as data breach, data exfiltration, online frauds - both identity and financial, IOT based attacks, multi path attacks over 5G network etc. The control objectives one should focus on to secure the next generation retail, are as mentioned below, though not limited to: Conclusion: As we foresee the coming years to bring in more enriching experience to the consumers, elevating their spending on shopping, all on the foundation of hyper data personalisation, technology enablement into the digital space. This will increase the drivers for hackers to attack and mine into the technology anomalies stealing a hell amount of personal data, financial data and executing more sophisticated attacks. The cybersecurity will become an essential and hygiene element of any business, including the next generation retail, and will not be limited within the organisation board. It is time for each one of us to be vigilant and educated on protecting our personal data and identity of the future. Hiten Panchal Practice Director - Cyber Risk Services, Consumer Business Hiten has around two decades of experience into the information security and cyber risk. He spearheads the Change & Transformation of the Cyber Risk Advisory and Services for the Consumer's Business Unit @ Wipro. He is a thought leader backed with certifications in Blockchain, Data Privacy - GDPR, PCI-DSS and Information Security Management. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

Why Managing Risk Exceptions

----- Arcticle source ----- https://www.wipro.com/cybersecurity/why-managing-risk-exceptions-matters-during-the-unprecedented-times/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Why Managing Risk Exceptions Matters During the Unprecedented Times May | 2020 Amid the coronavirus pandemic, organizations have deviated from their standard operations to maintain some sense of business as usual – working from home, for example, rather than on site. Such shifts can expose an organization to new risks, and even elevate existing ones. The pandemic may have changed the operating models of some businesses, but not the responsibilities of executive leadership, who are still expected to manage risks and meet corporate obligations. Leadership teams are still accountable for the decisions they make today and their potential impact on the future of the organization, making risk management programs more important than ever. How is your organization keeping track of decisions? Do you have processes and systems in place to provide a holistic view of the underlying risks to your organization? How are you managing risk exceptions and mitigating underlying risks today? When exceptions and deviations aren't tracked, when their severity is not evaluated, when the appropriate compensating controls are not in place, decisions can pose great risks to the organization. The concept of risk exception management is not new; it is a vital component of any risk management program. A risk exception management program enables users to request exception or exemption to comply with corporate policy, or deviate from standard practice for a stipulated period of time. A typical risk exception management process consists of several steps: Risk exception management provides a great deal of flexibility for users who are unable to comply with a corporate policy or standard practice or mitigate risk due to technical constraints or circumstances beyond their control. For instance, the application owners who aren't able to comply with password policy requirements may request exception due to technology constraints in a legacy application or till the budgets allocated to make necessary enhancements to a legacy application.   At the same time, programs enable organizations to keep track of risks and ensure appropriate compensating controls are in place to guard the backdoors that were left open due to the risk exception. Common pitfalls: The importance of understanding your program It's common for organizations to struggle with risk exception management programs, but it doesn't have to be. Most challenges to implementation stem from a lack of familiarity with the processes: Key elements of an effective risk exception management program A good risk exception management program should: Challenges in managing risk exceptions Risk exception management may seem straightforward, but many organizations that are slow to go digital, standardize, train, and govern also struggle with the following common challenges: Seven steps to build an effective risk exception management program Step 1: Evaluate the maturity of the program Understanding the maturity of the current program is the key to developing and implementing an effective risk exception management program. Step 2: Define a framework Establish a cross-walk between risk exception, risk, policies, and controls, with an ability to fully engage data to mitigate and manage risks. Step 3: Define a governance

structure An ideal governance model should include a clearly laid-out RACI matrix, including process and procedures for reporting willful violations. Step 4: Define metrics Define risk exception metrics to track, monitor, and predict potential impacts on risk posture and be proactive in mitigating risks. Step 5: Automate processes Automate the risk exception management process, including checks and balances, to eliminate silos, standardize programs throughout the organizations, and establish a single source of truth. Step 6: Create awareness Create roll-out awareness sessions to educate users on the process for requesting exceptions, their roles and responsibilities in managing risk exceptions. Conduct awareness sessions via WebEx based, e-modules, and class room based trainings. Also, roll-out campaigns to review and report metrics on level of awareness via quick polls, surveys, contests, and quizzes as part of awareness initiative. Step 7: Track and monitor metrics Keep thorough accounting of metrics and take timely actions on expired risk exceptions. As stated above, untracked risk exceptions may result in the underlying risks being left open when things return to normal, posing greater risks to the organization. Managing risk exceptions is therefore key to managing risks, especially during unprecedented times. How can we help? With deep roots in technology and domain expertise, Wipro is uniquely positioned to help organizations implement risk and compliance programs successfully. We provide end-to-end services – from developing governance, risk, and compliance (GRC) strategies, selecting the right tools to implementing programs, and work closely with executive and stakeholders to design, configure, onboard, and maintain solutions for managing various risk and compliance programs. We have developed pre-defined frameworks, toolkits that can help you to understand the maturity of your current risk exception management program, address gaps, and jumpstart automation with plug-and-play solutions. To learn more about how Wipro enables enterprises to better manage risk exceptions, click here. Sesh Vaidyula Sesh heads the Americas region of Wipro's risk compliance and assurance practice. He is a seasoned professional with 20+ years of experience advising companies on cybersecurity, risk, compliance, and audit matters. Sesh is a subject matter specialist in GRC with a multi-domain exposure to the areas of enterprise/ operational risk, cybersecurity, third-party risk, internal audit, systems audit, fraud investigations, business cycle and ITGC reviews, and compliance, especially with respect to Sarbanes-Oxley, HIPAA, CCPA and the like. Email: seshagiri.vaidyula@wipro.com Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. Securing a Remote Workforce

----- Arcticle source ----- https://www.wipro.com/cybersecurity/securing-a-remote-workforce/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Securing a Remote Workforce Digital Workspace (VDI) Security May | 2020 To effectively manage business continuity, enterprises are rapidly working to support a remote workforce, which has become a "New Normal" way of working remotely. While each one of us fights against the pandemic, businesses are making sure that employees and vendors are working as usual from home, like working from the office. It has brought many service providers and technology vendors to collaborate to build an agile solution which will help organisations to rapidly activate their remote workforce. Technology vendors have released digital workspace (virtual desktop infrastructure – VDI) solutions, which provide prompt activation of services. Often, while rapidly enabling a turnkey solution to allow a remote workforce, security controls are missed, which increases the risk to a business. While organisations are busy enabling remote working using digital workspace environment, many security challenges with limited control are introduced. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. ======================

How to Maintain Data Security in Uncertain Times

----- Arcticle source ----- https://www.wipro.com/cybersecurity/how-to-maintain-data-security-in-uncertain-times/ ----- Related Articles Contact Wipro Please fill the required details to access the content How to Maintain Data Security in Uncertain Times May | 2020 Disruptive situations force businesses to change the way they function. Stringent data security used to be an afterthought for some businesses, until privacy issues gave rise to GDPR regulations. Now, data security is an essential element of all business strategies. The principal challenge of an organization is to keep critical business functions running while maintaining adequate security. Security threats in the current state With more employees working remotely now – either on a device issued and managed by the company or on an unmanaged personal device – company data faces greater risks than it did in the workplace. Public Wi-Fi networks, for example, are less secure than private networks. In many cases, employees are taking home workplace desktops, which have not been equipped with the technology to manage them

remotely and ensure security is maintained, and hackers are taking advantage of the vulnerabilities. But the highest risk for any business involves privileged users who have access to sensitive information in database. Without adequate security, remote access by these users can provide hackers a foot in the door to critical company information. For many organizations, the rush to provide remote-working technology has led them to cloud platforms and SaaS providers. However, cloud service providers treat cloud security risks as a shared responsibility with their customers. Without the proper defence mechanisms, there is always a possibility of data theft from cloud applications by malicious actors. Bring your own device (BYOD) programs have encouraged the adoption of shadow IT, which can put an organization's security at risk as employees process and store company data on unapproved cloud services without much thought. How businesses should respond The current coronavirus pandemic has created significant security challenges for businesses. It's also provided an opportunity to build more resilient environments for remote work. All organizations need are the proper information, tools, processes, and the right training for their employees. Build a robust environment There are many tools and approaches for data protection, including data governance, access control, classification, encryption, and data loss prevention. One of the first steps an organization should take is to protect data at the source by enabling content security on centralized repositories. Sensitive data should be available remotely to employees based on permissions: Employees should have access only to the data they need to do their jobs. Companies must identify the precise levels of access needed by remote employees and implement least privilege rights to ensure employees only access what they've been permitted to. Organizations should also assess cloud data access policies, as access from unmanaged devices will increase. This will enable IT to maintain control, even remotely, and identify any irregularities which could indicate data breaches or threats. Businesses must also enable data loss prevention policies at endpoints to prevent data exfiltration, and support remote compliance with data-protection legislation by applying policies to sensitive data directly. Device encryption should be enabled to secure data in case a device is lost or stolen. For employees using their own devices, information rights management solutions must be applied to control access to files and ensure they're shared only with approved audiences. In a multi cloud environment, cloud access security brokers (CASBs) must be employed to establish security parameters for data, which can help organizations achieve zero-trust security. Shadow IT is not going away. Organizations need to take steps to minimize the security risks. IT departments need to know which applications are being used and the risks that they pose to data security. They need to improve visibility and optimize monitoring procedures. How Wipro can help Wipro's data security practice has over 13 years of experience in the field, enabling global enterprises (including many fortune 500 companies) to manage their data security requirements. We help organizations define processes, identify solutions, and enable controls based on their current needs. We perform data protection impact assessments, and provide end-to-end data governance services including data loss prevention, information rights management, encryption, data privacy and data security in cloud. Together, with clients, we build comprehensive data security frameworks to ensure they have the support they need to continue business operations while strengthening the

security of their critical data. To learn more about how Wipro helps enterprise clients secure their data, contact us. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

Managing third-party risk during unprecedented times

----- Arcticle source ----- https://www.wipro.com/cybersecurity/managing-third-party-risk-during-unprecedented-times/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Managing third-party risk during unprecedented times Why traditional risk management practices fall short May | 2020 Amid the COVID-19 pandemic, global economies have come to standstill, significantly affecting the global supply chain. Businesses – regardless of size, geography, or sector – have shut down their operations either partially or completely to help flatten the curve. COVID-19 hasn't just affected business operations, though. The entire third-party ecosystem has felt the impact, including vendors, business partners, suppliers, and service providers. It may even challenge their ability to support organizations in the post-COVID-19 world. To combat this, organizations have allowed vendors remote access to their enterprise systems for remote executions – creating a backdoor for perpetrators launching cyberattacks. The recent rise in cyberattacks indicates perpetrators are taking advantage of the remote access allowed by business organizations and their third parties to facilitate remote working. Businesses have pivoted from frequent touchpoints with their vendors to creating exceptions that facilitate remote work. But with reduced insight to what their vendors are working on or even need, the potential for cyberattacks happening undetected rises significantly. "Unless organizations closely monitor the health of their third-party ecosystem during these unprecedented times, the temporary shutdown might permanently affect their ability to resume business operations due to the rippling effects of COVID-19 on the global supply chain." Considering these new working conditions, traditional risk management practices adopted by organizations to manage third-party risk may not be sufficient due to assessments that: Additionally, key stakeholders (business managers, procurement, and risk management teams) who manage third-party risk often operate in silos, using disparate, non-information-sharing technologies that result in problems: gaps in identification of risks, redundant/missing controls, duplication of efforts, and ineffective risk management strategies. In addition to these factors, traditional third-party risk management programs often suffer from these pitfalls: To overcome the current crisis, organizations

must look beyond traditional third-party risk management and adopt practices that uncover hidden patterns and anomalies for risk analysis. Then, they must proactively monitor and manage third-party risk while considering the changing enterprise risk landscape – i.e. adopt an integrated approach that: Integrated third-party risk management extends third-party risk coverage throughout the third-party lifecycle from onboarding to off boarding with increased scope -- i.e. non-traditional areas such as geo-political, human rights, social media, and more. In addition, it enables organizations to collect real-time insights on third-party activity. Using these insights, it proactively detects potential threats and fraud involving third parties on the dark web and clear web. In nutshell, integrated third-party risk management equips organization with intelligence to identify, prioritize, and manage critical third parties to minimize the impact that third-party ecosystem changes have on an organization's ability to resume operations in the post-COVID world. Also, it enables organizations to direct their limited resources, efforts, and budgets to maximize third-party risk management coverage during unprecedented times. How can we help? With deep roots in technology, as well as domain expertise in risk and compliance, we are uniquely positioned to help organizations implement risk and compliance programs successfully. We leverage years of rich experience helping organizations – from developing third-party risk management strategies and programs to performing risk assessments, implementing TRPM solutions, and providing TPRM as a service that proactively manages and monitors third party risk. Our TPRM framework and solution set is technology agnostic and deployable on multiple GRC tools, helping you jumpstart your journey to adopt an integrated approach to managing third parties – all while accelerating your return on investment via "TPRM as a Service." Sesh Vaidyula Sesh heads Risk, Compliance and Assurance practice for America's geo. He is a seasoned professional with 20+ years of experience in advising companies on cybersecurity, risk, compliance, and audit matters. Sesh is a subject matter specialist in GRC with multi-domain experience in enterprise/operational risk, cybersecurity, third-party risk, internal audits, systems audits, fraud investigations, business cycle and ITGC reviews, and compliance with a focus on Sarbanes-Oxley, HIPAA, CCPA, and the like. Email: seshagiri.vaidyula@wipro.com Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.
=====================

Rebooting to a secure and resilient vendor ecosystem

----- Arcticle source ----- https://www.wipro.com/cybersecurity/rebooting-to-a-secure-and-resilient-vendor-ecosystem/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Rebooting to a secure and resilient vendor ecosystem May | 2020 In the movie 'After Earth', Will Smith asks his son Kitai to "take a knee" whenever he is out of ideas during a crisis. This 'forced break' amidst commotion provided the mental clarity and logical rebooting that Kitai needed, so that he could overcome challenges and obstacles and push his abilities. The current COVID-19 pandemic has forced the entire planet to "take a knee'. Organizations have been compelled to pause, take a mental break, and utilize this opportunity to ideate and formulate the right strategy to propel them ahead when the horizon becomes clear. Managing cybersecurity risks in the vendor ecosystem is one such strategy that can be employed to increase productivity, optimize contracts and assets, and enhance customer trust, to gain a competitive advantage. Businesses have realized the importance of suppliers, and the impact that non-availability of critical and urgent products and services can have on their top-line, brand image and employee satisfaction. Considering the rise of cybersecurity threats and attacks banking on the Coronavirus, the security and availability of the third-party ecosystem cannot be taken lightly. Enterprises need to consider third-party risk management as one of the top priorities of their cybersecurity program, because customers do not regard the enterprise as a separate entity from its third parties. The investments in vendor security risk management should be a business enabler. Key considerations to revamp third-party risk management capabilities and gain the most out of the program are listed below: Conducting Diagnosis and Capability Assessment An in-depth diagnosis of 'As-is' third-party risk management capability of the organization will identify the scope of improvements in people, process, and technology to augment the maturity of the third-party risk management program. Such an assessment can provide insights into queries like: Closure of the gaps identified from such a maturity assessment will lead to optimization of cost, standardization of efforts, flexibility, and improvement of performance. Establishing a vendor data map There are no regulations that mandate creating a vendor data map, unlike what GDPR prescribes for personally identified/identifiable information. To evaluate the security posture or risk of vendor relationships, organizations need to know how many third parties they have, who the third parties are and the relationship of the vendors to organizational functions, assets, and processes. It presents a challenging situation for CISO to receive notifications from an unknown third party that they experienced a breach affecting the enterprise! A dynamic supplier information database can act as a single source of all suppliers within the organization. It can have linkage with procurement, business continuity, risk and compliance, and privacy office and business lines. Creating a better experience for vendors

participating in the assessment process Vendors are inundated with security questions from multiple organizations consuming or going to consume their products and services. In responding to the assessment questions, probability for human error increases and the response review cycle takes more time and effort. Adopting Zero trust model for third-party security In 2013, why did the HVAC vendor of the breached retail organization have access to the retailer's billing and project management systems? Provisioning access of third-party personnel to organizational applications and data on a need-to-know and least privilege principle lays the foundation of zero-trust strategy. These privileges should be granted post approval from both business and the CISO office. Access granted should be monitored and immediately decommissioned on change of vendor personnel role or end of contract. Real-time monitoring of vendor risk Point-in-time risk assessments no longer provide the right information for an effective TPRM. A vendor triage process determines the frequency and rigour of the vendor security assessment questionnaire. Instead of determining a snapshot of the vendor security posture annually, organizations are shifting to technology enabling real-time monitoring and treatment of risks such as unsafe authentication mechanisms, vulnerable applications, exposed sensitive data and potential phishing and Denial-of-Service threats across their high-, medium- and low-risk vendor ecosystems. Near real-time identification of a geo-political risk or data leakage alert impacting vendors can shorten the path to mitigate risk and assist in effective decision-making. Automating the third-party risk management process A solution that provisions the vendor database and automates end-to-end workflow for assessing and managing third-party risk over the lifecycle of their relationship can be a good investment choice. Such third-party risk assessment solutions have the capability to incorporate supplier security insights from external security score providers and ingest feeds from independent external sources to analyze disparate sources of threat and risk scores using AI and ML. Dashboards and reports can provide visibility into vendor performance trends, open issues and risk across the vendor ecosystem, thereby enabling faster risk-informed decision-making. This pandemic will create opportunities for organizations "taking a knee" to ideate and formulate the right third-party risk management strategy. Organizations will take progressive steps for a consolidated, leaner, efficient and effective third-party risk management system, considering these changes brought on by the current COVID-19 scenario: Bhaskar Maheshwari is an industry-recognized cybersecurity consulting professional. For the last 13 years, he has been delivering business value to multiple clients across the globe in the fields of cybersecurity, risk & compliance, data privacy, and business resiliency. Bhaskar is part of Wipro's Cybersecurity Consulting & Advisory Practice. Navigating Uncertainty with Cyber-Resilient and Compliant Cloud

About the Author Related Articles Contact Wipro Please fill the required details to access the content Navigating Uncertainty with Cyber-Resilient and Compliant Cloud June | 2020 Reports suggest that, over the last two years, more than 33 billion documents faced security breaches due to misconfigurations of cloud-native services, costing businesses worldwide nearly $5 trillion. Security breaches due to cloud misconfigurations are witnessed across industry verticals. Another report reveals that an average of 230 million misconfigurations are carried out per day! Fueled by the continued spread of the coronavirus pandemic, businesses have been acting quickly to enable remote connectivity. Microsoft has reported 775%2 increase in Microsoft Teams monthly users in Italy due to social distancing. Other collaboration tools are also experiencing a spike in usage, although some are exhibiting serious weaknesses and vulnerabilities. When moving business applications to the cloud, extending cloud-based collaboration tools, or enabling business continuity, cybersecurity has generally taken a back seat. Cyber threats are increasing due to a lack of necessary security controls on work-from-home devices and a weakened security architecture due to swift increases in cloud usage. At the same time, remote access of the hybrid cloud environment, by workers, partners, and consumers, is increasing existing risks and presenting new vulnerabilities. In the current environment, enterprises should consider the following recommendations to strengthen their cloud security posture across cloud service models. Cyber Resilient and Compliant Cloud Usage Secure Remote Work and Collaboration Businesses rushing to the cloud to enable millions of workforces for remote work during the COVID-19 crisis are facing various security challenges. At the same time, to meet regulations and compliance, businesses need a curated security approach. Looking forward, organizations must examine their short-term security measures and embrace zero-trust based initiatives to strengthen their cloud security posture and achieve sustained compliance. Bhaveshkumar Bhatt Bhavesh is a cloud security practice lead at Wipro's Cybersecurity and Risk Services. He is a knowledgeable cybersecurity professional with 18+ years of experience in security covering business strategy design, solutions and services development, and program and delivery management across industry verticals. He leads efforts to enhance cloud security practice offerings and provides thought leadership. He can be reached at bhaveshkumar.bhatt1@wipro.com Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by

monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

Are you ready?

----- Arcticle source ----- https://www.wipro.com/cybersecurity/working-from-home-how-safe-is-your-organization/ ----- Remote Access Personal Devices Data Security Threat Monitoring Compliance Contact Wipro Please fill the required details to access the content Working from Home: How Safe Is Your Organization? By now, remote work may feel like old news. Whether you've been remote-friendly for years or just made the switch to working from home in the last few months, you've probably got some systems in place to host meetings, manage projects, and collaborate virtually. What you may now have is a strong sense of security in these systems. As a leader among IT security service providers, Wipro has a long history of helping businesses enhance their cybersecurity through digital transformation, and we've found that while remote work increases business flexibility it also increases vulnerability to cyber threats. Fortunately, these threats are entirely manageable. The only catch is that businesses need to understand the risks before they can mitigate them. How familiar are you with the risks associated with working from home? How prepared are you to mitigate those risks? To help you answer these questions, we've provided a brief self-assessment based on frequently asked questions from enterprise clients about their own work-from-home programs. Does your workforce have secure sign-in and remote access? On-site, workers likely pass through several layers of security just to access a secure network. What are you doing to extend those protections to remote access? Because remote access means new devices and networks and accounts, credentials need to be obtained, verified, stored, and secured. Access needs to be managed appropriately and monitored thoroughly. Are workers using personal devices to work from home? Do those devices meet your organization's security standards? Personal devices can be risky because they're managed by individuals rather than the organization. How can you say for sure whether your workers' devices meet company security standards, and that they aren't being used in ways that put the company at risk? Old devices not up to date on antivirus protection will be more vulnerable to cyberattacks, but even devices supplied by the company and managed by the company are not immune. Security controls need to be extended to all personal and remote devices to ensure they're protected to the same extent as on-site devices. How are you securing company data, and ensuring it's only used for the intended purposes by the intended people? Data security is always important, but remote access makes data security a top concern. New networks and devices provide more vulnerabilities for hackers to exploit, putting critical company information at risk when accessed remotely. Least access measures and endpoint controls are essential for remote work. So are detailed analytics about access and usage. How are you monitoring threats associated with remote working? How are you mitigating those threats? As the IT infrastructure expands to accommodate remote devices, the visibility

over that infrastructure must increase so much more. IT needs to know who's accessing what, when, and from where. They also need to be able to identify potential threats from end to end, throughout that entire line of communication. Clearly, this requires sophisticated monitors and controls. It also requires an efficient system to communicate and act before threats have the chance to become attacks. Does your WFH program meet government regulations? Your on-site systems may have been compliant with government data and security regulations, but what about your remote systems? From personal devices to new networks to third-party applications, staples of remote work can jeopardize company and personal information, as well as security compliance.   =====================

Ready to enhance your risk preparedness?

----- Arcticle source ----- https://www.wipro.com/cybersecurity/risk-and-readiness/ ----- The new threat landscape Cybersecurity touchpoints across your organization What to look for: Top cybersecurity issues What to do: Planning your response Contact Wipro Please fill the required details to access the content Risk and Readiness In just two months, between January and March of this year, usage of virtual private networks (VPNs) and remote desktop protocols (RDPs) increased 124% and 41%respectively in North America. Businesses have shifted to remote work fast – but are they aware of the risks associated with this new paradigm? An OpenVPN survey reports that 73% of executives "believe remote workers pose a greater risk than onsite employees." Remote workforces require enhanced security controls. New applications and infrastructure changes that allow employees to work from home also increase an organization's exposure to cyber threats. As businesses move quickly to cloud-based solutions that support remote work, many are neglecting their security architecture and the necessary monitors and protocols, leaving them more vulnerable than ever to the rising number of cyberattacks. Named as a leader in Everest Group's 2020 PEAK Matrix Assessment for IT security services   providers, Wipro is well positioned to help you achieve cyber resilience while transitioning to new ways of working. Here, we'll get you started by guiding you through the first steps toward cybersecurity preparedness.   How sound is your security architecture? To answer this question, CISOs need to consider their organizations' cybersecurity across all touchpoints: from highcontact entry points to essential infrastructure to monitoring and oversight. Information leaks Accessing company data from a home or pubic network puts sensitive information at risk. Accessing company data from a home or pubic network puts sensitive information at risk. Vulnerable Devices Unlike workstations and devices managed by the organization, personal devices may not meet company security standards, or be equipped with the necessary monitors or controls. Unlike workstations and devices managed by the organization, personal devices may not meet company security standards, or be equipped with the necessary monitors or controls. Supply chain disruptions Visibility throughout your supply chain is essential for continuity planning as well as security planning. To stay ahead of disruptions, businesses need to be able

to identify threats all along the pipeline. Visibility throughout your supply chain is essential for continuity planning as well as security planning. To stay ahead of disruptions, businesses need to be able to identify threats all along the pipeline. Exposure to threats Network changes, new VPN configurations, alternate devices, ports, and IP addresses: transitioning to new operations can leave your organization temporarily exposed and more vulnerable to cyber threats. Network changes, new VPN configurations, alternate devices, ports, and IP addresses: transitioning to new operations can leave your organization temporarily exposed and more vulnerable to cyber threats. Regulation oversight How well do your existing security regulations apply to remote work? Unless you're reviewing and renewing them, it's hard to say for sure. Remote work presents new scenarios and applications that may not be accounted for in traditional regulations, resulting in security oversights. How well do your existing security regulations apply to remote work? Unless you're reviewing and renewing them, it's hard to say for sure. Remote work presents new scenarios and applications that may not be accounted for in traditional regulations, resulting in security oversights. Human errors Quick shifts to new processes with little notice increase the chance of people making mistakes. Without proper training, workers may not be aware of security best practices, inadvertently putting the organization at risk. Quick shifts to new processes with little notice increase the chance of people making mistakes. Without proper training, workers may not be aware of security best practices, inadvertently putting the organization at risk. Limited system capabilities How many VPN connections will your remote workforce require? How many can your IT infrastructure support? Not knowing your system's capabilities can doom your shift to remote work before it even begins. How many VPN connections will your remote workforce require? How many can your IT infrastructure support? Not knowing your system's capabilities can doom your shift to remote work before it even begins. Identity threats Identity theft has always been a big threat to cybersecurity, and remote connections elevate the risk. Insufficient access monitoring (least privilege standards, gated controls) and weak authentication processes for third-party applications (cloud, SaaS) open the doors to fraudulent activity. Still, many organizations lack adequate endpoint controls for remote work. Hackers know this, and they're exploiting these weaknesses, flooding organizations with digital identity threats. Identity theft has always been a big threat to cybersecurity, and remote connections elevate the risk. Insufficient access monitoring (least privilege standards, gated controls) and weak authentication processes for third-party applications (cloud, SaaS) open the doors to fraudulent activity. Still, many organizations lack adequate endpoint controls for remote work. Hackers know this, and they're exploiting these weaknesses, flooding organizations with digital identity threats. 1. Comprehensive risk assesment Evaluate your security architecture and any planned changes to support your cloud-based or remote-friendly workforce. We put together a free WFH self-assessment to get you started. It's based on frequently asked questions from enterprise clients about their own work-from-home programs. These questions will test your familiarity of the risks associated with working from home, how prepared you are to mitigate them, and guide you toward a more efficient cybersecurity preparedness plan. DevSecOps Demystified: Securing the Dev and Ops Worlds

----- Arcticle source ----- https://www.wipro.com/cybersecurity/devsecops-demystified-securing-the-dev-and-ops-worlds/ ----- About the Author(s) Related Articles Contact Wipro Please fill the required details to access the content DevSecOps Demystified Securing the Dev and Ops Worlds August | 2020 As digital journeys become the cornerstone of IT ecosystems, agile has become a preferred SDLC model, inviting an abundance of open source, third party solutions to the market, and making these journeys faster and smoother. This has led many organizations to move toward an automated DevOps ecosystem where continuous integration, testing, and deployment orchestrate in tandem. As new-age applications created artifacts using the DevOps ecosystem, organizations realized the following benefits. Organizations liked the DevOps ecosystem because there was hope for standardization amidst the "engineering democratization" and IT governance becoming more data-centric. Today, more and more organizations are leveraging DevOps data to build quantifiable information for KPI and governance automation. As the application development, testing, and support worlds are unifying under continuous delivery (CD), the cloud is making Infrastructure as Code (IaC) mandatory, therefore uniting the infra and app worlds. Despite these new ways of working, the IT ecosystem's security and risk management worlds still occur in silos, meaning: Importing increasingly vulnerable tools and technology into the IT landscape made customers think about how to bring security and related ops into the pipelines for better governance. Below are scenarios where organizations

could benefit from a DevSecOps approach. a) Static analysis and security testing (SAST)/Dynamic analysis and security testing (DAST) b) Enterprise leveraging DevOps tools c) Dynamic spin-up of an environment If an organization wants to deploy, provision environment, provision infrastructure, and provision application automatically, security hardening and related sanity testing of the environment must occur. Ignoring security, risk, and compliance outside of the DevOps ecosystem is not a consideration. Looking at SecOps inclusive DevOps or DevSecOps is now a mandate. Speed without compromising security is the new mantra. Allam Vinodh Kumar Practice Partner, Cybersecurity & Risk Services Wipro Ltd. A globally recognized Cybersecurity Assurance Evangelist, Vinodh A has more than 20 years' experience architecting, developing, and securing web-based software systems. As Practice Partner at Cybersecurity & Risk Services Wipro Limited, his technology teams launch and expand critical application security initiatives and build secure applications and infrastructures, integrating security throughout the development process. Annapoorna Venkateswaran consultant with a focus on DevOps and Mainframe modernization. In her current role, Annapoorna focuses on engineering productivity across the enterprise. In previous roles, Annapoorna has led delivery organizations serving global leaders in the financial sector and mainframe practices, including the related Modernization (In-the-Box) and automation Center of Excellence. With Wipro for 23 years, Annapoorna continues to lead the DevOps practice across the enterprise. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. =====================

Recovery from COVID-19 Crisis Demands a Balancing Act from CISOs

----- Arcticle source ----- https://www.wipro.com/cybersecurity/recovery-from-covid-19-crisis-demands-a-balancing-act-from-cisos/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Recovery from COVID-19 Crisis Demands a Balancing Act from CISOs August | 2020 As businesses battle the severe economic downturn due to the COVID-19 crisis, there is an expectation that CxOs will focus on prudent cost management. CISOs have already started thinking on these lines and identified discretionary spend that can be rationalized. They are currently balancing between reducing costs and positioning for recovery and future growth. How CISOs can drive cost optimization in the new normal CISOs can look at a range or methods to release funds for current and future needs (See Figure 1). By applying a combination of measures, one

can unblock the potential use cases needing attention: 1)　Business 'line of sight': Realign to the shift in business priorities by capturing revised Business & IT directives into a capability map. Undertake a broad-based view of cybersecurity capabilities and the present and planned cost models. Figure 1: Strategies for cost optimization　2)　Drive simplification: The present situation provides the best opportunity to organize simplification drives across business. 3)　Improve productivity: The CISO organization, while being largely understaffed, has multiple activities and responsibilities that could be optimized through process streamlining and re-organizing working methods. Assurance, Operations, Service-Delivery are domains that can be prioritized. 4)　Exercise flexibility with partners: While current service contracts are multi-year or due for renewals, CISOs can tap into the flexibility built into these constructs and adapt to change in demands. Close to 20% reduction in costs can be exercised by exploring options that can allow operations at planned volumes. Reducing service levels, decommissioning low usage systems, limiting capacity of some environments, and right-sourcing using a global delivery model can be explored with partners. 5)　Hyper-accelerate cloud journeys: CISO functions, while being the enabler for IT cloud initiatives, could use some of the cloud-specific cost attributes themselves. A quick assessment of current service characteristics from a 'cloud-readiness attribute' should deliver a view of controls and services that can leverage cloud-specific consumption models. Re-platforming and retooling may not deliver immediate cost benefits, but it is a step in the right direction. Focus should be towards a detailed execution plan and a clear view of the savings that is to be unlocked (See Figure 2). The execution team should also be empowered with quick decision-making and resources. Figure 2: A plan to unlock savings Investing for a cyber-resilient future CISOs also have an interesting opportunity at hand. While it must contribute to overall cost savings, it must establish Cyber-Resilience as an important context for business/board support. The savings, if invested into cyber resilience initiatives, will prepare the enterprise for the new normal. The newer business imperatives and need to drive revenues, in most industries, is a shift to Digital and the channels it offers. CISOs' priorities for investments are: Balancing cost reduction while re-organizing investments for business priorities is the new normal for CISO offices while taking their functions to the next normal. Rajesh Pillai Sr. Partner – Consulting & Advisory, Wipro Rajesh represents Consulting & Advisory at Wipro and works from the London office. The What, Where & When for Effective Dark Web Threat Hunting

