----- Arcticle source ----- https://www.wipro.com/analytics/is-it-a-tough-time-for-energy-retailers-/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content . In today's connected world, with rising living standards and with the proliferation of digital gadgets, consumption and demand for electricity should ideally be growing steadily. However, reality offers a different picture. A quick look at the statistics from some of the developed countries shows us some quite surprising trends. Residential Energy consumption in Australia has actually declined over the last 3 years. Growth in electricity in US households is forecasted to rise by only 0.6% till 2040, a far cry from the 8% growth seen in the last few decades. Europe has seen modest increase in consumption but a lot of it can be attributed to severe cold winters over the last few years. So why do we see this flat growth in energy consumption globally? Is it the rising electricity prices that have forced consumers to cut consumption? Are all the home solar installations eating into the energy requirements from the grid? These concerns coupled with rampant consumer churn figures in markets like Ireland and Australia have left most retailers scratching their heads. Utilities are used to little competition and follow the - 'build it and they will come' mode of operations. And this requires a sea of change, specifically from a supply side perspective, which indeed is underway. We have seen a few of our own customers re-orienting both their business structures and IT systems focusing on the retail

operations within the organization. But this is not enough. The new business model entails taking a leaf out of the traditional retail practices and completely re-orienting your business from a customer centric perspective. For an industry that is used to worrying more about meters than customers, Utilities, surprisingly are very well placed to better understand and know their customers. A McKinsey paper highlights Utilities as being placed the best amongst organizations in terms of data availability and ease to capture data. Where traditional retail firms spend a lot of time and effort in identifying the customer and linking it back to demographics, Utilities have always had a rich set of household, credit and demographic history for all their customers. In fact, adding the consumption patterns from smart grid data is also providing a whole new view on the customer base. Clustering techniques can also provide a better view of the customers and enable Utilities to target them better with only the relevant offers. These techniques can also help identify which prospects are more likely to respond to certain campaigns, thus reducing the customer acquisition costs and enhancing the campaign ROI. Identification of the most profitable customers / plans or early view of the potential churn is something that most Utilities will need to know and manage to operate profitably in this new market. With the prevalence of social media, they also need to know and manage their online 'reputation'. Employing social media analytics and building a response strategy around the same is also going to be critical to improve customer satisfaction. On a related note, it is not just the customers' side of things; there are a number of other ways to improve profitability; for example, being able to predict the potential revenues based on weather forecasts or identifying potential defaulters' thus improving credit collection or better management of peak time demand requirements. The bottom line is that the Utilities that will prosper are those that will quickly adapt their processes to this fast changing competitive landscape and make the best use of the vast amounts of data they already capture. The era of constantly growing demand with economic growth seems to be coming to an end and the quicker they adapt to it - the better! To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Analytics to the Utilities Rescue

----- Arcticle source ----- https://www.wipro.com/analytics/analytics-to-the-utilities-rescue/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Organizations in every industry, when faced with challenges, leverage them to innovate and differentiate; and those who do not capitalize on them, get trapped and tip off the profitability curve. The utilities industry is no different. Today, the

utilities industry faces a number of challenges due to numerous disruptive changes and uncertainties primarily triggered by the economic, regulatory, technological and customer-centric factors. The question that poses utilities now is whether they can turn these challenges into opportunities instead of terming them as hurdles against growth. Let us explore some of the challenges and understand how utilities can leverage them: Can these above examples be understood as challenges or can they be considered as opportunities to differentiate? Why do utilities find it difficult to outpace these challenges or rather turn them into opportunities? Most of these utilities suffer from delayed decision making that often proves to be expensive. For instance, spending on maintenance or upgrading the power plants after a breakdown or frequent outages may be a costlier affair than if scheduled maintenances are performed. For this, the key decision makers should have a real time insight into what is happening or might happen to facilitate a timely intervention or action. Using the right technology to gather real-time data from internal and external data sources and applying advanced analytics to derive real-time meaningful insights can help decision makers to shift to a more predictive mode of functioning than a reactive one. This will help these utilities to reap benefits in the long-term. They will be able to improve product quality, boost customer satisfaction levels, run targeted campaigns to promote environment-friendly usage, predict outages or threats and ensure timely submission of compliance information. Nitesh Kumar Jain- General Manager & Vertical Head - Consumer Goods, Wipro Limited Nitesh Jain is General Manager & Vertical Head - Consumer goods (Europe & Emerging markets) at Wipro. Nitesh has more than 17 years of experience in spearheading different areas of technology led transformations. He has been leading the practice and business portfolios in the areas of analytics, BI, Trade promotions, Foreign exchange trading solutions and corporate performance management practices at Wipro and other leading organizations. He is actively engaged in the field of consulting, business analytics, performance management, data warehousing and implementing strategic analytical solutions for Retail, CPG, Manufacturing, Healthcare, Medical devices and Banking/Financial Services domains. In his career spanning 17 years, he has helped various leading retailers, Manufacturing Companies and Banks implement strategic analytics driven initiatives. Nitesh holds a Master's in Business Administration from Pune University and has a Bachelor's degree in Mathematics. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

The CFO-CRO Partnership: Answering the Call of Convergence

The CFO-CRO Partnership: Answering the Call of Convergence Greater the risk, greater the reward holds as true for the BFSI domain as any other. Playing the balancing game between profitability and risk has become all the more challenging with the rise in economic uncertainty, increased defaults, volatile markets, riskier products being launched, unpredictable consumer behavior and increasing regulatory oversight. What this has culminated into is a call for more collaboration and co-ordination between the offices of Chief Financial Officer (CFO) - who is charged with assessing the profitability and the Chief Risk Officer (CRO) - who is charged with assessing the risks. With regulators seeking a unified view of financial and risk data using common and consistent templates, the convergence of data, market and industry research, analytical and modeling tools, and reports across the two functions is inevitable and unquestionably important. This partnership results in giving a boost to efficiencies and reducing costs. Can there be better reasons for the urgency to integrate the two roles? CFOs and CROs are fighting the same battle and the good news is that leaders in BFSI have acknowledged the need for bringing the two roles closer. This convergence makes it simpler to balance operational and strategic decisions and to protect capital in order to meet the looming threat of business disruption and continuity. On the other hand, there is a larger pretext of organizations holding on to the staunch belief in the disparity of the two roles: the more independent they are, the better it is for businesses. This school of thought emanates from the fact that these organizational structures and managerial hierarchies were meant to minimize friction between roles. But over the years operational niceties and diverse IT needs have pushed the two away into silo mode of operation. Today, the evolution in the roles of CFO-CRO as well as the evolution of IT technology at their disposal, has brought us to contemplate the rationalization, unification of systems and workflows. The end result of the exercise should be aimed at improving the quality and consistency of information and reducing the cost to manage and process it. The re-engineering and unification of data and analytical systems are worth the pain. The impact in doing so is felt across the enterprise. In a sense, the concept of shared services and platforms needs to be extended to areas on either side of the CFO-CRO wall. Many roles and functions within the organization will benefit when the data and analytics being shared is cross-leveraged for operations, risk-management, reporting and strategic decision-making, across all levels. When the CFO-CRO relationship is strengthened, we can expect to reap the benefits of

operational stability, predictability of returns, enhanced reporting, increased compliance and improved profitability. Narrowing the information, communication, process, workflows and systems gap between the two functions go beyond protecting value and, in fact, add tangible business value to organizations. Sriram Kannan- Practice Partner - CXO Services, Wipro Analytics, Wipro Ltd. Sriram Kannan is a senior fin-tech and analytics consulting leader with almost 17 years of extensive and progressive experience in a suite of areas - BI, Analytics, EPM/BPM, Management controllership, Finance-technology, Risk & Compliance - with proven ability to manage large-scale, multi-discipline programs effectively and exceed expectations in delivery of results. At Wipro, he seamlessly collaborates with sales-force and GTM teams in defining and crystallizing strategy, building target operating models, ROI driven road maps and business cases and contributes to crafting and shaping opportunities through "CxO level" engagements. Additionally, his role entails leading Finance, Risk transformation and Performance improvement engagements globally while encouraging the adoption of BI/Analytics solutions for clients - enabling customers gain sustainable competitive advantage through increasing speed and accuracy in reporting, analytics and decision making. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Self-Service BI and Data Governance - A Perfect Match

----- Arcticle source ----- https://www.wipro.com/analytics/self-service-bi-and-data-governance---a-perfect-match/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Self-Service BI and Data Governance - A Perfect Match Self-Service BI provides businesses easy access to critical information for quick decision-making. It eliminates the redundant and often constraining IT processes, as well as the involvement of technology experts, which is the downside in traditional BI. The agility thus rendered to Self-Service BI platform allows end-users to customize what they want to see. But all that glitters is not gold. Such independence from technology layer comes at its own cost. Reliability of the insights generated is the first to bear the brunt with multiple users manipulating data according to their own needs, often taking inputs from unreliable sources. The data generated in a Self-Service BI environment may further complicate the problem without robust frameworks for its organization and storage. Such freedom to use also exposes data to risks of inconsistency and poor quality. However, there always exists a silver lining,

which in this case is the concept of data governance. Data governance fits right into the voids created by Self-Service BI. With ever increasing volumes of data, relying on data processes without a governance layer is equivalent to sitting on a bomb waiting to explode. The risk of carrying unreliable data snowballs into risk of rendering unreliable information and insights which itself can spiral the organization into a series of flawed decisions - causing irreparable damage to the firm. The benefits of data quality and integrity management in terms of reliability and security alone are reasons compelling enough for organizations to embrace data governance. However if we look at the value add that a conjunction of self-service business intelligence and data governance practices bring to the table, the prospect transcends from a 'business want' to a 'business need'. Ability to discover data and insights with the speed and diversity that Self-Service BI offers coupled with the reliability leveraged as a result of data governance policies and processes can truly enhance the efficacy with which the business users sift through the data volumes to get to actionable insights. Organizations who can leverage capabilities of drawing insights in real-time to near real-time have the best chance of sustaining their edge in the foreseeable future. It is in this space where the combination of Self-Service BI and data governance converge to create an imperative business solution. With Self-Service BI, the role of IT as a gate keeper for data gets eliminated, yet with a governance framework in place, business user can be rest assured about the authenticity of the data they are operating on. With well-structured data policies to keep tabs on reliability of data, organizations can reduce the data to insight cycle time significantly and continue to derive a synergies of sorts from this meant-to-be partnership of data governance & Self-Service BI. Vaibhav Suresh - Senior Executive, Strategic Marketing, Wipro Analytics Vaibhav Suresh is a senior executive in the Strategic Marketing team for Wipro Analytics. Vaibhav holds a Bachelors of Technology in Petroleum Engineering from University of Petroleum & Energy Studies, Dehradun and a post graduate diploma in management from K J Somaiya Institute of Management Studies & Research, Mumbai. In his current role, he is managing the marketing for Business Intelligence & CXO service lines at Wipro Analytics To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Capitalizing on Machine Data

----- Arcticle source ----- https://www.wipro.com/analytics/capitalizing-on-machine-data/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Capitalizing on Machine Data Lowering Cost of Quality, Getting Closer to the Customer The Cost of Quality Increasingly, large parts of manufacturing are outsourced in an effort to

lower costs and reduce time-to-market. Boeing typifies this new manufacturing model. It uses its expertise to assemble aircraft in its factories but the quality of the aircraft that rolls out depends on a large number of suppliers around the world. Boeing's latest 787 Dreamliner aircraft appeared to benefit from such global collaboration. The 787, its most fuel efficient aircraft, used lithium-ion batteries to power its electrical systems and became the fastest selling aircraft in history. But trouble began soon after. The batteries began overheating, leading to fires on board the aircraft; the US, Japan, India and Chile grounded their 787 fleets.1 Boeing is not the only one in this unfortunate predicament. When maps failed to work on the Apple 5C mobile phone, stocks dropped. The market is unforgiving when a company breaches product quality, especially when expectations are high as per the brand promise. What went wrong at these companies? How can the risk of reputational damage be mitigated? It is indeed apparent that there is a significant cost to ignoring quality (see Figure 1: Cost of Quality). Cost of Quality Data and analytics can help reduce the cost of not attaining quality by reporting trends, providing alerts, determining priorities, spelling out trade-offs and accurately indicating ROI for each decision.   Figure 1: Cost of Quality Also, the cost of poor quality is rising as legislative bodies and society become increasingly unforgiving. For example, General Motors has said it will spend USD1.2 billion to fix the 25.68 million cars it has recalled2 – among which are the 2.6 million switch-related recalls. This is in addition to the base USD 1- USD 5 million that GM is expected to pay by way of compensation to each of the families of the 13 who died in accidents3 caused due to the defective switch (additionally, GM will pay each surviving dependent USD300,000 to cover the cost of emotional damages). Large corporations with modern production processes have begun to comprehend the potential of machine data and rightly believe that data and analytics can help meet their elevated quality objectives. In fact, there is more that the data can deliver by way of a competitive edge. Manufacturing can use data to predict failure and reduce downtime, refine inventory management for spares, provide maintenance forecasts, provide feedback into product design and usage, define skills requirements and reduce the cost of fixing problems. The real value in this is a greatly improved experience – for the customers who use such products – due to improved reliability and reduced downtime. Meeting Today's Quality Norms There are three stages that must be considered to meet quality norms. Manufacturers can capitalize on machine data and analytics to shape their quality curve at each stage: Components: Every lot manufactured in-house or by outsourced partners must be inspected and examined, using relevant quality measurements, testing or sampling methods, to determine if the components meet quality expectations Assembly Process: Multiple test stations must be established to ensure quality at each step of the assembly/production process. This is especially important for new products where failure can be high. The metric that captures quality at this stage is First Pass Yield (FPY) Shipped Product: Failure at this stage can be due to a number of reasons ranging from poor quality in shipment and installation processes, unsuitable product usage, poor integration in the product ecosystem, weather, etc. The impact is on brand reputation, litigation costs, customer compensation, recall and repair costs. The first two stages depend The first two stages depend on factory data while the third depends on Machine2Machine Data (collected from networked machines). Manufacturers have by and large focused their efforts

on quality management in the factory using statistical process control methods. However, in the field, they have found themselves to be reactive to quality problems. A 2014 study, Manufacturing and the Data Conundrum – Too much? Too little? Or just right?6, commissioned by Wipro and conducted by the Economist Intelligence Unit (EIU) suggests that the news on data usage is only partially positive. Conducted with C-suite and factory executives across North America and Europe, the research shows that 86% of those surveyed had increased the amount of production and quality control data for analysis over the last two years. This is offset by the fact that only 14% reported that they had no problems managing data. The obvious conclusion is that while manufacturing is well on its way to capturing and acquiring data, it also lags in its ability to leverage this data Figure 2: Source: Manufacturing and the Data Conun The study exposed extreme polarization in the intensity of capture and use of data. For example, while some companies like GE were forging ahead with heightened attention to quality at 400 of their factories – GE refers to these factories as "brilliant factories" – with one battery plant capturing 10,000 variables, some as frequently as every 250 milliseconds, only twothirds of the study respondents said that they were capturing sensor generated data (see Figure 2: Manifold Data Sources). The study observes that despite decades of quality improvement programs after World War II, tens of thousands of factories in North America and Europe are light years removed from advanced, cutting edge digital processes to ensure product quality. Bigger Drivers of Machine Data on their way Examine Figure 2 in the light of the Internet of Things – where billions of devices will be connected with products having to work quite differently – and you can see the pre-eminent role of data and analytics in quality management. We are transitioning into a world where intelligent machines will be used a lot more to manage life, and humans will work in tandem with them distributing work based on strengths. Telematics in vehicles, smart grids, connected wearable medical devices etc. are already creating an overwhelming amount of data. We now need a model to manage big data – or, put another way – we need models that can translate big data into meaningful and useful insights. In effect, there are two main challenges to be overcome: 1. To have a strategy to extract signals from the data, and then separate noise from the valuable signals that contain insights. The questions to ask here are: 2. To arrive at a data structure that can overcome the challenge. The questions to ask here are: The Road Ahead Today, manufacturing is no longer de-coupled from its customer. There is just one degree of separation between the two. Soon enough the manufacturing industry will be leveraging the Internet of Things to collect product and usage data directly and regularly rather than depend on dealers and surveyors to collect and send in the data after a machine or device has broken down. This will give them visibility to product and customer issues in near real time and enable them to fix such problems remotely in a semi-automated fashion, even before customers come to know about their malfunctioning machines. A powerful example of this is Vehicle Telematics. In-vehicle systems are capable of exporting vehicle performance, location, drive conditions and usage values to a central server, analyse the data and alert the owner about driving behaviour improvements, suggest fuel optimization strategies, service needs, when to expect failure, where to find the nearest dealer, and how to avoid the disruption. By ensuring that the right spares and skills are available at the right time, data can also help

the dealer in reducing service time. Vehicle Telematics is not only helping automobile manufacturers and dealers in getting closer to their customers but is also creating whole new products and services ranging from the Autonomous (driver-less) vehicles such as the Google Car to new services such as Uber and Lyft that offer low cost rides to people who do not own cars. It is further helping communities with creative solutions to address traffic congestion and pollution thereby helping move more cars per hour without having to incur large amounts of capital in widening roads or building new ones. The focus of business is shifting. From being a one-time sales transaction with customers, businesses now want to have a lasting customer relationship. Manufacturing organizations that bring this focus to their data strategy are already headed for earning more impactful customer experiences that translate into profitable long-term growth. This is indeed validated by the EIU survey results which indicate that the most data-adept companies are also the most profitable. Nitesh Jain Nitesh Jain is General Manager and Global Practice Head for the MyViews practice, Advanced Technologies & Solutions (ATS) at Wipro. He is responsible for the P&L, providing vision, business direction and strategy to the practice. He is a proven Business Analytics & IT professional with expertise in leadership roles in advanced analytics & performance management practice, BI & data warehousing projects and program management. He is responsible for solutions, services, thought leadership and growth in analytics and performance management across Industry verticals globally He has more than 17 years of Industry experience ranging from managing Advanced Analytics practice, leading Data warehousing and analytics projects for Retail, CPG, Manufacturing & Banking sectors, architecture design and development of various operational and analytical solutions for Retail, Medical devices and Banking/Financial Services domain. He holds a Master's in Business Administration from Pune University and has a Bachelor's degree in Mathematics. Dr. Kandathil Jacob Dr. Kandathil Jacob is a General Manager within the Advanced Technologies and Solutions (ATS) service line and focuses on defining and implementing solutions that provide Analytics based Insights to major corporations across the world. His engagements span the entire customer value chain and include trade and marketing spend optimization, customer life cycle analytics, manufacturing quality management, supply chain analytics and most recently machine learning analytics using Big Data platforms. His personal expertise is in providing thought leadership on how predictive analytics can enhance the profitability of manufacturing and hi tech companies. In the past, he has held Director and Sr. Manager positions at Apple, HSBC, Del Monte, FICO and several analytics oriented start-ups. Dr. Jacob has taught MBA courses at the Haas School of Business and at the School of Management, IIT Bombay. He is a Doctor of Engineering in Industrial Engineering, and an MBA in Marketing, both from the University of California, Berkeley. His undergraduate degree is in Mechanical Engineering with Honors from IIT Bombay. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners.