----- Arcticle source ----- https://www.wipro.com/cybersecurity/the-what-where-when-for-effective-dark-web-threat-hunting/ ----- About IntSights Related Articles Contact Wipro Please fill the required details to access the content The What, Where & When for Effective Dark Web Threat Hunting September | 2020 As the cyber-crime ecosystem evolves, cyberattacks are becoming more complex, creative, and tailored to the industries and organizations they target. To do this, attackers must research, prepare and seek out information on their targets prior to an attack. While each attack may differ, the general types of information an attacker is required to have to succeed remain similar. So, by setting up the right monitoring and investigative processes, it is possible for organizations to detect and gain context around an attacker's plan of attack before damage is done by tracking what they seek out. Today, the cybersecurity community focuses a great deal on technical elements and indicators of malicious activity to detect threats - and has thus invested heavily in technologically driven solutions. However, at IntSights, we believe there is much to be gained from investigating the human factor behind attacks and that in doing so, it is possible to uncover actionable warning signs much earlier in the cyberattack chain than through technological means alone. That is why we continuously monitor the dark web, collecting millions of data points on hacker behavior to give our clients the best chance at detecting an attack before damage is done. When classifying each data point we gather, we always start with the same three questions: No matter the maturity level of your organization, when analyzing a new piece of intelligence, you should always start by asking yourself these three questions. They will enable you to better understand the scope and nature of detected threats, form a strategy to prioritize and monitor risk, and finally, if and how to allocate resources towards a response or intervention. The Big Three: What, Where, When. When it comes to identifying new sources of risk and potential indicators of attack, there are three guiding questions: What? Where? When? They may seem obvious, but from our experience working with clients across the globe, sometimes answering these questions can be quite challenging. Let's break them down: What Where When   Am I Protecting • Asset Types • Employee Groups • Geographic Locations • Customer Data • Secret Projects or IP   Am I Defending Against • TTPs • Adversary Groups • Insider Threats • Customer Fraud   Did this Info Come From • Forums & Markets • 3rd Party Data Leaks • Mobile Messaging Apps • Government Notification   Am I Defending Against • TTPs • Adversary Groups • Insider Threats • Customer Fraud   Was It Detected • Reconnaissance • Initial Compromise • Early Foothold • Lateral Movement • Data Exfiltration   Is Action Required • Immediately • In the near term • Longer term What. There are two big 'whats' every threat hunter needs to be able to answer: When answering these questions, avoid generic statements or groupings,

and try to be specific. If you work at a large retailer for example, rather than protecting "company assets", try and focus on the two or three key targets that keep you up at night – perhaps POS and customer loyalty databases – and the techniques or groups focused on those asset types – perhaps ransomware and Russian organized crime. Being able to answer the two whats is essential to sourcing the right threat intelligence and analyzing what is truly actionable, as they define the basis from which relevance, actionability, and impact severity can be derived. Where. Where can I find actionable intelligence? Having defined what you are protecting and what types of attacks you are most likely to encounter, this is the logical next question. Given the proliferation of both high quality and low quality threat intelligence sources, information on likely attack techniques or indications of an attack can be found in a lot of different places. For beginners, dark web forums are a great place to start. The forums, of which there are hundreds, are popular communities where hackers exchange ideas and even trade illegal merchandise. The type, topic and users on the forum varies - they can be malware analysis sites that have samples of malware that could be analyzed for attack indicators – or they could be mobile based chat groups with attackers seeking specific information related to your organization to better inform an upcoming attack. For the less sophisticated, industry specific ISACs and threat intelligence firms, such as IntSights, can be a great resource for those without the resources or desire to go dark web hunting on their own. Understanding where, even at a broad level, hackers may be sharing or discussing information relevant to your organizational needs will dramatically narrow your scope of monitoring and enable you to get the most out of your limited resources. When. When in the attack chain does a particular threat occur? And when can it be detected? Understanding the answers to these questions can enable you to better gather the right qualitative indicators that appear earlier in the attack chain. These human driven factors often appear far earlier than technical indicators and can enable preventative action such as reporting and removing of fake domains before a phishing attack is executed. It is also possible sometimes to directly engage with an attacker, using avatars, to gain more information on the nature or severity of the threat. By focusing on these questions and developing systems to watch and alert as threats arise, you'll be able to peer earlier into the attacker supply chain and be positioned to act quickly and with the context needed to minimize damage or stop an attack entirely. Classifying Threats - The IntSights Process Having answered the big three (what, when, where), you should now have a solid understanding of what information is useful to begin collecting and gathering, and the focus can shift to data classification and filtering. As stated earlier, threat intelligence can come in many forms and being able to bucket and group this information into a framework that can be leveraged and acted upon is essential. At IntSights, we've spent a great deal of time thinking about this problem and use the answers gained from the big three to classify the cyber threat intelligence we gather into six main categories: Attack Indication, Data Leakage, Phishing, Brand Security, Exploitable Data and VIP. Attack Indication: Attack indications are, as the name suggests, documented indications that an attack may be being planned, organized, actively executed, or recently occurred. These are typically soft indicators, such as online chatter between hackers or derived from a new item up for sale. While often not directly actionable, this information can provide critical

insight into the types of threat actors targeting your organization, how they plan to exploit a vulnerability in your defenses to gain entry, or what types of information they are attempting to steal. Data Leakage: Unfortunately, this is often a retroactive indicator suggesting an attack has occurred. Data leakage is the posting of confidential information online. This type of data can help incident response teams more quickly scope what type of data may have been stolen, the source of intrusion, and if caught quickly, prevent further damage. Phishing: This branch of social engineering has become a favorite of hackers of late due to its relative ease to set-up and high success rate. Cyber criminals use domains similar to company domains or spoof legitimate accounts aimed at getting employees or customers to volunteer sensitive information. In recent years, dark web vendors have popped up offering customized turnkey phishing solutions targeting well-known brands – making it even easier for hackers to launch these types of attacks at scale. Brand Security: Brand security and Phishing often overlap, but brand security is a broader term designed to encompass the misuse of a corporate or organizational brand. This can include phishing emails and spoof websites, misleading social media ads, fake app listings, digital messages, fake employee profiles or accounts and misrepresentation forums. Exploitable Data: Exploitable data relates to vulnerabilities and holes in existing enterprise defenses. Unlike Data Leakage which focuses on the data itself, Exploitable Data relates more closely to exposure and vulnerability gaps that could enable a bad actor to access or steal sensitive information. Threat intelligence examples of this could include chatter on stolen credentials, unpatched systems, expired signatures, unencrypted data, and network vulnerabilities. VIP: This catch-all category refers specifically to threats related to key figures in an organization that are, for obvious reasons, prime targets for a campaign. They could be high profile individuals, employees with access to sensitive data or employee groups at higher risk of targeting due to some other factor. Type What Where When IntSight Approach Attack Identification •Announced intention •Domain specific malware •Target lists •Stolen goods •Insider recruitment •Scam pages •Accounts for sale •Forums •Malware repositories •Black markets •Paste sites •IM platforms •IRC chats All stages We use avatars to contact the threat actor, and try to either gain a sample of the data that is offered for sale, or extract more information from them. Then we can understand where the data came from, and try to understand the scope of the attack and the capabilities of the attacker. Data Leakage •Confidential information •Leaked credentials •Email •Paste sites •Company website •Data breaches •Insider leaks After initial compromise Varies based on type of leak, but we will investigate source of leak, change passwords and encourage user awareness training and dark web monitoring. Phishing •Social engineering via original domains or domains similar to corporate domains •Employee or customer targeted emails •Whois services •Spam report sites •Internal IT •Customer support •FBI Initial recon, compromise, and privilege escalation Block suspicious domains from communicating with email gateways and firewalls. Remediate domains by contacting registrar and host service provider. Encourage user awareness training. Brand Security •Social engineering via unauthorized use of brands aimed at high employees or customers •Fake account profiles •Fake corporate apps •Social media •Fake spoof sites •App stores Preparation stage (before the attack, very early stage or ongoing attack) Warn employees not to communicate with

suspicious profiles or download suspicious apps. Request fake apps be removed from app stores. Exploitable Data •Unpatched vulnerabilities •Open ports •Unencrypted login pages •Internal pages accessible via IP •Exposed •Corp/partner sites •Vulnerable software •Bug bounty programs •Dark web forums •Zero days exploits After initial compromise Investigate vulnerable points or open ports, ensure all relevant software updates are downloaded and patched. Review and secure web and service login pages. VIP •Top executives •Board members, •R&D team members •Email •Social media •Credential theft All stages Tighter IT controls and improved user awareness training. Case Study - The IntSights Process in Action Having detailed how IntSights gathers and classifies threat intelligence, let's step back and take a look at how this all comes together to make a meaningful impact on an organization's security by examining how a leading North American retailer used threat intelligence gathered by IntSights' to clamp down on gift card fraud. At the time of this attack, hackers had focused in on gift card theft due to their lower profile and less stringent security oversight when compared to credit cards. They had been racking up large financial gains as consumers, retailers and providers had not fully awoken to the risks involved or losses being generated. While monitoring dark web chatter on behalf of this retailer, IntSights discovered that unknown to the company, their gift cards were being systematically produced and later sold on the black market. Leveraging IntSights' platform, the retailers' security team was able to rapidly alert the company, and provide them valuable context to the incident - including attack identification, brand security and exploitable data examples - and suggest recommended remediation actions through the IntSights dashboard. IntSights Intelligence Dashboard visualizes and categorizes threats by type and severity from across the clear, deep and dark web. As a result, IntSights was able to raise the company's awareness to a growing and unknown source of fraud. The company was then able to use this information to justify the creation of an ongoing monitoring program, the implementation of better security measures in store gift cards and reduce the amount of black market activities using store gift cards. Reimagining Security with Threat Intelligence As you've seen, there is a great deal that can be gained by focusing on the human element of cybersecurity. Leveraging dark web threat intelligence can provide tips or context to a potential attack weeks or months before the use of technical indicators alone. As you look ahead and begin to apply the lessons learned in this paper, here are a few closing tips to remember: Threat intelligence is more than IOCs: While many organizations focus on technical indicators, there is great value to be gained from qualitative and non-technical indicators of attack. Take a moment to step back and make sure you are considering how all forms of intelligence can advance your goals. Get clarity on the big three – What, When, and Where: Every decision made related to sourcing or responding to threat intelligence should tie back to the answers gained from these questions. Being unclear or not fully understanding the answers to these questions can lead to gathering the wrong information or responding to the wrong threats. Know what is actionable to you: There are many forms of threat intelligence and some will be more valuable to you than others. Use the big three questions to help focus on gathering only the intelligence and data types that are actionable to you. Classify, then analyze: Having a solid classification process is critical to deciphering threat intelligence.

Attempting to analyze raw data without context is a slow and painful process. Make sure you have the right tools: Before jumping head first into the world of threat hunting, make sure that you and your team are equipped for success. Enterprise threat intelligence and mitigation platforms such as IntSight's can help by automating much of the gathering and analysis of threat intelligence and even aid in remediation to dramatically shorten your time to value. If you decide to walk alone on the dark web - don't forget to take basic precautions to ensure your operational safety - use VPN proxies, operate inside VMs, and develop unique non-identifiable avatars. No amount of intelligence is worth compromising your organization's operational security.   This article is contributed by IntSights Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

Take Control of Your Security

----- Arcticle source ----- https://www.wipro.com/cybersecurity/take-control-of-your-security/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content Take Control of Your Security Why Wipro's Zero Trust Security Framework is Your Best Defense Strategy November | 2022 As they refine and redefine their cybersecurity strategies and pursue digital transformation, banking and finance enterprises should consider the importance of an integrated architecture to transform their cybersecurity environment. Zero-trust security, in particular, is proving itself to be a holistic, practical and adaptable solution to the cybersecurity challenges that banking and finance enterprises now face. Even for organizations that have already adopted zero-trust, this is a moment to step back and reconsider the potential gaps in the enterprise's zero-trust cybersecurity estate. The move to remote work at the outset of the pandemic created instantaneous cybersecurity risks for the banking and finance industries. A cybersecurity strategy could no longer rely mostly on the defined network perimeter of a large office. Instead, companies were forced to trade their traditional security architectures for ecosystems that allowed employees to access cloud services from anywhere. Most enterprises handled the situation using temporary cybersecurity fixes. However, it is now abundantly clear that remote and hybrid work are here to stay, and companies must convert ad-hoc remote/hybrid cybersecurity strategies into durable strategies for the new reality. As they refine and redefine their cybersecurity strategies, banking and finance enterprises should consider the importance of an integrated architecture to transform their cybersecurity environment. Zero-trust security, in particular, is proving itself to be a holistic, practical and adaptable solution to the cybersecurity challenges that banking and finance enterprises now face. Even for organizations that have already adopted zero-trust, this is a moment to step

back and reconsider the potential gaps in the enterprise's zero-trust cybersecurity estate. Cyber security strategy using zero-trust Verizon's most recent Data Breach Investigation Report states that external threats currently account for 73% of all data breaches in finance and insurance companies. Most external data breaches take advantage of a lack of internal control mechanisms, which allows for unhindered lateral movement of malware in the network. The other 27% of breaches are internal. In these cases, the employee enabling the data breach has legitimate reasons to access company data and applications. However, in the case of a threat, they are using the network or accessing the data in a way that goes far beyond their business function. In both cases, the problem is that bad actors can navigate through IT systems with very little friction or visibility. A zero-trust approach to cybersecurity aims to solve the problem of wide-open, un-policed internal IT systems. Zero-trust, first coined by Forrester more than a decade ago, takes into account information about data, networks, people, workloads and devices (see Figure 1). This strategy leverages analytics and automation to provide visibility and access based on a trust-but-verify approach. The goal is to protect sensitive data and information while also providing access to users based on legitimate business needs. As such, zero-trust is becoming a vital cybersecurity framework for organizations that rely on significant amounts of sensitive or private information. Because this approach responds to an organization's unique data types, management structure and networks/devices, it can be adapted and fine-tuned based on the business priorities of a given enterprise. Figure 1: Five elements of zero trust security and use cases Zero-trust security for the banking & finance industry Wipro provides a holistic approach to zero-trust security, leveraging a framework and a working model that relies on a comprehensive range of security tools and functionalities while also integrating elements of cybersecurity controls. This approach helps enterprises adopt zero-trust security seamlessly, using specific process-driven security toolsets to define and control various levels of access to organizational resources. For example, in one client engagement with a large private bank, we employed zero-trust security to both strengthen the security architecture and adhere to regulatory mandates. We assessed the entire network and controls, recommended changes in the security architecture based on application data flow and user access, and strengthened security controls for the "crown jewel" applications. The result: improved remote access for users combined with a reduction in attack surface. Wipro leverages a zero-trust framework (Figure 2) derived from the Forrester ZTX framework and other industry standards. This framework follows the National Institute of Standards and Technology (NIST) approach, but expands further to an adaptable architecture. Figure 2: Wipro's Operational Framework of Zero-trust Security Multiple security products with zero-trust capabilities can contribute as building blocks of the overall solution. The centralized platform enables visibility of an entire security estate and identifies potential security risks, driving constant monitoring that continuously improves the security posture. A truly mature cybersecurity architecture is fully interconnected; any anomaly in the system can trigger changes in the levels of access. Figure 3: Data flow of zero trust security architecture Wipro's approach to zero-trust Leveraging our zero-trust framework, Wipro assesses the enterprise environment's current cybersecurity maturity, rationalizes its security tools and strengthens the controls to creates a cohesive

architecture with the appropriate ecosystem of security tools. (See Figure 4 for more context on the five zero-trust capability levels that inform our maturity assessment.) Figure 4: Sample Analysis of Zero-trust Security Maturity Our assessment reports current zero-trust maturity and defines the direction for a cybersecurity roadmap. Based on this assessment, we prioritize focus areas and align a suite of cybersecurity products and approaches that will address those focus areas. We build use cases related to infrastructure, data and identity, and explore which enhancements, integration mechanisms and orchestrator tools will most effectively address the identified use cases. Finally, we deliver a comprehensive business case for adopting zero-trust, including the expected level of resulting cybersecurity maturity and the business benefits of an improved security posture. Benefits of a zero-trust framework for banks and financial institutions Angshuman Chattopadhyay Infrastructure Security, Zero-trust Security Head within Cybersecurity and Risk Services at Wipro Angshuman Chattopadhyay is the infrastructure security and zero-trust security leader within Cybersecurity and Risk Services at Wipro. He brings extensive experience with over 21 years in IT and cybersecurity across a wide range of global roles. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

Why Zero Trust User Access is vital for secure remote working?

----- Arcticle source ----- https://www.wipro.com/cybersecurity/why-zero-trust-user-access-is-vital-for-secure-remote-working/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content Why Zero Trust User Access is vital for secure remote working? September | 2020 Abstract Wipro and Microsoft recently hosted a joint CISO panel event on the topic of Zero Trust user access for a secure remote working environment. The purpose of this white paper is to discuss the role played by Zero Trust user access in securing the remote working, elaborate some of the key points from the CISO panel discussions and learn how Microsoft security solutions enable organizations to secure their users, devices, network, applications, and data through Zero Trust security approaches. The trusted perimeter is no longer effective A rare global crisis like COVID-19 has transformed human life as well as the enterprise operating model. Working remotely on a massive scale is bringing new security challenges to organizations as untrusted networks and unhealthy devices are being leveraged to connect to the enterprise network, systems and services. While leveraging existing remote connectivity solutions and trust-model dependent security solutions to meet the remote working requirements, organizations

are witnessing their attack surface grow in today's increasingly hostile threat landscape. All the CISOs in the panel echoed the same opinion - the need to rethink the fundamentals of perimeter centric and trust-based security and the way it protects enterprise critical applications, data, devices, and users. Zero Trust – The new security fundamental Today, organizations require a security model that effectively adapts to the complexity of the current modern workplace environment and safeguard from the evolving threat landscape. It should efficiently support the mobile workforce and protect users, devices, applications, and data wherever they are located. The Zero Trust security model is not new and it has been in discussions and practice for quite some time. However, it was majorly leveraged in a narrowed scope among risk signal sources such as network, data, applications, users, and devices. They work independently and do not share the threat signals and intelligence with each other, preventing it from being a comprehensive and effective security model. However, they all share the common Zero Trust principles such as: But with the new normal working atmosphere, we are all in a perimeter-less world and identity is the new perimeter. Hence the Zero Trust should start from the user access, and it is very critical that the enterprise access management solution supports the above three core Zero Trust security principles. Based on a majority view of the CISOs at the panel discussion on the Zero Trust user access, it appears that several organizations are in the process of adopting the Zero Trust security model and would start with identities. Start your Zero Trust journey with Microsoft Security Stack Microsoft provides a strong foundational security solution to kick start your zero trust journey. Azure Active Directory Conditional Access helps organization to provide granular access to users and devices to access applications and data securely by leveraging billions of threat signals and providing real-time threat protections. Figure 1: Microsoft working model of Zero Trust User Access reference architecture Azure AD native integrations with mobile device management systems (Intune), Advanced Threat Protections (ATPs) and Cloud App Security provide a strong Zero Trust orchestration platform to enforce your organizational Zero Trust user access policies. Microsoft Graph APIs allow integrating with third party risk signals and automating real-time risks remediation before the user trust is established to gain access to corporate data. Microsoft security solutions provide adequate building blocks to drive your Zero Trust user access implementation. Some of the key pillars of the Zero Trust user access include: Conclusion and Takeaways: From the collective view points from the panel discussion, it is obvious that most of the organizations are re-prioritizing their security programs to focus on strengthening their remote workplace environment by adopting Zero Trust security principles. Some of the key learnings from this event include: Prakash Narayanamoorthy Microsoft Security Practice Partner & Principal Security Architect at Wipro Prakash Narayanamoorthy is the Microsoft Security Practice Partner & Principal Security Architect at Wipro. He has spent 17+ years in the Identity and Security domain, and helped multiple large global organizations to solve complex IAM challenges. He can be reached out at Prakash.narayanamoorthy@wipro.com Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by

monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

Security Management Center

About the author Related Articles Contact Wipro Please fill the required details to access the content Security Management Center Why Your Security Operations Need this Productized Service September | 2020 Traditionally, security infrastructure and components are managed using a hierarchical support model, with engineers and service desk team performing pre-defined set of activities. They are responsible for the upkeep of the infrastructure, management of the devices, handling of service requests, and reporting of service status as part of regular review with the stakeholders. Various commercial tools and platforms are used to help in the operations. These are tools to monitor device availability or performance, scripts to automate generic tasks, along with service management platforms for ticket and workflow management in the operations process. With the increase in the number of security products and the associated complexity, enterprises and service providers have started using orchestrators and compliance management tools to reduce the effort of managing these products, and to improve compliance of the infrastructure. Despite the presence of these security tools and technologies, enterprises face cyber-attacks, and malware infections. The main reason for the security gap is missing "security hygiene" of the infrastructure and limited visibility of infrastructure and associated service effectiveness. A proactive and cohesive approach to security Effective security service requires standardized infrastructure and components. It also stipulates the use of a platform that can provide the required set of services, yet be flexible enough to cater to any new or complex requirement. Hence, the concept of productized services is highly effective in ensuring service effectiveness and filling the gaps in traditional security operations. Wipro's state-of-the-art Security Management Center (SMC), built on the principle of "Beat Before Beaten", has an integrated approach combining Predictive, Preventive and Proactive activities based on automation and analytics, which ensures a 360-degree business-oriented view of security operations and thus, SMC is a purpose-built security operations and orchestration product to help deliver managed security services. It offers operational insights, prioritization of risks, pre-integrated tools, short deployment time, reusable use cases, etc. to help enterprises attain operational maturity, thereby greatly reducing time-to-market. Its unique proactive approach to provide insights into the security infrastructure gives organizations visibility into their security posture. Wipro uses Security Management Center to visualize the security infrastructure, holistically to view its customer's security posture. The consolidated view comprises of risk, reliability and efficiency posture of the infrastructure. It delivers the richness of correlated data, aggregated information, and transparency related to the offered services. Figure 1: Effective security operations with

Security Management Center SMC provides a unified view translating individual tool views/ reports into meaningful dashboards to stakeholders within the enterprise hierarchy. For instance, an executive view for the CISO shows whether any risks are manifesting due to ineffective or inconsistent application of security controls or if configurations are not meeting the baselines. Similarly, it provides an operational view to Operations Manager and a technology view to Analysts and Engineers. Figure 2: Snapshots of Security Management Center dashboards Security Management Center: Ensuring integrated visibility SMC service architecture consists of multiple tools, collector and different data access methods using which the data is captured, correlated and aggregated to create the required views in the portal. Figure 3: Indicative diagram for SMC data flow The architecture consists of a server hosting SMC platform with the data collection module, with IP connectivity to various security devices available in the infrastructure. The configuration of these security devices, are assessed using set of use cases defined as the baseline criteria. These use cases are derived from security frameworks, regulatory standards, vendor best practices and Wipro's experience. SMC integrates with these security devices using APIs to collect the required information. The vulnerability management tool deployed at customer infrastructure is integrated to collect relevant information defined by pre-defined use cases. SMC integrates with orchestrator tools deployed at the customer's premise, which integrates with the firewall, load balancer devices to collect the configuration and rule bases, and access Firewall logs to analyze and create meta data content. The meta data is then sent to management server for further analysis. The service management tool hosted at customer data center is integrated with SMC using supported mechanisms and collect security operations ticket data in pre-defined time interval. The health monitoring tool is hosted in the data center, which monitors the infrastructure security devices including firewall, load balancer, forward proxy, end point security management servers, etc. to collect health and performance related data, for analysis and reporting to SMC. The data gathered from all the above processes are then sent to the database of SMC platform, where it is further correlated and aggregated, to provide integrated visibility towards security infrastructure and security posture. SMC portal shows consolidated view of security posture as operational risk, efficiency and reliability view, with the capability to drill down to individual device status. Angshuman Chattopadhyay Infrastructure Security within Cybersecurity and Risk Services, Wipro Angshuman Chattopadhyay is the Consulting & Solutions Lead for Infrastructure Security within Cybersecurity and Risk Services at Wipro. He brings extensive experience with over 19 years in IT and cybersecurity across a wide range of global roles. Angshuman can be reached at angshuman.chattopadhyay1@wipro.com Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. More than a shield that protects intellectual property, innovation, and people, security is a foundation for building digital trust. With cyber attacks on the rise and remote working exposing an organization's security vulnerabilities, data breaches and cyber intelligence have transcended the CISO's interests, garnering the executive management and the board's attention. The evolving cybersecurity ecosystem With high-profile cyberattacks making the headlines and increased network security vulnerabilities with vast numbers of people working from home for the first time, newfound vulnerabilities and sophisticated bad actors are causing many to reassess their organizations in the wake of stricter cyber laws and shared accountability. It's said that the best defense is a good offense, and the same philosophy applies to cybersecurity. Data breaches happen when security is perceived as an IT responsibility and not a shared organizational responsibility. From shoring up your digital defenses to tracking cyber risks to building a more cyber-resilient organization, the challenges are many. Over the past three years, nation-state cyber attacks have changed, requiring more collaboration and coordination to keep sensitive information, people, and systems safe. Check out the infographic below for a quick overview of the trends around data breaches, cybersecurity intelligence alerts, global malware statistics, vulnerabilities in security products and open-source projects, and changing cyber laws around the globe. ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/state-of-cybersecurity-report-2020/covid-19/ ----- Contact Wipro Please fill the required details to access the content COVID-19 October | 2020 How strong is your cyber response? COVID-19 changed how we work, shop, and interact. Lockdowns accelerated the rise of remote work, which was already gaining traction within many industries. With entire economies at a standstill, critical links in the global supply chain were broken, supply chain disruption rippled across every industry. Consumer fear, bottlenecks, and shipping delays created surges in demand and shortages in supply. With operations focused on meeting demand and sourcing hard-to-find materials, bad actors' opportunities to target vulnerabilities in a 'keep-the-lights-on' frenzy magnified. While nations and businesses grappled with the pandemic,

cybersecurity ecosystems scrambled to manage new realities. The opportunities for profiting from espionage, IP theft, ransom, and other criminal activities increased while the world directed their attention to the clear and present danger. Today, as economies enter recovery and the world prepares for a potential second wave, the focus has shifted to a fortified cyber response. The pandemic made many businesses, from auto manufacturing to energy and life sciences, fully appreciate the need for enhanced security monitoring strategies to better prepare for future supply chain disruption and to stay competitive in a post-COVID-19 world. Keep reading how organizations' cyber responses have evolved since the COVID-19 outbreak. Download The State of Cybersecurity Report 2020 to level up your cyber response. ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/state-of-cybersecurity-report-2020/state-of-cyber-resilience/ ----- Contact Wipro Please fill the required details to access the content State of Cyber Resilience October | 2020 What is Cyber Resilience? COVID-19 was an impetus for rapid digitization virtually overnight. With thousands of employees working remotely, CISOs were tasked with creating a secure remote work environment to ensure business continuity. CISOs had to grapple with data security, application security, and endpoint security in an unprecedented context. The lessons learned in this hyper-accelerated transition to remote working catalyzed a radical shift to traditional security governance and cyber-resilience efforts. A cyber-resilience framework With more organizations adopting cloud, automation, and digital transformation to prepare themselves better for future disruptions, the need for a secure foundation has never been stronger. Organizations that want to reap the benefits of cloud and emergent technologies need a cyber-resilience framework that provides the mechanisms for communicating roles and responsibilities, feedback, and critical imperatives between corporate hierarchies to strengthen an enterprise's posture. The journey toward cyber security resilience starts with a continuous appreciation of cyber risks that can impact an organization's ability to thrive and deliver on its core business imperatives. Zero trust architecture will play a critical role in managing threats as organizations shift their traditional approaches to keeping data, people, and systems secure. Keep reading for a high-level overview of where organizations are on the road to cyber security resilience. Download the State of Cybersecurity Report 2020 to dig deep into trends driving greater cybersecurity and business alignment. ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/state-of-cybersecurity-report-2020/the-state-of-collaboration/ ----- Contact Wipro Please fill the required details to access the content The State of Collaboration October | 2020 Lasting change can only come through collaboration. When people work together within organizations and with external stakeholders to enhance threat intelligence, remediation measures, and best practices, they're better prepared for increasingly sophisticated cyber attacks. Strong collaboration between the public and private sectors can help identify new cyber threats and develop strategies to counter them. Collaboration becomes even more critical when protecting national, critical infrastructure operated by the private sector. Governments around the world are facilitating collaboration through legal and quasi-legal constructs, including sharing networks. Given various factors, such as reputational risks and reservations around working with competitors, the private sector has

been cautious in their participation. Despite the trepidation, more organizations are participating in cyber-attack simulation exercises to assess their preparedness level and identify critical gaps in their application security, supply chain security, and endpoint security. To hedge their losses from cyber attacks, enterprises are adopting cyber insurance as a risk transfer mechanism. While cyber attacks can lead to erosion of trust and negative publicity, organizations can use cyber insurance policies to cover some legal and recovery expenses. However, cyber insurance policies aren't a primary risk management strategy. To learn more about the levels of cyber-insurance coverage and to dig into the nuances of the state of collaboration, download The State of Cybersecurity Report 2020. ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/state-of-cybersecurity-report-2020/future-of-cybersecurity/ ----- Contact Wipro Please fill the required details to access the content Future of Cybersecurity October | 2020 We analyzed cyber patents, cyber startup funding, and cybersecurity trends to lay out our perspective on the future of cybersecurity. A nearly 350% increase in cyber patent filings from 2015 to 2018 indicates a rapid rise in cybersecurity research, technology growth, and adoption. One cybersecurity prediction is the coming dominance of artificial intelligence and machine learning to monitor threats, detect anomalies, and predict user behavior. Additionally, 5G, quantum computing, and digital twin will see gains in the coming years as more businesses worldwide embrace these game-changing technologies. As part of digital transformation, new technology adoption will widen a business's attack surface and expand operational risks. In the post-COVID-19 era, cybersecurity implementations will have to rely on collaboration and trustware, which encapsulates a broad set of trust-enhancing technologies, frameworks, and standards. Trust-as-a-service will be a pressing demand, and organizations will have to realign their business processes to take advantage of this service. For all ten predictions, download The State of Cybersecurity Report 2020. ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/state-of-cybersecurity-report-2020/banking-financial-services-and-insurance/ ----- Contact Wipro Please fill the required details to access the content Banking, Financial Services & Insurance October | 2020 With cybersecurity, one size doesn't fit all. IT security challenges vary widely across sectors, but they have one in common: devastating financial and reputational consequences when cyber risks don't get the attention they deserve. In a world racing toward digitization, cloud, and IoT, growth opportunities seem limitless, but without a strong IT security foundation and collaboration between the CISO and other vital stakeholders, banks and financial services institutions expose themselves to vulnerabilities, waiting to be exploited by bad actors. The Banking and Financial Services industry has always been a prime target for social engineering attacks. The financial rewards and volume of PCI and insurance data available make the industry a tempting target. "41% of the information sold on the black market comes from banking and financial services," according to IntSights. Despite this, the industry has been a trendsetter when addressing cyber risks, often being an early adopter of new defense strategies. To learn more about the banking and financial security landscape, download The State of Cybersecurity Report 2020 here. ===================== ----- Arcticle source ----- https://

www.wipro.com/cybersecurity/state-of-cybersecurity-report-2020/ communications/ ----- Contact Wipro Please fill the required details to access the content Communications October | 2020 With great power comes great responsibility. From the web to TV to radio, you can't help but notice the imminent rollout of 5G. 5G communications will revolutionize the way we live, work, and socialize. Still, this radical shift requires significant evolution of radio and core management systems and protocol layers, creating new security risks throughout the entire 5G network. Cloud and virtualization-as-a-service help telcos reduce costs and deploy and optimize services faster. Still, they expose APIs toward users and third-party services providers and execute programs on shared hardware platforms alongside dedicated telecom software. The result: remote updates of software, open architecture, and digital technology that enables 5G communications will create more significant security issues and create new opportunities for bad actors. Through Software Defined Networks (SDN) and cloud computing, the Communications industry will pivot at the center of this growth. Attacks on remote industrial systems, utility networks, medical devices, and self-driving vehicles will continue to rise through these expanding networks. To learn more about 5G communications, digital technology, and proactive frameworks to understand the current threat landscape better and fortify your cyber response, download the State of Cybersecurity Report here. ===================== ----- Arcticle source ----- https:// www.wipro.com/cybersecurity/state-of-cybersecurity-report-2020/consumer/ ----- Contact Wipro Please fill the required details to access the content Consumer October | 2020 Cybersecurity for consumer industries The consumer industry encompasses various markets and company profiles, ranging from retail, food, and consumer products. Despite differences, businesses in this sector have shared concerns around consumer trust and identity protection. COVID-19 changed how business is done (maybe forever). With people being more home-centric and increasingly shopping on desktop and mobile for the first time, the number of consumers keying their credit card numbers and other sensitive personal information into cloud-based commerce platforms has grown exponentially. In a world of eroding consumer loyalty, a diminished brand reputation isn't easy to recover. Embarrassing data breaches and interruptions to service can drive consumers to brands that prioritize their security and privacy. Brand reputation, regulatory pressure, and consumer action will continue to drive improved practices across consumer industries, especially as brands prioritize user experience. Learn how to build digital trust and address evolving cybersecurity for consumers by downloading The State of Cybersecurity Report. ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/state-of-cybersecurity-report-2020/ healthcare-and-lifesciences/ ----- Contact Wipro Please fill the required details to access the content Healthcare & Lifesciences October | 2020 Health and Pharmaceutical Industry The global pandemic has put a spotlight on cyber security for healthcare. From supply chain security vulnerabilities to large-scale legacy infrastructure breaches, the health and pharmaceutical industry is no stranger to ransomware or emboldened threat actors. The health and pharmaceutical industry is evolving rapidly. Technology is transforming how patients are diagnosed, treated, and managed. With the Amazon Effect rippling across industries, today's patients have higher expectations and want more convenience, choice, and flexibility to manage

their health. Yet innovation without a secure foundation can lead to challenges for organizations, supply chain operators, medical professionals, caregivers, and patients. But that's not all—cybersecurity risks are moving beyond traditional IT assets to connected medical devices. With deeper vulnerabilities exposed in new remote and mobile working environments, ensuring your infrastructure, IP, supply chains, and medical devices are secure enough is more challenging than ever. As we go back to the office and adopt flexible workplaces, cyber threats aren't going to vanish suddenly —they're here to stay. To learn more about supply chain security risks and cybersecurity trends impacting the health and pharmaceutical industry, download the State of Cybersecurity Report. ======================= ----- Arcticle source ----- https:// www.wipro.com/cybersecurity/state-of-cybersecurity-report-2020/energy-natural-resources-and-utilities/ ----- Contact Wipro Please fill the required details to access the content Energy, Natural Resources & Utilities October | 2020 If you're in the Energy, Natural Resources, and Utilities industry, you're often the backbone of a society's critical infrastructure. But if the pandemic taught us anything, it's that every industry can be a target for cybercriminals. With an increased focus on digitization, cloud, and operational technology (OT) and the rise of sophisticated ransomware, malware, bad actors, and hacktivists, cyber security for energy has never been more important. To avoid operational disruption and data breaches and to keep ahead in a hyper-competitive environment, your enterprise will need to take proactive measures to secure what matters. From investing in cyber security for utilities strategies to leveling up your existing threat monitoring capabilities with artificial intelligence and predictive insights, you will need to approach security holistically, especially as you modernize to improve user experience and support complex remote field operations. Energy and utilities have long been a prime target for threat actors because they handle and store vast amounts of IP and innovation gained over decades. Information may be stored on vulnerable legacy systems ill-equipped for cyber security for utilities frameworks. To dig deeper into cyber security for energy trends, download The State of Cybersecurity Report. =======================