Hyper Personalization Using Attribute Analysis and Event Sequencing

----- Arcticle source ----- https://www.wipro.com/analytics/hyper-personalization-using-attribute-analysis-and-event-sequenc/ ----- About The Authors Related Articles Contact Wipro Please fill the required details to access the content Hyper Personalization Using Attribute Analysis and Event Sequencing The Newest Development in Customer Engagement Introduction Personalization is Passe Personalization, at the moment, appears to be the name of the game. Digital technologies, Omni channel growth and rising consumer expectations are driving retailers, bankers, travel and hospitality specialists, healthcare organizations, media, telecom providers and just about everybody else to put personalization at the top of their priority list. But look under the hood and what do you find? Most organizations are using a weak substitute for real and effective personalization. Today's digital technologies and data sciences make it possible to go beyond the "Hi, [put your first name here]" emails and product suggestions based on earlier purchases or trends set by other shoppers. Advanced concepts and frameworks such as Attribute Analysis and Event Sequencing are now able to create one-on-one marketing strategies. It is hyper personalization - and not personalization - that should be on your priority list. Here is what passes for personalization. You go online and buy a sports shoe for your workout and the website makes suggestions for you to buy even more shoes. This comes as a recommendation from the seller and looks something like this, "Customers who bought this item also bought... Fig 1: Product recommendations for cross/up sellin " You FInd there 5 to 6 pages of additional shoes. Why would you want another shoe when you just bought an eye-popping dream pair made from a single strand of micro-engineered yarn and polymer blades for bounce back? Some sites are trying to make wider suggestions. They look into what other customers had in their basket along with the shoes you just purchased to make their recommendations. This is based on the technique of Market Basket Analysis. Fig 2: Product recommendations for cross/up sellin These could also include running gear such as jackets and socks, skipping ropes, shoe deodorizers, energy drinks and weather resistant waist packs. Doubtless, these are sensible suggestions. These suggestions can be FIltered a level higher by looking into the customer's purchase history, transaction records (what the customer placed in a cart or in a wish list), channel activity and clickstream data, the promotional emails opened, loyalty card records and even the customer's CRM interactions. With data from each one of these sources, the seller gets closer to the customer. Hyper personalize or bust Is this enough or do we want hyper personalization that

lets you get down to a cozy, single-person level conversation across email, on your website, during a call center interaction or via chat? Your universe of customers doesn't have to be categorized into broad segments any longer. You can now create communication and campaigns that are Customer Specific, persuasive and produce winning results. Hyper personalization relies on additional dimensions about thecustomer. These dimensions relate to their: This information can be gleaned from sources such as social media (Facebook, Twitter, Instagram, LinkedIn, Tumblr, Wikipedia, Flickr, etc.), and surveys. The really smart sellers go even deeper, making suggestions based on the customer's circle of friends on social media. It is an ingenious way to target customers, and it works. Fig 3: The new age customer interaction approach Traits and techniques of hyper personalization Hyper personalization is substantially different from personalization. Let's go back to our hypothetical purchase of running shoes. Hyper personalization techniques are not limited to recommending adjacent products alone. Let's take an instance. Hyper personalization will look at your gender (female), age (between 25 and 35), interests (health freak), social network (talks about health foods) and make a recommendation that includes low fat organic strawberries and blueberries or FIber rich complex carbs such as quinoa and black rice. In essence, a deeper and richer proFIle of the customer is mapped against a broader set of products to meet the needs of customers. Social streams create a vital addition to boost the results of hyper personalization. It is social data that makes the content and recommendations relevant. Two computational techniques are used to achieve this – Attribute Analysis and Event Sequence Analysis. Both help bring the customer to the center of communications based on rich and reliable profiles. 1. ATTRIBUTE ANALYSIS: This technique breaks down a customer into a map. The map describes every attribute of the person (example: female, between 25 and 35, educated, married, has a child, due for a promotion at work, prefers to use Uber, reads Daniel D'Silva on an e-reader, meets mother on weekends, makes it a point to visit art museums on vacations, prefers to use neutral language, etc.).   Fig 4: Attribute Mapping for customers Attributes can be captured and organized by type – demographic, physical, psychological, functional, professional, aspirational, etc. Each attribute then can be mapped on to a product, service, or piece of communication related to the original query/interaction. Attribute Analysis has become simpler and more reliable with the growth in social listening technologies. This means when a customer today says she is 'eco-friendly', retailers can translate that interest into energy efficient products or a bias towards stores that don't use plastic bags or proactively look towards reducing their personal carbon footprint by shopping online. 2. EVENT SEQUENCE ANALYSIS: This technique observes the sequence of events a customer goes through until the buy (or don't buy) decision is reached. The objective of event sequence analysis is to understand the lead indicators for certain positive action (for example buy) or negative action (attrite). For an e-tailer, the relevant events could be: 1. Method used for login (if it is via a Facebook ID or a Google ID, reasonably rich details about the customer become available) 2. Search terms used (example: refrigerator, power bank, LED lamps) 3. Adding items to basket or the wish list 4. Liking the Facebook page of the product 5. Crowdsourcing opinion by posting on Facebook (i.e. Apple vs Samsung) 6. Buying Every event offers an opportunity for hyper personalization. These can be done by email, a chat bot, an immediate offer

on the web page, providing discount coupons for select products and displaying items of interest. This is achieved through a combination of Attribute Analysis and Event Sequence Analysis. Fundamentally, the goal is to make the right offer at the right time to ensure three things: 1. Making the shopping cycle easier and faster 2. Not losing upsell opportunities 3. Ensuring that the customer does not drop away at any stage Attribute Analysis and Event Sequence Analysis make a powerful combination in businesses other than retail as well. A bank can, for instance, use them to make sure a loan repayment does not lapse or a loan does not get cancelled by a customer. The bank can observe late credit card payments or an 'unlike' for the bank on a Facebook page to signal a customer's lapse in loan repayment. Early intervention, at each event, can ensure the customer doesn't lapse or move away. Fig 5: Event sequence analysis for a bank to under Sundarababu Vasudevan Vasu has over 19 years of experience as a Data Scientist and Analytics consultant. He has played various roles in the past including business development, consulting for some of the leading Fortune 500 companies, and leading complex product development initiatives. In his current role within Wipro Analytics, he is leading the Analytics Consulting group and heading the 'Data Discovery Platform' initiative. Srinath Sridhar Srinath has over 8 years of experience as an Analytics Consultant post his MBA in Marketing. Other than leading various prestigious Analytics engagements, he has played roles of Thought Leadership, Presales and solution definition in the analytics space. In his current role, he is a Lead Consultant in the Analytics Consulting group within Wipro Analytics. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption ======================

The Forecast for Cloud is Sunny

----- Arcticle source ----- https://www.wipro.com/analytics/the-forecast-for-cloud-is-sunny/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content The Forecast for Cloud is Sunny When you begin to see advertising for a technology everywhere, you know it is mainstreaming. Today, you can find ads for Cloud computing at technology shows and events, at the major airports of the world, in subway stations and on expressways. Businesses are using Cloud infrastructure and traditional barriers in Cloud usage have come crashing down. Cloud infrastructure is penetrating fast, and the forecast for the industry looks really sunny. In fact, industries known for stricter regulations on data confidentiality have embraced Cloud for a variety of processes. These include Health and Life Sciences (HLS) and Banking, Financial Services and Insurance (BFSI). Also, what hasn't received wide press coverage is the fact

that even Government agencies – who presumably want to keep their information away from public gaze – have moved to Cloud. Cloud providers are making it easy for businesses of every size to leverage Cloud infrastructure. Some providers let businesses use their Cloud data warehouse for as little as 25 cents an hour, going up to US$1,000 per terabyte per year, helping businesses reduce costs and work without having to build expensive internal IT skills or foot exorbitant AMC bills. Modern businesses, low on asset acquisition, go to Cloud providers, spin out a cluster of servers within minutes, use it, shut it, pay for it and forget it. This means Cloud infra can be conveniently used when businesses expect spikes in usage (festival time, periods of peak collaboration over projects or product releases, short-term requirement to analyze massive quantities of data, annual tax filing, etc.) Clearly, the misconceptions around Cloud are starting to wear away. Some years ago, the very mention of Cloud computing conjured images of security and privacy breaches, loss of control over data, latency and governances / regulatory challenges related to the location of the Cloud infra and the data. Data Security Looked at logically, it can be assumed that vendors of Cloud technology are among the very best in the security business. All big to mid-sized vendors have highly skilled and dedicated teams working around data security. These vendors manage thousands of servers and data security is the very core of their business. Of the more famous and recent data security breaches (barring one), all of the cases are involved on premise enterprise systems. Data Privacy A typical Cloud infrastructure delivers cost effectiveness from the fact that different businesses share the same infrastructure. Steps are taken by vendors to ensure data privacy is intact in a multi-tenant model. Authorization access is set and controlled for each user within the virtual server environment. However, there are industries with special needs such as the HLS industry that mandates HIPAA (Health Insurance Portability and Accountability Act) compliant infrastructure to ensure confidentiality and security of healthcare information. There are a number of HIPAA compliant vendors that these industries can leverage, putting to rest their anxieties around data privacy. Loss of Control IT teams are often heard complaining that Cloud services imply loss of control over hardware. But Cloud essentially means a fully managed service – and in such a service you do hand over management to the vendor. The truth is that a managed cloud data warehouse service releases precious IT resources from the mundane task of provisioning and maintaining hardware and instead allows them to spend more time with business users and focus more on understanding the business requirements, designing of systems and their ability to address business concerns. Latency Cloud technology has made considerable progress in the last two to three years. Thanks to Massively Parallel Processing Technology (MPP), Cloud infrastructure can crunch petabytes of data in seconds. The response times of Cloud systems have been brought down to microseconds, which cover most enterprise requirements. However, there are businesses that require nanosecond responses. These would include organizations such as stock exchanges. In these cases, it is recommended that servers be located close to the business location (or on premise). Location The geographical location of Cloud infrastructure does have an impact on some businesses. Regulatory and legal norms of certain countries may dictate that data not be sent or stored outside the physical boundaries of the nation. This could have special implications especially on certain types of hybrid cloud environments.

Enterprises should simply look for a Cloud provider with a global footprint so that legal and compliance issues related to geography don't place limitations on infrastructure decisions. When to think of Cloud Thanks to the Internet of Things (IoT), data storage and data management, analytical needs of enterprises are bound to grow – often unpredictably. When data volumes grow, the most natural tendency is to enhance current Data Warehouses. However, this may also be the right time to stop a moment and consider migrating to Cloud (for more Cloud adoption triggers, see Table1: On Cloud vs. On Premise) On Premise Existing application with considerable investment in infrastructure requiring no capacity changes in the near future Data with high compliance and security requirements Low Latency needs requiring micro seconds of response time On Cloud Suitable for Small & Mid Size Companies due to low H/W costs Businesses requiring seasonal analysis can better utilize elastic storage on cloud Predictive Analysis is suitable for cloud due to zero set up time and flexibility to scale up and down to run analytical models Modernization of existing DW to leverage on wide range of data sources New DW can range from pure play cloud to a hybrid model; in hybrid models development and testing environments are on cloud. Think of the days without email and mobile phones. Businesses managed to function without these tools. But technology is improving our connections with customers and partners. Those who adopted the new tools found themselves becoming more agile and flexible. Some businesses have not adapted to the cloud yet, but it is only a matter of time before everyone begins to use it to gain agility and flexibility. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Do More with Less: BI Transformation - Market Trends & Implications

----- Arcticle source ----- https://www.wipro.com/analytics/do-more-with-less--bi-transformation---market-trends---implicati/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Do More with Less: BI Transformation - Market Trends & Implications It is hard to believe the staggering pace at which the dynamic wave-front of business intelligence (BI) continues to advance. Companies moving from BI standardization to experimentation with cloud-based, real-time and big-data platforms are on the rise. Stakeholders that adapt to this evolving

environment faster have better chances of sustaining the competitive edge. Rapid integration leveraging simple interfaces is going to become the standard in the future. According to a 2015 survey conducted by InformationWeek, 28% of respondent firms said that they are standardizing BI products. The past decade has seen a massive innovation across the BI space, which has resulted in a mixed and variable environments across the data value chain. More organizations are now adopting systems that render applications that are welterweight in operation. By deploying a leaner BI infrastructure that lends more homogeneity to the BI landscape, companies are now realizing the benefits of lowered costs, decreased time for information access and improved decision making ability. We also see that companies are evolving from an organizational and cultural perspective with focused effort towards consolidating silos to a more integrated setup. The comprehensiveness and capability of BI platforms available now can traverse the length and breadth of core functions across the business domains of finance, marketing, human resources, etc. Thus, enterprises are moving in order to make sense of their multiple-tool infrastructure with an actionable strategy to determining the right tools that add significant business value. The real value in movement to newer technology and advanced platforms can be derived only when organizations take stock of the applications that already exist and then rationalize to retire the redundancies. Frameworks that identify and then eliminate the duplicate reports and capabilities are increasingly taking center stage in the BI transformation journey. With the companies looking for newer avenues to spend lesser & lesser, enterprises can benefit reduced overheads and volume discounts which can be achieved by transformation to standardized platforms. However, mere reduction of the number of BI applications is far from being a one-stop shop solution to the problem. Management of the multi-tool environment with a long term BI governance strategy that ensures a semantic approach for introduction of tools lays the premise for the alignment between BI and business initiatives. A holistic view of the strategy for BI transformation can be obtained by mapping the functional as well as technical value add to the business of each tool in the operating premise. With a road map for transformation and rationalization that entails an unbiased understanding of the BI Inventory stack, enterprises can unlock the benefits of a cost-effective, agile and intelligent BI platform to stay ahead of the curve. Vaibhav Suresh Vaibhav Suresh is a senior executive in the Strategic Marketing team for Wipro Analytics. In his current role, he is managing the marketing for Business Intelligence & CXO service lines at Wipro Analytics To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Enriching In-Store Experience with Analytics

Enriching In-Store Experience with Analytics Fighting to Stay Relevant The proliferation of online shopping has significantly altered the retail landscape. While the physical store continues to exist - and even thrive in many cases - the risk of turning irrelevant remains. Millennials - who will constitute a significant percentage of the consumer population in the future - prefer the convenience of online and mobile shopping. When they occasionally do step into the store, it is more likely to experience the product than complete a purchase. Smart retailers know that the only way to survive the onslaught of multiple channels is to reinvent the store by offering a personalized experience that extends beyond what a consumer gets online. This calls for collection and analysis of consumer and transactional data. It is not just online retailers who are sitting on huge data mounds. Physical stores operating in digitized environments have access to rich shopper data too: POS systems, loyalty programs, surveillance cameras, and facial recognition systems. They must leverage this data by performing analytics and use the insights gained to improve the store experience in terms of ease of shopping, stock availability and meeting consumer preferences. Making Shopping a Pleasure Retailers must leverage the POS data in a more granular manner than before. Item sales patterns by day of the week and hour of the day can provide rich insight into hourly and daily trends. In an industry like retail grocery for example where shelf life is paramount, these trends at a store level can directly influence item assortment and quantities within a (distribution-center to store) replenishment run. Stores can also overlay POS and syndicated data. For example, store scans from POS can be studied alongside data on consumer demographics. This would help identify in-demand products and create better instore assortments. It can also be used for optimizing the planogram by deciding the number of facings a product should have and its right inventory level. Analytics can enable stores to not only stock the right products, but also to effectively place, price and promote them. Retailers can work towards delighting the consumer by enhancing the quality of the shopping experience. When a store shopper voluntarily identifies herself, the store associate should be able to pull up past purchase history and aid her with the shopping process, helping locate products, familiarizing her with new variations, and suggesting new products. In a study of consumers in the US, 66% of consumers said that they are more likely to shop in a store where they receive personal suggestions while shopping. One of the biggest challenges faced by retailers today is the limited understanding of consumer behavior while she walks along the store aisles. Is she really stopping by the new promotional display that just came up the previous day? What attributes of the product catch her eye as she touches it for the first time? Does she seek information from

other sources while in the store? Technology today, within the realm of maintaining consumer privacy, can aid in providing aggregated consumer behavior and help identify weak points in the shopping experience. Retailers can tackle showrooming by using tracking and analytics to determine vulnerable products and staff more store associates in these aisles to personally cater to consumers. These associates can point out the advantages of buying from the store such as the ability to pick products off the shelf and the absence of shipping costs. Retailers can thus work towards making the store tailored for an individual consumer experience. The Store of the Future As new technological innovations hit the market, retailers can further enhance the in-store shopping experience. Advanced video analytics providing aggregate analyses of store footfalls, parking lot information and physical characteristics of store visitors can optimize product assortments. Current challenges with the use of GPS and Wi-Fi may trigger a wider adoption of new Bluetooth Low Energy (BLE) protocol (Apple's iBeacon, the intelligent micro location platform, uses this new protocol. With a range of about 84,000 sq feet, the iBeacon is ideal for retail and can be used to offer personalized shopping experiences to in-store visitors.) Smart mannequins with inbuilt cameras can help analyze consumers' physical characteristics that could be used to build visitor profiles. It is worth reinforcing that the retailers must not go overboard in their data collection quest. They must be mindful of privacy concerns that consumers have and must collect data only after receiving explicit consumer approval. To Click or To Brick? There are hardly any widespread signs of the demise of the physicalstore. 8 out of 10 Americans are more likely to shop in a store that offered a customized shopping experience overall. The key to remaining relevant therefore is to provide a unique shopping experience tailored for an individual consumer. And technology, especially one that converges data from multiple sources, has a significant role to play. Arun Kumar, General Manager & Global Head of Retail Consulting Practice, Wipro, Ltd. Arun Kumar is a General Manager & Global Head of Retail Consulting Practice at Wipro. He is responsible for shaping Wipro's retail solution strategy and expanding Thought Leadership across customer experience, omni-channel retailing, supply chain management, merchandising and storeoperations. The Retail Data Overload – Through the Clutter

----- Arcticle source ----- https://www.wipro.com/analytics/the-retail-data-overload/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content The Retail Data Overload – Sifting Through the Clutter Retail data – Boon or bane? Retail organizations are experiencing a phenomenal growth in data. Staying on top of the volume, variety and velocity of the data, and being able to analyze it and deploy the intelligence, is enabling organizations to create a sharp competitive edge. How retail organizations handle this avalanche of data will determine if they rise above competition or get buried. Data – Big Data as it is popularly called -- is providing retailers new insights into improving customer intimacy and bringing about innovations in PLM, sourcing and supply chains, leading to improved bottom lines. So powerful is the ability of Big Data to infl uence business that a recent McKinsey Global Institute (MGI) report suggested that the use of Big Data and analytics in the US could increase annual GDP in retail and manufacturing by up to US$ 325 billion in 2020i. One recent IDC prediction suggests that "retailers will narrow and enable big data and analytics (BDA) projects in 2014 as 20%-30% of projects fell short in 2013"ii. It is evident that there is an urgent focus on data management. In reality, how are retail organizations doing? Are they capitalizing on data? What data are they able to capture? How many are able to derive timely and usable insights from the data? Which data brings them the highest ROI? How can retail organizations ensure they invest in only relevant data? To fi nd the answers to these vexing questions, Wipro commissioned the Economist Intelligence Unit (EIU) to examine how retailers are responding to the emerging data-rich landscape, its role in shaping customer experience, the benefi ts derived in delivering omni-channel commerce, enhancing corporate strategy and meeting regulatory challenges. The study, called The Data Storm – Retail and the Big Data Revolutioniii, was based on C-suite responses from retailers based in North America, Europe and Asia. Among the key fi ndings of the study was the fact that many retailers are still fl oundering at the very early stages of using Big Data. Only 46% of retail CXOs said they were confi dent that their fi rm's analytical abilities were keeping up with data volumes. Signifi cantly – and this is where we need to stop and ponder a while -- just 36% believed that they had a well-defi ned policy for analyzing the most valuable information. As many as 30 percent admitted that they are not consistently obtaining value from it. Clearly, while

data is fl ooding every business function – from production to sales and marketing, store operations, e-commerce/ m-commerce, human resource management, back offi ce and logistics -- retailers are stumbling when it comes to leveraging the opportunities it offers What to do with all this data? What's good, what's not? There are two key questions facing retailers: What should Big Data be used for? Or, what are the priorities to be set with regard to securing Big Data and leveraging it? How can technology be used to reduce and manage data overload without compromising outcomes? Even before those questions can be answered, many retailers need to understand that their current data management strategies will not be able to scale to meet the velocity and variety of Big Data. An IDC report in 2012 said that the digital universe will double every two years – largely thanks to the availability of cheap sensors and the propensity of the "always on" generation to record, share and store every moment in great detail. Data, said the report, will grow from levels of 130 exabytes in 2005 to 40 trillion gigabytes by 2020 – or what is otherwise by a factor of 300iv. Is it worth sifting through all the available data? Which data is good for business? Which data is required today in real time? Growing Data Sources in Retail The retail industry has seen a surge in the collection of customer information, operations data and sales/ marketing data. Estimates suggest that about half this data is unstructured. Structured Data for retail: Unstructured Data for retail: Which data is required for strategic growth? These are the questions that the retail industry needs to ponder. The EIU study digs into these questions to provide early pointers into the business functions that can be impacted using Big Data (see Table 1). However, according to the study, retailers are itching to build corporate strategy using Big Data (60% over the next two years as opposed to 40% in the past two years). Changing Priorities Which of the following business functions and processes have been the highest priority for investment in data analysis over the past two years and will be the focus for the next two? There is a good reason why retailers want to use Big Data to defi ne and shape corporate strategy -- investments in this area are already showing results. About 78% of respondents in the study claimed positive economic return from investment in data analysis for strategy, the highest fi gure for any function or process. We believe that Big Data can assist retail businesses answer strategic questions such as: Racing ahead with data This brings us to the second question that retailers must inevitable attempt to answer: How can technology be used to reduce and manage data overload without compromising outcomes? Most retailers quickly discover that they don't have the right IT systems to gather or manage the fl ow of such vast amounts of data. The technology to store the data is rapidly evolving. Businesses are being offered a variety of solutions ranging from object storage, clustered, scalable NAS, block-level SANs and even Big Data appliances with integrated storage, depending on their needs. But the challenges go beyond storage. The biggest challenge is to stream the data (with the intelligence, post analysis) in real time to executives that need the information, where they are. The retail industry doesn't have systems designed to meet these real-time needs. They have to begin by reinventing their systems. In the anxiety to do what is right, retailers take the risk of over inventing and over investing. This is where a technology partner with domain experience and data and analytical expertise comes in. An experienced partner can ensure that the business identifi es the data

required to be captured based on business goals and vision. Such a partner can then optimize the use of this data, ensuring it is analyzed and effectively deployed within the organization. Finally, the technology partner can be mandated to set up metrics and systems that measure the ROI of using data. Without this, most retailers would be lost in the data maze. Hari Shetty Vice President & Global Head of Retail Hari Shetty is part of the senior leadership team at Wipro and heads the Retail vertical across the globe. As head of Retail, he is responsible for strategy and execution of Wipro's business plan within the industry segment. Hari has been part of the Retail vertical since its inception and today Wipro is among the top 7 Retail technology service providers across the globe and provides services to 10 out of the top 20 retailers. Hari has over 20 years of consulting experience in the industry. His experience spans across multiple functions in retail and he has worked with some of the best-in-class retailers on cross channel strategy, business transformation, simplifi cation, predictive analytics, and technology transformation. Prior to his current role, he was responsible for technology and architecture in Retail and Consumer Goods industry groups. Hari has multi-disciplinary background in technology, management, fi nance and law. He is an evangelist on multi-channel retailing and strongly believes social media and a connected customer experience will change the face of retail. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =======================