Store Labor Optimization Driven by Advanced Analytics

Store Labor Optimization Driven by Advanced Analytics Client Background The client is a leading US retailer with 2000+ stores and offers basics and differentiated merchandize at low prices. Industry Landscape The need for a superior customer experience is driving a massive transformation in the retail industry. Retailing is undergoing huge pressure on costs and hence improving employee productivity has become an imperative. Interestingly, store labor operations (trailer unloading, backroom stocking, promotion execution, pricing updates, customer service) mark the second largest pie on the retailer's cost, after COGS, amounting to around 7-15% of the sales. This is compelling retailers to rethink on their existing store labor allocation approach. Analytics has emerged as a key tool enabling retailers meet this strategic objective. Opportunity The dynamics of the industry currently challenge the client to maintain workload- workforce levels in tandem with the demands. The problem client faced was that the corporate sales forecasts, labor plans, and budgets did not reflect the on ground staffing, scheduling, and operational needs of individual stores. This lack of collaboration made it difficult for store and area managers to meet corporate goals regarding productivity, improving retail customer service, and sales. Hence, the client was looking to find an optimal balance between the store staffing level and revenue growth potential. Solution Wipro proposed an analytics based approach to precisely determine the payroll need (workforce allocation) for the store's expected workload to increase the likelihood of meeting their corporate sales goal. The client used to have an ad-hoc method for payroll allocation/store where in a simple average of historical sales data was arrived at, by the corporate team, to allocate man hours required per store without considering the factors affecting individual stores. While the client had followed a top-down approach based on sales forecast, Wipro recommended a bottoms-up framework, that factored in the needs of each store, work centers and workload drivers (like number of pull trips, number of returns, Number of Items in Planograms etc.). Instead of relying only on 'sales' as the single payroll driver for the stores, Wipro's framework reviews other factors in store which impact the payroll. Payroll Optimization Framework Discover Predict Optimize Key highligts included: Business Impact Wipro optimized payroll hours to the right store at the right time for the right task to meet the corporate productivity goals by gaining sales and improving customer experience. we helped the client in terms of: Designing a new operating model: To enable adoption of the current dynamics of the payroll allocation according to the current performance,

corporate goals and sales Advisory services: Redefined the business processes for the corporate level payroll in order to percolate at the store level and provide remove a comprehensive plan for remove store planning. End- to-End Solution Architect: Provisioned the solution from identification of the problem to implementation of the solution by creating forecasting and regression models. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major Wipro's driver-based forecasting solution helped integrate treasury and product planning for a banking major =======================

Trade Surveillance: The Future of Banks

----- Arcticle source ----- https://www.wipro.com/analytics/trade-surveillance--the-future-of-banks/ ----- Related Articles Contact Wipro Please fill the required details to access the content Trade Surveillance: The Future of Banks Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30%   Industry Landscape Technology will keep aiding financial institutions in handling growing complexities of business in times when customer's need for convenience, increasing regulatory compliance and other such centric role in the business. Intensifying demand for transparency and consolidated outputs from trade systems is leading to deployment of capabilities to analyze historical data alongside real-time data for investigation and surveillance purposes. This would help the financial firms translate liabilities into an advantage. Client Background The company is a global financial services firm with offices in over 50 countries. It caters to private, corporate and institutional clients, offering wealth management, asset management, and investment banking services. The Europe-based firm employs more than 50,000 employees worldwide. Opportunity In Europe, the client had multiple systems for AML and Trade Surveillance – technology platforms and custom developed solutions with excel macros etc. – resulting in challenges like: The client was looking for technology intervention to streamline and standardize the processes in order to increase efficiency, thereby reducing the Total Cost of Ownership (TCO) to manage and maintain its systems. The Solution Wipro enabled the client to upgrade their legacy solutions to the latest version and as a single consolidated platform for AML and Trade Surveillance across geographies – EMEA, AMER, APAC. The implementation spanned business consulting, development and maintenance support. Key highlights of the engagement included:: Business Impact   15% reduced time-to-market for each application/source system with reusable components   25% reduction in the report-related production incidents and maintenance requests   Infrastructural Costs 30% reduction in annual TCO Through standardized alert workflows and case management system Wipro

also executed a 'SMARTS alert integration' to client's technology platform on a T+1 and near real-time basis. It enables efficient identification of potentially abusive instances by: Wipro helped the client upload information to SMARTS surveillance system generating alerts which were downloaded via their technology platform for client's compliance users to proceed with further investigations, reviews and closure process. Wipro also developed many reporting solutions in client's Risk Case Management which highlight the abnormal/un-accepted trader or employee actions. Few instances of reporting solutions include: Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major Wipro's driver-based forecasting solution helped integrate treasury and product planning for a banking major =====================

Boosting Marketing ROI:

Big Data Platforms

to the Rescue

----- Arcticle source ----- https://www.wipro.com/analytics/boosting-marketing-roi--big-data-platforms-to-the-rescue/ ----- Related Articles Contact Wipro Please fill the required details to access the content Boosting Marketing ROI: Big Data Platforms To The Rescue The client is a leading global medical device, pharmaceutical and consumer packaged goods manufacturer, with over 250 subsidiary companies and operations across 57 countries. Medical devices, pharmaceuticals and consumer packaged goods industry has a fragmented marketing environment. Major players are focusing on reducing their infrastructure costs and scaling their data platforms to accommodate their ever-growing customer and vendor base. To maximize sales outcomes in very short lead times, with optimized budget allocation to categories, markets and media, enterprises are looking to adopt cloud-based Big Data platforms. The client's online advertising and electronic media business had data sourced by multiple vendors, cleansed and hosted on the client's proprietary platform to evaluate campaign effectiveness and ROI of their marketing strategies. But their legacy platform was not built to support large data volumes, perform advanced analytics or visualization on the processed data. The prolonged decision-making cycle times due to data quality and data redundancy issues, coupled with huge capital and operational expenses owing to duplication in vendor service charges, prompted the client to adopt a new high-performance Big Data platform. Wipro deployed and operated a Big Data platform on Amazon Web Services (AWS) using Hadoop (EMR) and Redshift Technologies. The platform acted as the single source of truth for all Lines of Business (LOBs) and was the cornerstone of all commercial analytics across the client organization including marketing, operations and sales performance. Key highlights of

the engagement include: Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's driver-based forecasting solution helped integrate treasury and product planning for a banking major =====================

Infusing Accuracy in Budgets with Advanced Analytics

----- Arcticle source ----- https://www.wipro.com/analytics/infusing-accuracy-in-budgets-with-advanced-analytics/ ----- Related Articles Contact Wipro Please fill the required details to access the content Infusing Accuracy In Budgets With Advanced Analytics Wipro's driver-based forecasting solution helped integrate treasury and product planning for a banking major   Client Background The client is a global bank with presence in Retail, Corporate and Commercial segments, and operations in more than 100 countries and territories around the world, with an employee strength of over 300,000. Industry Landscape Treasury departments in most Banking and Financial Services companies are leveraging advanced tools to manage their cash flow planning and forecasting needs. However, with cut-throat competition, increasing range of products, wafer-thin margins and the increasing interest rate risk, these firms are now looking to adopt an integrated and real-time planning process that can couple product and treasury planning operations tightly. While there are some vendor offered solutions in this space, most customers are still looking at customized solutions to address their specific needs. Opportunity The client's treasury and product forecasting models were based on excel which was complex, error-prone and highly inefficient. The cost of funds calculated from products had an error-prone spread, leading to inaccurate decisions both on interest rates as well as matching fund flows between deposits and loan products. Also, they weren't equipped to run concurrent scenarios and multiple forecasts for real-time decision making. The client needed driver-based forecasting to improve accuracy of the budgets, with timely data updates to enable near real-time decision making. They were looking to eliminate multiple data entries and reconciliation between product & treasury budgets, and improve the accuracy of the planning process. The Solution Wipro identified client's key business drivers and built a driver-based forecasting model based on user controlled business rules to help driver-based budgetary allocations. The solution also allowed adoption of single source of truth for treasury and product planning by implementing single data entry into one application and then leveraging the data across applications through automated data transfer mechanism. Some other highlights of the engagement include: Business Impact   Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and

Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major ======================

Faster Claims Settlement

at Lower Cost

----- Arcticle source ----- https://www.wipro.com/analytics/faster-claims-settlement-at-lower-cost/ ----- Related Articles Contact Wipro Please fill the required details to access the content Faster Claims Settlement at Lower Cost Using predictive analytics, Wipro delivered an efficient claims settlement process for a major European insurance provider, facilitating higher customer satisfaction through better and faster settlements   Client Background The client is a large banking group in Europe with activities spread across Retail banking, Commerce, Insurance etc. Additionally, it has operations spread across the US, Europe, the Middle East and Asia. Industry Landscape Customer research indicates that while 85% of customers shop around at policy renewal, those unhappy with a claim settlement almost certainly change insurers. Conversely, those who have been delighted with the claim settlement become "sticky". The major determinant in satisfaction is managing the customers' expectation in terms of the redressal they can expect and the speed at which that remedy will be delivered. The fast growth of the direct online channel has also led to a greater choice for customers, greater transparency in pricing and policy coverage details, as well as openly reported levels of customer satisfaction. As a result, it has become imperative for innovative insurers to focus on ensuring excellence in their claims service both to attract customers and to improve customer loyalty and advocacy. The Opportunity By achieving greater predictability and certainty over the claims process (regardless of the claim type), an insurer can guarantee that customers are made fully aware of all the steps to be taken very early on, thus avoiding delays and disappointments arising from mismatches in expectations. The head of claims operations at the client organisation introduced several innovations into the home insurance claims processes in order to increase control over the process and to meet customer's expectations. Some of these innovations include: It is important that as soon as a claim is raised, the insurer is able to predict its complexity and the likely settlement route. Thus, the client wanted to identify ways through which the above initiatives could be complemented using a claims triage and profiling system so that the most suitable Claims handler could be assigned as early as possible. A single named point of contact assures the customer of a clear and consistent journey together with an agreed set of expectations. The Solution The triage decision needs to be accurate and happen in a sensitive customer-focused manner. While the customer is raising the claim, it needs to quickly determine the likely claim profile. Wipro's approach based its solution on the knowledge that by integrating a 3600 view of claims with the 3600 view of the customer and their coverage, it will be possible to extract the patterns that explain the differences

between claims' characteristics. These patterns can be used to define 'claim profiles' that form the basis of the triage step so that each new claim is sent to a specific expert who has the specific competency to deal with the selected profile. The difficulty centred on the fact that the relevant data lay in many places (thousands of word documents containing claims reports of initial investigators), was voluminous (thousands of excel workbooks detailing damages, associated repair estimates and subsequent actual costs), and was often in narrative form. Essentially, this presented what we call a 'Big Data Analytics' problem comprising terabytes of unstructured and structured data on customers, covers and claims never assimilated and analysed before. Wipro developed a strategy based on Text Analytics techniques to extract signals from text and blended them with data from structured and semi-structured sources into a larger modelling data mart. Many more sophisticated patterns emerged out of this strategy and the insight thus obtained played a powerful role in achieving the required accuracy of claims' profile predictions. Wipro demonstrated how its larger ecosystem can facilitate such a complex project to deliver a comprehensive analytical view through: Business Impact The insurer now benefits from an efficient claims settlement process powered by predictive analytics. The claims handling process now has the capability to control the variance in costs, durations and customer interactions arising from the complex range of settlement routes. This has resulted in a 33% faster claims resolution process. The claims handler (whose assignment is based on the analytics that Wipro delivered) is now fully informed of the predicted key metrics of the claims and is able to keep the customer duly informed. This has resulted in higher levels of customer satisfaction – 28% reduction in customer complaints, and a steady fall in attrition. Overall, the initiative has led to a 20% reduction in cost.   Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Grow with Total Customer Relationship Analytics

----- Arcticle source ----- https://www.wipro.com/analytics/grow-with-total-customer-relationship-analytics/ ----- Related Articles Contact Wipro Please fill the required details to access the content Grow With Total Customer Relationship Analytics For a global hi-tech major, Wipro delivered a modern customer master data ecosystem to empower the customer facing teams with improved analytics and faster time-to-market The Client Background The client is a multinational electronics and semiconductor manufacturer headquartered in Europe. It is among the world leaders in a broad range of segments, including semi-conductors for industrial applications, smartcard

chips, automotive integrated circuits, computer peripherals, and chips for wireless and mobile applications. Industry Landscape Due to the proliferation of several customer touch points, it has become extremely critical and challenging for enterprises to build a single view of customer and derive a total customer relationship. But a number of factors like siloed operations, lack of high quality trusted master data and sub-optimal data management processes pose a serious threat to the ongoing business transformation initiatives. A golden copy of the master data enables a single view of customer on top of which customer analytics can yield actionable insights leading to definite business outcomes. The Opportunity In order to propel itself into the next level of growth, the client was looking at improving its global accounts coverage through better visibility, freeing up salesmen time for more customer contact and capturing new accounts and design opportunities. However, some of the major impediments were: The Solution The client needed a substantial change in the existing way of customer management by defining a customer model that is extensible and provides enriched and trustworthy information to key applications like CRM and EDWH. To achieve this, the client partnered with Wipro and embarked on a CMDM-CRM (SFDC) implementation program. The Customer MDM journey transformed their complex legacy business and IT landscape into a modern customer data ecosystem empowering their customer facing teams with improved analytics and faster time-to-market. Highlights Of The Engagement: Business Impact This CMDM program was intended as a paradigm shift for the client across critical dimensions such as Sales & Marketing business processes, information assets and change management. The implementation of solution not only proved to be major facilitator in enhancing business operations and decision making capability but also played a major role in boosting IT infrastructure and capability.   Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major ======================

Accelerating Planning Cycles with Advanced Analytics

----- Arcticle source ----- https://www.wipro.com/analytics/accelerating-planning-cycles-with-advanced-analytics/ ----- Related Articles Contact Wipro Please fill the required details to access the content Accelerating Planning Cycles With Advanced Analytics Wipro's robust analytics solution shortened the planning and forecasting cycle by over 90% for an American chain of department stores Client Background The client is an American chain of off-price departmental stores, with over 1,200 stores spread across the country. Industry Landscape The planning and forecasting process for retail domain is undergoing a major shift. While the group or corporate level top-down

approach to budgeting has been adopted by many customers already, the challenges associated with running a profitable retail chain like managing overheads, working with wafer-thin margins has led to the need for detailed store planning. Major retail chains are moving beyond sales and P&L planning to operational areas including merchandise, store operations, labor & manpower and integrating them with corporate financial planning. Opportunity The client had no unified system for budgeting, planning & forecasting and no centralized location for corporate plans. Their existing processes were manual, cumbersome and not user-friendly – resulting in an inability to handle multiple versions, iterations, data integrity, robust variance analysis, simulations and alternative scenarios evaluations. They had no system of record for official version of plans or audit-trail for adjustments. Data upload extended to about three days, which led to longer planning cycles. The client needed to implement a unified and centralized budgeting and planning system that could perform on-the-fly evaluation of alternative scenarios, thus reducing the overall time taken for planning and forecasting. The Soluition Wipro enabled the client to implement an Integrated Budgeting Solution using the Hyperion EPM stack on Exalytics appliance. The solution enabled the client to replace existing desktop-based Cognos TM1 solution used for store expenses budgeting and extend the planning process. Business Impact   Reduced data load time in budget cycles from 2-3 days to 4 hours   Enabled planning for a 5 year time horizon   Reduced IT manual intervention, enhanced accuracy of planning   Including multiple versions   Analyzed stores across 26 different attributes   Key highlights of the engagement are given below: Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Empowering Public Transportation

with Analytics

----- Arcticle source ----- https://www.wipro.com/analytics/empowering-public-transportation-with-analytics1/ ----- Related Articles Contact Wipro Please fill the required details to access the content Empowering Public Transportation with Analytics   For a Government transport authority in APAC, Wipro delivered 19% savings in a year through its best-in-class analytics driven solution Client Background The client is a statutory board under the Ministry of Transport of an Asian country, which spearheads land transport developments across the country. It is responsible for the planning, design, development, management and maintenance of the transit

systems, roads and related facilities. It also plans the long-term transport needs of a major city of the country with the ultimate goal of providing a smooth and seamless journey for its inhabitants Industry Landscape While planning long-term transport goals, the transportation departments of most governments face dual challenges of creating a scalable as well as streamlined infrastructure. Confronted with fast paced socio-economic development and increased pressure on land transport networks, the use of analytics emerged as highly useful in planning and policy formulation. The Opportunity With a population of over 4 million, the city of interest for the client body is expecting the population to grow by 25% by 2020 and host more than 10 million tourists per day. The economy is growing significantly and all these trends were adding to the pressure on the existing infrastructure. The client body handles more than 12 million ticketing transactions per day and wanted to develop and fine-tune the land transport (whether by car, bus or train) policies using advanced analytics to ensure comfort, convenience and pricing of the city public transport. The scope was identified as the implementation of an enterprise data warehousing platform that would enable the client to perform in depth analysis of bus, train ridership and taxi availability for meaningful trend analysis, long term policy planning and data mining. The Solution With over 12 million records being captured on a daily transport basis, Wipro designed its solution to enable speedy response time and to provide comprehensive information for the analysis of historical performance and general traveling patterns. Wipro's solution consolidated anonymized data from disparate transactional systems, performed high-volume data crunching and enabled the business users to perform statistical analysis on the information from different perspectives. This solution was built leveraging the following components: This system is now an integral part of client's policy planning to support an overall vision of making public transport a preferred mode of transport, optimizing road network and meeting diverse needs of people. A data-driven policy and planning decisions with fast turnaround enabled the client to build a people-centered land transport system. Solution Highlights Data Integration process implemented for incoming data from Transit and Traffic Management Applications, Vehicles and Manual sheets Data Layer constituted an ODS, normalized data warehouse and subject oriented data marts Presentation layer set up with 100+ reports, 20+ dashboards, OLAP & Data mining models Improved daily data transformation and loading by 67% Business Benefits   Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major

Business Insight

on Demand

Related Articles Contact Wipro Please fill the required details to access the content Business Insight on Demand The energy company is one of the largest natural gas gathering, natural gas liquids (NGL) and gas transportation and processing companies in the United States. Industry Landscape The US energy gathering, processing, storage and transportation industry is highly competitive and is characterized by transactional activity and operational data that offer opportunity for business analysis and idea "mining." Companies rely on data-driven insight into operational and financial activity to help them identify trends, understand opportunities and improve performance. Business intelligence is a key lever for enabling these objectives. The Opportunity The company found that their traditional reporting platform supplied only a portion of the required flexibility. Employees were routinely performing detailed analyses by copying data from the standard reporting platform into other productivity tools such as spreadsheets, to conduct ad-hoc analyses. Leadership recognized that business insight could be accelerated by empowering end-users through self-service business intelligence, enabling both reporting and detailed analyses. Solution This solution reinforces key concepts such as data-as-a-service and self-serve business intelligence, while leveraging everyday productivity tools for usability. The scope included migration of reports to a Microsoft® business intelligence platorm without changes to existing report functionality. In addition, it enables the ability to leverage Microsoft PowerView to create and interact with reports based on tabular models and/ or Microsoft PowerPivot workbooks. The Microsoft Report Designer allows users to create operational reports, shared data sources, shared datasets and report viewer controls used across a variety of data sources.   In addition to front-end analytic tools, the solution includes SharePoint services and business intelligent platform components that include SQL Server Analysis Services, SQL Server Reporting Services and the SQL Server DBMS. Business Impact Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Optimized Operations by Leveraging Master Data

Please fill the required details to access the content Optimized Operations By Leveraging Master Data Wipro is delivering the back office transformation across multiple operating countries through a multi-domain MDM implementation for a Telecom major Client Background The client is a telecommunications leader focused on the African continent with over 75 million subscriber based across countries in Africa and the Middle East. Industry Landscape Telecom communication service providers are stressed due to dipping call rates and reducing call volumes - requiring them to look at improving efficiencies in operations. Several leading companies are looking at standardizing their back office operations across multiple operating countries and setting up central shared services to provide better control of the operations and costs across the enterprise. Opportunity The client was experiencing extreme cost pressure in several markets across due to several factors like limited growth opportunities in mature markets, rising competition from OTT players like Skype, demanding customers, limited decline in fixed-costs and rising bandwidth requirements needing CAPEX (> US$10 billion in past 5 years). These business challenges were aggravated further with inconsistent, incomplete and incorrect master-data across the enterprise leading to challenges like: As a result, the group company embarked on a broad transformation initiative across multiple operating companies involving a back-office transformation program across divisions. It includes an ERP & MDM implementation to support divisions and a common shared service center to ensure consistency across business functions and operating companies in 18 countries. The Solution Wipro is the partner for this strategic back office transformation program with a responsibility to implement a global template solution utilizing Oracle E-business suite products and rolling out the solution to 18 operating countries. As part of this program, Wipro implemented an ERP solution to automate SCM, Enterprise Asset Management (EAM), Finance and HR Management Processes. In order to ensure consistent, complete and correct master data to these business processes, Wipro implemented a multi-domain Master data management (MDM) and Data Governance (DG) solution. Key highlights included: Business Impact Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Decision Making Powered by Deeper Insights

----- Arcticle source ----- https://www.wipro.com/analytics/decision-making-powered-by-deeper-insights/ ----- Related Articles Contact Wipro Please fill the required details to access the content Decision Making Powered by Deeper Insights The client is a leading US-based health care services company who specializes in distribution of pharmaceuticals and medical products, serving more than 100,000 locations. They also manufacture medical and surgical products, including gloves, surgical apparel and fluid management products, in addition to operating one of the largest network of radiopharmacies in the US. Global Healthcare is facing unprecedented challenge with the prevalent information platforms which are not architected to deliver an intuitive, user-friendly interface for efficient performance management, data mining and research. Moreover, with inconsistent data delivery in the upstream processes, major players are facing challenges to take business decisions in a highly competitive landscape. This has compelled most enterprise to embrace SAP HANA for better performance and high visibility. The client had disparate reporting systems across the organization and ad-hoc reporting was a real challenge with more than a million data sets. Their data was growing rapidly, especially in areas like Demand Planning and SNP, which resulted in lengthy data load cycles. The client needed to implement a scalable reporting framework for speed, agility and performance to realize deeper insight across Sales and Finance statistics providing competitive edge and helping innovate faster.In order to deliver business visibility. The global healthcare major needed to improve the current state of performance, usability and timelines of information delivery. Wipro enabled the client to implement high performance SAP HANA Platform to accelerate and streamline the operational reporting systems. As part of the engagement, Wipro recommended the overall application roadmap, and constructed efficient HANA Models and Business Object Reports leveraging Agile Methodology. The client is now empowered to run reports faster and improve productivity by utilizing their time for analysis and better decision making. Key engagement highlights include: Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Reducing Cost by Transparent Vendor Data Management

Reducing Cost by Transparent Vendor Data Management For a global Pharma major, Wipro delivered 25% reduction in Cost of Operations through a vendor master Data Lifecycle Solution enabling enterprise Client Background The client is a pharma major with a diversified portfolio and an innovative approach to pharmaceuticals that helps improve the lives of people in over 100 countries where it operates. Industry Landscape The need to manage product, customer and vendor, clinical and research data is extremely critical to the pharmaceutical industry. A top priority for the industry is to integrate and manage data with consistency across product and operational silos. This is proving to be a challenge, especially with the rising industry trend of rapid inorganic growth and swift acquisitions. Many companies find themselves vulnerable to operational and reputational risk by ignoring the need for data standards backed by superior data management. Poor data management is also hurting them because it negatively impacts costs, service quality, efficiency and productivity. The Opportunity The client realized that inadequate vendor data management was negatively impacting productivity which in turn impeded growth and innovation. Additionally, there were inconsistencies leading to inaccurate or misleading business insight. The key challenges faced by the client were: The opportunity was to create a Vendor Data Foundation program aimed at transforming the sourcing and procurement function. Once implemented, this program could drive operational efficiencies, improve decision-making, enhance productivity and re-ignite innovation while remaining compliant to the ever increasing rigor of industry regulations. Solution Wipro developed a single scalable solution to manage end to end vendor master data lifecycle enabling enhanced enterprise wide master data visibility into the data management process. For the client, this program was central to achieving sustained long-term success. Their vision to transform the procurement function chiefly focused on setting up a centrally managed vendor master. Wipro designed and implemented the Vendor Data Foundation program enabling: The Wipro solution comprised the following: Business Impact Optimizing vendor master data enabled the client to access early vendor risk indictors that are vital for compliance in Pharma. The benefits included: Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Sharpen Planning Accuracy with a 360° View

Sharpen Planning Accuracy With A 360° View Wipro's robust analytics solution simplified planning, forecasting, and optimized staff resources, resulting in GBP 60K annual savings for an electricity distribution major Client Background The client is a UK-based Electricity Distribution Network Operator who owns, operates and maintains UK's North West region's electricity distribution network, connecting 2.4 million properties, and more than 5 million people to the National Grid, with the annual revenues of over £500 million. Industry Landscape The game for the power & utilities sector is fast changing across business, regulatory and operational environments. Companies are faced with the paradoxical challenges of meeting increased demands against growing environmental regulations, keeping customer costs down against increasing buying power and lower switching cost, maintaining system reliability against diversifying needs. In order to remain competitive, companies are looking at achieving sustainable advantages by investing in a range of measures aimed at ensuring lower costs, agility, and responsiveness. They are as well looking for deeper and sharper insights into their customers, markets, and operations and the macroeconomic environment. These have compelled leading companies to embrace BI for a complete process transformation. The Opportunity The client's decision making and information flow for matters of network demand & generation, asset monitoring, faults tracking, fleet management, resource planning & forecasting etc. were highly localized. The data resided at the department/program/operations level. There was no reliable tool for historical comparison and trend analysis - to integrate data at all operational levels and furnish actionable insights for resource planning and forecasting. Solution Wipro identified the client's key business drivers and implemented a data warehouse and reporting solution which improved the turnaround time for regulatory reporting, data analysis/ trending information. The BI solution provided a centralized dashboard to drive overall productivity & improved management control in Operations, Finance, Customer Service, and Human Resources, Costs effectively. The key highlights of the engagement include: Business Impact
 resulting from FTE staff reductions through improved processes through automation of the estimation process, minimising manual effort resulting in lower penalties being paid   with lesser complaints through process improvement Being an electricity distribution company, the client has to optimize CAPEX & OPEX costs related to network assets for delivering quality power supply/connections as per Guaranteed Standards of Performance (GSoP) standards under RIIO ED1 framework. The UK regulatory body - Office of Gas and Electricity Markets (Ofgem), used to levy

huge fines for non-conformance and non-compliance. The client needed all their information corrected, centralized and available for the nearly real-time analysis, decision making and regulatory reporting. Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Tracking Customer Sentiment on Social Media

----- Arcticle source ----- https://www.wipro.com/analytics/tracking-customer-sentiment-on-social-media/ ----- Related Articles Contact Wipro Please fill the required details to access the content Tracking Customer Sentiment on Social Media The digital disruption is impacting the media industry significantly. Access to and consumption of content is continually being reshaped by constant technological advances. The ability to download easily and watch, play or listen to the content is both helping the industry giants to cater to the ever growing needs of the audience quickly as well as creating more demand. As companies put in efforts on social media engagement and content for their brands, the next step is to optimize investment, understand social reach and issues and track analytics to evaluate performance. Social Media Analytics is emerging as a key tool in understanding customer sentiment. The company is one of the forerunners in products and services for the Entertainment and Media Industry. The company provides paid applications that help stream millions of movies and songs on different device platforms like mobile phones, tablets, laptops, TVs, gaming consoles, media players, projectors etc. The client had launched their applications services recently and needed a way to understand customers' perception, issues, demands and their overall experience with this new launch based on real customer feedback. They lacked a method to improve promotional activities and constructively engage with customers. Also, they were facing a long response time for customer issue resolution. In an industry that must generate profits to invest in new content experiences, it is very important to take cognizance of customer feedback in order to stay relevant. Social media analytics, in the form of Sentiment Analysis, could provide these key insights to the client's strategic marketing and customer relationship management team. It promised the power to improve promotional activities and constructively engage with customers to constantly improve services. The Solution Wipro's Social Media Analytics (SMA) solution, which has been built over time through various client engagements, was used to accurately understand customers' core sentiments and translate them into key business insights. The SMA solution was runon social media data collected from Twitter, Facebook, blogs, forums etc. where customers express their feelings about the products and the services. The solution, based on Naïve Bayesian

and Association Mining Technique, is also capable of handling data that has noise. Based on the insights generated out of the SMA, recommendation reports were sent out to the client on a weekly/fortnightly basis. The frequency of reporting was determined by the business requirement of the respective client business. Highlights of the Solution   Taxonomy Generation Wipro used a Taxonomy Generator, built in-house, forthe categorization of social media data into relevant themes like functionality, issues, network, environment, competition and content. Data Collection Based on preset rules and configurations defined by the client, data was collected from diverse social media in real time, using a social listening tool. Data Preparation by categorization Data categorization was leveraged to identify critical issues, recent trending topics and the right customer sentiments about the product under analysis. Text Analytics Engine The data was then fed into an in-house built Text Analytics Engine which transforms social media data into a more structured format that can be analyzed quantitatively. Insights Generation Finally, insights were obtained around competitor trends, geography/demography/topic based sentiment, product launches, campaigns, product/service performance to assess how sentiments were changing over time.   Business Impact Reduction in Response Time The resolution time of the network issue for the newly launched game console was reduced by 65%(within two weeks of identification). New Market Expansion The client was able to track the popularity in various countries/ cities and is launching services in 3 new countries (in Europe). Better Customer Segmentation The client was able to identify the age groups that were generating maximum buzz on social media and could plan promotional activities accordingly Wipro's Socila Media Analytics solution enabled promotional activities for customers to constantly improve services by performing Buzz Analysis, Launch Analysis and Campaign Analysis. The business benefits include: Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major ======================

Enterprise Data Warehouse Transformation for a Leading Networking Company

----- Arcticle source ----- https://www.wipro.com/analytics/enterprise-data-warehouse-transformation-for-a-leading-network-c0/ ----- Related Articles Contact Wipro Please fill the required details to access the content Enterprise Data Warehouse Transformation for a Leading Network Company Wipro enabled faster data processing and computing for a leading

manufacturer of networking equipment with centralized data systems Client Background The client is one of the world's leading manufacturer of networking equipment. Their product categories include networking devices, network management, optical networking, storage area networks. Industry Landscape The current emphasis of network equipment industry is on new technologies like data storage, network mobility, VoIP, networking, internet and new forms of internet security. Research and development becomes extremely critical as the networking technology and products are constantly getting innovated. In order to keep the impact on market in globalized world, network equipment companies need to develop new and improved products constantly to sustain their position in the industry as niche player. The Opportunity With increasing Lines of Business (LoBs), the client's enterprise data warehouse found it challenging to accommodate growing data volumes and support faster report generation. The legacy platform was nearing obsolescence and needed to be upgraded. The client was looking for a centralized data warehouse architecture model to reduce support and maintenance costs, while enabling business users to adapt to the new Enterprise Data Warehousing Platform. Solution Wipro established a centralized data warehouse based on Teradata for catering to all geographies and lines of business. To ensure greater user acceptance for the new platform, the team created 'Landing Zone' where the same architecture as that of Oracle was created in Teradata and data was loaded in both tables. Users were asked to point their reports to both these data systems. This helped users compare the systems and appreciate technological advantages with Teradata. With greater acceptance of the Teradata platform, the team gradually migrated other applications to the new platform and EDW was established. Business Impact   Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Enhanced Gaming Experience with Cloud Platform

----- Arcticle source ----- https://www.wipro.com/analytics/enhanced-gaming-experience-with-cloud-platform/ ----- Related Articles Contact Wipro Please fill the required details to access the content Enhanced Gaming Experience with Cloud Platform The client is world's leading provider of software products and services. They offer a public website for online gaming, which is a significant source of revenue. The online gaming industry has evolved to become a place for social connections for people of all age groups. The evolution, aptly fueled by rapid emergence of gaming sites and technological innovations is offering a 'never before' kind of experience to gamers. In this fiercely competitive landscape, poor application performance and inability to

scale seamlessly to accommodate an ever growing user base are the major threats for gaming giants to retain a loyal user base. Any drag in experience leads to customer attrition and brand dilution. The Opportunity The client's legacy software posed a challenge to improve site performances. The software stack, based on Windows 2003 and Content Management System 2003 on which the games were hosted, were near obsolescence. Besides, these servers resided on client owned data centers, making it difficult to scale to accommodate a rapidly expanding user base. They were looking to migrate their applications and infrastructure to a cloud-based platform to enable on-demand scaling based on usage and to ensure improved user experience so as to retain their loyal gamer community. Another key aspect for them was to support new game formats such as HTML5 that enables to attract new game developers onto their gaming site. With the legacy software they were not able to add new game types. Solution Wipro's Microsoft Azure Platform implementation provided a comprehensive solution to the client's challenges. The end-to-end engagement covered Requirement Gathering and Analysis, Design, Implementation and Testing. The key highlights of the engagement include: Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Business Decisions Empowered by Self-Service BI

----- Arcticle source ----- https://www.wipro.com/analytics/business-decisions-empowered-by-self-service-bi/ ----- Related Articles Contact Wipro Please fill the required details to access the content Business Decisions Empowered by Self-Service BI Wipro's reporting and visualization solution enabled improved reporting efficiency and productivity for a leading healthcare provider Client Background The client is global healthcare company headquartered in the UK with offices in over 100 countries and major research centers in the UK, USA, Spain, Belgium and China. They have a portfolio of products for major disease areas such as asthma, cancer, infections, mental-health, diabetes and digestive conditions. Industry Landscape As the healthcare service provider industry moves from its traditional sales and marketing approach to customer-centric service models, companies are seeking to better cater to physicians' need for product, information, disease state etc. A recent IMS study indicates that physicians want fewer, but stronger relationships with company representatives who can provide more valuable information, deliver more relevant services, and better respond to specific needs of the practice.

Hence, innovative companies need to adopt a value-based approach to engage physicians, using new personnel structures, communications, training, and performance metrics. The Opportunity The client's existing processes for internal requests on critical data for performance monitoring/ analysis were manual and cumbersome. Their processes also outlined the creation of detailed presentation decks for each of the 19 Business Units/ Therapeutic Areas, most of which required a manual update of graphs and charts. The resulting long lead times and high risk of error and rework compelled the client to adopt a BI reporting and visualization platform to simplify data and mine insights from business decisions. Solution Wipro employed a Scrum Based Agile Development approach which is an iterative and incremental agile software development method for managing software projects and product or application development. With QlikView's Business Intelligence tool, Wipro enabled an accelerated solution delivery and rapid turn-around. Key highlights of the engagement include: Business Impact Faster decision making through easy and fast access to business critical information Enhanced reporting efficiency 60% reduction in slides per business unit, with automatic updates for all Improved Productivity An estimated 6 weeks saved, which is available for other important initiatives Self-Service BI Stakeholders can directly access data or reports themselves Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Large Pharmaceutical Company

transforms Marketing and Sales in the

US using Master Data Management

----- Arcticle source ----- https://www.wipro.com/analytics/large-pharmaceutical-company-transforms-marketing-and-sales-in-the-us-using-master-data-management/ ----- Contact Wipro Please fill the required details to access the content Large Pharmaceutical Company transforms Marketing and Sales in the US using Master Data Management Client background Client: A leading pharmaceutical company Revenue: USD 39.9 Billion Industry: Pharmaceutical Area of operations: Global Customers: Anyone with a medical and dental condition Challenges The client was charged for poor compliance and record-keeping by the FDA. They were also overpaying for getting provider data for marketing and sales across all its departments.

One of the significant challenges was to harmonize data across platforms along with centrally managing the data, resulting in silos of similar redundant data of pharma & consumer systems across the enterprise. Lastly there was a time gap in order processing which needed to be cut short to achieve more effectiveness and optimization in sales. Solution Wipro implemented Informatica MDM, a comprehensive Master Data Management solution, along with Informatica Data Director and real-time APIs, to overcome the challenges which the client faced. Business impact Implementation of best-in-class Master Data Management solutions resulted in a central repository of customer, product and alignment with a single source of truth for all data. Quote: On successful implementation of CERPS project which integrated Consumer and Pharma data, the order processing time was brought down to 2hrs. "It has been a long 18 months, but you guys did it and I'm very thankful for all your efforts over this time period" - Director for information Systems PD =====================

Largest European global corporation transforms its field services personnel efficiency across eight countries

----- Arcticle source ----- https://www.wipro.com/analytics/largest-european-global-corporation-transforms-its-field-services-personnel-efficiency-across-eight-countries/ ----- Related Articles Contact Wipro Please fill the required details to access the content Largest European global corporation transforms its field services personnel efficiency across eight countries A leading energy management and automation service provider enables simulation for workload and capacity in field services to improve utilization rate by 35% using cloud based, in-memory Anaplan solution Client background Client: European multinational corporation providing energy management and automation solutions in homes, buildings, data centers, infrastructure and industries. Industry: Manufacturing Area of operations: France, Germany, Italy, US, Canada, India, UK, UAE, Australia, China etc. Customers: IT, Buildings, Power, Energy Utilities and Automation companies. Challenges The client did not have any system that would provide a short/mid/long term view of their workload vs. capacity, and would provide them opportunity to perform simulations and what-if analysis. Operation managers had no means to ensure if they had enough resources to cater to customer requirements. Field service vice presidents had no concrete means to challenge operations and sales to improve workload and capacity. HR business partners were lacking the view of training, cross skilling, hiring employees and contractors in short & mid-term view. Solution

Wipro implemented Cloud based Anaplan solution, a comprehensive simulation product that is based on in-memory and SaaS model. The entire solution was integrated using Informatica Cloud to eliminate manual processes on a day to day basis, providing business a truly business-owned model. Business impact Implementation of best-in-class Anaplan Cloud solution which is highly optimized to consider the space constraints at hand, enabling the master planners, HR business partners, field service managers, operations managers, field service directors and VPs to have transparent and detailed information on workload vs. capacity which was never available before. Quote: "Thank you very much to you and your team for the great job you have performed in the last 6 months (since we have started the project). We really appreciated your reactivity and your flexibility. The agile way for handling the project was I think a key reason for the success of this project, to be delivered on time with the business expectations fulfilled. Last, but not least, we were very satisfied, and to tell you the truth, positively surprised, by the level of understanding, you and your team, had on our business requirements." - Client Manager Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Data Warehouse modernization for fast analytical reports

----- Arcticle source ----- https://www.wipro.com/analytics/how-a-global-company-enabled-faster-business-decisions/ ----- Related Articles Contact Wipro Please fill the required details to access the content How a global company enabled faster business decisions US business services company drives 83 percent reduction in operational expenses over a period of three years by moving on-premise data warehouse to Amazon Redshift Client Background Client: Business services company Industry: Commercial & professional services Services: Business data, Credit & risk, Sales & marketing, Analytics Area of operation: United States, Canada, United Kingdom, Ireland, Greater China, India Number of Employees: Over 4000 Challenge The client was running a commercial enterprise data warehouse that contained aggregated data from different internal reporting systems across geographies. The data warehouse was growing at over 20 percent year over year (YoY), with higher growth expected in the future. This growth required them to keep upgrading the hardware to meet the storage and compute needs, which was expensive. Also, licensing was based on CPU cores, so adding hardware to support the growth required additional investment in licenses, further spiralling the costs. The on-premises data warehouse environment was an extension of the transactional system. Analytical queries experienced performance issues when they were executed

against large datasets and the client's customer queries took longer time for execution, which ultimately impacted their interactive experience with dashboards. With data growing by 20 percent YoY, the query performance further degraded. The client realized the need for a dedicated analytical environment to address the performance and scale issues for user reports. The primary need was to enable quick and accurate analytics to drive faster business decisions. Solution Amazon Redshift was identified as the ideal solution for setting up a new analytical reporting environment. Business Impact The migration to Amazon Redshift provided the client an agile data warehouse infrastructure with no additional licensing costs and effort for software and hardware upgrades. The client saw immediate performance improvements at significantly lower costs. Data users were able to query and obtain reports quickly using features of Amazon Redshift. Quote The legacy database to cloud transformation program enabled operational savings of 83% and 70% performance improvement for the client. With cloud as a new data platform, the client is getting access to quality data 20 hours earlier than the legacy, helping to improve customer satisfaction by generating right business insights, faster and better. Wipro brought in the right tool stack to maximize automation during implementations. They also played a good balancing act by keeping 'the lights on' for the existing KYC application while being 100% focused on new implementation. Rakesh Verma, Practice Head – Data, Analytics & AI, Wipro Read the Amazon blog for more details https://aws.amazon.com/blogs/database/using-amazon-redshift-for-fast-analytical-reports/ Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

How a large energy company turbocharged its asset management

----- Arcticle source ----- https://www.wipro.com/analytics/a-large-energy-company-turbocharged-its-asset-management/ ----- Related Articles Contact Wipro Please fill the required details to access the content How a large energy company turbocharged its asset management Client background Client: A large Energy & Utilities company Industry: Power Headquarters: Canada Employee: Over 6,000 employees Area of operations: Global Customers: Over 650,000 Challenge The client's asset management processes were manual, decentralized and managed by legacy SAP ERP and other systems, which lacked relevant functionalities. The previous SAP solution had grown organically (with little historic documentation) and business processes were in siloes. This led to poor tracking of asset financial

data, revenue loss, and compliance issues. The client initiated a business transformation program through ERP implementation. The intent was to adopt ISO 55000 standard of compliance, enable process documentation, enhance portfolio and project management, segregate roles and responsibilities for the workforce, and implement predictive asset failure analytics. Solution Wipro enabled the consolidation of assets and work management data by implementing SAP ECC 6.0 solution and migrating data from legacy SAP ERP, GIS and flat files. The key aspects of the solution approach were: Business Impact Implementation of the fully integrated ERP solution brought in compliance, cost efficiency, improved health of assets and accelerated performance. The solution automated contractor work allocation and invoicing, aligned business processes to ISO 55000 with redesigned asset hierarchy, and provided quantitative risk assessment tools via predictive asset failure analytics. It also enabled management of assets right from acquisition to disposal from the shop floor to the financial/ regulatory asset registers. Migration to asset management platform enables ISO 55000 compliance and annual savings of $2.5 Million Quote The full scale asset management transformation enabled redesign of the client's asset hierarchy, bringing this in line with industry standards of ISO 55000. It automated client's business processes and procedures, and enabled an objective and metrical way for decisions on asset investment planning. - Narayanan Ram Ramji, Client Partner, Wipro Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

How a top utility company achieved

GDPR compliance

----- Arcticle source ----- https://www.wipro.com/analytics/how-a-top-utility-company-achieved-gdpr-compliance/ ----- Related Articles Contact Wipro Please fill the required details to access the content How a top utility company achieved GDPR compliance The multinational company built data inventory and enabled data protection with Data Discovery as a Service Client background Client: A leading Energy & Utilities company Industry: Energy & Utilities Area of operations: UK and USA Revenue: £15 Billion Challenge The client had major challenges in discovering and managing personal data that was spread across their vast data ecosystem consisting of 600+ data applications. Their applications and systems landscape consisted of multiple diverse technologies including legacy systems and other applications. Many of these systems were old and thus, there was lack of clarity about systems carrying personal data. The client needed an

appropriate solution that would support data discovery and creation of data inventory to help discover and protect data as required for GDPR compliance. Solution Wipro implemented Data Discovery as a Service using a data security intelligence and analytics product, and solutions for managing unstructured data on the client's systems and applications to help discover and build inventory for personal data. Solution highlights: Business impact The implementation of the data discovery solution enabled the client to take a holistic approach towards compliance, data discovery and data protection, and helped: "Wipro team delivered 'structured and unstructured data discovery engagement' for the client as part of GDPR compliance. The engagement started with the team assessing customer needs and suggesting the best possible technology solutions. The engagement had stringent deadlines and demanded high level of data accuracy due to regulatory nature of the engagement. Wipro team delivered the solution on time, exceeding client expectations. " - Raman Awal, General Manager, Information Management – Data, Analytics & AI, Wipro   Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

How a top tech company enabled consistent and trusted master data

----- Arcticle source ----- https://www.wipro.com/analytics/how-a-top-tech-company-enabled-consistent-and-trusted-master-data/ ----- Related Articles Contact Wipro Please fill the required details to access the content How a top tech company enabled consistent and trusted master data? Savings of $12 Million over five years due to migration to cloud-based master data management solution Client Background Challenge The client had been through a major reorganization. Its IT landscape dictated that the master data management (MDM) solution should be able to interface with all applications and provide better service levels and improved functionality. However, the prevalent MDM platform posed severe scalability challenges. The client was looking for a solution that could standardize customer management process and provide foundation for master data governance. It needed to move a large volume of records (Over 1.3 Billion objects) to a new highly scalable cloud-based MDM Platform. Solution Wipro implemented an effective data management solution for the client leveraging a Cloud-based MDM platform. Solution highlights: Business Impact The new MDM solution served as the backbone infrastructure for Sales Data Management to support partner profiling, account creation, and matching and alignment. The solution brought entire pre-sales customer and partner profiling

environments in to a single system of record with tight automated linkages to Business Intelligence, Channel Data Management, CRM, and Sales Compensation. This was a large MDM implementation on the cloud in terms of scale and size. The innovative cloud-based MDM solution helped the client move to a scalable platform with a strong foundation for master data governance. This resulted in savings of $12 Million over a period of five years. – Raman Awal, Global Practice Head - Information Management, DAAI, Wipro Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major

Global pharma drives 60% cost savings

in ERP data migration

----- Arcticle source ----- https://www.wipro.com/analytics/global-pharma-drives-60-cost-savings-in-erp-data-migration/ ----- Related Articles Contact Wipro Please fill the required details to access the content Global pharma drives 60% cost savings in ERP data migration Global data migration factory solution using data stewardship improves time-to-market by 20% Client: A global pharmaceutical company Industry: Healthcare Products: Pharmaceuticals, vaccines and consumer health products Employee: Over 100,000 employees Area of operations: Global Customers: Over 800,000 The Challenge The pharma giant was using various legacy ERP systems. This led to several challenges like multiple versions of truth, error-prone reporting, high costs of IT operations, and inefficiencies in procurement operations. The client initiated consolidation of its existing legacy systems into a single global SAP ECC 6.0 platform to transform its ERP landscape. This initiative cut across commercial markets, trading partners and manufacturing plant operations with objectives to standardize business processes, reduce the opex/capex and improve time-to-market. The client needed a global data migration strategy to leverage best-in-class industry practices and enable adherence to regulatory compliance. Solution Wipro executed Data Migration services leveraging Wipro-patented Data Migration Factory Framework to optimize the execution cost without compromising on quality and regulatory compliance. Migration services scope included rollout for over 50 market sites, spread across 33 countries with disparate processes and legacy systems. The key aspects of the solution approach were: Business Impact Implementation of the fully integrated Data Migration Factory Service brought in tighter compliance to regulatory processes, accelerated time to market, and improved cost of delivery and operational efficiency. Quote "55 sites, 33 countries with 11 go-lives in a

year– this was one of our largest SAP ECC data migration implementations. The implementation enabled the client to meet compliance and regulatory requirements, and accelerated time to market by 20%." – Raman Awal, Global Practice Head - Information Management, Data Analytics and AI, Wipro Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. University evolves into a data-driven enterprise

----- Arcticle source ----- https://www.wipro.com/analytics/university-evolves-into-a-data-driven-enterprise/ ----- Related Articles Contact Wipro Please fill the required details to access the content University evolves into a data-driven enterprise University establishes modern data environment and develops actionable insights at all levels of the organization Client background Client: A prestigious university in Australia Industry type: Education Number of students: Over 50,000 Challenges The university had disparate source systems for institutional data, leading to challenges in developing actionable insights. It wanted to build a modern data environment by integrating data from multiple data sources to enable analytics and relevant insights. The university needed automated information analysis and analytical reporting capabilities through data warehousing and business intelligence technologies. One of the major intents was to analyze the corporate credit card data to understand the spending patterns of the staff for compliance to rules and regulations. Solution Wipro implemented an effective data management solution and learning analytics solution for the client leveraging Talend Cloud-based SaaS platform hosted on AWS. As part of the learning analytics solution, Cloudera was leveraged for Big Data along with Talend as data ingestion and transformation layer, and Tableau as a consumption layer. Solution highlights: Some of the use-cases developed for consumption of insights were: Business impact The new modern data environment served as the backbone infrastructure for the university staff to enable spend analysis, student retention, contextual and demographic understanding of the student, and fine-tuning of the courses. This was a large Talend Big Data real time implementation on the Talend Cloud in terms of scale and size. Enterprise data warehouse and dashboard enabled the university to have improved visibility of spends incurred through the corporate credit card. The modern data environment helped in providing a university-wide resource for storage, management and review. It also allowed the university to keep its intellectual property safe and usable. -Raman Awal, Global Practice Head - Information Management, Data, Analytics and AI, Wipro

How a health tech major became a data-driven enterprise

----- Arcticle source ----- https://www.wipro.com/analytics/how-a-health-tech-major-became-a-data-driven-enterprise/ ----- Related Articles Contact Wipro Please fill the required details to access the content How a health tech major became a data-driven enterprise Client background Client: A multinational technology company Products/Services: Electronics, medical equipment Areas of operations: Global Challenges The client's business data was spread across multiple regions with each region having a different way of storing and reporting data. The client wanted to enable a single source of truth by consolidating its data and standardizing its data management processes. The current data landscape included 49 ERP kernels (data silos) residing across the globe in non-standard formats. The need was a re-usable and scalable ERP system compliant to latest standards, which could support reporting and tracking. To enable this, the client wanted to consolidate business data from all geographies into eight kernels and migrate data from the legacy SAP system to S/4 HANA system. Solution Wipro and the client worked together to build a strong competency centre to enable migration of data and native HANA reporting to support global deployments. For efficient deployment, many countries were merged under certain geographies, for instance - NLATAM was Peru, Costa Rica, and Colombia Solution highlights: Business impact Wipro efficiently orchestrated data migration from the disparate legacy systems to the centralized system for the client and delivered the project seamlessly with savings of 3300 person-weeks of effort by leveraging cross teams for deployment. The consolidation and standardization of data led to increased productivity and operational efficiencies. This was a large data migration program to accelerate data management across many geographies through a simplified and faster time to market solution. This enhanced clarity on data helped in rapid onboarding of new geos and new acquired entities. -Sridhar Havaldar, Sr. Program Manager - Information Management, Data, Analytics & AI Wipro Limited. How a large global bank simplified FATCA compliance

----- Arcticle source ----- https://www.wipro.com/analytics/how-a-large-global-bank-simplified-fatca-compliance/ ----- Related Articles Contact Wipro Please fill the required details to access the content How a large global bank simplified FATCA compliance Client background Client: Multinational banking and financial services holding company Industry: Banking, financial services Products/Services: Retail banking, corporate banking, investment banking, mortgage loans, wealth management, credit cards, finance and insurance Areas of operations: Global Challenges The Foreign Account Tax Compliance Act (FATCA) is a legislation introduced by the United States government to help counter US tax evasion by encouraging better reporting of FATCA reportable customers' information. FATCA intends to increase transparency for the Internal Revenue Service with respect to US persons that may be investing and earning income through non-US institutions. While the primary goal of FATCA is to gain information about US persons, FATCA imposes a withholding tax where the applicable documentation and reporting requirements are not met. The client was committed to become fully FATCA-compliant in all countries and territories where they operate. The main challenge was to meet the stringent timelines and avoid huge penalties for not adhering to FACTA implementation guidelines. Solution Wipro implemented a FATCA-compliance solution for the client with increased due diligence for commercial banking customers in stipulated timelines and in accordance with legal and compliance requirements, leveraging ETL, data integration, and database management tools. Solution highlights: Business impact Wipro implemented a commercial banking-remediation compliance solution for four European countries in record time of 12 months. This helped the bank in timely regulatory reporting, leading to increased reputation and trust with the bank's clients, shareholders and media. Wipro identified FATCA reportable customers by establishing complex algorithms and data analysis, leveraging various AI techniques, which helped timely regulatory reporting for the client and made it FATCA-complaint. - Raman Awal, General Manager, Information Management – Data, Analytics & AI, Wipro Limited. Financial services company takes control of its data

Financial services company takes control of its data Client background Client: A financial services company Industry: Insurance Products/Services: Insurance and superannuation, banking Areas of operations: Australia and NZ Challenges The client wanted to provide and maintain high standard of services to their customers. However, managing humongous customer information was challenging due to scalability issues. To meet their vision, they required data and analytics capability, which could provide actionable insights and support them in better decision making. The client need was a foundational information and master data management (MDM) system that could support analytical capabilities, understand the customer needs better, and generate more revenue opportunity. Solution Wipro implemented automation for MDM to maintain the golden records and utilize the information effectively. This helped keep the data accurate, complete and current/valid. The MDM solution had CRM and other business apps, which provided inputs and acted as source to the MDM app. The MDM solution was also integrated with an enterprise data warehouse (EDW) application. Solution highlights: Business impact The MDM application decommissioned the legacy CRM application and proved to be the key point for customer data and analytics capability. It allowed them to focus more on insights rather than data preparation. The client now has more control over the data with its MDM application taking care of all the data quality, governance and security issues. "This strategic MDM support proved to be the foundation for our client's data and analytics capability. The implementation of MDM test automation was enabled along with DevOps. This PaaS implementation manages millions of customers and is one of the largest implementations, in terms of scale and size. Automation improved the business responsiveness to their customers with cost savings of 20%." Raman Awal General Manager, Information Management – Data, Analytics & AI, Wipro Limited. Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. US financial services company makes data work for it.

Here's how.

US financial services company makes data work for it. Here's how. Client Background Challenge The client's data processing system had been built over two decades across multiple lines of business with over seven thousand data pipelines. These pipelines/workflows carried out extract, transform, and load of data as well as various analytical calculations, which was then stored in the enterprise data warehouse. The legacy system had scalability issues, as the throughput was not adequate to meet the client's growth plans. The tool also had low adaptability to new big data technologies. To add to that, the customer was paying millions of dollars as license cost for the legacy product. The client was bracing for more sophisticated fraud detection, enhanced security protection, etc. and this required additional data processing for new data attributes being captured, real time data processing and quicker turnaround time. Solution Wipro built a new platform on Spark, the open source data processing framework, using Java/Scala due to its ability to scale up easily as well as process high and varied data volumes within a limited time. The solution components included: Business Impact The transformation to Spark platform enabled the client with a comprehensive framework to manage big data processing and sophisticated analytics with speed and flexibility. This led to a number of benefits, both short term, and long term: The new Big Data platform provided the customer the processing power required to minutely analyze the data and capture every aspect of the dynamics of the business. The company is geared for future business expansion as it is no more restricted by the computational power of the system. Judhajit Senmazumdar, Director - Data Analytics & AI - Global Sales, Wipro Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Top manufacturer creates pricing advantage

Top manufacturer creates pricing advantage Client background Client: A leading multinational company Industry: Manufacturing Products / Services: Industrial machinery, electronics Areas of operations: Worldwide Challenges The client, which manufactures multiple products in different business segments and markets them globally, were facing difficulties in achieving faster quote turnaround time for pricing negotiations with its customers. The client's existing technology had limited capabilities to capture and measure market pricing, assess the impact of pricing actions and decisions, and support transactional negotiations across all products. They were not able to identify the pricing levers that were affecting their profitability. Therefore, pricing and sales tactics were not meeting market trends and requirements, resulting in inconsistency in pricing execution, significant margin drop and lost revenue. Solution Wipro implemented a pricing transformation initiative that assessed the client's pricing and sales effectiveness as well as transformed key elements of strategy, price setting, and transaction and performance management. The solution included data integration, transformation, building of a data lake, automation using the open source business intelligence tool Pentaho, and data storage in Amazon Redshift. Solution highlights: Business impact The client enabled best-in-class pricing capability as a core competency and competitive differentiator. The pricing transformation enabled the client to measure the impact and effectiveness of pricing decisions throughout the pricing lifecycle. It enabled automated, intelligent, and data-driven negotiation governed by policies and pricing guidelines. This was a complicated data integration implementation in terms of scale and size. The pricing data mart enabled business users to identify poor pricing practices, make data-driven decisions, identify high and low performing customers and products, and measure impact on revenue. - Raman Awal Global Practice Head - Information Management, Data Analytics and AI, Wipro Limited. Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Telecom company transforms into an intelligent enterprise. Here's how.

Contact Wipro Please fill the required details to access the content Telecom company transforms into an intelligent enterprise. Here's how. March | 2020 Client background Challenge The client was adding a variety of customer-facing services and applications across its digital channels. These channels and services, in turn, were generating valuable customer data that could help draw insights to further fuel business. However, the client's legacy data warehousing and campaign management systems could not be easily integrated with the digital channels. The new sources of data and the systems were not streamlined to handle various data formats. These could not be scaled to store the growing data volumes, and batch processing/ latency issues prevented the client from making effective use of the data. The option to add storage to the legacy system was not cost-effective as it would mean making large investments in license and maintenance costs. The client's campaign management system was also not able to cope up with the various business demands due to technical constraints in their legacy data warehouse system. Solution To leverage the availability of rich data, to extract real-time actionable intelligence, and to execute real-time personalized campaigns, the client engaged Wipro to build its next-generation data-warehousing platform and campaign management platform. The goal was to build a foundation that could measure customer inventory, launch real-time marketing campaigns and evaluate 160 KPIs used to improve uptake of new products and services while delivering an increase in average revenue per user. Over a period of 1.5 years, Wipro worked on a program that cut across the user base leveraging a modern Ab Initio Collect/ Integrate framework and Cloudera Big Data and Hadoop ecosystem. The system was architected to provide scalability and the ability to process high volume and variety of data in real time. The Ab Initio interface provided business users the ability to add new sources of data and configure new business and campaign rules without any dependency on the technology team. The implementation of the campaign management platform involved complex integrations with channels and other surrounding systems including business intelligence. Business impact Business impact with the new data warehousing system and campaign management solution, the client placed itself firmly on the road to becoming an intelligent enterprise. The new platforms provided several business capabilities and benefits "This was an innovation and insights-driven implementation, enabling revenue growth for the client. Overcoming the legacy barriers, we created a real-time data provisioning and insights platform and deployed configurable campaign management solution to help provide personalized offers to its subscribers and thus improve customer experience." - Raman Awal, Practice

Leading Canada and US Bank Develops Intelligent Decision-Making Capability through Data Transformation

Related Articles Contact Wipro Please fill the required details to access the content Leading Canada and US Bank Develops Intelligent Decision Making Capability through Data Transformation July | 2020 Client background Challenge The client's data management environment was highly fragmented with data stored in disparate information management systems. This hampered timely delivery of transactional reports, impacting customer experience and business continuity. Lack of visibility into enterprise-wide data, combined with a sluggish data processing platform hindered users' ability to get comprehensive insights into customer needs. In addition, it was crucial to modernize the legacy data platforms to optimize costs. The client was therefore looking to build enterprise data lake infrastructure and framework for insights- and AI/ML-driven analytics while modernizing legacy data repositories. This was crucial to reduce infrastructure cost, avoid duplication of data sets, and enhance regulatory compliance by adhering to international standards, such as DFA and BCBS principles. Solution Wipro implemented data modernization across the enterprise to create an integrated data ecosystem spanning across more than 100 source systems and 10+ lines of business. The layered architecture helped the client improve data consistency, enabling business users to gain access to enterprise-wide data in Information-as-a Service model. Wipro also enabled advisory services for strategic maturity assessment, helping clients develop their new age data and analytics roadmap. The highlights of the solution include: Business impact Wipro helped the company leverage intelligence by enabling transformation of their data and insights processes. The solution helped the client: Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5

Global IT giant manages 1.3 billion customer data with intelligent data platform

----- Arcticle source ----- https://www.wipro.com/analytics/global-it-giant-manages-1-3-billion-customer-data-with-intelligent-data-platform/ ----- Related Articles Contact Wipro Please fill the required details to access the content Global IT giant manages 1.3 billion customer data with Intelligent data platform September | 2020 Client background Challenge The client had been through a major reorganization, which led to the need to streamline its IT landscape and business processes with the new operating model. The legacy Master Data Management (MDM) platform was not able to interface with all the business applications in the new environment and posed scalability challenges to business users. Other challenges the client faced to run its day-to-day business included: Hence, the client sought an experienced partner to help migrate their MDM solution to a new platform and establish a corporate master data governance process. Solution The client chose Wipro as the preferred partner due to their decades-long experience of working with global companies, and their proven capability in large-scale data transformation initiatives. After studying the legacy MDM platform, a robust, flexible and secure solution with data models, data analysis and profiling, data migration, custom utilities creation, match / merge rule setup, and fine-tuning was built on Reltio MDM platform. The new MDM solution served as the backbone for Sales Data Management and supported partner profiling, account creation, matching and alignment. The transition to Reltio also enabled single system of record with tight automated linkages to Channel Data Management, Business Intelligence, CRM and Sales Compensation. Key highlights Business impact With the implementation of Reltio MDM solution, the client was able to realize cost savings of over 12 Million USD in a span of five years. The transition to a cloud based solution ensured optimal use of resources with minimal maintenance, bringing down costs and leading to a more efficient MDM platform. With the ability to handle contact preferences at scale, the solution maintained privacy norms, thus sustaining the client's brand image. Some of the key outcomes of the MDM implementation were: Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Leading aerospace company harnesses best-in-class HR analytics capability in their journey to becoming an Intelligent Enterprise

----- Arcticle source ----- https://www.wipro.com/analytics/leading-aerospace-company-harnesses-best-in-class-hr-analytics-capability-in-their-journey-to-becoming-an-intelligent-enterprise/ ----- Related Articles Contact Wipro Please fill the required details to access the content Leading aerospace company harnesses best-in-class HR analytics capability in their journey to becoming an Intelligent Enterprise Leveraging Azure cloud helps the customer save costs, reduce processing time and efficiently manage enterprise data December | 2020 Client background Client: A leading aerospace company Industry: Manufacturing – Aerospace products Products/Services: Aerospace machinery Areas of operations: Worldwide Challenges The client's two-decade old HR analytics system was inadequate to meet modern-day real time reporting needs for the client. The data warehouse ran HR reports (employee productivity, satisfaction, diversity, ethnicity, etc.) in batch mode on a monthly basis and took up to 20 hours for report generation. As a result, it was difficult to make real-time data-driven decisions on matters such as employee incentive and project bonus to attract, manage and retain employees effectively. Moreover, these HR reports were critical in nature as they were accessed directly by the Chief Financial Officer (CFO), and other c-suite executives to ensure compliance to government and regulatory bodies' guidelines on employee diversity, workplace practices, etc. Non-compliance could invite heavy legal, financial and reputational damages to the client. Also, in the current context of the COVID-19 pandemic, it was important for the client to have real-time employee information in order to implement dynamic changeover of resources as needed. For instance, mapping employees' location proximity to field locations to ensure employees residing nearby were sent on site visits, thus minimizing travel and ensuring employee safety. The client decided to embark on a digital analytical platform implementation initiative to transform the existing HR analytics data warehouse and business intelligence systems for the digital age. Solution The client partnered with Wipro to spearhead a large-scale intelligent HR transformation exercise leveraging the power of digital technologies. The Wipro team migrated the legacy HR system to Azure cloud to ensure agility and on-demand scalability in reporting. Wipro's intelligent HR analytics solution covered three broad dimensions: Business impact Wipro's proven solution and accelerated implementation helped migrate historical data from legacy HR system to Azure cloud. The new platform handles 500 GB of data daily. With this best-in-class HR analytics capability as a core competency and competitive differentiator, data-driven decisions were enabled for the client, accelerating

their journey to an Intelligent Enterprise. Key business benefits delivered to the client include: Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major ========================

Wipro Teams with Large US Bank to Reduce Infrastructure Costs and Align with 'Data Centre Exit' Strategy with Hadoop Platform