Comparative Analysis of Machine Learning Techniques for Detecting Insurance Claims Fraud

----- Arcticle source ----- https://www.wipro.com/analytics/comparative-analysis-of-machine-learning-techniques-for-detectin/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Comparative Analysis of Machine Learning Techniques for Detecting Insurance Claims Fraud Insurance fraud detection is a challenging problem, given the variety of fraud patterns and relatively small ratio of known frauds in typical samples. While building detection models, the savings from loss prevention needs to be balanced with cost of false alerts. Machine learning techniques allow for improving predictive accuracy, enabling loss control units to achieve higher coverage with low false positive rates. In this paper, multiple machine learning techniques for fraud detection are presented and their performance on various data sets examined. The impact of feature

engineering, feature selection and parameter tweaking are explored with the objective of achieving superior predictive performance. 1.0 Introduction Insurance frauds cover the range of improper activities which an individual may commit in order to achieve a favorable outcome from the insurance company. This could range from staging the incident, misrepresenting the situation including the relevant actors and the cause of incident and finally the extent of damage caused. Potential situations could include: The insurance industry has grappled with the challenge of insurance claim fraud from the very start. On one hand, there is the challenge of impact to customer satisfaction through delayed payouts or prolonged investigation during a period of stress. Additionally, there are costs of investigation and pressure from insurance industry regulators. On the other hand, improper payouts cause a hit to profitability and encourage similar delinquent behavior from other policy holders. According to FBI, the insurance industry in the USA consists of over 7000 companies that collectively received over $1 trillion annually in premiums. FBI also estimates the total cost of insurance fraud (non-health insurance) to be more than $40 billion annually . It must be noted that insurance fraud is not a victimless crime – the losses due to frauds, impact all the involved parties through increased premium costs, trust deficit during the claims process and impacts to process efficiency and innovation. Hence the insurance industry has an urgent need to develop capability that can help identify potential frauds with a high degree of accuracy, so that other claims can be cleared rapidly while identified cases can be scrutinized in detail. 2.0 Why Machine Learning in Fraud Detection? The traditional approach for fraud detection is based on developing heuristics around fraud indicators. Based on these heuristics, a decision on fraud would be made in one of two ways. In certain scenarios rules would be framed that would define if the case needs to be sent for investigation. In other cases, a checklist would be prepared with scores for the various indicators of fraud. An aggregation of these scores along with the value of the claim would determine if the case needs to be sent for investigation. The criteria for determining indicators and the thresholds will be tested statistically and periodically recalibrated. The challenge with the above approaches is that they rely very heavily on manual intervention which will lead to the following limitations These are challenging from a traditional statistics perspective. Hence, insurers have started looking at leveraging machine learning capability. The intent is to present a variety of data to the algorithm without judgement around the relevance of the data elements. Based on identified frauds, the intent is for the machine to develop a model that can be tested on these known frauds through a variety of algorithmic techniques. 3.0 Exercise Objectives Explore various machine learning techniques to improve accuracy of detection in imbalanced samples. The impact of feature engineering, feature selection and parameter tweaking are explored with objective of achieving superior predictive performance. As a procedure, the data will be split into three different segments – training, testing and cross-validation. The algorithm will be trained on a partial set of data and parameters tweaked on a testing set. This will be examined for performance on the cross-validation set. The high-performing models will be then tested for various random splits of data to ensure consistency in results. The exercise was conducted on ApolloTM – Wipro's Anomaly Detection Platform, which applies a combination of pre-defined rules and predictive machine learning algorithms

to identify outliers in data. It is built on Open Source with a library of pre-built algorithms that enable rapid deployment, and can be customized and managed. This Big Data Platform is comprised of three layers as indicated below. Three layers of Apollo's architecture Data Handling: Detection Layer Outcomes The exercise described above was performed on four different insurance datasets. The names cannot be declared, given reasons of confidentiality. Data descriptions for the datasets are given below. 4.0 Data Set Description 4.I Introduction to Datasets   Table 1: Features of various datasets 4.2 Detailed Description of Datasets Overall Features: The insurance dataset can be classified into different categories of details like policy details, claim details, party details, vehicle details, repair details, risk details. Some attributes that are listed in the datasets are: categorical attributes with names: Vehicle Style, Gender, Marital Status, License Type, and Injury Type etc. Date attributes with names: Loss Date, Claim Date, and Police Notified Date etc. Numerical attributes with names: Repair Amount, Sum Insured, Market Value etc. For better data exploration, the data is divided and explored based on the perspectives of both the insured party and the third party. After doing some Exploratory Data Analysis (EDA) on all the datasets, some key insights are listed below Dataset – 1: Dataset – 2: For Insured: For Third Party: Dataset – 3: Dataset – 4: 4.3 Challenges Faced in Detection Fraud detection in insurance has always been challenging, primarily because of the skew that data scientists would call class imbalance, i.e. the incidence of frauds is far less than the total number of claims, and also each fraud is unique in its own way. Some heuristics can always be applied to improve the quality of prediction, but due to the ever evolving nature of fraudulent claims intuitive scorecards and checklist-based approaches have performance constraints. Another challenge encountered in the process of machine learning is handling of missing values and handling categorical values. Missing data arises in almost all serious statistical analyses. The most useful strategy to handle the missing values is using multiple imputations i.e. instead of filling in a single value for each missing value, Rubin's (1987) multiple imputations procedure replaces each missing value with a set of plausible values that represent the uncertainty about the right value to impute. The other challenge is handling categorical attributes. This occurs in the case of statistical models as they can handle only numerical attributes. So, all the categorical attributes are transposed into multiple attributes with a numerical value imputed. For example – the gender variable is transposed into two different columns say male (with value 1 for yes and 0 for no) and female. This is only if the model involves calculation of distances (Euclidean, Mahalanobis or other measures) and not if the model involves trees. A specific challenge with Dataset – 4 is that it is not feature rich and suffers from multiple quality issues. The attributes that are given in the dataset are summarized in nature and hence it is not very useful to engineer additional features from them. Predicting on that dataset is challenging and all the models failed to perform on it. Similar to the CoIL Challenge [4] insurance data set, the incident rate is so low that with a statistical view of prediction, the given fraudulent training samples are too few to learn with confidence. Fraud detection platforms usually process millions of training samples. Besides that, the other fraud detection datasets increase the credibility of the paper results. 4.4 Data Errors Partial set of data errors found in the datasets are: 5.0 Feature Engineering and Selection 5.1 Feature Engineering Success in

machine learning algorithms is dependent on how the data is represented. Feature engineering is a process of transforming raw data into features that better represent the underlying problem to the predictive models, resulting in improved model performance on unseen data. Domain knowledge is critical in identifying which features might be relevant and the exercise calls for close interaction between a loss claims specialist and a data scientist. The process of feature engineering is iterative as indicated in the figure below   Fig 1:Feature engineering process Importance of Feature Engineering: Some Engineered Features: 5.2 Feature Selection: Out of all the attributes listed in the dataset, the attributes that are relevant to the domain and result in the boosting of model performance are picked and used. i.e. the attributes that result in the degradation of model performance are removed. This entire process is called Feature Selection or Feature Elimination. Feature selection generally acts as filtering by opting out features that reduce model performance. Wrapper methods are a feature selection process in which different feature combinations are elected and evaluated using a predictive model. The combination of features selected is sent as input to the machine learning model and trained as the final model. Forward Selection: Beginning with zero (0) features, the model adds one feature at each iteration and checks the model performance. The set of features that result in the highest performance is selected. The evaluation process is repeated until we get the best set of features that result in the improvement of model performance. In the machine learning models discussed, greedy forward search is used. Backward Elimination: Beginning with all features, the model removes one feature at each iteration and checks the model performance. Similar to the forward selection, the set which results in the highest model performance are selected. This is proven as the better method while working with trees. Dimensionality Reduction (PCA): PCA (Principle Component Analysis) is used to translate the given higher dimensional data into lower dimensional data. PCA is used to reduce the number of dimensions and selecting the dimensions which explain most of the datasets variance. (In this case it is 99% of variance). The best way to see the number of dimensions that explains the maximum variance is by plotting a two-dimensional scatter plot. 5.3 Impact of Feature Selection: Forward Selection: Based on experience adding-up a feature may increase or decrease the model score. So, using forward selection data scientists can be sure that the features that tend to degrade the model performance (noisy feature) is not considered. Also it is useful to select the best features that lift the model performance by a great extent. Backward Elimination: In general backward elimination takes more time than the forward selection because it starts with all features and starts eliminating the feature that compromises the model performance. This type of technique performs better when the model built is based on trees because more the features, more the nodes, Hence more accurate. Dimensionality Reduction (PCA): I t is of ten helpful to use a dimensionality-reduction technique such as PCA prior to performing machine learning because: 6.0 Model Building and Comparison The model building activity involves construction of machine learning algorithms that can learn from a dataset and make predictions on unseen data. Such algorithms operate by building a model from historical data in order to make predictions or decisions on the new unseen data. Once the models are built, they are tested on various datasets and the results that are considered as performance criterion are calculated and compared. 6.1 Modelling