----- Arcticle source ----- https://www.wipro.com/analytics/wipro-teams-with-large-US-bank-to-reduce-infrastructure-costs-and-align-with-data-centre-exit-strategy-with-hadoop-platform/ ----- Related Articles Contact Wipro Please fill the required details to access the content Wipro Teams with Large US Bank to Reduce Infrastructure Costs and Align with 'Data Centre Exit' Strategy with Hadoop Platform Situation A large international bank had a long-term strategy of reducing the company's data centre footprint. Using its Cloud-first approach, it sought to transform the banking customer experience. With more than 40,000 employees and operations in the US, UK, and Canada, this bank renders a variety of services in retail and commercial banking, credit cards, and auto loans. To achieve this strategy, a key requirement was implementing a Cloudera EDH platform migration on cloud that included: Solution Wipro's Delivery Transformation group focused on agile transformation to reduce delivery times and drive best DataOps practices. The innovation council led the way by creating architectural design patterns to accelerate the migration of their Hadoop platform to cloud. Cloud-native modern design patterns were used to build the automated reusable frameworks for migration, data quality, EDW and ETL modernization accelerators, data lake and cloud data engineering tools, and big data applications, successfully deployed at scale using these frameworks. The following best practices were followed for EMR consumption: Business Outcome The Hadoop platform migration journey, brought immediate benefits, including In addition, the team added more than 20 global scrum teams across different LOBs, 1000+ Cloudera workloads were rationalized and re-engineered on AWS, and 500+ new big data applications built on AWS Hadoop platforms using cloud-native and open-source frameworks. The client's long-term strategy of reducing the company's data center footprint was realized, going from eight in 2014 to three in 2018, and none by 2020.   Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML

and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Accelerating a Pharmaceutical Leader's Time to Market with BI Modernization

----- Arcticle source ----- https://www.wipro.com/analytics/accelerating-a-pharmaceutical-leaders-time-to-market-with-bi-modernization/ ----- Related Articles Contact Wipro Please fill the required details to access the content Accelerating a Pharmaceutical Leader's Time to Market with BI Modernization March | 2021 Client Background Challenge The global pharmaceutical market is projected to grow at a compound annual growth rate of 13.74% from 2020 to 2027. To maintain its position in this fast-growing industry, a global pharmaceutical leader sought to reduce the time to market for its healthcare innovations. The company recognized that boosting its efficiency, eliminating redundancies, and launching a next-gen reporting platform could deliver greater insights and lead to improved decision-making for its global teams. Optimizing its business intelligence (BI) landscape to be faster, more systematic, and standardized was critical to achieving this objective. Solution Wipro studied the pharmaceutical leader's existing BI inventory on its legacy COGNOS system. The COGNOS platform had functioned for years across multiple lines of business for enterprise and self-service reporting. Although it had supported strategic decisions, operational KPI monitoring, ad-hoc analytical reports and visual canvases, the BI system required modernization to handle the company's future needs. Based on strategic discussions with the client's BI teams, Wipro proposed a robust, flexible solution to migrate the company's platform to Tableau using SNIPE, Wipro's next-gen BI transformation toolkit. This solution helped to simplify and standardize the COGNOS landscape by creating detailed rationalization outputs based on reports and usage data for each line of business. SNIPE's automation capabilities to accelerate Tableau migration empowered the pharmaceutical leader to begin its transforming into an intelligent enterprise in a scalable way. Meanwhile, Wipro's BI modernization competency center served as the backbone for the pharmaceutical leader's migration to a future-ready BI landscape. Business benefits The automated metadata extraction of more than 3,000 COGNOS reports into a central repository enabled full self-service through an advanced UI, delivering a 25% increase in business productivity. Furthermore, the BI landscape became 22% leaner due to the migration to Tableau and elimination of redundant and obsolete reports on COGNOS. The Tableau transition also increased BI migration productivity by 35%, significantly reducing the leader's time to market for its pharmaceutical innovations. Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major

implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major

Improving Processes and Cost Savings through Automation for a Financial-Services Leader

----- Arcticle source ----- https://www.wipro.com/analytics/improving-processes-and-cost-savings-through-automation-for-a-financial-services-leader/ ----- Related Articles Contact Wipro Please fill the required details to access the content Improving Processes and Cost Savings through Automation for a Financial-Services Leader June | 2021 Client Background: Challenge: A multinational investment bank and financial-services company had experienced significant growth, and business projections anticipated the positive trend to continue. The subsequent growth in data would stress the company's existing storage and computing capabilities, and operational risks would arise if the data became too siloed and caused increased on-premise expenses. To maximize its efficiency, visibility, and collaboration, the company hoped to migrate to a platform that would improve its ability to process large data sets while scaling to meet growth projections. It also hoped to save costs while enhancing overall security. Solution: The client wanted to offload a significant amount of their big-data workloads and consolidate their data lake on Azure to reduce operational expenses and enhance security for their entire ecosystem through a scalable platform that responds to clients more quickly, even during peak operational hours. With an aim to facilitate seamless platform modernization and faster delivery, Wipro developed a platform based on solution accelerator IntelliProc to automate big data workload conversion to a Spark equivalent and deploy it into Azure Databricks. The Databricks platform was set up to ingest data from various sources and perform analytics, eliminating the problem of siloed data. IntelliProc's high-level automation of business logic conversion and data mapping validation features was designed to improve data integrity and accuracy for the client, which previously was a challenge for their teams. Business Impact: IntelliProc modernized existing big-data workloads at scale to leverage the benefits of Azure Databricks. The development, data quality, and testing phase guaranteed 35% effort savings, and implementing the Azure Databricks environment significantly reduced the on-premise expenses and helped in elimination of the traditional siloed data ecosystem which led to better collaboration among the data teams in a more secured environment. The use of Databricks improved client data team productivity by 20%, and the scalable environment provided better computing capabilities with increased operating efficiency and lowered infrastructure costs by 25%. IntelliProc also converted big data workloads–Hive and Impala scripts into their Spark equivalent—which led to a more than 60% overall effort reduction. The converted scripts had no changes to the business logic,

saving cost and time. The requirement gathering phase manifested up to 40% effort savings. Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major ======================

Transforming Data to Accelerate Business Value for Software Leader

----- Arcticle source ----- https://www.wipro.com/analytics/transforming-data-to-accelerate-business-value-for-software-leader/ ----- Related Articles Contact Wipro Please fill the required details to access the content Transforming Data to Accelerate Business Value for Software Leader September | 2021 Client background Challenges To accommodate its continued growth through mergers and acquisitions, one of the world's largest enterprise software providers needed an efficient way to manage the vast amount of data associated with its strategic initiatives. Its existing IT system aggregated 35 disparate systems, each with varied processes, business models, and legacy applications. The software leader sought a solution that would provide a single source of truth, streamline and integrate end-to-end business processes, and reduce operational costs. Such an integrated platform would also empower the company to improve sales planning, enable various planning and forecasting use cases, and gain a 360-degree view of its four business domains: customer, vendor, products, and finance. Solution: Wipro partnered with the company to create a six-layer data migration program to provide a consolidated view of enterprise data across all four domains. This initiative accounted for 200 million records spread across eight target systems and created a 360-degree view of customer data, enriched with vendor and product master data to help with cross- and up-sell opportunities. This allowed the sales team to target its most profitable customers and accelerate the sales planning process. The system smoothed the migration process by using pre-built canonical models to map data from all source systems with target data model and a stringent program governance with multi-layer data reconciliation. Wipro also implemented a new BI solution with data-acquisition layers to enable near-real-time reporting for business users, thus improving data consistency and maintaining a single source of truth. To manage data enrichment from third-party vendors, the system seamlessly integrated a multi-domain master data management (MDM) platform from Informatica. Batch and real-time integration of business applications like SFDC, NetSuite, Workday and Anaplan enabled the software leader to improve use cases like sales planning, IT project cost planning and human capital management. Meanwhile, a legal consolidation system (OneStream) was integrated into

the overall architecture to help meet the company's compliance requirements. Outcomes This large-scale implementation consolidated 70 SaaS applications into 20, allowing the enterprise software leader to reduce operational expenditures by 50% to 60%. The state-of-the-art framework also transformed the company into a future-ready enterprise with the ability to easily onboard any new acquisition and integrate it seamlessly with the existing MDM system. With the informatica MDM, the software company realized a 45% reduction in the number of duplicate accounts and reduced its master data setup cycle time to less than 5 hours, thus accelerating the end-to-end the business process integration. The company's improved data visibility across its planning models empowered business users to forecast efficiently and more accurately, while its newly simplified planning process reduced the planning duration from two weeks to two days. Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major ======================

Boosting HR Efficiencies through Artificial Intelligence

----- Arcticle source ----- https://www.wipro.com/analytics/boosting-hr-efficiencies-through-artificial-intelligence/ ----- Related Articles Contact Wipro Please fill the required details to access the content Boosting HR Efficiencies through Artificial Intelligence September | 2021 Client Background Client name: Wipro HRSS Industry type: IT consultancy Area of operations: Global Products or Services: IT Services Challenge Wipro's Human Resources Shared Services (HRSS) serves more than 200,000 employees across six continents. This expansive workforce leads to extraordinary volumes of data, complicated by process variations for each country, that risked causing delays in onboarding, background-check verifications, insurance enrollments, and payroll. Mindful of the company's growth projections, Wipro HRSS hoped to design and implement a system that not only enhanced the employee experience, but also generated measurable business value by accelerating process turnaround times, thus reducing operational expenses and freeing HR to focus on strategic issues rather than manual and transactional activities. Solution Wipro's AI Solutions team used an Enterprise IQ framework to help develop a transformational plan that identified and implemented multiple use cases across the full "Hire to Retire" track. This approach used several AI solutions and Wipro's Holmes augmented intelligence platform to create and implement a new, more efficient system. The solution combined Wipro Holmes with Google OCR and advanced machine-learning techniques, automating tasks such as new-hire and agency background verification, enrollment via a third-party insurance portal, and digitizing payroll accounting. The solution also achieved 100% touchless hyperautomation of

HR processes by applying a re-engineered, AI-first process that combined smart data capture, AI, RPA, and chatbots. Automating these processes would improve turnaround times, reduce errors, and eliminate the manual processes that were stymying the teams' abilities to focus on value-added activities. In addition, the employee experience and compliance elements were improved with use cases such as Employee Appraisal Conversational Assistant, Employee State Insurance Registration, the Embark Assistant, and travel and expense fraud detection. These features added flexibility and security while enhancing the customer experience through automation, quick responses to queries, and real-time fraud prevention. Outcomes This AI-driven approach generated a total business value of approximately $25 million due to operational savings in the form of efficiency and productivity gains. Background document verification speed increased 10x, payroll turnaround times reduced by 98%, and productivity doubled while maintaining 90% accuracy of data extraction. Meanwhile, the automation in this award-winning solution helped reduce employee onboarding times from 7-8 days to 3-4 days and eliminated many repetitive tasks, enabling HR teams to focus on more-strategic tasks while transforming the employee experience touchpoints. Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major ======================

Enabling a Customer-Centric Future for an Australian Telecommunications Leader

Related Articles Contact Wipro Please fill the required details to access the content Enabling a Customer-Centric Future for an Australian Telecommunications Leader September | 2021 Client background Challenges: One of the largest telecommunications companies in Australia collected and stored data across more than 20 siloed sources. Eliminating these siloes would allow the company to increase its data quality and consistency, boost data-access speeds, and improve the customer experience. It would also enable data scientists to spend time creating models that could bolster the company's cross-selling/upselling efforts and ROI. The telecommunications leader envisioned a system that provided a 360-degree view of the customer and eliminated the need for data scientists to spend more than 80% of their time organizing, formatting, and cleaning data. With improved customer data quality and access, business users could spend more time developing analytics, use cases, and models that allowed them to better track and improve customer churn analytics, estimate

customer lifetime value, and provide personalized product and content recommendations. In short, the transformation would make the Australian company a customer-centric enterprise. Solution: Wipro eliminated the data silos and created an easily accessed single source of truth by implementing an Informatica master data-management (MDM) solution across business, governance, data, and technology functions. This approach, coupled with a data-governance strategy and ETL tools, resulted in a master repository that provided a 360-degree view of the Australian company's 85+ million customers. The solution then accelerated data-science workflows by implementing feature engineering as a separate process. This enabled data scientists to reduce their model-building times and deploy analytical models more quickly, avoiding the previous time commitments for non-analytical work. With this easily accessible and simple-to-use data product, analysts could complete daily tasks without complex programming skills. Meanwhile, the MDM solution provided a seamless customer experience with real-time marketing updates via a self-service portal, and it improved customer serviceability via consolidated customer addresses. Outcomes: The new customer-centric view eliminating the need for manual efforts from data scientists, delivering 87% accuracy in customer match rates and 400 transactions per second in the customer-data hub. It also generated more cross-selling/upselling opportunities and increased marketing effectiveness by 60% due to seamless data flow to the campaign management system, which created better insights. Existing customer data quality improved by more than 90%, increasing ROI from data science projects. The solution also improved business experience with API-based self-service for marketing, billing and customer care teams to access customer data in real time. Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major ======================

Strengthening Business Processes and Customer Experiences through Cloud-enabled platform

----- Related Articles Contact Wipro Please fill the required details to access the content Strengthening Business Processes and Customer Experiences through Cloud-enabled platform December | 2021 Challenge An Australian energy-distribution company wanted to become more customer-centric across its organization and provide a superior customer experience. Achieving this required migrating business processes to a cloud-based infrastructure, a strategic decision that would consolidate data from disparate third-party vendors, enable the company to gain valuable insights

by breaking down data silos, and improve operational efficiencies. This transformation would also minimize delayed and potentially erroneous communications to customers regarding outage and financial reconciliations. Solution Wipro's solution was built to enable a consolidated view of energy customers and simplify operations management for the brand's customer business teams. This was achieved by adopting an industry-leading, new-age SAP IS-U platform on S/4HANA using Azure cloud, which entailed extensive data migration. Wipro developed and executed an end-to-end strategy for migrating and consolidating two years of historical data from four different source systems comanaged by the energy leader and a third-party IT partner. Upfront data profiling helped identify data gaps early and improved business process efficiency, allowing manual cleansing activities to be planned on a monthly basis for 100-plus business rules. An automated data remediation using rule-based cleansing resulted in increased throughput, especially for high-volume data scenarios. The automated migration resulted in a 99.99% success rate, and a Wipro solution built on SAP Business Object Data Services (BODS) and EMIGALL enabled a minimized error rate. Benefits With the migration and consolidation complete, the Australian company gained a unified view of its consumers' data to better serve their needs. By retiring its legacy system, the energy distributor dramatically simplified its customer and billing business processes with minimal disruptions. Its omnichannel customer experiences were enhanced with timely, data-driven customer communications, and no time was wasted on correcting or reconciling data that's critical to managing outage notifications to customers. The organization also saw a reduction in the total cost of ownership of its IT infrastructure for the migrated legacy applications related to customer, billing, and revenue management operations. Migrating right the first time led to further financial benefits, saving the enterprise approximately AUD$3 million (on average). This was mainly based on avoiding 5% of billing and revenue exceptions that typically occurred in legacy applications attributed to 50,000 National Metering Identifiers (NMIs). The successful data migration of these NMIs to a new-age platform resulted in savings of approximately 25,000 person-hours of effort. Wipro employs predictive analytics for Store labor optimization for a leading US retailer leading to enhanced customer experience and $100 million in estimated savings. Wipro helped a global financial services major implement a consolidated platform for AML and Trade Surveillance across geographies, bringing down annual TCO by 30% Wipro's high-performance Big Data platform projected savings of USD 1.5 Mn from campaigns for a global medical device and pharmaceutical major =====================

Volkswagen Credit, Inc. Transforms
Data Science Capabilities with
Amazon SageMaker

Contact Wipro Please fill the required details to access the content Volkswagen Credit, Inc. Transforms Data Science Capabilities with Amazon SageMaker Challenge VW Credit, Inc. (VCI), a financial services arm of Volkswagen Group of America, provides competitive financial services to its dealers and 1.2 million customers. The credit arm wanted to provide more timely and customized products to its customer base. VCI was working with disparate on-premises data-science platforms. Achieving its goals would require consolidated data that provide timely insights to improve price-prediction models and MLOps efficiencies to improve the time to market. Better insights and decision-making are essential for near real-time loan approvals, adaptive price prediction models, etc. These improvements would help VCI offer its customers the right mix of services exactly when needed. Solution Cloud migration was required to allow integration of all platforms, provide a unified view of data and provide the ability to see market changes in real-time. VCI collaborated with Wipro and the AWS team for the cloud migration journey. Wipro proposed a modular phased approach with the creation of a detailed architecture design for data model migration. Wipro leveraged the Amazon SageMaker ecosystem for the cloud migration journey and other required features like security (encryption keys, VPC), automation, notification and alerts, integrated and automated logging, monitoring services and future model scalability. The complete solution leveraged a wide range of AWS services: SageMaker notebooks help VCI data scientists quickly build new machine learning models – from developing, building, training and deploying. Reusable frameworks expedite feature engineering, model training and model deployment. SageMaker Model Monitoring service automated model monitoring – if there is data drift, the accuracy of models could impact the price prediction leading to potential revenue losses. Automated monitoring helps VCI capture all inference requests, compare them against baseline on a defined schedule (hourly, daily, etc.) and send timely alerts. AWS Step Functions Data Science SDK framework, created by Wipro, helps VCI data scientists quickly create ML lifecycle workflows, effectively orchestrate all model lifecycle steps, ensures conditional checks and approvals for model deployment, and sends notifications for any failures. New machine learning models are published seamlessly to give VCI the agility to respond to changes in the market. Amazon Event Bridge and SNS allow DevOps teams to configure and standardize type and text content for all notifications and alerts. Wipro created event-based triggers to invoke the state of machine model training/ retraining, model scoring and model monitoring. SNS notification service

sends email/SMS notifications for any SDK pipeline status change and success or failure events to promote faster resolution. Amazon Cloud Formation Templates automated the deployment process with no manual interventions for code migration to the higher environment. Reusable cloud formation templates enable automated deployments, minimizing errors from incorrect code promotion. Features include version control with automated CI/CD pipelines resulting in higher code consistency across multiple environments. AWS Lambda provides serverless computing that listens to the event notifications and executes code in response to the events. In addition, it automatically manages compute resources to drive efficiency. AWS S3 stores objects with customer-managed encryption keys and Amazon Cloud Watch is logging and monitoring resources to ensure that data and models are secure. Business Impact For VW Credit, Inc., the benefits of the solution are far-reaching. VCI has reusable templates for model pre-processing, training, deployment templates, etc. The templates reduce the effort required for onboarding new use cases and ML models. The new architecture is scalable and can grow with future needs. The data science team has streamlined workflows to structure their code and promote collaboration and automated pipelines are improving model training and deployment. Batch-based and real-time Inference pipelines help accelerate the model deployment process, and integration with applications is helping improve model adoption. Continuous model monitoring and drift notifications help the team take quicker proactive action on data anomalies or model performance degradation. While all these new capabilities are driving the desired efficiency and performance of the data science and DevOps teams, the features have given VCI the ability to provide new, timely and custom financial products to their customers. According to Chirag Patel, Software Engineer Technical Lead and Jaymin Mehta, Senior Manager, Big Data and Analytics, "With the help of Wipro and the AWS team, we were able to consolidate our data science platforms and automate the MLOps pipeline with proper monitoring. This will help us to achieve elasticity and scalability for our data science platform."

Wipro and Integra LifeSciences, Continuum of Care Delivered Through Technology Modernization

----- Arcticle source ----- https://www.wipro.com/analytics/wipro-and-integra-lifesciences-continuum-of-care-delivered-through-technology-modernization/ ----- Contact Wipro Please fill the required details to access the content Wipro and Integra LifeSciences, Continuum of Care Delivered Through Technology Modernization Ambition Doctors and surgeons around the world depend on Integra LifeSciences's products and solutions to deliver the vital neurosurgery treatments that patients need. As a global leader in medical devices used in treating soft tissue, nerve, and tendon issues, the

enterprise's ability to continually meet ongoing medical demands requires an extensive and effective data analytics platform. The legacy platform was a source of frustration as it required an eight-to-ten-hour nightly refresh, costly maintenance overhead and integration challenges. Even worse were the delays in processing critical data that was interfering with Integra's ability to make business critical decisions and help patients and surgeons globally. Recognizing that keeping such platforms up to date is necessary for staying competitive, Integra developed a strategic transformation program to modernize its analytics operations and achieve greater business value. Ensuring that Integra's data warehouse was utilizing the latest cloud innovations would enable its teams to make better and faster data-driven business decisions, avoid delays in access to critical information, and better understand their markets. The enterprise also sought to improve product quality, enhance data ingestion processes, and accelerate product development while saving costs. Action Wipro was selected as a strategic partner for the transformation program based on Wipro's deep understanding of the healthcare domain and excellent data and analytics credentials. Working side-by-side with the Integra team, and after careful evaluation and multiple proofs of concept, Wipro architected an ecosystem of the most effective technologies and partners. Azure Data Platform Cloud services were selected for Enterprise Cloud Data Architecture, and a reputed ecosystem partner was selected for data-processing engine for the lakehouse platform. Wipro adopted a two-pronged approach by, first, designing and developing its next-generation data lakehouse, leveraging Wipro FullStride Cloud Services. Second, migrating to a data-processing engine to enable Integra to effectively gather real-time data, enable AI/ML usage and create a single view of its customers. Ambitions Realized With the new platform in place, Integra gained a series of valuable efficiencies, both in its data processes and across business operations. The life sciences leader could decrease manufacturing defects by 10%. The company decreased its lag in data availability by 52% and reduced its data warehouse loading time by 60%. Integra cut the amount of delays its teams were experiencing in receiving and processing stockouts and inventory data by half. The new platform also delivered financial benefits based on reducing operating costs by more than 45% and dropping license costs by 50%. By collaborating with Wipro, Integra solidified its leadership in the medical device industry and expanded the tech maturity of its organization. The faster processing times led to greater agility and the enhanced analytics platform allowed the company to become more customer focused. Following the implementation, Integra can meet its business SLA's with confidence and focus on bringing life-saving medical technologies to surgeons and patients throughout the world. =====================

Stronger Collaboration and Better Decision Making Through EPM Automation at Cigna

----- Arcticle source ----- https://www.wipro.com/analytics/stronger-collaboration-and-better-decision-making-through-epm-automation-at-cigna/ ----- Contact Wipro Please fill the required details to access the content Stronger Collaboration and Better Decision Making Through EPM Automation at Cigna Cigna boosts compliance and efficiency with automation and EPM modernization. Ambition Cigna recognizes the importance of quality data for its external and internal reporting for both its business and its customers and has been taking steps to foster a truly data-driven culture throughout its entire organization. Enterprise performance management (EPM) tools are critical to this process. So, when Cigna went to modernize its EPM landscape, it took a comprehensive approach that would accelerate its digital transformation efforts. The existing Oracle EPM landscape was vast and complicated, designed to meet the numerous financial reporting needs of Cigna's global operations. More than 15 EPM applications were supporting planning, budgeting, forecasting, consolidation, and allocations for multiple users across countries. Multiple source systems fed data into these applications for monthly, quarterly, and yearly reports. By streamlining planning and consolidation processes and increasing efficiency, Cigna hoped it could reduce close-cycle times and ensure that teams completed regulatory reports on time. A new automation-friendly approach to management reporting would also increase forecasting accuracy, enabling the business to cut costs and increase revenues. Cigna knew that financial planning and consolidation processes would require constant monitoring to ensure successful data load and remediation of failures. Due to the criticality of the relevant business processes and strict time-to-market demands, Cigna also needed 24x7 vendor support to meet its strict SLAs. Action Wipro consultants developed multiple end-to-end automations for functions such as data loads, data extracts, data copy, and clear zero data. These automations eliminated manual interventions, improved accuracy, and saved time for both the business and IT. Wipro also worked with Cigna to develop new allocation processes and a solution for integrating newly acquired entities into the EPM landscape, enabling seamless data loads and faster close cycles. Cigna partnered with Wipro to create a team capable of managing its Oracle EPM applications. Wipro implemented an onsite-offshore model with 24x7 support during the month-end and year-end close cycles and budget/forecast cycles to ensure zero downtime for the business. Along with managing production operations, the Wipro team has taken complete ownership of knowledge management (maintaining and creating knowledge repositories and new SOPs) and status reporting. The team also participates in functional and performance application design and testing. With strong program leadership in place, Cigna is now working with Wipro's Managed Services EPM Support team to address additional business KPIs and further enable an IT ecosystem that maximizes business impact. Nafia Sekander Application Development Director Cigna Ambitions Realized By modernizing legacy processes and

adopting new automations, Cigna increased the efficiency and accuracy of its EPM processes, achieving a range of business benefits. Time of data load cycles reduced by 30%, enabling more timely completion of internal and regulatory reporting. Cigna also reduced the database size of this Oracle Essbase application by 40% and reduced its processing time by 25% by customizing allocation rules/calculations. Wipro has delivered on SLAs 98% of the time during steady-state operations, considerably reducing the time it takes to close the month-end reporting cycle. With a more responsive enterprise performance management system now in place, Cigna business users are able to access essential data more quickly and efficiently and leverage that data to make decisions that will drive the business forward. Contact Us =====================

Empowering Business Intelligence through BI Transformation

----- Arcticle source ----- https://www.wipro.com/analytics/empowering-business-intelligence-through-bi-transformation/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Empowering Business Intelligence through BI Transformation August | 2019 Introduction If age is catching up with any business input, it has to beBusiness Intelligence (BI). The ever-popular two-dimensional charts and spreadsheets littering the desks of productionheads, sales managers, procurement executives and financial chiefs are being retired quickly. They are being replaced with sophisticated dashboards, visualizations, reports and query engines. These are not new tools. They have been around, within the domain of IT specialists at very large corporations. But now, they are available to business leaders, small business owners and just about anyone keen to know industry trends, spot business problems and opportunities, improve decision making and boost operational efficiencies. One can imagine how sophisticated and pervasive BI can become when you look at how Uber, the marketplace for drivers, uses it. Uber presents real-time business intelligence to drivers with its dynamic peak-time surge pricing mechanism. By offering more take home dollars for service rendered within a small geographic area, Uber instantly attracts more taxis to the area, keeping supply and demand balanced. What better proof of the efficacy of BI than this every day example? De-bottlenecking technology with technology BI is changing faster than ever before. Driving this change are technology trends like Cloud, Mobility, Big Data, IoT, Artificial Intelligence and Analytics. Simultaneously, the demand for data and insights from users is growing as competition increases and regulatory requirements become more stringent (especially in industries such as BFSI, Retail and HLS). The bottleneck in keeping up with this rate of change is legacy technology. Systems and platforms that were adopted six to seven years ago are unable to keep pace with the demand. These systems are inflexible and lack scalability; integration with other new applications and third party systems is complex; the cost of maintaining them is high; for many, end-of-life support is not available. These are signs that your BI platform is ripe for

transformation. The sooner the better To overcome above challenges, organizations are looking for structured ways and means to standardize the governance of their BI platforms by rationalizing the existing report inventory, standardizing the BI tools across enterprise, migration to newer BI platform and then setting-up the BI governance. There is a significant cost to delaying the transformation. One study showed that organizations with low BI tool consolidation have fewer employees (~12%) using BI tools vis-a-vis organizations with high BI standardization and consolidation having more employees (~25%) using BI tools. Resultantly low BI standardization costs significantly higher on a per employee basis. The study also found that organizations that have standardized their BI tools have on average 36% lower BI spends as a percentage of revenue. The implications of these findings go deep, suggesting that there is a hidden cost to delaying BI transformation, which many organizations fail to appreciate: in the absence of simplfication and consolidation fewer employees use BI leading to lost oppor tunities and operational inefficiencies. BI transformation framework The key to successful BI Transformation is to consider BI consolidation and address simplification, standardization and governance processes holistically with robust migration frameworks, tools and accelerators. The end result should be a BI platform that is flexible, extensible and customizable.The advantages of standardization and consolidation are undeniable. To achieve this, organizations must follow four simple steps: Tools Selection and Standardization: Work with your IT and Business Heads to understand existing and emerging BI needs. This helps choose the right technology stacks and consolidate BI into a single, world class BI platform. This has the immediate effect of improving data trustworthiness by 20 to 25% enterprise semantic models and reducing TCO by 30% owing to lowered support, maintenance and governance of fewer BI tools. Once the tools are selected, they also help define governance around them. Report Rationalization: Multiple BI platforms result in multitude of reports residing within the organizations without any systems to keep tab on their usefulness. Organizations need to document their inventory of reports with a structured and automated process for identification of similar/duplicate and "Unused/Unuseful" reports and their rationalization. Typically, 40-50% of reports are found to be candidates for rationalization and their elimination can bring down generation and maintenance costs by upto 25%1. Platform Transformation: Users are accustomed to set patterns, processes and dashboards. How will they respond to change? There are two aspects to Platform Transformation: technology migration and change management from a user perspective. It is best to define a framework for migration that includes automation to reduce time-to-market and ensure low error rates. Extracting metadata from existing systems and mapping it to the target platform is crucial. You should be able to transform data from your system to any target system of choice. It is also recommended that change management processes be put in early by explaining the technical benefits to users, creating awareness of the simplification and reducing user discomfort. Governance & Roadmap Definition:A sound BI Transformation Plan includes governance (policies and processes) and a roadmap. These need to be aligned with users, organizational process maturity and technology adoption. For example, On-premise, Cloud and Hybrid models will demand different governance processes, depending on industry/ regulatory requirements and technology environments. The value of good

governance cannot be underestimated. Many organizations show 20% more benefit realization when they have good governance in place. Time to make the move To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey. This is because organizations are moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities.Unless efforts and investments towards standardization and consolidation rise up the priority charts of organizations, organizations will continue to be exposed to risks of underachievement on the critical strategic agenda of Business Intelligence. Deepak Maheshwari is a Business Intelligence enthusiast with almost 17 years of experience in helping customers in identifying, consulting and solving underlying "decision management" problems.In his current role, he heads the Enterprise Business Intelligence practice within Wipro and is responsible for managing practice growth. He is one of the key thought leader who helped conceptualize BI Transformation and has architected multiple solutions under it, not only helping customer to understand the risk of their BI landscape standardization and consolidation but also standardized the whole migration process through some well defined frameworks and automated tools. Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption Key trends directing future investments in Enterprise Risk Management =====================

Key Risk Indicators (KRIs): The Custodians of Risk Management

----- Arcticle source ----- https://www.wipro.com/analytics/key-risk-indicators--kris---the-custodians-of-risk-management/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Key Risk Indicators (KRIs): The Custodians of Risk Management Introduction Financial institutions reckon that the close linkages between global markets and businesses means that risk can arise unexpectedly from anywhere. As a result, tracking, measuring and mitigating risk has become a major concern. Additionally, there is an urgent need to meet the ever-changing demands of regulators and of objectively assuring stakeholders of the highest compliance standards towards effective risk management. However, the world of finance is subject to a complex risk landscape from volatile market conditions, unexpected natural, economic and geo-political events, and from exposure to staff oversight and imprudence. The mechanisms put in place to identify and respond to credit, market and operational risks therefore have a major bearing on profitability, liquidity and solvency. Naturally, directors and stakeholders are insisting on improved methodologies to identify risk triggers (a.k.a. risk events), manage risk and ensure that regulators have access to a single view of risk. This has

brought Enterprise Risk Management (ERM) to center stage. With the increase in the uncertainty around global financial markets, risk managers are turning to data and systems that can identify risks and flag threats based on Key Risk Indicators (KRIs). It is not surprising that CROs and CFOs today are busy arming their risk function with technology that can monitor and measure KRIs across various business units. Embracing KRIs KRIs are invaluable tools in the finance industry to provide early insights into how risks shape up and pan out. The advantage of systematically measuring KRIs is that they also function as lead indicators of emerging trends and help expose critical gaps and vulnerabilities within an organization. This places the organization in a position to take early and appropriate evasive action against reputational and business loss. A deep focus on KRIs is becoming indispensable. The flaw lies in measuring KRIs in isolation. For the system to be effective, a host of other parameters related to the financial environment must be measured, co-related and mapped against KRIs. For example, if one of the KRIs is "Loss of key staff", then certain factors might influence the likelihood of this risk occurring, which might include general staff turnover (acting as a proxy for key staff turnover), undocumented processes, salary gaps identified by annual benchmarking exercises etc. Further, warning thresholds can be established by defining limits of acceptability (tolerance) for each of these indicators. Identifying the right KRIs is a result of understanding organizational goals and strategic priorities. It therefore should be apparent that KRIs will remain subject to constant change as the organization adapts to newer strategies. A continuous evaluation and refresh of KRIs and their thresholds is therefore beneficial and recommended. Old KRIs may need to be retired as they may have served their purpose or need to be tweaked to meet emerging scenarios with new trigger levels. Challenges in KRI Management Multiple factors make managing KRIs a complex task. KRIs may go unidentified due to poor data availability. Data collection may not be automated, leaving the organization vulnerable because reporting is not timely or is prone to inadvertent error as well as willful manipulation. And thresholds for KRIs may not have been adjusted as required by business, leading to poor decision-making. It is evident that developing and managing KRIs is not a simple task and calls for high quality data to be available to the risk management team. The data must then be translated into standard KRIs and mapped to other risk-related metrics. Eventually, with accurate measurement, this matrix of data must translate into actionable decisions that mitigate risk. Technology to Manage Risk Emerging risk technologies holds an answer to the problems associated with KRIs and risk management. It can collate risk data accurately, making the process of creating and managing KRIs robust, seamless and dependable. It can combine and collate data across risk events, occurrences, categories, products, services, processes and geographies to provide a comprehensive and unified view of risk. It can isolate the critical from the non-critical metrics, based on changing regulatory requirements and can embed these insights on to a customized dashboard for actionable intelligence. In most current operations within the financial industry, metrics are measured diligently. But, as often seen, the impact of breaches is witnessed before action can be initiated. This is because measuring risk is not yet a completely automated "real-time" process which it needs to be. Technology can place remedial action in the hands of decision-makers before risk thresholds are breached. Among the more interesting outcomes of

leveraging technology to manage risk is that it makes available a clear audit trail for regulators to examine. An Eye on the Future With regulations – and regulatory penalties growing, technology is going to progressively play a critical role in ERM. Financial services organizations will depend on advanced, highly sophisticated data and analytical tools to ensure that their management is enabled with the latest approaches to risk mitigation. There can be little doubt about the efficacy and applicability of technology in the area of risk management. How it is implemented and the extent of flexibility it presents to accommodate future scenarios will differentiate the leaders from the laggards. Sriram Kannan is a senior fin-tech and analytics consulting leader with almost 17 years of extensive and progressive experience in a suite of areas - BI, Analytics, EPM/BPM, Management controllership, Finance-technology, Risk & Compliance - with proven ability to manage large-scale, multi-discipline programs effectively and exceed expectations in delivery of results. At Wipro, he seamlessly collaborates with sales-force and GTM teams in dening and crystallizing strategy, building target operating models, ROI driven road maps and business cases and contributes to crafting and shaping opportunities through "CxO level" engagements. Additionally, his role entails leading Finance, Risk transformation and Performance improvement engagements globally while encouraging the adoption of BI/Analytics solutions for clients - enabling customers gain sustainable competitive advantage through increasing speed and accuracy in reporting, analytics and decision making. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption Key trends directing future investments in Enterprise Risk Management
=======================

CFO: The new Technology Evangelist of the Enterprise

----- Arcticle source ----- https://www.wipro.com/analytics/cfo--the-new-technology-evangelist-of-the-enterprise/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content CFO: The new Technology Evangelist of the Enterprise Evolution of the CFO Role The traditional notion of a CFO, limited to that of the official beancounter and implementer of financial discipline, has morphed. Theorganization recognizes their ability to maximize efficiency and profitability across functions. Now they are seen as service-oriented strategic business partners. Every part of an organization wants to tap into the numeracy and analytical skills of the CFO. And CFOs are happy to oblige with their data-driven expertise and analytical insights. Want to know the new geographies your organization should expand in? Want to have an intelligent business discussion around the profitability of new products and

services? Want to know how a currency hedging strategy can save money? Want to ensure cost savings by paying the right duties and meeting regulatory compliance? Want a risk-adjusted forecast for supply chain efficiency? Make a beeline to the CFO's office Today's CFOs are indeed game changers. They have access to real-time financial numbers flowing in from every part of the organization, from external sales partners and channels, from markets, regulators, news feeds and social media. Their ability to co-relate and cross-pollinate events and data has become enormously powerful. Naturally, the organization expects the CFO's office to add value to verticals. A recent global study of over a thousand CFOs and finance executives found approximately 80% saying they were meeting or exceeding the organization's expectations around real-time analytics for decision making. Aiding these CFOs are a host of stable, robust and disruptive technologies. These range from complex data assimilation and predictive analytics to cloud, digital, mobile and social. Technology is not new to the CFO environment. Payroll management, accounts payable, accounts receivable, general ledger reporting etc. have been outsourced by the CFO for decades using technology. With Finance and Accounting Outsourcing (FAO), CFOs became early beneficiaries of efficiency, accuracy and spend avoidance through technology. They already appreciate the impact technology can have on the organization. Over the last few years, cutting edge technology has been integrated even more intensively within the CFO's workflow. The CFO is creating new real-time, collaborative and analytical capabilities using cloud-based and mobile-friendly financial planning, budgeting and analytical systems available in Platform-as-a-Service (PaaS) and Software-as-a-Service (SaaS) models. They are open to proposals around best-of-breed technologies. They are exploring new technology-based operating models. They want to investigate hosting platforms that make them more agile and responsive. Not surprisingly, they are also becoming vocal technology evangelists. Ask a CFO about cost reduction and chances are they will come back with a confident "Have you tried a cloud service? It could deliver annualized TCO reduction of 25 to 40% and substantially improve operational efficiency." They know the benefits of cloud-based data and analytics because they have implemented it within their own function. They may even come up with ways to monetize ERP investments further through the use of data models, embedded BI systems and quick dashboards. They can do this because of their first-hand experience, often an outcome of having to provide BI to the board. There are subtler reasons for the CFO to embrace technologies such as cloud. For example, it is a well-recognized fact that CFOs are cautiously optimistic. They generally don't want to change anything that already works. This is because they have witnessed slow and painful implementations cycles of technology in the past. But in their experience, cloud-based implementations – especially now that cloud security is not a bogey anymore – are turning out to be quick and low risk with interfaces that are leagues ahead of legacy systems. This experience is beneficial to the organization because now, suddenly, thanks to the CFO's understanding of technology, the cycle time between the CIO, business and CFO approval are coming down. The CFO-SaaS experience is equally interesting. For decades the CFO has been burdened with mundane financial and management reporting activity. Armies of accountants have been chartered with collecting data from scores of sources, checking its validity, cleaning and organizing it. Practically close

to 70% of finance office spends its energies around calendared reports (for investors, the board, regulators, etc.). Now, using SaaS, the CFO can deftly move a team of about 30 to 40 people (in a medium to large organization) to analyzing the data rather than preparing it.The primary advantage of SaaS is that it immediately rationalizes the number of technology components and improves efficiency. Significantly, it also arms the CFO with flexibility. Based on changing business needs, the financial applications landscape can be rapidly re-configured with an additional layer of industry and domain specificity. This helps present intelligence in more meaningful and insightful ways. Finally, from a finance perspective, the single-biggest advantages of SaaS are the multiple commercial models like subscription-based services, pay-peruse models, outcome or benefit based models that the organizations can leverage. Clearly technology has become uber-critical to the finance function. It has already helped businesses create the finance organization for tomorrow. Now, it is the turn of the CFO to become the technology evangelist and help business move from Best Practices to Next Practices. Sriram Kannan is a senior fin-tech and analytics consulting leader with almost 17 years of extensive and progressive experience in a suite of areas-BI, Analytics, EPM/BPM, Management controllership, Finance-technology, Risk & Compliance - with proven ability to manage large-scale, multi-discipline programs effectively and exceed expectations in delivery of results. Taking the Risk Out Of Risk Technologies

----- Arcticle source ----- https://www.wipro.com/analytics/taking-the-risk-out-of-risk-technologies/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Taking the Risk Out Of Risk Technologies Key trends directing future investments in Enterprise Risk Management Introduction The tremors from the global financial meltdown in 2008-09 were so intense and widespread that they are still being felt across the world. When major Wall Street institutions went under, wiping out billions of dollars of personal wealth at the hands of what were mere

mid-level traders, it triggered a whole new wave of compliance and risk management processes. Such deep, broad and stringent legislative changes and systemic risk regulations have never been unleashed in the financial sector since the Great Depression of 1930s. As per global studies, financial institutions would have invested close to US$30 billion on risk-IT in 2014. This would have gone up by around 13% by end of 2015. Risk governance and integration are at the top of the spend list of financial institutions. Once implemented, these systems should help financial institutions lower their vulnerability to fraud, money laundering, spend and pricing discrepancies while ensuring capital adequacy. However, the fact is that there is little that financial institutions can do to avoid the rising tide of ever increasing risk management legislations. The list is long and continues to grow: the Dodd-Frank Act, Basel III, Enhanced Prudential Standards in the US, Solvency II and the European Market Infrastructure Regulation (EMIR) are just some of them. It is therefore important to understand the key trends that will direct and dictate future investments in Enterprise Risk Management (ERM) frameworks, policies and programs. Key Trends Draining IT Budgets Operational Fraud: Organizations typically tend to have a knee jerk response to major incidents of operational frauds. Typical, it takes approximately 18 months to detect a fraud, if at all it is detected. The cost of these frauds can be between 2-5% of revenues, which is considerably on the higher side. This damage can almost be halved by proactive detection using data and analytics. Current ERM systems may not be the best fit, as they use a sampling approach owing to the massive volumes of data (and the fact that data is locked up in siloes). These systems will need to turn to data integration, predictive modelling, artificial intelligence and real time data and analytics, ensuring that every data point is examined and a lineage is established. With robust implementation of these relevant systems, the cost of operational frauds, duplicate payments, fraudulent claims, etc. be effectively controlled. Stress Tests: Regulators, amidst increasing public and media scrutiny are insisting financial institutions to stress test their systems for capital adequacy, forward looking risk assessments and institutional risk appetite. Having garnered positive results in the industry, especially in the US, the tests have emerged as a key step in building confidence in the financial institutions. Europe is also headed in the same direction. Regulatory Compliance: Risk management is aimed at maintaining capital ratios, capital management/allocation, consumer protection and common reporting standards around trading and transactions (i.e. front-to-back). The investments that need to be made to comply with regulatory requirements are around data models, real-time analytics and capital calculation engines, etc. These models and systems must be flexible, adaptable and customizable in order to seamlessly integrate with future systems and keep pace with a rapidly evolving regulatory environment. Anti-money Laundering (AML): With growing cross-border terrorism (which needs funding) AML regulations have become more stringent. While traditional AML solutions can manage structured records to unravel monetary trail, the industry is now faced with massive volumes of unstructured data as well. New solutions must have sophisticated data and industry-specific analytical systems to establish and unravel monetary trails, flag suspicious activity and predict incidents. The key challenge here is to ensure that automated IT systems do not make errors when dealing with unstructured data that appears to be similar. For instance, tax registration numbers can be confused for social

identity numbers by automated systems. Technology to the Rescue Financial institutions have no room for errors. Inaccuracies and blunders can lead to alarming social, financial and reputational damage. This is one reason why we find sophisticated tools such as Robotic Process Automation (RPA) and Artificial Intelligence (AI) engines being brought to the risk IT management discussion. RPA implementations are able to manage large scale data volumes without incremental costs, reduced processing time and increased accuracy. RPA is proving to be an attractive option for risk IT management practitioners because it can be integrated into existing systems/architectures without disruption. The outcome is exactly what financial institutions need: real-time risk reduction, improvement in process velocity, increased compliance and enhanced monetary savings. Increasing Priority for Reducing Vulnerability Regulations are going to impact both the top-line and bottom-line. As mobile and digital technologies grow, as cloud adoption becomes more widespread, and social media becomes part of business processes, organizations will be vulnerable to new and imminent threats. This is when regulators will have to step in with even wider requirements. Each of these will come with its own cost of compliance. As capital requirements grow and revenue generating opportunities plateau, the only smart way to improve margins will be through astute cost management. This is why risk management must be brought to the top of the operational agenda. Sriram Kannan is a senior fin-tech and analytics consulting leader with almost 17 years of extensive and progressive experience in a suite of areas - BI, Analytics, EPM/BPM, Management controllership, Finance-technology, Risk & Compliance - with proven ability to manage large-scale, multi-discipline programs effectively and exceed expectations in delivery of results. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption ====================

Predictive Insight on Batch Analytics – A New Approach

Predictive Insight on Batch Analytics - A New Approach While various industry players are investing in data management systems, several companies globally, face an increasing challenge of system failures and outages resulting in unhappy customers, brand damage and revenue loss. To illustrate, in March 2013, the regulatory body of U.K. fined a multinational banking and financial services holding company for failing to keep updated information on client objectives, risk profile and risk appetite. The regulatory body found that the reason attributed to this was the failure of the bank's data processing systems to allow sufficient client information to be processed and not so much a human failure. Such failures can have long term impact on companies with loss of potential customers even in the future. Out of several factors that can be attributed; failures and delays during data warehouse batch runs are an important area of focus for data managers today. This paper proposes a reference architecture to improve operational IT analytics with predictive capabilities to overcome such challenges. The proposed solution is vendor agnostic and provides consistent experience across a range of Data Integration and Business Intelligence tools. Industry Landscape Data warehouse and application service loss can adversely impact businesses in many ways like delay in financial closure leading to liability, penalty for non-compliance in delivering data on time and down time for information workers. On average, businesses lose between $84,000 and $108,000 (US) for every hour of IT system downtime, according to various estimates from the studies performed by industry analyst firms .Application problems are the single largest source of downtime, causing 30% of annual downtime hours and 32% of downtime cost, on an average .The leading cause of application downtime is software failure (36% of cost on average), followed by human error (22%) and third such rising costs are attributed to complex data warehouse environments that exist in companies today. The dynamic nature and complexity of the data warehouse The increased complexity of the data warehouse environment intensifies the task of data managers manifolds. The ask of troubleshooting under such a dynamic environment becomes tougher. Additionally, a host of other issues such as human error, hardware failure, and natural disasters can disrupt data warehouse availability. Over several years, innovative solution providers have tried to address these problems. There are multiple analytical solutions (Operations Management (OM) tools) existing today which help data managers monitor and measure the data warehouse environment. These solutions are catered to by features within Data Warehouse DI or BI tools and also within infra monitoring schedule management tools. The solutions help identify issues, isolate causes and resolve outages. The solutions also support performance management

through IT infrastructure support. However, these features which are restricted only to each particular tool, do not take into account the business process aspects and at best provide insights into what has gone wrong (instead of finding what would go wrong). These tools do not have the feature to constantly and proactively monitor system behaviour and provide real time insights into system performance and capacity trends. A typical solution today would analyse historical data to develop a certain trend in performance, after the failure has occurred. Whereas data managers are increasingly demanding capabilities to predict a failure before it occurs. This has created a need for predictive analytics driven proactive monitoring of data warehouse processes. Current OM Tools – Limitations As discussed above, a host of OM tools and solutions are used by data managers today. However, these solutions have the following limitations: Current OM Tools – Potential Improvements The limitations of the existing solutions, outlined previously can be plugged in through "predictive insight on batch analytics". The various capabilities of such a solution are outlined below: Proposed Reference Architecture Based on the characteristics outlined previously, below is the proposed reference architecture: The numbered areas in the above reference architecture are described below: 1. Data Acquisition and Conversion 2. Data Integration 3. Predictive Analytics 4. Alert Interface Benefits Several benefits can accrue to the data managers through the new approach: Reduced Risks: The new architectural approach de-risks batch operations through predictability, early warnings and fast issue resolution resulting in lower downtime of operations and improved reliability of data. In addition, infrastructure capacity utilisation forecasts. Optimised Costs: The proposed architecture further improves productivity by reducing manual monitoring and troubleshooting efforts resulting in reduced Total Cost of Ownership, lower cost of batch optimisation exercise and improved productivity of the platform due to reduced downtime and improved system availability. Standardised Operations: Data managers can avail standardised batch operation processes across technology stacks leading to – i) A tool-agnostic approach - the alert management, predictive insights, diagnostics and trend reports are uniform irrespective of the tool used. This also helps reduce system upgrade costs. ii) Simplified operational process and iii) Improved standardisation of IT operations overall Conclusion This proposed architecture catering to improving operational IT analytics is vendor agnostic and provides consistent experience across a range of data integration and business intelligence tools. It provides predictive insights that are business process aware and helps achieve higher availability and better reliability of data environments. It combines ability to monitor infra resources, integration tools as well as job schedules. Data managers will find the proposed solution cost effective in addition to helping reduce overall operational risks and design standardised operations. It will help organisations maintain high customer centricity through improved operational processes. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities &

experiences make them to most suited to embrace as well as advocate technology adoption =====================

Anti-Money Laundering: Get Clued Before It's Late

----- Arcticle source ----- https://www.wipro.com/analytics/anti-money-laundering--get-clued-before-it-s-late/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Anti-Money Laundering: Get Clued Before It's Late Need for Solutions to Evolve to Keep Financial Crime at Bay Cognizance of the Looming Threat A recent disclosure by US law enforcement authorities reported about three Colombian nationals who used Hong Kong banks to launder at least US$5 billion from a global narcotics business . That's more than the GDP of a few nations such as Sierra Leone or Barbados. In this instance, the money was used to largely buy counterfeit products from China and Hong Kong, and ship them to the rest of the world. But it could just as well have been used to pay for weapons or fund terrorist activities. Money laundering is posing one of the biggest threats to societies and economies across the world. Banks are naturally becoming the first line of defence against the dangers of financial crime. Increasingly, regulators are asking banks to gather information about their customers and their transactions that will help surface, identify and prevent potential illegal activities. This has set off an intense chase for data and supporting documentation, inconveniencing customers, causing business delays and further adding to operational costs. The Know Your Customer (KYC) process mandated by regulators is turning into a double-edged sword: while augmenting anti-money laundering (AML) processes, financial institutions are becoming more vulnerable with increasing instances of customer privacy breach and data theft. Uncovering the Challenges Global banks and financial institutions need to comply with the ever increasing regulations, protect their customer data, implement AML technologies and processes, ensure they are not exposed to reputational damage and keep the cost of doing all this under control. While there is no common estimate of what these safety measures cost the financial industry owing to various qualitative factors, they do result in increased lending rates and service fees. Current compliance processes are intensely manual in nature. This means collating information from diverse and disparate sources to include origin of customer, nature of business, holding structure, political affilliations and connections, financial history, referrals, sanctions, indictments, liabilities, news reports, teller/automated clearing, house/wire transaction records, frequency and volume of transactions, currencies and geographies across which transactions take place and so on. The task encompasses country to country, bank to bank and people to people transactions. Almost 80% of this task is done manually by analysts, often spending days and weeks in acquiring, searching, documenting and reporting precise information about people and organizations - their financial standing and their reputations rather than in actually analyzing to make informed decisions. Finally, when the analysis is

done, it may have been weeks, months or even years after a money laundering event Need for AML Solutions 2.0 Current AML solutions have evolved their ability to manage structured records and data. What the industry needs is an automated way of searching and sifting through the growing volumes of unstructured data along with the structured data. The solution must then have an additional layer of analytics that understands and unravels monetary trails using sophisticated models to uncover relationships and predict patterns of suspicious activity. The solution calls for a combination of technological expertise and domain knowledge. Simply put, the system must look for appropriate and high quality data independently across defined sources (public, syndicated and third party), interpret unstructured data (such as descriptions and narratives, opinions and notes), synthesize and standardize it, create profiles that are aligned with regulatory requirements, use a set of industry-and-business-specific models to query and analyze the corpus of data and immediately flag activities that analysts need to take decisions on. Making Smart Solutions Smarter The problem is that even the most sophisticated systems deployed across financial institutions are prone to making errors when dealing with unstructured data. For example, systems may get confused between social identity, tax registration, phone and even travel document numbers. Cognitive Process Automation (CPA) and Artificial Intelligence (AI) engines developed under the guidance of industry compliance and risk practitioners offers a reliable, fast and scalable solution to this problem. CPA is driven by a set of instructions describing processes. CPA-based systems can literally "learn" these instructions by observing the actions of financial analyst and by examining a historical database of actions and behavior. As the system processes more data, it learns continuously to develop new rules and associations, presenting them to analysts for approval and inclusion in the rules engines that analyze data. There is no doubt that growing regulatory requirements, the massive amounts of structured and unstructured data and the cost of managing these present a challenge to the industry at large. The risk associated with poor AML practices cannot be underestimated simply because crime methodologies are getting highly sophisticated and need equally intelligent counter measures. 1. http://www.scmp.com/news/hong-kong/law-crime/article/1857155/ laundering-ring-pumped-billions-drug-money-through-hong 2. As one way to view the broader impact, research by the International Monetary Fund has suggested that proposed reforms could reduce economic output in advanced economies alone by ~3% during 2011–15: https://www.imf.org/external/pubs/ft/wp/2012/wp12233.pdf To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

The No-Pain Route to Analytics

The No-Pain Route to Analytics Enabling Speedy Decision Making Through 'Analytics-as-a-Service' Introduction There is a new corner office and it belongs to the Chief Analytics Officer (CAO). This CAO is the outcome of growing data volumes. For businesses with access to large data streams, analytics holds the key to making fast and accurate decisions. CAOs can now use data for a variety of purposes. It can help manage operational efficiencies, discover customer needs, identify new markets, give shape to new products and value-added services and develop defensible differentiators. In other words, the onus to support the organizational business strategy now falls upon the CAO. And assisting CAOs with this goal is the science of analytics Every business function in an enterprise recognizes the need of actionable insights from data. That is why analytics is being recognized as a key-driver of decisions and as a business differentiator. In a competitive environment, every decision counts. CAOs are tasked with making this decisions-which in turn makes it easier for the enterprise – for anyone,, anytime and anywhere. If the CAO fails to deliver actionable insights, it could mean loss of business momentum, customer attrition and erosion of market share. CAOs are therefore careful when they embark upon the analytics transformation journey. They know it requires the ability to balance the business landscape with technological developments. But can they undertake this journey on their own leveraging resources residing within the enterprise in terms of people, processes and technological skills? The answer is tricky. This paper proposes an 'Analytics as a service' model comprising an end-to-end analytics service that covers platform, analytics, domain experts as well as visualization to deliver actionable insights for quicker decision making Can Traditional EDW Support the Chief Analytics Officer? Some enterprises may believe they can continue to rely on existing and proven enterprise data warehouses (EDWs) and management techniques to consolidate their data and run it through their analytical engines. But CAOs know that traditional EDWs are rigid and hard to change. Traditional warehouse platforms and methodologies are reactive – they chiefly deliver reports; they don't understand business change, are not flexible, are forced to be more technology oriented, don't incorporate methodologies that align with business lifecycles, cannot scale for demand and don't execute with agility. Data in existing EDWs is aggregated, making it almost impossible to access at granular levels that analytics demands, leading to performance issues Access to data in most EDWs require operational clearances which means that data scientists may not have access to relevant or complete data sets across functional/divisional silos. For example, marketing data may not be shown to finance data scientist. Rigid functional siloes in which data is trapped (like product development, production, sales and marketing, finance, supply chain etc.) can pose a serious challenge. Above all is the daunting fact that EDW appliances are expensive and as the data volume grows, so do IT investments. Looked at another way, the CAO has a

formidable challenge to bring—and maintain—the enterprise's data and analytical practices up to speed. But the larger question before every forward-thinking CAO is: what is a better platform for changing and unpredictable business needs? Need for 'Analytics as a Service' As a result of these challenges, enterprises tend to avoid using existing EDW platform for their analytical needs. Even if they want to expand the capabilities of their EDW platforms, it is extremely difficult and expensive. But, the danger of not doing so is self-evident: loss of strategic and operational insights and missed business opportunities. However, current technological developments have begun to provide relief to troubled CAOs. The advent of open source and cloud has dramatically changed the data analytics landscape. Big Data demands that enterprises implement analytical platforms that provide greater agility. But the prevailing perception is that these solutions (let's call them Data Discovery Platforms) are complex and expensive. Luckily, this is not the case. When architected meticulously using commodity hardware on cloud that leverages open source technologies and agile methodologies, Data Discovery Platforms are quick to develop, easy to use, reduces time to insights and costs way less than traditional BI systems. Data Discovery Platforms alone don't ensure the speed to analytics. These technologies are sophisticated. Many of the traditional ETL (Extract, Transform, Load) functions are performed using complex custom Map Reduce Code. For an enterprise, meeting all of the above requirements is difficult in terms of people, processes and technological skills. It is therefore important to engage a partner who can provide an end-to-end analytics service that covers platform, analytics, domain experts and visualization through a flexible commercial model. Enterprise Impact Through LoBs A CAO understands the profound organizational changes being led by the data deluge on the entire set of users (end users, super users, business analysts, data scientists and subject matter experts). Its effect cannot be trivialized or overlooked. LOBs have typical questions such as, "What can my business do to prevent customer attrition?" or "How can I identify my bottom 10% customers and ensure their cost-to-serve matches the ROI of the segment?" In addition, they want possible hypothesis to test. In a traditional BI world, the access to data is easy through SQL queries and need not require a deep technical expertise. Now, business users have to rely on IT to provide the data and the transformation dictated by functional needs. They know the data, they have the questions, but they don't have the technical depth to perform the required analytics. The IT staff is in a similar situation – with an understanding of the analytics platform but with no understanding of the business data. Hence, establishing a new operating model (see Figure 1: 'Analytics as a Service' – Operating Model) between business and IT can go a long way in accurately identifying and understanding data that matters to the enterprise, thereby ensuring faster time to insights. It is also imperative for the Data Discovery Platforms to have reusable analytical libraries across the business functions which act as accelerators. Figure 1: 'Analytics as a Service' – Operating Mod Proposed Solution to Enable 'Analytics as a Service' The Data Discovery Platform, as discussed, available on cloud and constructed on open source technologies can be a potential solution to enable 'Analytics as a Service'. This platform has next generation capabilities such as Batch Analytics, Real Time Analytics, Text Analytics and Ad Hoc Analytics. Organizational data (structured, semi-structured and unstructured), needs to be brought into this platform for exploratory

analytics. A unique Analytical Data Mart can capture and store the data in the form of dimensions, events and facts. These form the crux of the exploratory analytics. Backed by this unique and powerful architecture, business users can represent any journey map like customer journeys, customer taste graphs, product lifecycle and production lifecycle on a near real-time basis with significant events being captured and acted upon in real-time or near real-time. Figure2 : Proposed Data Discovery Platform A typical Data Discovery Platform packages Machine Learning algorithms that work on the analytical data mart to unearth patterns and outliers hidden in the data. Such a platform (see Figure 2: Proposed Data Discovery Platform) should provide several accelerators and applications that create a robust foundation with reusable analytical libraries and ways to adapt and accelerate innovations across the enterprise. A simple interface to the Data Discovery Platform enables Self-service Analytics for business users. Usability is an important aspect of the platform. For example, such a platform should be able to provide a set of Map Reduce functions for Descriptive Analytics. The platform should hide the complexities while providing a simple interface to query data in an iterative fashion and test the hypothesis in real-time without IT support. Key Facets of 'Analytics as a Service' 'Analytics as a Service' provides unique capabilities to the CAO that are becoming critical as data volume, velocity and variety grows. These include: The growth in data has certainly not reached a plateau. If anything, there are signs that it will continue to grow. There is no way to tell what data is going to be important a few years or even a few months from now; there is no way to predict how an enterprise may want to query its data. CAOs don't want to spend months—and precious dollars—each time re-architecting and implementing new analytical systems. Instead, the 'Analytics as a Service' model assures them of speed and agility where it is wanted most in today's business – in the analytics department. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Bridging the CFO-CRO Divide

----- Arcticle source ----- https://www.wipro.com/analytics/bridging-the-cfo-cro-divide--answering-the-call-of-converging-ne/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Bridging the CFO-CRO Divide Answering the Call of Converging Needs Pressing Need for Convergence There is an increasing recognition that CFOs and CROs are not on opposite sides of the battlefield. Instead, it is more appropriate to think of them as two sides of the same coin. But, the question to ask is how can this realization actually add value to the organization? The history of capital markets and the banking industry is

steeped in the premise of risk management: The greater the risk, the greater the reward. The harsh side of the risk-reward equation is equally true: The greater the risk, the greater the probability of loss. Risk and reward have always been two sides of the same coin. That perhaps makes it easier to recognize why the roles of the Chief Finance Officer (CFO) and the Chief Risk Officer (CRO) demand better integration. The call for convergence grows even louder in the challenging environment of economic uncertainty with increased defaults, volatile markets, newer (exotic) and riskier products being launched unpredictable consumer behavior, growing regulatory oversight and an increasing demand from stakeholders for more profitability. National standards authorities and industry regulators have been busy confronting these challenges with progressively complex mandates. Regulators have been gradually seeking a unified view of financial and risk data using common and consistent templates (Basel III and Solvency II being good examples to go by). CFOs and CROs too are headed in the same direction. When the CFO-CRO relationship is strengthened, we can expect to reap the benefits of operational stability, predictability of returns, enhanced reporting, increased compliance and improved profitability. Further, whenever need be, they can respond to crisis with utmost resilience. The convergence of data, market and industry research, analytical and modelling tools, and reports across the two functions is inevitable. This convergence makes it simpler to balance operational and strategic decisions and to protect capital in order to meet the looming threat of business disruption. The partnership results in giving a boost to efficiencies and reducing costs. Can there be better reasons for the urgency to integrate the two roles? Bridging the Great Divide The good news is that leaders in BFSI have recognized the need and are in the process of bringing the two roles closer. The bad news? For a majority of the industry, the two roles continue to operate in silos with staunchly held traditional belief that the more independent they are, the better it is for the business. However, the truth lies somewhere in between. The operational niceties may vary from organization to organization. One may prefer to keep the two roles independent, while another may have a direct line of reporting from the CRO to the CFO. A third may see the two roles report directly to the Board. These are organizational structures and managerial hierarchies meant to minimize friction between roles and, operate in the best interest of the organization and its stakeholders. They certainly do not mean the two roles cannot benefit from greater coordination and integration. The most immediate impact of the rising trend of CFO-CRO integration is on enterprise technology. Traditionally IT systems meet the adversarial needs of the two roles, delivering different sets and quality of data, reports, research and analytics to both. This can obviously be counterproductive and risky from a compliance perspective. Clearly, IT must sit down to do a rethink with the CFO-CRO duo to rationalize and unify systems and workflows. The end result of the exercise should be aimed at improving the quality and consistency of information and reducing the cost to manage and process it. Independence with Interdependence The data used by financial institutions is processed through a variety of risk models. The output is consumed by the CEO, COO, CFO and the CRO.By their very nature, risk models are designed by the CRO's offices. Today, risk models must also be viewed from the lens of the CFO, if the two roles are to work in tandem. It is another matter that the CFO and the CRO may disagree over the

interpretation of the output. But the differences, arguments, reasoning and decisions must be based on the results and actionable insights obtained from the same data and underlying models. If anything, it is even more important to ensure that the two roles remain fiercely independent in their perspective of business, even as they build on systemic and operational cooperation. The re-engineering and unification of data and analytical systems are worth the pain. The impact in doing so is felt across the enterprise. In a sense, the concept of shared services and platforms needs to be extended to areas on either side of the CFO/ CRO wall. Many roles and functions within the organization will benefit when the data and analytics being shared is identical for operations, risk-management, reporting and strategic decision-making, across all levels. Face-to-Face to Shoulder-to-Shoulder If they haven't already done so, financial services organizations must re-asses their thinking related to the roles of the CFO and the CRO and to their approaches to risk, governance and oversight. Does narrowing the information, communication, process, workflows and systems gap between the two functions go beyond protecting value and, in fact, add value to the organization by helping it exploit new opportunities with greater confidence? In every instance, the answer to that question will be an unqualified and a resounding "yes". Sriram Kannan is a senior fin-tech and analytics consulting leader with almost 17 years of extensive and progressive experience in a suite of areas - BI, Analytics, EPM/BPM, Management controllership, Finance-technology, Risk & Compliance - with proven ability to manage large-scale, multi-discipline programs effectively and exceed expectations in delivery of results. At Wipro, he seamlessly collaborates with sales-force and GTM teams in defining and crystallizing strategy, building target operating models, ROI driven road maps and business cases and contributes to crafting and shaping opportunities through "CxO level" engagements. Additionally, his role entails leading Finance, Risk transformation and Performance improvement engagements globally while encouraging the adoption of BI/Analytics solutions for clients - enabling customers gain sustainable competitive advantage through increasing speed and accuracy in reporting, analytics and decision making. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Real-Time Data Access Using Restful