Fig2:Model Building and Testing Architecture   The following steps are listed to summarize the process of the model development: Separate models generated for each fraud type which self-calibrate over time - using feedback, so that they adapt to new data and user behavior changes. Multiple models are built and tested on the above datasets. Some of them are: Logistic Regression: Logistic regression measures the relationship between a dependent variable and one or more independent variables by estimating probabilities using a logit function. Instead of regression in generalized linear model (glm), a binomial prediction is performed. The model of logistic regression, however, is based on assumptions that are quite different from those of linear regression. In particular the key differences of these two models can be seen in the following two features of logistic regression. The predicted values are probabilities and are therefore restricted to [0, 1] through the logit function as the glm predicts the probability of particular outcomes which tends to be binary. Fig3: Modified MVG   Boosting: Boosting is a machine learning ensemble learning classifier used to convert weak learners to strong ones. General boosting doesn't work well with imbalanced datasets. So, two new hybrid implementations were implemented. Fig4. Functionality of Boosting Bagging using Adjusted Random Forest: Unlike single decision trees which are likely to suffer from high variance or high bias (depending on how they are tuned), in this case the model classifier is tweaked to a great extent in order to work well with imbalanced datasets. Unlike the normal random forest, this Adjusted or Balanced Random Forest is capable of handling class imbalance. The Adjusted Random Forest algorithm is shown below: The advantage of Adjusted Random Forest is that it doesn't overfit as it performs tenfold cross-validations at every level of iteration. The functionality of ARF is represented in the form of a diagram below Fig5. Functionality of Bagging using Random Forest 6.2 Model Performance Criterion The Model performance can be evaluated using different measures. Some of them used in this paper are: 6.2.1 Using Contingency Matrix or Error Matrix   The error matrix is a specific table layout that allows tabular view of the performance of an algorithm The two important measures Recall and Precision can be derived using the error matrix. Recall: Fraction of positive instances that are retrieved, i.e. the coverage of the positives. Precision: Fraction of retrieved instances that are positives.   Both should be in concert to get a unified view of the model and balance the inherent trade-off. To get control over these measures, a cost function has been used which is discussed after the next section. 6.2.2 Using ROC Curves Another way of representing the model performance is through Receiver Operating Characteristics (ROC curves). These curves are based on the value of an output variable. The frequencies of positive and negative results of the model test are plotted on X-axis and Y-axis. It will vary if one changes the cut-off based on their Output requirement. Given a dataset with low TPR (True Positive Rate) at a high cost of FPR (False Positive Rate), the cut-off may be chosen at higher value to maximize specificity (True Negative Rate) and vice versa. The representation used in this is a plot and the measure used here is called Area under the Curve (AUC). This generally gives the area under the plotted ROC curve. 6.2.3 Additional Measure In modelling, there is a cost function used to increase the precision (which results in a drop in recall) or increase in the recall (which results drop in precision), i.e. to have control over recall and precision. This measure is used in feature

selection process. The Beta (ß) value is set to 5. Then start iterating feature process (either forward or backward) involving calculation of performance measures at each step. This cost function is used as a comparative measure for the feature selection (i.e. whether the involvement of feature results in improvement or not). The cost function increases the beta value, with increase in recall. 6.3 Model Comparison 6.3.1 Using Contingency Matrix The performance of the models is given below: Table 2: Performance of models on Dataset 2   Key note: All the models performed better on this dataset (with nearly ninety times improvement over the incident rate). Relatively, MMVG has better recall and the other models have better precision.   Key note: The ensemble models performed better with high values of recall and precision. Comparatively ARF has high precision and high recall(i.e. 1666 times better than the incident rate) and MMVG has better recall but poor precision.   Key note: MRU (with four hundred and sixty times improvement over random guess) and MMVG (with hundred and thirty three times improvement over the incident rate and reasonably good recall) are better performers and logistic regression is a poor performer. For Dataset - 4   Table 3: Performance of models on Dataset 4   Key note: Overall issues with the dataset make the prediction challenging. All the models performance is very similar, with the issue of inability to achieve higher precision keeping the coverage high. 6.3.1.1 Receiver Operating Characteristic (ROC) Curves   Adjusted Random Forest out-performed other models and Modified MVG is the poor performer All the models performed equally.   Boosting as well as Adjusted Random Forest performed well and Logistic Regression is the poor performer. All the models performed reasonably well except Modified MVG. Area under Curve (AUC) for the above ROC Charts   Table 4: Area under Curve (AUC) for the above ROC 6.3.2 Model Performances for Different Values in Cost Function Fß   Fig6. Model Performances for Different Beta Values   To display the effective usage of the cost function measure, a graph of results is shown for different ß values (1, 5, and 10) and modelled on dataset-1. As evident from the results, there is a correlation between ß value and recall percentage. Typically this also results in static or decrease in precision (given implied trade-off). This is manifested across models, except for AMO at aß value of 10. 7.0 Model Verdict In this analysis, many factors were identified which allows for an accurate distinction between fraudulent and honest claimants i.e. predict the existence of fraud in the given claims. The machine learning models performed at varying performance levels for the different input datasets. By considering the average F5 score, model rankings are obtained- i.e. a higher average F5 score is indicative of a better performing model. Table 5: Performance of Various Models The analysis indicates that the modified random under Sampling and Adjusted Random Forest algorithms perform best. However, it cannot be assumed that the order of predictive quality would be replicated for other datasets. As observed in the dataset samples, for feature rich datasets, most models perform well (ex: Dataset - 1). Likewise, in cases with significant quality issues and limited feature richness the model performance gets degraded (ex: Dataset - 4). Key Takeaways: Predictive quality depends more on data than on algorithm: Many researches indicate quality and quantity of available data has a greater impact on predictive accuracy than quality of algorithm. In the analysis, given data quality issues most algorithms performed poorly on dataset-4. In the better datasets, the range of performance was relatively

better. Poor performance from logistic regression and relatively poor performance by odified MVG: Logistic regression is more of a statistical model rather than a machine learning model. It fails to handle the dataset if it is highly skewed. This is a challenge in predicting insurance frauds, as the datasets will typically be highly skewed given that incidents will be low. MMVG is built with an assumption that the input data supplied is of Gaussian distribution which might not be the case. It also fails to handle categorical variables which in turn are converted to binary equivalents which leads to creation of dependent variables. Research also indicates that there is a bias induced by categorical variables with multiple potential values (which leads to large number of binary variables.) Outperformance by Ensemble Classifiers: Both the boosting and bagging being ensemble techniques, instead of learning on a single classifier, several are trained and their predictions are aggregated. Research indicates that an aggregation of weak classifiers can out-perform predictions from a single strong performer. Loss of Intuition with Ensemble Techniques A key challenge is the loss of interpretability because the final combined classifier is not a single tree (but a weighed collection of multiple trees), and so people generally lose visual clarity of a single classification tree. However, this issue is common with other classifiers like SVM (support vector machines) and NN (neural networks) where the model complexity inhibits intuition. A relatively minor issue is that while working on large datasets, there is significant computational complexity while building the classifier given the iterative approach with regard to feature selection and parameter tweaking. Anyhow given model development is not a frequent activity this issue will not be a major concern. 8.0 Conclusion The machine learning models that are discussed and applied on the datasets were able to identify most of the fraudulent cases with a low false positive rate i.e. with a reasonable precision. This enables loss control units to focus on new fraud scenarios and ensuring that the models are adapting to identify them. Certain datasets had severe challenges around data quality, resulting in relatively poor levels of prediction. Given inherent characteristics of various datasets, it would be impractical to a' priori define optimal algorithmic techniques or recommended feature engineering for best performance. However, it would be reasonable to suggest that based on the model performance on back-testing and ability to identify new frauds, the set of models offer a reasonable suite to apply in the area of insurance claims fraud. The models would then be tailored for the specific business context and user priorities. Data Discovery-The Way Ahead

----- Arcticle source ----- https://www.wipro.com/analytics/data-discovery---the-way-ahead/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Data Discovery - The Way Ahead Have you ever imagined the amount of data that is churned out every day? Well, the answer is it runs into quintillion bytes every single day. This data is generated across industries whether it is from retail, banking, insurance, healthcare, power, oil and gas, telecom and the list can go on. The question here is do we have a robust system in place to extract meaningful insights out of this huge storehouse of data. If used correctly, this can not only help businesses to generate insights which can help them unlock new business avenues but also help them provide solution for better governance. There was a time when only data-centric companies such as Facebook, Google or any e-commerce firm would use this data to generate insights and analyze trends. Data scientists, who were hired for this job soon realized the potential that analytics had in every other business and industry. And while enterprises started to shift their focus to analytics, they faced challenges starting from compiling such huge volumes of data to cleaning them up and extracting relevant information from it. Traditional Business Intelligence (BI) systems in place would no longer be enough to cope with this challenge and hence companies are looking to migrate to new data discovery platform. With traditional BI systems, a data scientist would spend most of his time in the back-end slicing and dicing data and generating reports which can be tested against some hypothesis. Thanks to Analytics Data Discovery Platform which helps a business user to explore this data and generate insights without much training and expertise in any analytics tool. It provides a visual dashboard which enables a business user to perform analytics and engage in rapid decision making. Analytics Data Discovery Platform spreads across the entire data-information-insights supply chain starting right from data ingestion to extracting meaningful insights and thus enabling businesses to reach their goals in lesser time. There are companies who have realized the benefits that such data discovery platform can bring and are marching ahead in the competition by implementing the same. Determining new products and services to be launched coupled with leveraging data and analytics for decision making has helped organizations in making rapid decisions and implementing new offerings quickly. Having said that, there is always a caveat of checking the feasibility of the process which enterprises must exercise before going ahead with the implementation. Srinath Sridhar- Principal Consultant, Analytics Consulting Group, Wipro Limited Srinath has over 8 years of

experience as an Analytics Consultant post his MBA in Marketing. Other than leading various prestigious Analytics engagements, he has played roles of Thought Leadership, Presales and solution definition in the analytics space. In his current role, he is a Principal Consultant in the Analytics Consulting group within Analytics at Wipro Limited. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Evaluating relative efficiency of retail stores – a Data Envelopment Analysis approach