Framework for Multi-Platform

Data Warehouse Environment

----- Arcticle source ----- https://www.wipro.com/analytics/real-time-data-access-using-restful-framework/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content The IT departments in enterprises see a lot of value in building service oriented architecture around their data warehouse environment to empower their internal customers. The arrival of the Internet of Things (IoT) introduced a new deluge of data getting processed and used for analytics. With more data getting processed and stored, the need for multi-platform data warehouse environment has emerged. The volume, velocity and variety of data and its potential use for the organic growth of the business elicited the data platforms growing bigger. Today, data warehouse environment in organizations are at the threshold of fulfilling diverse use cases and provide data to broad users across the spectrum like business applications, business intelligence, data analysts, data scientists, etc. Real-time data ingestion and extraction need to be easier with or without the involvement of IT. With the availability of features like text analysis, pattern matching in analytical platforms, REST as a framework is a great vehicle to carry and retrieve data from the data process and storage engines. This paper addresses how RESTFUL framework becomes a cost effective solution to achieve the mounting need to serve data in real-time. Introduction The heavy dependence on Extract, Transform and Load (ETL), and business intelligence tools has created some fatigue among business users. It takes multiple iterations and a long wait for businesses to get the data that they need. The emergence of simple but efficient open source frameworks like REST enable fast movement of data using most popular web protocols. Internet of Things (IoT) and Big Data Internet-enabled computer embedded chips in products and devices are used primarily for data-gathering, offering enterprise-level details on everything from how efficiently their machines are running to the purchasing habits of their consumers. Without proper data-gathering in place, it will be impossible for businesses to sort through all the information flowing in from these embedded sensors. What that means is that, without analytics on the Big Data being captured, the Internet of Things can offer an enterprise only little more than noise. Emergence of Multi-Platform Data Warehouse Environment The 21st century was the period which marked the emergence of data warehouse as a science. The need to process and store data got traction with the business finding its usage. With more and more data getting processed, data appliances became popular. With the arrival of Internet of Things, data collection and processing got a new definition as the amount of data being collected

increased exponentially. The need to build multiple platforms to process and store data has hit the organizations. With the introduction of architectural principles like Teradata Unified Data Architecture (UDA), there are a lot of options to build a true multi-platform data warehouse environment. It is possible to store data of any size. Data Lake gives the options of storing data as it comes and in any data format. A combination of platform which is interconnected gives the facility to move data between platforms. There is now an option to perform insights on data in real-time. Tools like Teradata Query Grid, helps to move data between platforms and also has features to retrieve data from different platforms without the user knowing where the data was stored . The volume and variety of data is directly correlated to the number of components to process. The days of conventional batch processing and canned analytics don't satisfy the new type of users who use this data. That's why organizations are looking out for non-formal ways to integrate, store and access data. The Open Source RESTFUL framework is one of the technologies which facilitate the ease of data integration and extraction. RESTFUL Web services: REST defines a set of architectural principles by which one can design web services that focus on a system's resources. Major advantages being: • Use HTTP methods explicitly • Be stateless • Expose directory structure-like URIs • Transfer XML, JavaScript Object Notation (JSON) or both Building Real-Time Data Access with RESTFUL Framework Given that multi-platform data warehouse environments have different work load capabilities, looking for real-time data ingestion and extraction becomes more difficult. Assume that there is a requirement to load and access unstructured data in real-time into multi-platform data warehouse environment. Being unstructured data, it makes sense to load into Hadoop (which is basically meant/good for batch processing). After the data is cleansed and ready for integration, it is meaningful to load the cleansed data into EDW or IDW to make it more efficient for the need for real-time access. The web HDFS (Hadoop Data File Store) feature which is being offered by Apache or Hortonworks could be used for real-time data ingestion into HDFS. Also, the REST API can easily communicate to the Hadoop clusters. The file read and file write calls are redirected to the corresponding data nodes. It uses full bandwidth of the Hadoop cluster for streaming dataiv. Conceptual Representation of Using REST for Multi-Platform Data Warehouse Environment Data Ingestion The architecture diagrams below elaborate how variety of data from different sources can be injected in to multiple data storage platforms (like UDA) with the help of REST framework. Data Extraction Data access from a multi-platform environment is easy with REST service as it provides the abstraction on top of the storage environment. Below is a sample architecture diagram on how REST acts as a Façade Layer for data storage. Advantages of RESTFUL Framework There are many advantages for using REST in a multi-platform data warehouse environment: • Being a public API, REST API is very easy to adopt and develop • REST API for Teradata provides driverless connectivity to read and write data into Teradata database. Similarly REST API for HDFS makes it easy to work with Hadoop Clusters • Helps in work load balancing; no dependence on ETL tool or ESB (Enterprise Service Bus) for real-time integration • REST works on top of HTTP; thus, only browser is needed for it to work Conclusion Real-time access to Hadoop along with other data warehouse platforms is promising because it provides the data pipeline not only for structured data but also to

handle data types that the average data warehouse environment doesn't support. REST API's natural support to JSON objects add value, when new platforms like Mongo DB, Cassandra gets added in to the data warehouse environment. The major benefit of using REST for real-time access is the low cost of development and the ease of deployment. Moreover REST naturally fits in the world of diverse data storage as it provides the perfect FAÇADE layer to inject and extract data from different platforms. Also, REST gives the ability for data scientists and business analysts to mix and match data on the fly without knowing where they reside. Also, now they don't have to wait for a day or two till the data load jobs complete in the conventional way. Imagine moving machine data or web data in real-time using REST to Data Lake, processed using analytical platforms like Aster or in-memory analytical tools and stored in Teradata for business usage. At the end, the processed and report-ready data can be accessed using REST. All this is possible without the need to use highly priced business intelligence or ETL tools. RESTFUL framework is indeed going to empower the internal customers and provide a cost effective way to integrate and access data in real-time. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Operational Intelligence

----- Arcticle source ----- https://www.wipro.com/analytics/operational-intelligence-/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Operational Intelligence Extracting Insights of the New Oil Data is the New Oil The phrase "Data is the new oil" has been the recent topic of discussion amongst the business executives. Data is the genesis for insights but the question is how much value do we really extract from it? Extracting value from data has indeed created profitable avenues, just as it has from oil. The oil metaphor for data is interesting and needs to be taken a step further. When put through a data-refinery, especially in real-time or near real-time, it provides invaluable Operational Intelligence (OI). OI answers the question, "What's happening within my business and IT operations now?" OI platforms do this by accumulating mountains of data, refining it, and overlaying it with machine learning and analytical models to extract insights in the form of live

dashboards, reports and real-time alerts (see Table 1: Data Types and their outcomes). This output is invaluable for executives of large and medium size enterprises tasked with dynamic, real-time decision making. For them, real-time updates and continuous insights have become imperative. This data can be used in scenarios for answering questions such as "Should I procure additional servers now or delay the purchase to next quarter?" or "Am I about to miss my SLA for the next 200 customers? What action should I take to mitigate the fallout?" Data Types and their Outcome Data Input Types Offline or slow moving data: Daily, weekly and monthly data from business systems (ERP, CRM,SCM, HRM) and IT inventory. (Asset, Capacity, external data). Near real-time data: Hourly data from servers, storage, router, networks, websites, portals,device telemetry. Real-time data: Continuous data stream from machines, routers, transactional systems, events, etc. Data Output Various input data are correlated together to give OI in the form of reports, dashboards, live monitoring, alerts and actions. It includes: Enterprises need all three data types – historic offline or slow moving data, near real-time data and real-time data – to arrive at sophisticated cross-relations resulting in pro-active diagnostics, event predictions, and recommendations that enable quick and immediate decision-making. The most significant driver for OI adoption is its ability to deal with a dynamic world moving at Google Speed. Decisions can't wait for weeks now; we have minutes or often seconds to take them. For instance, in an e-commerce website, a delay in page loading time by a few seconds results in customer attrition. If there was to be a real-time event correlation (page load times and the number of abandoned carts), it would help resolve the problem in real-time before significant revenue loss. The Data "Refinery" Managing and transforming data into OI is a key remit of CIOs in medium and large enterprises. Their goal is to keep an (digital) eye on business and IT activities so that aberrations, inefficiencies and threats can be dynamically identified along with prescriptive solutions before they impact operations. Data, and how it is captured, stored and correlated, becomes critical to achieve this goal. Sources of data - the new oil wells: Any business or IT operation has several sources of data (Table 1) and the challenge therefore is to rapidly transform the input from multiple and varied sources into desired business and IT operational insights. Moving the data through the "refinery" The "refinery" must ingest and move all types of data to appropriate containers, stores and models. A variety of tools for data collection (e.g. Scoop, Flume) que the data for persistent storage leveraging real-time data streaming technologies and object/file stores. Once the data is inside the `refinery', data processing, search and analytics models and tools are applied (e.g. real-time processing, machine learning for predictive modelling, batch processing). The 'refinery', in essence, transforms the data. The finished data "refinery" products The "refinery" is the insights engine that uses data to extract value and spew out intelligence, action and visualization in formats that operations can intuitively use for accurate decision-making. Operational Intelligence can take the form of authentication and authorization, predictive analytics that preclude threats and system failures, auto-ticketing, availability and capacity forecasting, chargebacks to LoBs and SLA adherence. The efficiency and accuracy of the digital insights engine depends on how the data "pipes" are laid within the "refinery" and how its components are integrated and configured. This determines the manner in which data is ingested, orchestrated and

crunched. The architecture and components within the insights engine determines the types of data an organization can leverage. Ideally, this should range from offline to near real-time to real-time and must include structured, semi-structured and unstructured. Conclusion OiI platforms' abilities to operate in scalable environment, to quickly re-configure itself using accelerators and best practices, to lay the data "pipes" and analytical models in new combinations and structures help enterprises manage their data across its lifecycle and extract from it the fuel that they require to sustain their competitive edge in an ever changing landscape. Balwant Singh Balwant Singh is Practice Head, Data Platform Engineering and Senior Member of DMTS (Distinguished Member of Technical Staff) Group at Wipro. Balwant is a technologist with passion and drive for emerging technology business with more than 17.5 years of experience in Software Products and Internet Scale Solution engineering of highly available, fast, reliable and scalable systems using open source and disruptive technologies such as Cloud, Big Data/Hadoop, HPC and Cluster Computing & Storage Systems. Balwant holds a Bachelor of Technology Degree in Electronics & Communication from the University of Pondicherry, India. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. Data Helping Manufacturers Increase Efficiencies and Reduce Cost of Quality

----- Arcticle source ----- https://www.wipro.com/analytics/data-helping-manufacturers-increase-efficiencies-and-reduce-cost0/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content All forms of business management, and all studies of management science, require accurate, duplicable and reliable data at their very foundation. Big Data is helping manufacturers achieve the same. The advanced integrated, systemic data collected has capabilities that are beneficial and is a pathway to greater productivity. In many cases, the gains from adoption of the latest digital control techniques can be substantial. An important principle of business management is to plan before executing any strategic initiative. But what is seen in companies today is a blind rush to collect data. The answer to how should this data be used and implemented still eludes many. According to the Economist Intelligent Unit study commissioned by Wipro, 'Manufacturing and the Data Conundrum', just

42% of companies have a well-defined data management strategy. Deriving applicable insights from the collected data is what will impact your business positively. For example, At Meritor, a maker of drivetrains, brakes and other commercial vehicle components, customers tend to focus on one metric - the number of rejected parts per million (PPM) - to evaluate suppliers. To respond, Meritor quintupled the amount of data it collects and began to track defect rates not just by part, but also by individual production operations. It also decided to differentiate between reject PPM of products shipped to customers and supplier PPM, which takes into account quality levels from component suppliers. In 2013, Meritor's reject rate was 139 parts per million. During the 2014 first quarter, with more plants working to improve the traceability of production issues, the rate fell to 67. Today you are bombarded with tons of data, the path to success lies in putting that data to effective use and drawing valuable insights to understand your customers' needs better. And the customer is happiest with a good quality product and this is where data analytics can prove to be a game-changer for manufacturers. Nearly 72% of the participants in the EIU study feel that data can make a big difference; they pick product quality management in their top three business areas likely to see gains from more data, a much larger proportion than for any of the other areas and 28% points more than the proportion picking the number-two area of potential gains. Data is helping manufacturers understand their customers need better as data-driven product designs that report performance issues automatically to manufacturer service departments. For example, jet aircraft engines that are linked to the Internet and communicate on their own when service is needed. Emerging problems, in turn, lead to an enhanced need to boost analytic capacity linked directly to shop floor production processes. The machines themselves, in other words, feed the need for process data, leading to installation of more linked machines, and more actionable data in the factory. After all is said and done, it turns out that coordinated digital control systems can and do produce insights that are extremely valuable as shown in the study. So have you tasted the benefits of big data yes? Do share your thoughts in the comments section below. Dr. Srinvasa Vegi - VP And Global Practice Head, CXO Services, Advanced Technologies & Solutions, Wipro, Ltd. Dr. Srinivasa Vegi is responsible for practice strategy and management, business and competency development and thought leadership on developing integrated SMAC solutions for CFOs, CROs, CMOs, CPOs etc. With 20+ years of experience in driving business in the areas of Analytics and Information management, Dr. Vegi comes with a deep understanding of critical business drivers for global markets and industries. He has comprehensive experience in Data Warehouse architecture and design with a focus on Business Intelligence, Performance management, Big Data, Social, Mobile, Analytics and Cloud. Dr. Vegi has advised multiple Fortune 100 organizations to deliver transformational Data Warehouse, Business Intelligence and Analytics projects in Banking, Telecom, Healthcare, and Public sector. He has also been a regular speaker at leading industry & CXO forums. Dr. Vegi holds a Ph.D in Computer Engineering from Andhra University. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put

Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Big Data Analytics Driving Growth in Retail Banking

----- Arcticle source ----- https://www.wipro.com/analytics/big-data-analytics-driving-revenue-growth-in-retail-banking/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Banking on Big Data Nicolasi has a vision of running a nouveau French restaurant. His grandmother's cooking, which has its origins in the French Basque Country, has taken on an avant-garde twist ever since she arrived in the US. His friends like her cooking style and Nicolas believes he is ready to give a shot at entrepreneurship on the back of his grandma's creativity. At the moment, he is discussing a loan with his banker. But, this is where the "I-dream-of-owning-a-restaurant" story takes a turn. The banker has decided to advance Nicolas the working capital, but, in addition, has some fine business advice. Would Nicolas like to know the best locations in the city for a nouveau French restaurant and the price point at which it can garner customer loyalty much faster? Nicolas is all ears. Many banks would be happy to give Nicolas a loan. Not many would be able to add an invaluable service that opens a new revenue stream for the bank. For Nicolas, the bank sifts through its growing stockpile of customer and transactions data – acquired largely due to regulatory requirements – and churns out remarkable insights. The bank can also help Nicolas acquire customers through targeted promotional campaigns. The bank examines demographic data, income groups, preferences and spend patterns, behavior indicators by area codes and mashes it with social and mobile data, to come-up with great business insights for Nicolas. This is the power of Big Data! Regulatory pressure has been forcing banks to invest in more data acquisition, storage, licenses, security, AMCs and people to manage the data. Practically every bank today has a big data implementation in terms of Hadoop running on their IT systems. But not all can generate revenue from data – turning a liability into an asset. Banks and themselves at the intersection of advanced technology and sophisticated customers in a world gone digital. The data coming-in from IVR, web, mobile devices, ATMs, kiosks, CRM, surveys, social networks and partner services can lead to superior personalization of services. Using advanced analytics on top of Big Data, customer data can help retail banks solve business problems far more complex than those faced by Nicolas. Banks are in the process of transforming their traditional data warehouses into information delivery platforms or 'Insights-as-a-Service' – an area that can aid service diversification and improve profitability. 'Insights-as-a-Service' will help retail banks go beyond non-interest income products. Banks can also improve top-line growth by acquiring new customers, efficient customer servicing through customer lifetime value maximization, by cross-selling/up-selling new products and services, and

preventing customer attrition. Big Data has a way of solving the leading challenges the industry faces that old methods cannot. These include the following: Meeting New Customer Demands: Technology companies like Google and Facebook are setting new customer expectations. As a consequence, customers want scores of new features from their banks as well . Big Data is doing this in three ways: by helping identify the services that customers want; by helping identify the price points for new services and forecasting ROI; and by helping customization of services. Managing Customer Lifetime Value: Big Data can surface campaign strategies to acquire new customers, track customer response across channels, and adjust channel investments. Insights from Big Data can drive offers that matter to individual customers rather than generic approaches with non-optimal returns. Successful on-boarding can be followed with precise cross-selling, up-selling and next best offers. Restricting High Cost of Operations: Channel ROI can be maximized by using Big Data to identify locations where new physical branches need to be established, scaled-down or shut; data can flag services that can make branches profitable; and it can establish cost-effective channels for customer outreach, interaction and service. Dealing with Regulatory Scrutiny: Banks are not sure how regulatory scrutiny will shape-up in the future. But as banks are held more accountable, their stores of Big Data will strengthen their positions vis-à-vis compliance by providing signals that aid early fraud detection. Emerging Core: Leading to Data Independence and Transparency One of the key challenges in banking has been the data silos created due to multi-product/multi-LOB scenario and the data (structured and un-structured) being buried amidst multiple databases and core systems. Retail banks are exploring setting-up a common data repository that lies between front office (channels/touchpoints) and back office (core systems). A replica of all customer data and transactional data, including financial and non-financial data, is pulled-up and held in a common repository that forms parts of the middle office layer also referred by us as "Emerging Core". This has been touted to be the best approach to deal with the digital disruption – increasing the speed and agility to leverage customer data. The set-up of this common data repository, aligned with the maturity and size of the bank is essential. Once consolidated, Big Data can turn into the underlying engine for building unassailable customer intimacy, creating new revenue streams, lowering cost of existing operations and risk management. APIs and Open Source technologies along with new approaches like Emerging Core are helping organizations to get their arms around huge volumetric data and make the prospects of gaining insights faster in a cost effective way. It is easy to see why banks taking bold steps with Big Data will lead the future. References i Our fictitious example who helps explain the business magic that data can conjure ii For example, they want hashtag banking on a social media platform or the ability to transfer funds directly to friends using just an email ID like PayPal   Sandeep Bhagat, Practice Head, Big Data Analytics, Wipro Analytics Sandeep Bhagat is a Big Data technology strategist, product and platform visionary at Wipro. Sandeep plays a vital role in business & practice management, solution conception to execution, innovative application & product development. He is a Data Science practitioner with over 18 years of experience He has extensive experience in Business-Technology alignment, technology strategy advisory, new service offerings launch, new revenue stream generation and capability building for niche skills such as performance engineering, Big

Data & data science. His core technology expertise includes Big Data & Analytics, Data Science, Machine Learning, Business Intelligence, Information Architecture, Designing & Architecting High Performance applications, Product Engineering, Performance Engineering and Cloud Computing. In his past working engagement outside Wipro, acting as the chief architect, he has developed an innovative big data management platform BigDataEdge™. Sandeep holds a Master's Degree in Computer Science from University of Pune & has undergone an Executive Program in Global Business Management from Indian Institute of Management Calcutta (IIM-C). Sandeep also has various industry certifications to his credit in Enterprise Architecture, Data Science, Data Management, High Performance Computing & Cloud Computing. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Big Data - The Alchemist in Manufacturing

----- Arcticle source ----- https://www.wipro.com/analytics/big-data---the-alchemist-in-manufacturing/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Big Data - The Alchemist in Manufacturing Big data has arrived in manufacturing and in a big way. Needless to say that it governs the future of manufacturing as is clear from the Economist Intelligence Study commissioned by Wipro – 'Manufacturing and the Data Conundrum' where 86% survey respondents report major increases in collection of data and 90% respondents saying their companies have mature data analysis capabilities for many manufacturing processes. Having said that, some questions need to be answered. How are manufacturers using these huge volumes of data for deriving valuable insights which in-turn will help in profitability? Is data collection easy or cluttered with problems related to quality and transparency? Is it easy to integrate data from various sources? The time has come to shift from mere forecast of problems using data to actually solving the above questions using data effectively. Despite the complications between shop-floor data theory and practice, companies surveyed have found a number of comfort zones where the benefits of real-time machine-generated information are accessible. As mentioned above, many have mature data analysis capabilities and using insights gathered from production-data analysis, two-thirds of companies report annual savings of 10% or more in terms of the cost of quality and production efficiencies. According to a McKinsey report, nearly 1.8 billion people will enter the

global consuming class over the next 15 years and worldwide consumption will nearly double to $64 trillion. In such a scenario data analytics provide manufacturers with a huge opportunity to predict, innovate and implement. The challenge now is to integrate the data from multiple sources and draw valuable insights. Although state-of-the-art digital systems can predict problems and suggest solutions in advance of actual need, more than half of manufacturers aren't confident that their analytical skills are up to the task. In Professor Daniel Apley's (professor of industrial engineering and management sciences, Northwestern University) words 'It is very difficult to find young, talented people who want to go into manufacturing. They want to be with financial companies, or Google and Facebook'. Just 22% of surveyed companies have predictive analytical capabilities for production throughput, for example; just 16% have mature analytical capacity to generate potential solutions.   After all is said and done, it turns out that coordinated digital control systems can and do produce insights that are extremely valuable. Some 34% of those surveyed have generated annual savings of more than 25% annually in the cost of quality; the same proportion report 25% or better efficiency improvements annually. Effective use of data is the alchemist to the many challenges manufacturers are facing today. Do you have any other thoughts on how data is being used in manufacturing processes to provide transparency, increase efficiencies and reduce cost of quality? Jayant Prabhu - General Manager & Global Practice Head, Big Data Analytics, Wipro, Ltd. Jayant Prabhu is General Manager and Global Practice Head for the Big Data Analytics practice, a part of the Wipro Analytics service line. He is responsible for practice strategy and management, business & competency development and thought leadership on leading technologies like Big Data Analytics, Artificial Intelligence, Machine Learning, Internet of Things etc. Jayant has over 17 years of IT experience around Information Management consultancy, Data Architecture and Implementation road map, Process Modelling, and Design and Implementation of BI & IM solutions around leading product suites. He has advised multiple Fortune 100 organizations on devising strategies to leverage Information as a strategic asset to drive innovation derive competitive advantage and manage costs utilizing leading edge concepts like Big Data, Cloud, and Analytics. He has also been a regular speaker at leading industry & CXO forums organized by Gartner, IDC, MDM Institute on topics around Big Data Analytics, Master Data Management & Information Management strategies. He has also co-authored whitepapers on Big Data Analytics, Information Governance, Data Monetization etc. that have been published in leading publications. He is one of the founders of the 'Wipro MDM Leadership Council', a successful thought leadership platform that brings together practitioners from several organizations that are or are looking at implementing MDM to drive business transformation. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Data Appliances for the Insurance Industry

Data Appliances for the Insurance Industry A Big Step Forward The challenge of data volumes Financial reporting for insurance companies continues to grow in complexity. Regulatory standards are evolving with a host of new and mandatory rules, thresholds, schedules, submissions and disclosures being routinely announced. The time and effort required to meet these technical requirements has ballooned. With it, there is pressure on finance executives to reduce turnaround time and increase accuracy. This is truer for some process than others. One such process is the Finance Close process in Property & Casualty (P&C) insurance. Finance Close is a key accounting activity for the industry and solving problems associated with the process are not only important but they also offer insights and cues into managing other process better. Finance Close is notably complex and time consuming. The process determines how premiums, loss and reinsurances are ultimately recorded at the General Ledger (GL) level. The process is complex because it has dependencies on several operational systems and sub-ledgers. With increased regulatory oversight, the data associated with the Finance Close process has grown exponentially. Insurance companies today urgently need to find ways to manage this exponentially increasing data. The solution lies in a new breed of data appliances that combine data storage and analytical engines. In a business where stakeholders and regulators are demanding more detailed explanations, higher granularity of data, shorter periods for filing technical reports and financial statements, new definitions and disclosures, enhanced governance processes, external auditor testing and reviews, the only way an organization can deliver is to use database appliances to reduce stress on IT systems. The Finance Close landscape also serves very well to explain the more general problem in the industry. An organization may collectively insure thousands of its employees for, say, a period of 10 years. Although the premium for the coverage may be paid upfront on a single day each year, the insurer cannot record the complete revenue in its GL. The premium for each individual covered needs to be broken down for each day across the 10 year period of the policy. Only the portion of the premium calculated until the current date can be recorded as revenue. In essence, a single transaction sets off literally thousands of different records for the duration of the policy. Each record must be meticulously and accurately calculated, verified, captured and stored for retrieval. Regulatory remit may require these records to be stored for upwards of 7 years. Any service request in the future could invoke those records or a query from the Insurance Regulatory Authority (IRA) may require recovery of the records for disclosure and analysis. Now multiple this situation with insurance policies covering the entire P&C spectrum—damage to property, worker compensations, underwriting equipment

warranties and re-insurance—and you have a situation where records management, retrieval and analysis can become a nightmare using traditional tools. Limitations of traditional data management Traditional data management techniques require database administrators to perform a number of time-consuming tasks to define and structure the data before the database can be queried and deliver the quality and performance expected by large sets of users. As the data grows, it must be migrated to an increasing number of servers. This may initially not appear to be problematic as database management technology has been around for over three decades and has evolved considerably. However, the technology was built to manage several millions of records running into a couple of thousand gigabytes. Today, most enterprises deal with several billions of records. Insurance data has reached a point where some institutions have begun to refer to themselves as petabyte companies. Their data often takes 15 to 20 days to process. Teams providing data for the Finance Close for final posting to the GL do not have the luxury of such time. Migrating to an increase number of servers presents several hurdles. To begin with, database administrators must work with different system vendors to get their DBMS to scale out. Secondly, as the IT sprawl associated with the data grows, performance and availability of the complex system become uncertain. Finally, a decision to migrate to multiple serves means a continuous and increasing investment in hardware, storage, software, upgrades, licenses, backups, maintenance and services. How database appliances can take the stress out of the process With pressure on costs and the need to ensure high system availability, database administrators are exploring the use of database appliances. A database appliance is a single-stop solution to today's growing demand for efficient, reliable and scalable data management. These appliances tightly integrate servers, storage, operating system, software and DBMS. They have the tools to extract data and analyze it for business intelligence. In other words, the processing happens as close to the data as possible, eliminating the time required and the stress of securely shipping the data. This also means optimal performance as the software is built for the hardware. When data volumes grow, additional modular components can be simply plugged in. The advantages of database appliance in the insurance industry cannot be overlooked. These include: What to expect with database appliances? In the light of the advantages, it is therefore not surprising to see a surge in interest in database appliances in the insurance business. The focus is on systems that manage between 1 terabyte and 10 terabyte of data. Most large insurance database appliance users will do well to consider systems that manage between 10 terabyte and 100 terabyte of data. With such large data volumes, even a few seconds shaved off each database transaction can result in massive changes in capability. Processes that take two weeks because data is spread over a variety of systems can be brought down to 10 hours with the introduction of database appliances. The fact is that decisions in the industry cannot wait two weeks. Timely reconciliation and the close of certain processes are essential to operational efficiency, minimizing financial risk and reducing the likelihood of regulatory action. Going into the future, a thumb rule would be to bear in mind that investments in database appliances would do better if they had a wide availability of tools – hopefully from the open source space – and were built with industry specifications and standards in mind. A system that is built for purpose will certainly deliver

better ROI and will be, for IT in the long run, simpler to manage. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Data Platform Transformation

----- Arcticle source ----- https://www.wipro.com/analytics/data-platform-transformation/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Taming the data deluge Digital is Driving New Trends in Data Usage The dominance of digital has given rise to an era where the growth of data has become an area of concern. Data isn't bad news. Quite the contrary, organizations are welcoming data into their systems. But they have been caught unprepared by the implications of data at scale and its diversity. That is why data platforms are in urgent need of transformation or rationalization. If organizations don't do this, valuable business intelligence will remain buried and inaccessible within the data. No business can risk that. Today's global business requirements must manage millions of business transactions, an inordinate increase in the number of concurrent users and exponential data growth from internal and external sources. Additionally, as businesses change their processes, data structures undergo a concurrent change. This food of complex data is crippling current systems. What businesses need is robust scalability, resource optimization, consolidation and flexibility to meet even unforeseen business needs. That's why, across industries, there is a growing demand for innovation around data platforms. Migrating to improved data management solutions Database vendors have come up with an effective solution in the form of data appliances. These are pre-packaged servers loaded with OS, database management systems (DBMS), memory, storage, analytical engines, services and support. The appliances are able to support the growing volumes of data and transactions generated by modern businesses. With data being in close proximity to the analytic engine, there is no need to prepare and ship data to remote servers. Time cycles are reduced, the data is more secure and total costs associated with support and maintenance etc. can be brought down. Although more expensive than traditional relational database management systems (RDBMS), data appliances offer an effective solution to the data problem. But the very cost of these appliances is also forcing organizations to migrate their data from one platform to other platform either on premise or cloud based solutions. In these instances, organizations are wary of migration. This stems from a variety of factors and perceptions that play a role in shaping the final data platform and migration solution: Data migration to another RDMS or appliance is risky without SME knowledge about existing platforms The Expertise required to manage new platforms is scarce. The transformation process implies downtime and is too hazardous

for business These are natural anxieties. But they also point to the precautions that must be in place before migration. These precautions include consulting technology partners about standardizing the IT landscape, tailoring the solution to meet specific business needs, restructuring data to meet new process requirements, rapidly deploying the solution without compromising quality and minimizing downtime. 5 ways to tell if you are ready to transform your data platform The foremost question that every organization wants answered is: Am I a candidate for migration? There are multiple scenarios that help identify ideal migration candidates: How to minimize downside and increase upside Once you've worked your way through the Am-I-a-candidate-for migration filter, there is going to be a short list of challenges that will crop up. First and foremost is the problem associated with the required data structures for migration from legacy systems to appliances. The odds that your database knowledge has long gone with an employee are high. You will need to ponder on how to either build that knowledge back into the system (very time consuming and iffy) or outsource it to platform experts (cross checking their ft for your business needs could be daunting) before data can be safely migrated to the target state. It is also necessary to keep an eye out for data integrity and consistency. Given the growing number of platforms spewing data at your business, the source of data needs to be carefully chosen to maintain data integrity. Finally, a non-technical quality is essential for effective data platform transformation. Risk must be minimized by ensuring that the transformation is rolled out in a phased manner, calling for tremendous planning and patience. An aspect of migration that is not well thought-out is the effort required for data validation and quality, post migration. No business should wait for the lack of data quality to affect business before responding. Instead, the migration plan must include a data validation/ reconciliation strategy that is also incremental and in step with the phased roll out. The benefits of data platform transformation can be realized across operations, technology and support groups through: Is it enough to gain the benefits listed above? We think not. Working with an experienced partner to understand existing data structures, create new architectures that meet business needs, identify early migration candidates within the enterprise and create data validation strategies is the complete story. When undertaking such a significant exercise, enterprises must also invest time and effort in improvements. This would mean identifying existing bottle necks, recommending the acquisition of select in-house skills and adopting industry best practices. It is this holistic approach that makes for successful data platform transformation. Is it enough to gain the benefits listed above? We think not. Working with an experienced partner to understand existing data structures, create new architectures that meet business needs, identify early migration candidates within the enterprise and create data validation strategies is the complete story. When undertaking such a significant exercise, enterprises must also invest time and effort in improvements. This would mean identifying existing bottle necks, recommending the acquisition of select in-house skills and adopting industry best practices. Driving Customer Insights for Retailers in the Digital Era

----- Arcticle source ----- https://www.wipro.com/analytics/driving-customer-insights-for-retailers-in-the-digital-era/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Driving Customer Insights for Retailers in the Digital Era Amanda, a working mom , spotted a summer skirt on the website of a top clothing brand and ordered it. When the skirt arrived it was the wrong color. Instead of sending it back by courier and having to exchange endless mails over the return, Amanda took time off from her work and visited the brand's store to have the skirt exchanged. But the store was unable to assist. returns and exchanges which had to happen over the same channel that the purchase was made, said the store manager. "Why can't you refund me and send the skirt back to your warehouse?" asked a miffed Amanda. It is a natural question for a customer – one you must have asked several times yourself. The answer is simple: retailers have been happily adding sales channels without unifying data across them. As a result, one part of the business is blind to the other. And who pays the price? Well, the customer certainly but so does the brand – in dropping customer satisfaction levels. While the

growing volume of customer data is good for business, it is only so when managed well. The growth in digital and Big Data technologies is bringing a deluge of opportunities for retailers. But with it comes operational difficulties. Amanda makes a good example of a customer who has several needs – none of which are managed well by most retailers. For example, Amanda wants to know why she has to repeat her complaint on the phone to the customer service agent when she has already written a mail to the retailer listing and documenting every detail of her transaction. "Last week, I wanted to buy a bluetooth speaker and found that the price at the retailer's online store was different from the price on their mobile shopping app. I wonder if I am being taken for a ride." Of course Amanda is not being taken for a ride. What is happening is this: there is a lack of uniform and coherent omni-channel customer experience due to poor data management. The chaos from growing channel proliferation can be damaging. There have been many such damaging instances in the retail industry. Poor data management is leading to several hiccups: pricing errors and discrepancies across channels, shipment and delivery errors, lack of visibility into inventory, damaging legal action from customers and regulators with serious cost implications. Conflicts in promotions across channels and inadequate customer knowledge are adding to customer dissatisfaction. The question is: how can omni-channel experience be improved? Master data management (MDM) is the key. MDM put in place tools that processes and controls reducing errors, improve data usability, enhance the quality and reliability of master data (core information about the business – customer, product, supplier, etc.), offering a "single version of the truth". A study commissioned by Wipro and conducted by the Economist Intelligence Unit, called The Data Storm – Retail and the Big Data Revolution (see Figure 1), found that only about one-third of retail CXOs admitted to having a well-defined data management strategy. They want data to enable better product pricing. They want it to enable demand forecasting. They know it can shape merchandizing strategy that results in brisk sales. In addition, with adequate customer data, they know it is possible to reward customers and grow loyalty, cross-sell and upsell with a high degree of success, shape promotions and improve customer engagement. But the problem they face is quite frustrating. In your business, in which of the following areas do you see big data analytics yielding the biggest gains? Select the top three (% respondents) Source: The Economist Intelligence Unit study commissioned by Wipro, "The Data Storm – Retail and Big Data Revolution"   Figure 1 : Areas in Retail that hold potential for Historically, the systems to manage these processes were designed in isolation. As a consequence,today, product and customer data is tucked away in various parts of the business. The challenge is to create a "single version of the truth" that aids Business Intelligence (BI) across the enterprise. MDM in an enterprise enables the business processes' access reliable data (customer, product, location and others). This is acquired from enterprise applications, legacy systems and third parties. It is then transformed using data models, governance policies, etc. and synchronized across the enterprise for analytics, reporting, decision making and improving customer interactions. Smart retailers know that adopting MDM is not an IT decision – it is a strategic business decision. It means integrating data from various enterprise systems (ERP, CRM, SCM, warehouse management solutions, ecommerce solutions, legacy apps and others) and external sources (demographic, web, social, mobile, locational),

and allowing different business teams to extract real-time customer insights (see Figure 2). Omni-channel retailing hinges on creating a unified view of the customer and delivering a seamless experience across channels. This means the retailer must be able to integrate all channel data, and leverage it to hyper personalize the experience (see Figure 2).   Figure 2: Success Factors for Omni-Channel Retaili MDM as an enabler: Single trusted view of master data with unique referencing across all the systems or applications. Benefits: As the retail industry continues to witness a surge of data, MDM has become a strategic business imperative. MDM can ultimately improve the satisfactions levels of Amanda and other customers. But it can also guide buying decisions and become a unique way to drive down operational costs. Not surprisingly, MDM is one of the most talked-about initiatives in retail. Is your business talking about it? References To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. Smart Factory in the Age of Big Data and IoT