----- Arcticle source ----- https://www.wipro.com/analytics/evaluating-relative-efficiency-of-retail-stores-a-data-envelopment-analysis-approach/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content Evaluating relative efficiency of retail stores - a Data Envelopment Analysis approach I n today's highly competitive retail industry, it is crucial to recognize the factors which help retailers to thrive in the long run. One of the major factors which distinguishes a successful retailer from others is information regarding the efficiency of its stores. Like Charles Darwin's 'survival of the fittest' theory, the efficiency of a store enables the retailer to function effictively in the market, with minimum inputs and maximum output, to be the fittest amongst all the rest. A retail store is a critical asset in the retail industry. Customers interact directly with the retail store and most of the revenue in the retail industry comes from stores. Hence, efficient management of store operations is essential, to achieve and sustain customer satisfaction, as well as cost-effectiveness. Techniques to evaluate a store's productivity and its relative efficiency involves evaluating many factors-such as inventory turnover, sales per selling space, employee productivity, customer traffic, effectivity (retail conversion rate), average sales, gross margin (sales profit before costs), among other factors. The current industry practice generally involves a simple, logical, efficiency-based approach which is not mature in terms of leveraging solid analytical techniques. Thus, generally, store efficiency is evaluated by considering only sales density, that is, sales per square foot or number of employees. This involves only two metrics at a time, ignoring other factors. These standalone factors contribute individually and independently towards the evaluation of a store's performance. This leads to information throw in various random directions, while business leaders are

attempting store performance evaluation and goal setting. Various store performance dashboards showcase different charts as these can't be clubbed together to get one performance index for a store. Combining them into one, to get the overall performance in terms of an efficiency score, which can then be used to compare various stores, is possible through a non-parametric approach from data mining and analytics called Data Envelopment Analysis (DEA). DEA uses a linear programming procedure to evaluate store efficiency by considering parameters-such as staff information (employee count and payroll), operating expenses, fuel consumption and space as inputs and sales, EBITDA, gross margin as outputs for a store. Advantage DEA DEA is a very powerful technique to evaluate the relative efficiency of business units when multiple inputs and outputs are involved. This framework has been adapted from multi-input, multi-output production functions and applied in many industries. In general, DEA minimizes inputs and maximizes outputs: In other words, lower levels of the former and higher levels of the latter represent better performance or efficiency. Instead of central inclinations, DEA focuses on boundaries. It doesn't try to fit a regression plane through the center of the data as in statistical regressions; rather, DEA proves particularly proficient at detecting relationships that would remain unseen with other evaluation approaches. DEA benchmarks units against their best peer groups. It can be applied to explore production data as well as cost data. Based on the business problem, one must be able to differentiate the various factors into inputs and outputs to apply DEA analysis efficiently. Some benefits of this technique are: DEA impact: A retail case study About 750 stores of a top US retailer had to be compared in terms of features such as area, sales, gross margin, payroll and incentives, operating expenses, EBITDA, revenue etc. To get the best and most significant factors influencing the efficiencies of the stores, correlations among the inputs and the outputs were checked. Among all the variables, number of employees working in the store and the area of the store, represented the best inputs, whereas sales and EBITDA represented the best outputs. DEA algorithm was leveraged to analyze data and get relative efficiencies across stores. Key insights were derived from the results (given as findings 1, 2, 3, 4 and 5) which helped store managers and operation leaders undertake critical business action plans to improve store performance. Findings 1: Insights based on relative efficiencies across stores Findings 3: Sales and area vs. relative efficiencies across stores Findings 4: Sales and number of employees vs. relative efficiencies across stores Findings 5: US states where top ranked stores are located From data to insights DEA solution framework is a powerful tool that enables identification of production frontiers and efficiency of firms in various sectors. It has been recognized as a valuable approach, useful in uncovering relationships that remain hidden with other methodologies. DEA provides relative efficiencies, that is, efficiencies relative to the data considered rather than absolute efficiencies. After applying the DEA algorithm, one can begin to tackle, with a clear degree of insight, issues such as identification of best and poor practices, target setting, resource allocation and monitoring efficiency changes over time. Sandipan Bhattacharyya - Lead Consultant - Analytics, Wipro Sandipan is part of Data Discovery Platform team and leads an initiative which involves creation of industry-specific applications across verticals. Targeted Campaign
by Uplift Model

----- Arcticle source ----- https://www.wipro.com/analytics/targeted-campaign-by-uplift-model/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content Targeted Campaign by Uplift Model Introduction In today's age of consumerism, marketing plays an important role of creating awareness, driving consumer engagement and growing businesses. Leveraging the right targeting techniques has become the most crucial factor for building and sustaining sales. From a retailer's perspective, one of the key challenges is to identify market segments that hold potential customers for their products. Consider this: Over the past decade, retailers have increased their marketing expenditure by more than 15 percent. However, this has not translated into proportional increase in business in terms of new customer acquisition or sales. For example, Mc Donald's – one of world's leading food service retailers – has increased their marketing expense by more than 15 percent in the last six years; however, the overall revenue grew merely by about 12 percent. One of the key reasons for this is that marketing campaigns are not targeted to the right set of audience, taking into account their buying behavior – which in turn leads to lower than expected response rates. An efficient audience targeting will enable retailers to identify various segments with their influential decision parameters and design the right strategy to maximize response rate for a given a campaign budget. But how do we analyze millions of behaviors and their billions of transactions distributed across multiple channels, to figure out the audience base who are most likely to respond to a campaign? This is the biggest task when it comes to targeted marketing. An advance in computing has swept away media distribution barriers, releasing a Pandora's box of new content. The resulting fragmentation has shattered the notion of the mass-media consumer, forcing marketers to use hard quantitative data and analytical techniques to find and reach their audience.

Targeted Campaign by Uplift Model The benefits of targeted marketing are two-fold: one, the total cost of marketing and acquisition decreases, and two, a well targeted campaign increases the likelihood amongst target audience to respond. This leads to enhanced response rates and Return on Marketing Investment (ROMI). To effectively target the right set of audience, it is imperative to know the different segments. Broadly, on the basis of campaign response behavior, target audience can be segmented into four exclusive segments: Analytically, there are different techniques available to target customers in a campaign scenario, but the Uplift Model is one of the most efficient and graceful ways to target customers by addressing the needs of different segments. Uplift Model approach: Following Uplift Modelling may be a more suitable approach for campaign design. The base population (includes all four segments of customers) is divided into two groups: Test (who are administered the targeted campaign) and Control (who are not). 1. The propensity of each customer is calculated using the algorithm below, separately for test and control Where 2. Linear regression is used using the same set of variables to predict expected revenue/profit (separately for test and control) 4. Selection: Customers are rank-ordered on incremental revenue/profit and top demi-deciles are selected for model performance and subsequent targeting. The incremental effect of the campaign is calculated for each demi-decile (in intervals of 5% of customers each) and an illustrative schematic is demonstrated below. Benefit of the model: A normal targeting on buyer propensity usually targets the top decile and measures the performance with test control scenario. Following scenario explains the incremental benefits of the current technique. Let us assume the following three scenarios: Uplift Model can identify all these similar profitable, non-profitable and neutral segments within the customer base, which normal targeting model will fail to distinguish effectively. Uplift Model-based targeting framework is a powerful tool that enables retailers to identify profitable target segments for customer-centric activities, integrating and analyzing various customer data to realize better return on investment for marketing expenditure. Targeting strategy Following are the guidelines that can be useful to capture some of the business applicability for response and Uplift Modeling: To summarize the benefit estimation framework for Uplift Model-based targeting in simple 4-5 steps. Start with dividing the base population in two sets of data – Test and Control – with their buyers in the campaign advertised division. Step 1 - Build a propensity model for Test and Control, separately Step 2 - Build a sales/margin model for Test and Control, separately Step 3 - Score the population based on these four models Step 4 - Define incremental benefit as: (Test Propensity model Probability * Test Sales Model Expected) - (Control Propensity model Probability * Control Sales Model Expected) Based on the magnitude of this value, we can decile the people and see the incremental effect. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Cloud service brokerage - The lynchpin in cloud management platforms

----- Arcticle source ----- https://www.wipro.com/analytics/cloud-service-brokerage-the-lynchpin-in-cloud-management-platforms/ ----- About the Authors Related Articles Contact Wipro Please fill the required details to access the content Cloud service brokerage – The lynchpin in cloud management platforms As cloud computing continues to become the "new normal," multi-cloud has emerged as a best practice, as enterprises want to consume the best-of-breed technologies from cloud providers to build internet-scale services and data platforms rapidly. Unlike traditional data center and warehouse infrastructure, where customers were happy to follow a managed services model, today's businesses want unrestricted access to API-enabled cloud services. Traditional IT operations tools designed by MSPs are no longer sufficient to maintain the modern cloud services. This is challenging for MSPs as the rate of cloud provider's service innovation is much faster, leading to a gap in services adoption and their management. In the private cloud space, enterprise focus is mostly on IaaS with deployment, management and monitoring capabilities being enhanced continuously. However, sparing a few vendors, PaaS in private cloud is still in its nascent stage with limited options and adoption. The growing number of public cloud service providers and a lack of standards to manage IaaS, PaaS and SaaS services, especially through a single system of record, is fueling the concern on governance. The life cycle management of these different services is not consistent across cloud providers as they are being brought to action using the provider's secret recipe to deploy, manage and monitor these services. All of this is making way for unified consoles that can not only provide integration, aggregation, and customization of cloud services in a self-service environment, but also keep pace with the rapidly evolving services from cloud service providers. Enterprise cloud adoption strategies Most businesses today operate with a combination of Private and Public Clouds, i.e., a multi-cloud model, and are leveraging different strategies for cloud adoption keeping agility and cost optimization of IT procurement and management as the cornerstones. As a natural progression, some of the enterprises have moved or are in the process of moving from physical or virtual infrastructure to a private cloud model, while others have directly jumped onto the public cloud for faster time-to-market and to benefit from the on-demand nature of public cloud without having to make significant CAPEX investments. While the myth around public cloud security has started to diminish, regulatory bodies are yet to give a complete go-ahead, limiting adoption of public cloud by enterprises under their domain and forcing them to innovate in the private cloud environment. We have seen a few customers who are successfully driving innovations on a private cloud. However, many continue to leverage it like traditional infrastructure. We are