----- Arcticle source ----- https://www.wipro.com/analytics/smart-factory-with-big-data-and-iot/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Smart Factory in the Age of Big Data and IoT The Shape of Things to Come Industrial Revolution 4.0 is here. Where are you? Compared to the acres of floor space once given over to mechanical and electric systems, today's factories are practically unrecognizable. Walk into a plant manufacturing washing machines, automobiles, paints or petroleum products and you'll notice they look quite different. They are humming with hardware, sensors, microprocessors, robots and monitors connected to one another. These plants are getting increasingly connected to external systems and actual users in real time. Thanks to the wide availability of processing power, the miracles of miniaturization and growing connectivity (wired and wireless), factories, production plants and mills are unleashing a new era in industrialization – it is an era of Big Data generated and transmitted by millions of devices on a backbone called the Internet of Things (IoT). In a global study conducted by the Economist Intelligence Unit (EIU) and commissioned by Wipro in 2014 called Manufacturing and the Data Conundrum – Too much? Too little? Or just right? 44% of manufacturers said they understood the value of shop floor data. Manufacturers are beginning to realize they can capitalize on their data to increase shop floor efficiency, reduce waste, impact quality, re-engineer their supply chains for higher effectiveness and to improve

warehousing, shipment and logistics. GE, one of the leaders of the smart factory concept, has crammed its US$170m Durathon battery plant in Schenectady, New York, with 10,000 sensors. All of them are linked to the company's 400 global factories. The sensors capture 10,000 variables from manufacturing process, building information (energy use, temperatures and humidity), and even extend to the rooftop weather station. The data is captured with a frequency of an astonishing 250 milliseconds. Using Wi-Fi links staff members are alerted to anomalies and deviations. The plant is a test bed into how Big Data and IoT can deliver a smart factory – or, what GE calls, the "Brilliant Factory". In other words, Industrial Revolution 4.0 is here. And its central quest is to free the intelligence that lives with zettabytes of data related to your factory and its products. Some interesting smart factory use cases What can factories do with their data? Industries are using it in different ways, shining a light into the future. Defence: In one defence equipment manufacturing plan, the number of times a screw must be turned to tighten it is specified (say 12 times). If the screw turns an additional time, it is flagged as an anomaly and signalled for rectification. The example serves to show the depth to which the pursuit of quality can go using sensors and the data they generate. Automobiles: A growing number of cars equipped with intelligent systems like navigation systems, trip computers and on-board diagnostics systems are becoming smarter with IoT. Sensors are getting better in identifying other cars, objects or people and avoiding accidents. Pharma: IoT in Pharma is driving cost savings with applications like 'Organ in a Chip' which drastically reduce the R&D cost by running rapid trials running multi-stage diagnostics, Clinical Development through faster subject screening and analysis using sensors, and Supply Chain by reducing operations and maintenance cost. Oil & Gas: The industry is using data for preventive maintenance. The returns are forecasted to be huge. For example, a well-known fact is that a 1% improvement in the performance of all Electrical Submersible Pumps (ESPs) currently in use to pull oil from wells can deliver over half a million additional barrels of oil each day. At US$100 per barrel, that translates to over US$50 million a day. Real-time monitoring of data from the ESPs can help prevent downtime and improve asset performance. The gains from smart factories The benefits of data to factories is across several vectors. These include: Let your imagination soar The primary task before realizing a smart factory is to identify equipment and processes that generate valuable data and take the network to the very point where the data is being generated. In other words, where is the tip of your data? What is the format of the data – is it structured, unstructured or semi-structured? Can your network transmit the data coming in from -- and being sent to -- millions of devices? Can your data management system ingest the growing data? Once the answers to those questions are 'yes', you can put the data to practically any use, limited only by imagination. Smart factories are the future. But they don't have to mean abandoning your current investments in technology, data management and monitoring. If your plant has operational expenses of US$100 million a year, a 5% improvement using smart factory technologies can deliver savings of US$5 million a year. That itself should be compelling to consider making data a strong ally in the age of IoT. Narendra Ghate Narendra is a Senior Manager (Data Platform Engineering practice) at Wipro Analytics. Narendra has more than 25 years of experience in Product Engineering in New Technology areas that are at the leading edge of the Technology and Market

trends. His experience spans working on High End UNIX Servers hosting SMP and NUMA architectures, Wireline Products from CPE to Metro Edge, and Radio Network Controllers in the Wireless Networks. He is currently involved in consultation and building of the Big Data and IoT Platforms for different domains and industry segments like Retail, Manufacturing, Healthcare, Medical devices and Banking/Financial Services. Narendra holds a Bachelor of Engineering Degree in Electronics & Communication from the University of Mysore To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. Integrated Manufacturing Operations

-Data & Connected Technologies

----- Arcticle source ----- https://www.wipro.com/analytics/integrated-manufacturing-operations---data---connected-technolog/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Integrated Manufacturing Operations - Data & Connected Technologies Over the past few decades, manufacturing operations have undergone a major evolution from being passive and largely human controlled to extremely complex and intelligent. One major driver in this evolution has been the way manufacturing data is handled, analysed and used in making real time manufacturing decisions. According to Manufacturing and the Data Conundrum, a study conducted by the Economist Intelligence Unit regarding data collection and its use in manufacturing, the amount of shop-floor data being collected has increased manifold for a majority of the respondents. This is largely from the widespread availability of real time sensor data at various stages of the manufacturing process which is essential to integrated operations. But, on the other hand, only a minority of manufacturers have advanced data analytics in place to predict issues. Fewer still have managed to integrate data from diverse sources or have skilled personnel to analyse it. Through effective and integrated data management and analysis from various manufacturing process, a significant impact can be made to various facets of manufacturing – from product quality management and process controls to safety and facilities management. The study mentions examples of companies like Meritor, ABB and GE, where increased focus on quality through integrated systems was demanded by new contracts and proves an often debated point on the economics of investing in data analytics for

product quality management. Implementing an integrated and effective data collection and analysis architecture does come with its share of hurdles. Many manufacturing facilities are still on old legacy systems which generate different forms of data. Managing the data in a coherent and common format can be a gargantuan task and moving to a common architecture is not without its birthing pains. Big data also presents with it the problem of staffing the infrastructure with trained personnel. Most often than not, different manufacturing facilities and even departments within the same facility are silos in operation which resist any change to status quo. Rallying them on the importance of moving to common data architecture and an integrated view of operations requires a strong leadership drive. All said and done, the next leap in manufacturing process control is bound to come from effective and integrated management of big data. 34% of the surveyed companies report annual savings of more than 25% through effective implementation of sophisticated, integrated digital control systems. The survey also found that companies which have a well-defined data strategy are more likely to be profitable with average earnings growth of more than 10% annualized. In conclusion, there is no denying the fact that advanced, integrated data capabilities are beneficial to the companies in the long run. Also, availability of data has never presented a problem with most modern manufacturing units being capable of churning out terabytes of data from thousands of sensors. The challenge lies in the capability to effectively store, manage and analyse integrated data to give actionable insights. What are your views on integrated manufacturing operations? Please feel free to write in. Nitesh Kumar Jain- General Manager & Vertical Head - Consumer Goods, Wipro Limited Nitesh Jain is General Manager & Vertical Head - Consumer goods (Europe & Emerging markets) at Wipro. Community Analytics Catalyzing Customer Engagement

Community Analytics Catalyzing Customer Engagement Introduction For generations, an individual's community has been the cornerstone of healthy exchange of ideas, knowledge and a source of support. Astute technology companies have relied upon online technical and non-technical communities to help other users with product or service features, highlight glitches, raise red flags, sight early warnings, discuss performance issues, etc. The importance of communities as a platform for collaboration cannot be emphasized enough as businesses increasingly rely on collective participation. But could it be possible that there are ways in which communities can be made to contribute more to the success of a product, service, brand or company than we currently believe? We try to find answers for that in this paper. Communities: A Catalyst for Business Growth Large technology companies with multiple products and services rely on the wisdom of their developers, architects, domain experts, quality leads, testers, product and program managers in the online community platforms they set up within the enterprise. Here, the community posts questions, exchanges information and offers advice, expertise, tips and best practices. Today's advanced online platforms allow participants to express themselves more easily and freely. Participants can "share" the posts of other colleagues, "like" them or vote them up/down based on usefulness, accuracy and relevance and also take part in the online conversations. External communities go a step further, involving a second level of participants. These could be in the form of technology and business partners, direct customers and vendors. Together, this larger community can become the catalyst for gathering more perspectives and collaborate to rapidly solve problems. As the store of ideas, problems and solutions grow, the platform evolves into an institutional knowledge base. In theory this looks perfect. Many enterprises are pleased by the gains. But it is essential to see precisely how these communities impact business. If there is a way to measure the impact of community conversations and collaboration, the logical upshot is: what are the interventions that can improve the business outcomes? There are two clear ways in which community activity can be measured from a business perspective (See Figure 1: Value-driven Community Analytics): Are communities impacting revenue and business? Customer Engagement Level 0 Support Customer Engagement: Let's assume that a technology company has sold its product to 200 customers. Of the 200, we assume 20 are important customers from a revenue, usage and sales-promotion perspective. If these 20 customers are creating original content and their ideas are being leveraged by the other 180, one can assume the community health is good. Soon enough the engagement and interactions of the 20 customers will ensure the entire community becomes

a vibrant source of ideas and advice. This could result in demand for existing products, new products and better ways to use existing products – self-help and troubleshooting. The host enterprise should pay careful attention to the conversation in such a community and use analytics to rapidly extract usable business information. But if the top 20 customers are not engaged, then it is a cause for concern because a major source of business information lies inactive. Immediate remedial steps need to be taken. Level 0 Support: Online communities are a wonderful source of free Level 0 tech support. Customers facing snags, glitches and complications with regard to product installation, usage, errors and performance can find answers within the online community. The community acts as a quick, reliable, helpful and sympathetic support group. When conversations around a problem grow beyond set thresholds, it signals the need for enterprise intervention. Using analytics to understand the content and behavior of customers can be an invaluable tool to re-engineer a product or service, thus reducing support costs and improving customer satisfaction. Cost of Neglecting Community Conversations Enterprises that do not respond promptly to customer queries and problems face several risks. When a customer problem goes unanswered, it increases the cost of support (See Figure 2: Business Impact of Unsupported Customers). The customer is forced to use a customer care centre. This means footing support centre costs. When the number of unanswered questions from customers continues to pile up, not only does the cost of support go up but it also reduces Net Promoter Score (NPS)1. NPS is an indicator of how likely a company or person is to recommend an enterprise's product or service to others. The biggest and simplest opportunity missed in the absence of a healthy community is the ability to cross-sell and up-sell: Existing customers may post questions with regard to a product they are interested in, but they don't get a response. This often happens when an enterprise does not formally list "online community" as a potential sales channel and give it the attention it deserves. When a large number of questions across users remain unanswered, it could spell big trouble. The cost of support goes up, NPS scores fall and there may even be potential contract renewal challenges. The questions and problems posed to an online community offer tremendous product and service insights. They may signal opportunities to re-assess and upgrade product or service documentation and training enhancements. In each of the above cases, analytics plays a crucial role. By deploying analytics, enterprises can discern community signals for beneficial action. Business impact of Unsupported Customers Leveraging Analytics to Improve Community ROI If the complexion and mix of a community could be controlled, there would be little or no problem. But that isn't the case. A typical community has all kinds of users – from the passive to the extremely active. Enterprises need to invest in understanding user types. Communities can be analyzed along different parameters. Some communities could be focused around a product/ service, others may be better defined by geographies, still others by the skills and company size they represent. A quantitative (number of posts, replies, shares,likes, etc.) analysis combined with a text-based sentiment analysis (crawl communities, pick-up keywords that indicate problems) can give insights on which of the community types a group fits into. Getting below the skin of users and their behavior can provide answers to the all important question: what can improve the maturity levels of users so that we can extract business value from them? When users are on top of the

maturity curve, the healthier will be the ROI. (See Figure 3: User maturity curve). Benefit of High User Maturity   User maturity curve Conclusion Text Analytics and community tracking ensures that enterprises keep tabs on customers' voices, understand how active important customers are, what the conversation topics are, who the influencers participating in conversations are, etc. Quite often, alertness within communities for identifying potential problem areas leads to substantial benefits. Community analytics is a useful way to protect the enterprise brand because the chatter can be regulated within a set of closely bonded stakeholders as opposed to uncontrolled criticism on social media. Community analytics can also provide trustworthy insights from enterprise's own user base that can aid product development/enhancement. Often thisrequires intensive research which can be made more focused, based on the insights from these communities. It can also lead to identification of newergeographies for expansion based on the popularity amongst the audience who choose to show interest on the communities. Key influencers (based on frequency and virality of posts, engagement rate) can be tracked and involved in product enhancements as well. Monitoring communities closely, leveraging analytics in conjunction with social media is, therefore, essential for a company aiming to get a competitive edge through active and superior customer engagement. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

A Perfect Combination: 'MDM' and 'Big Data'

----- Arcticle source ----- https://www.wipro.com/analytics/a-perfect-combination-mdm-and-big-data/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content A Perfect Combination: 'MDM' and 'Big Data' Today, enterprises are becoming more customer-centric and are trying to know more and more about their customer preferences by collecting all kinds of data from available sources. These data, essentially termed as 'big data', typically encompasses large volumes of texts and other forms of unstructured behavioral data from a variety of sources. Master data management (MDM) primarily revolves around the creation of a trusted source of highly structured data throughout an enterprise. Data management analysts see a better future for enterprises through better insight into their customers, when they use MDM and big data in tandem. Let us see what is driving this. Big data tools enable the analysis of massive volumes of data from various sources, however, the real challenge is: While big data is certainly an enabler in the direction of customer centricity, it alone does not serve the purpose. What is required is

a combination of a strong MDM along with big data to outpace challenges and realize this objective. Let us see how enterprises can leverage this combination of MDM and big data to build customer-centric strategies: To address the challenges posed from using just big data, there comes the need for a strong enterprise level MDM initiative that has a bigger role to play in aggregating useful information from pools of data and then matching it against the master data spread across an enterprise's transactional systems. Large volume of processed data start making more sense only when it is tagged and related to the master data entities of the organization. Enterprises are starting to see the benefits big data and MDM together could bring. According to a survey result by The Information Difference Ltd. an MDM consulting and Research Company, 67% of survey respondents saw MDM driving big data, rather than the other way around, with just 17% seeing big data producing new master data, including the ability to use master data to automatically detect customer names in sets of big data. The most popular choice was for existing MDM data to help drive big data searches. Essentially, the foundation needs to be laid by master data across a variety of sources that big data brings along. Enterprises will need to move from a single customer record to a single customer profile which will provide an impetus to their business goals. While analyzing big data to unearth findings and insights is important, doing that on clean master data across locations, products, customers, cost centers, plants and other important master data domains will provide the right direction. So for those who want to invest in big data, pause a while and think again. Are you ready for relating data with master data entity in your enterprise? Will a big data strategy alone help you to understand customers better or would it be a perfect combination of MDM and big data? Venkataraman Ramanathan- Senior Architect, Analytics Practice, Wipro, Ltd. Venkataraman has more than 15 years of experience in the areas of MDM, DQ, Data Governance, CRM, BI and Java. He has been involved in various consulting and engagements across geographies for a variety of Fortune 500 companies. He is involved in the areas of customer re-engineering, machine learning, data quality, data governance, sales and service efficiency, business strategy and business analytics/intelligence To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption
======================

Evolution of Information Management in the Digital Era

Evolution of Information Management in the Digital Era The Digital Revolution For over two decades Information Management (IM) professionals have developed techniques, methodologies and best practices in multiple disciplines of IM such as – Data Profiling, Quality, Data Integration (DI), Data Architecture and Management, Metadata, Master Data Management (MDM), Data Migration, Data Archival, Data Security, etc. As the digital wave sweeps the business world, traditional approaches towards managing data are impacted significantly such that methodologies and techniques require an overhaul to support this new digital age data. The digital transformation of enterprises across the globe has opened-up new challenges, possibilities and opportunities in the IM space. Digital is all about re-imagining certain aspects if not entire business processes, services and interactions with customers, partners and vendors by leveraging consumer oriented digital technologies to deliver a superior experience. Enterprises have chartered Chief Digital Officers to partner with businesses to identify, develop and implement these new "digital apps". Enterprises always had applications to support business known as Systems of Records like ERP, CRM, SCM, Risk, DWH, etc. These applications are transaction-driven and designed to initiate, record, execute, monitor and report on business transactions. These are the "core" applications of any business. Fig 1: Enterprise IT – Core and Edge – SYSTEMS OF Digital apps have carved out a new set of IT applications that are created with deep emphasis on engagement with the end-user. These are the "Edge" applications of any business, known as Systems of Engagement. They are created for a specific type of customer engagement and share different characteristics in the applications lifecycle. E.g. experience-driven customer on-boarding in a bank as a part of digital banking initiative or mobile-driven digital claims process using mobile. Most of them are born in the cloud, built with mobile-first philosophy and designed for a frictionless experience to the end-users. The proportion of "Edge" apps will grow significantly as digital initiatives gain more prominence within enterprises. Given the state of digitization and nature of these applications, many of them will be experimental in nature, leading to a faster rate of change than that for the core applications. Additionally, an Edge application can also retire fast, if it has outlived its utility or needs replacement due to an evolving business need. Fig 2: Enterprise IT – Core and Edge – SYSTEMS OF Systems of Engagement The digital apps though built differently can't work in isolation. For instance, a customer on-boarding or digital payments app has to still go through the customer id creation process in the operational MDM at the core, credit decision making system for risk evaluation and validation against eligible customer segments. Fig 3: Enterprise IT Layers Enabling Multi-channel In

case of a social media-based payment app, it has to go through AML processes at the core for fraud prevention and validation against suspicious transactions. This means that the data exchange and process hand-off between the experience and execution layer needs to be orchestrated to deliver the seamless experience that the digital application promises to offer. Customer Journey starts with an interaction at the experience layer. Every customer journey in the experience layer can be through a different channel and will interact with the execution layer to complete the process and transaction enabled by the "integration layer". Opportunities for IM Given the necessity of the interaction between the Edge and Core layer, to deliver a unified experience, IM practitioners need to look at three areas in order to build on new capabilities: Implementing these new capabilities will also require new architectural approaches such as Lambda and Data Lakes to augment the existing data warehouses. At the Intersection – Interface Layers between Core and Edge Data Gravity Shift to the Cloud - Proliferation of cloud applications and data platforms drive the need for an integrated approach to manage new integration patterns. Also, SaaS data model changes happen at a much faster rate pushing new data elements to the warehouse faster Many enterprises are rapidly migrating some of their applications into the cloud i.e. Salesforce, Marketo, Infor and Workday, etc. to These workloads are not just batch, but consist of a mix of batch, real-time and streaming. These capabilities are addressed via newer technology platforms such as Integration Platform as a Service (IPaaS) that provides for better leverage the operational expenses model and reduce TCO. Additionally, some EDW workloads (i.e. investigative analytics) are also migrating to cloud through provisioning of analytical databases like HP Vertica and Amazon Redshift. This demands a new set of cloud DI patterns such as the foundational platform to integrate not just on-premise and cloud but also Core and Edge applications in the enterprise. Technology vendors like Snap Logic, Informatica, Actian, Kapow and Jitter Bit enable these new capabilities. At the Edge: Data Management Functionalities for the Intelligent Edge Apps Fast Data - The Real-time Enterprise Data ingestion rates are continuous and need to be processed either as streams or complex events as digital apps are real-time based The rate of data flow has increased manifolds due to social media, Machine data (CDRs), IoT, etc. A new class of applications i.e. Listening Platforms are being deployed in enterprises that allow the organizations to read streams of social interactions and glean insights from them. This means, reading from wirehose of social data providers such as Gnip and DataSift for a specific digital app around a specific conversation or topic. Also, the real-time decision making is in need of an enterprise to necessitate the creation of new patterns of DI pipelines inside the enterprise that handle: a. Collection, reading, aggregation and repor ting of KPIs and metrics for data stream monitoring (e.g. machine health monitoring, social object monitoring, network operations monitoring). Pattern focused on fast ingestion of data and repor ting b. Data transformation of streaming data, based on business rules and ingestion into data lakes or data warehouses (e.g.Telecom CDR sessions) pattern focused on maintaining the state of incoming data and transform data for complete state and if required deliver a new stream of data c. Real-time data processing for critical events based on model scoring and interfaced with decision management applications to provide real-time responses (e.g. Next best offers based on in-store location data received

from iBeacon, personalized micro-campaign launch for top 10% customers whose calls were dropped more than normal in the last 'n' minutes etc.) Pattern focused on interfacing with operational applications to support high request-response pipelines d. Complex event processing across multiple data streams - monitoring for pre-defined complex events over multiple streams of data and by querying the streams continuously to build high-level metrics and detect anomaly events (e.g. fraud detection based on a defined complex event pattern derived from multiple streams of data, machine failure threshold identification based machine data streams) pattern focused on monitoring complex events across streams that individual streams alone can't compute There are many technologies that can address these fast data requirements and they are not restricted to open source realm of Esper, Storm and Kafka, etc. Technologies such as Stream Base, SQLStream, IBM Info Sphere Streams, WSO2, Oracle CEP, Microsoft Stream Insight, Amazon Kinesis, Informatica Rule Point, VoltDB can provide the foundational components required to build these fast data pipeline processing capabilities. Digital Applications - Age of Polyglot Storage Data that comes for analysis doesn't come in rows and columns anymore. Log Files, JSON, and XML etc., stress the existing IM capabilities In the past, enterprise data for all the applications it neatly into relational tables. Digital apps are built using new set of data management technologies decided upon the factors such as availability, requirements and ease/rapidness of development i.e. NOSQL database such as Aero Spike, MongoDB, Cassandra, etc. Digital Applications - Age of Polyglot Storage on a multi-model storage engine like Foundation DB, Arango DB. A hypothetical digital app may store its application data in more than one database like customer information on a relational DB, catalogue information on document database, click-stream and mobile session information data in Cassandra, etc. Once these digital apps are deployed, rich interaction around a certain context and business process is now available to be integrated with information in the data warehouse for completely new set of insights. From an IM perspective the data supply chain has to be re-configured with new capabilities to manage this integration   At the Core: Bringing Business Speed to Selected Core Layers Big Data Integration – Leveraging Hadoop for Batch Data Processing Processing data through the engine of an ETL server is reaching its limits and even the ELT approach of database push-down introduces contention in the databases. A parallel processing framework with distributed file system to push-down heavy workloads is the solution. As enterprises grapple with Big Data and continue exploring Hadoop, for low-end use cases such as enterprise landing area, data provisioning platform etc., the traditional model of processing data through the memory of an ETL engine will crack, to pave way for a select set of workloads to move into Hadoop-based platforms. However, enterprises will want to leverage the existing DI tools that offer unmatched productivity and code management capabilities while undertaking the migration. In the world of Hadoop 1.0, all processing was directed via the map-reduce framework to access, read, processes and write files in to HDFS. Traditional DI vendors built connectors to extract data out of Hadoop and process it in the ETL server and delivere it to target systems. In some cases, the tools leveraged the usage of HIVE/PIG to convert the mappings into these high-level processing languages and executed their jobs in Hadoop, popularly known as push down optimization. With the advent of YARN in Hadoop 2.0, many traditional DI vendors are preparing a roadmap

for their products that can sit natively on Hadoop as another processing engine. This will provide the ability to develop mappings using the same set of mapping development tools and deploy for execution directly in Hadoop through MapReduce/Tez/custom engines (depending on the workload), that sit on YARN and access HDFS files natively. This way, data that is ingested into Hadoop staging stays in Hadoop till the processing is performed and the final data-sets are created for export into the data warehouse. This avoids movement of data from Hadoop to an ETL server and back. By using the same developer tools and mapping tools, data pipelines can be created faster using the familiar enterprise tools and Hadoop can be leveraged for what it is good – distributed processing and storage. The ETL server concept will still hold good for random I/O dependent (updates, upserts, lookups involving changing data etc.) data pipelines and for faster processing of small payload of data.   Conclusion Digital has thrown open a plethora of opportunities for IM professionals to experiment and build new capabilities at the core, edge as well as the intersections layers to help enterprises organize, process, manage and deliver data to the business. It is imperative that we create next generation architectural capabilities that are required for enterprises to succeed and not get trapped in technology led conversations. In the long run, technology will keep evolving but architectural capabilities will stay as the foundation on which data is managed. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Rethinking Data Discovery

----- Arcticle source ----- https://www.wipro.com/analytics/rethinking-data-discovery/ ----- About The Author Contact Wipro Please fill the required details to access the content Rethinking Data Discovery The New Research and Experimentation Paradigm for Analytics and Discovery Most enterprises across industries are realizing the growing importance of harvesting their data and drawing meaningful analysis for driving business growth and building competitive advantage. Many of them have already invested in building enterprise data warehouses to generate analytical insights, but it limits them to only structured data within the enterprise. In today's digital and Big Data era, data can be structured or unstructured and most of it resides outside the enterprise. It has, thus, become crucial to have a platform that can be used to integrate all kind of information, perform a lot of discovery-based analysis (to separate noise from real signals), perform analytics on top of it and fi nally consume it through an intuitive visualization interface. This avenue is now being explored in the form of data discovery platform in many enterprises. This paper discusses data discovery as the new Research and Experimentation platform for an

analytics-driven discovery. It also throws light on why enterprises should go ahead with the shift to build a competitive edge for their businesses. Introduction Every day, huge volume of data is being generated in various forms and from different sources. For instance, the retail giant, Wal-Mart, handles 1 million customer transactions every day, thereby adding 2.5 petabytes of information to the database1. The telescope installed at New Mexico, under the project Sloan Digital Sky Survey, collected more than 140 terabytes of information in a decade. Its successor, the Large Synoptic Survey Telescope scheduled to come online in 2016, in Chile, will gather that much of data every week2. Such enormous volume of digital information is the storehouse of meaningful insights such as valuable business trends, shifting consumer behavior, onset of an epidemic, changing weather patterns and rising crime rate, to mention a few. When managed well, this data can provide business houses and governments an opportunity to unlock new business avenues and solutions for better governance. For quite some time, only large data-centric enterprises such as Facebook and Google or e-commerce fi rms were using Big Data to analyze trends and derive insights for developing new products and services. They engaged specialized quantitative analysts called data scientists for this. Soon, these analysts began to realize the potential of analytics for every other industry and business. Enterprises, too, in other industries, began to recognize the latent potential of analytics. However, the biggest challenge for these enterprises was assimilating such volumes of data, segregating the irrelevant information from the relevant one and classifying them into meaningful categories. Enterprises had been using traditional Business Intelligence (BI) systems that use historical data to test a hypothesis. This approach is not only lengthy and comes with its own processing time, but also carries the risk of, "what if the question is wrong?" If the initial question asked is wrong, instead of throwing away the entire output, the report is tweaked to align the analysis with the question asked. This is not prudent for making crucial customer and market-relevant decisions at the frontline of a business operation. At the same time, the decision to migrate to a new data discovery platform is marred by the lack of proper knowledge and a number of associated concerns related to security, ROI, ease of use, etc. That apart, new data sources keep on adding to the enterprise data input. The question here is whether the latest data discovery platform will be able to create placeholder signals dynamically for the new kind of data that is coming in or not. Data Discovery Platform Today, enterprises need a comprehensive discovery platform that can process huge volumes of data in real time to provide meaningful insights. This discovery or decision-making platform is able to assimilate data, structure, refi ne, provide exploratory capability, identify and evaluate various patterns, and help make insight-based decisions faster. It offers layers that allow one to explore data, project trends and draw valuable insights using the known methods of analysis such as customer path analysis, social network analysis, mathematical analysis and more. The results/insights are readily visible on the dashboard. They are visual and easy to understand for the intended audience/decision maker. A data discovery platform is agile. It allows more types of data (as shown in Figure 1. – location data, market research data, customer data) to be considered for the analysis, more number of variables/cases to be used in models. Also, data with short shelf life can be analyzed fast, thus enabling enterprises to make swift decisions with respect to launching new products

and services faster. A potential data discovery platform can be visualized in a simplistic manner (see Figure 1). Figure 1: A Data Discovery Framework Understanding the Data Discovery Framework A data discovery platform is business user-friendly: Typically, the data scientists work in the back offi ce assessing and monitoring volumes of data and produce reports, based on a hypothesis, such as, the success or failure of a product launch, customer satisfaction, campaign effectiveness, etc. for the benefi t of the key decision makers in an enterprise. With data discovery, this is changing. An intuitive interface enables users to explore data without much training or expertise in any analytics tool. The proprietary platform is structured to store and model datagathered from disparate sources (like customer, production, supplier, location, market research data, etc.) while the built-in layers (as shown in Figure 1. – data collection, event hub, event correlation and syndication engine and visual front-end) obviate the need for aggregates, summaries and pre-calculations. A visual dashboard provides an interactive interface that empowers the frontline users to make important decisions related to a business operation much faster than usual. This greatly improves an enterprise's ability to perform analytics and engage in rapid decision making. A data discovery platform creates a foundation for data security and protocols: Every enterprise has a set of enterprise security standards that are very rigid in terms of their data usage, data access by employees, types of data that shouldûbe accessible and more. However, as the new paradigm of decision-making evolves, components of data security and control, such as data governance, in an enterprise need to evolve as well. The primary and most important requirement for building a strong foundation for enterprise data security is knowing and understanding the enterprise data and setting up data governance rules. This helps classify data and create data identity, which is the missing link for creating actionable data security and control policies. Defi ning data within an enterprise (both internal and external) is crucial. It is important to know what kind of data an enterprise has, where it is stored, how and why is it stored there. This helps application of appropriate policies and controls for data protection. Data discovery tools and software for visualization, integration, data migration, etc. help enterprises identify and locate sensitive structured and unstructured information and classify them. The entire process is automated, thus preventing anomalies. BI Vendors Need Rethink Current vendors who offer traditional BI systems, which comprise structured data warehouses and databases, time-consuming and expensive delivery models, will have to re-think about continuing to offer these products only as these are primarily IT driven and restrict deployment by specialised consultants. The latest data and analytics tools are expected to provide opportunities to analyze data for the benefi t of customers and the market. It is not only about making changes in internal processes, but also about evolving the products and services model in a positive manner. In short, data discovery tools are affecting business directly at decisionmaking levels unlike their predecessors that involved processing huge quantum of data, both structured and unstructured, to enable data specialists in making recommendations to business leaders. Conclusion: Early Adopters A few enterprises that recognized the importance of customer and market-facing analytics, pioneered the march into adopting data discovery tools. This helped in better understanding the relationships among various types of data as an essential core of a business process. The two key roles that data

discovery tools play are: Early adopters of discovery tools, while launching products and services, aided by data-driven insights, are also experimenting and learning to make more complex and data-driven decisions at speed and scale. Before implementing a new decision-making process at the production level, enterprises need to run pilots to check the feasibility of the process. This will help them acquaint themselves with an effective discovery environment that would enable them to make rapid decisions and implement new offerings quickly in the longer run. Nitesh Jain is General Manager and Vertical Head - Consumer Goods (Europe & Emerging Markets) at Wipro. Nitesh has more than 17 years of experience in spearheading different areas of technology led transformations. He has been leading the practice and business portfolios in the areas of analytics, BI, Trade promotions, Foreign exchange trading solutions and corporate performance management practices at Wipro and other leading organizations. He is actively engaged in the fi eld of consulting, business analytics, performance management, data warehousing and implementing strategic analytical solutions for Retail, CPG, Manufacturing, Healthcare, Medical devices and Banking/Financial Services domains. In his career spanning 17 years, he has helped various leading retailers, Manufacturing Companies and Banks implement strategic analytics driven initiatives.