now seeing a unique opportunity for enterprise IT to once again become the spear of innovation and trusted partners of businesses by redefining the way companies manage their hybrid IT environments. By 2020, 90 percent of organisations will adopt hybrid infrastructure management capabilities.1 Thus, it becomes critical to assess the role of Cloud Service Broker and integrate it into the overall IT strategy. Enterprise IT can not only define and achieve the milestones of successful cloud utilization, but also progressively achieve the desired outcomes and business results in enterprise digital transformation journey. By 2020, 90 percent of organisations will adopt hybrid infrastructure management capabilities.1 Implications & possibilities: The visible and the invisible With many enterprises taking a multi-cloud approach, a new set of challenges is emerging, which needs to be managed quickly and efficiently for successful cloud-led transformation. Enterprise IT is realizing that businesses want cloud services in self-service, subscription-based models, instead of the traditional request-based model. This creates an additional burden of managing subscriptions with the different cloud providers that may lead to a further rise of shadow IT. This is creating a quick-to-seize opportunity for the enterprise IT to take on the role of a service integrator and start providing Cloud Brokerage service to businesses and once more, become a trusted partner as well as a catalyst for enterprise growth and success. This would require enterprise IT to deliver Cloud Brokerage service with a diverse set of capabilities while leveraging the existing investments in ITSM tool sets. Multi-tenancy & access management Enterprise IT should provide a single gateway for enterprise users, developers and administrators to access multi-cloud services in a subscription-based model providing end-to-end subscriber, identity and access management capabilities to enable individual business units to consume the services relevant to them within administrator-defined quotas. Application-centric operations Marking a shift from Server/Service to Application Life Cycle Management, IT needs to focus on building an application-centric perspective to envision, design, orchestrate, manage and operate applications as-a-whole, instead of individual services constituting the application. Service management & optimization Enterprise IT should be able to manage the SLAs of cloud services keeping pace with advancements in the public cloud space, especially PaaS and SaaS. This includes a service catalogue for the end-users to pick and choose services and the ability for the operational aspects of the same to be managed from the same end-point. Integrated chargeback & financial management With the rising adoption of cloud, the procurement model has changed from CAPEX to OPEX across enterprises. Enterprise IT needs to answer the growing need for budget control and consumption tracking to find opportunities for cost optimization, for metering the usage of cloud consumption resulting in recovery and license & asset management in the hybrid environment. Operational intelligence The pervasive nature of analytics coupled with a shift from discrete monitoring to an integrated full stack monitoring must be leveraged by enterprise IT to extract meaningful insights into the application performance. The more real-time these insights, the better would be the optimization of resource utilization. AI/ML-led predictive and preventive maintenance are becoming the new trend. Policy-driven governance & compliance Enterprise IT needs to tame the challenge of enforcing enterprise security policies in a multi-cloud environment created by consumption of disparate cloud services and the diversity to deploy, manage

and monitor these services. As the scope of security widens from LAN to WAN, on-premise data security to the safety of data in public cloud, the simplest way forward is to deliver a secure and governed hybrid cloud. To conclude, we see the rising need of a Unified Cloud Brokerage Governance Console - a services hub - to facilitate consumption of an increasing diversity of cloud services from best-of-breed technology providers. All this, while centrally managing the provisioning, compliance, security, metering, chargeback and monitoring of such services. Reference 1 Gartner Press Release "Gartner Says a Massive Shift to Hybrid Infrastructure Services Is Underway" April 5, 2017 http://www.gartner.com/newsroom/id/3666917 Abhijeet Kumar Sinha, Principal Consultant Principal Consultant in Cloud and Data Platform practice, within Analytics. He has over nine years of work experience in cloud native data platforms and solutions with subject matter expertise on Amazon Web Services offerings. Why you need analytics for optimized Smart Meter rollouts

----- Arcticle source ----- https://www.wipro.com/analytics/why-you-need-analytics-for-optimized-smart-meter-rollouts/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Why you need analytics for optimized Smart Meter rollouts Utilities in the United Kingdom are going through a transformational phase with Smart Meter implementation. Ofgem, the government regulator for the electricity and downstream natural gas markets in Great Britain, mandates that energy suppliers install smart metering systems in Great Britain by the end of 20201. About 53 million smart meters must be deployed across Great Britain by the end of 20202. For a supplier, the ramp up of volumes to be installed, or exchanged annually during smart rollout, is about 5 to 10 times their

current deployment numbers. They face significant challenges like high cost of deployment, lack of business process and field activities efficiency, uncertainty around customer churn and customer acceptance, resource and technology limitations, among others. Business case estimates that smart meter deployment will deliver benefits of £18.6 Billion, at an estimated total cost of £11 Billion across Great Britain. Costs include meter installation, operations, IT systems, governance, administration etc. and benefits can be attributed to the consumer (savings from reduced consumption), supplier (unnecessary site visits, reduced complaints, queries) etc. Not all of these costs and benefits are relevant to suppliers, as costs and benefits are distributed unevenly among the major stakeholders of the smart metering implementation plan. What is critical to a supplier is a smart strategy with a single business objective of minimizing the cost of deployment while maximizing the benefits achievable. The rollout objectives As a part of deployment planning, suppliers need to address the different costs associated with field technician resources, non-deployment time, other urgent field work, multiple visits to finish each install, meter removal costs, resource spread, regulatory penalty, etc., and seek benefits like customer satisfaction, lessen churn likelihood, debt propensity, etc., to name a few (figure 1). Figure 1: Business objectives of the deployment 'Smart' deployment strategy Considering the complexities and large investments involved in smart meter rollout programs, suppliers needs to be 'smart' in how they plan the rollout, monitor progress, select customers, manage communications, and forecast resources. The challenge is in completing the rollout within the given time and cost while achieving acceptance from customers. To eliminate the risk of cost and time overruns suppliers should leverage analytics to guide smart meter rollouts, from planning through implementation. They should use advanced analytics techniques to produce the deployment plan while applying resource limitations, technological constraints, business rules and other assumptions that drive productivity. Use of analytics will help target the right geographies, identify the right customers, maximize utilization, optimize routes and workforce allocation, and plan and monitor rollouts to bolster the success rates of smart meter installations. Analytics: The efficiency enabler Analytics-led solution enables production and delivery of a continually optimized plan to maximize productivity and utilization of resources while minimizing the risk of non-delivery. The solution overview depicted (figure 2) illustrates two planning aspects: Figure 2: Solution overview for smart meter deployment planning Geography-based clustering, which is driven by the proximity of customers, reduces the average distance to cover within an area, helping reduce the average travel time between deployment jobs. Based on its attributes, a selected area can have different productivity levels. To drive utilization accurately, it is important to simulate events of the daily installation process and estimate its efficiency. Considerations like access rates, job success rates, constraints applicable, availability of resources etc., can be accounted. Event simulations enable 'what-if' analyses on changes in resource levels to determine impact on the number of visits and resultant installations. Operations research techniques will prescribe where and how much of smart meter deployment to plan for the given deployment deadline. For the selected area, deployment profile with the right operatives to be assigned and resulting number of visits and installs across time periods can be understood to achieve the goal while respecting limitations. Business can

produce multiple installation plans by varying factors such as resource levels, eligibility rules, access rates, etc., to enable comparison and scenario analysis. It can select an ideal deployment plan to follow by performing cost benefit analysis. Operational deployment planning is essential to plan and manage work by selecting the most appropriate customers and sites to engage with, to support the delivery plan. This highlights the ability to implement a deployment plan based on a set customer journey through high and low level planning, to trigger communications and achieve installations. Further, the factors required to produce the strategic deployment plan can be updated based on the operational experience. Rolling out benefits As the deployment numbers go up for suppliers, applying advanced analytics to implementation becomes relevant in solving logistical, technical, business and commercial challenges. It will help tackle the complexities involved in rollouts while maximizing the business impact. Scenario analysis and a proactive approach to deployment planning will help achieve the targets amidst stringent time and cost limitations. End note 1 & 2 – https://www.gov.uk/government/publications/sm art-meter-roll-out-gb-cost-benefit-analysis Tarkik Patel - Lead Consultant, Big Data Analytics, Wipro Tarkik has over eight years experience in analytics consulting and implementations. He is a management graduate, immensely passionate about driving business impact through advanced analytics and decision science. He has well-established experience working in multiple projects and solutions in the area of big data analytics and business intelligence across industries like utilities, healthcare and automobiles in the UK and US markets. Presently, he is into delivering use cases around smart meter deployment analytics and customer analytics. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. Fraud detection and prevention

----- Arcticle source ----- https://www.wipro.com/analytics/fraud-detection-and-prevention/ ----- About the Author Contact Wipro Please fill the required details to access the content Fraud detection and prevention The regulatory compliance of financial institutions is growing at a faster pace than before. Moreover, technology firms are reciprocating with solutions at an even higher pace. Of late, emerging technologies like artificial intelligence and machine learning have seen practical applications, which were earlier restricted to theory. Multiple specialized and boutique firms are now offering domain specific solutions and use cases against the big players who use artificial intelligence and machine learning as a platform. Institutions facing losses from financial crimes are growing at a similar pace. Fraudsters keep innovating and beating the system. This calls for a solution where technological advancements have to be leveraged to beat the fraudster and

allow early identification of their modus operandi.   The next decade will experience a transformational shift in the areas of fraud detection and prevention as institutions look out for solutions which provide transformational benefits and ROI. Benefits and ROI Getting applied to Financial crime detection and prevention is critical in any organization. Augmenting it with Artificial Intelligence and Machine Learning goes to show how far the industry has come in both theory and implementation. Sharad Kumar Ragam - Practice Manager for Financial Risk & Compliance Wipro Ltd. He has 11+ years of implementation, consulting and solutions experience, addressing the banking customers' needs across Fraud Risk Management, Basel & Regulatory Guidelines and Integrated Risk Management. ======================

What would it take for enterprises to

become truly intelligent ?

----- Arcticle source ----- https://www.wipro.com/analytics/what-would-it-take-for-enterprises-to-become-truly-intelligent/ ----- About the Authors Related Articles Contact Wipro Please fill the required details to access the content What would it take for enterprises to become truly intelligent ? Intelligent enterprises are being shaped by the rapidly expanding footprint of Artificial Intelligence (AI). In the years to come, organizations will be forced to dovetail technology with sophisticated human sensory perception, thought processes, judgment, choices and responses, to differentiate and gain an advantage over their rivals. But, how do you start? What is the best way to implement AI in your enterprise? Which are the essential building blocks? How do you strategize the transition to AI-powered infrastructure? How can you make AI real, productive and transformational? We intend to answer some of these questions – to proactively define a value-creating AI strategy for enterprises. To start with, harness the potential of intelligent data Don't fall into the trap of believing that robots and machines are ready to run businesses. The investments needed to scale up AI systems to deliver results are still limited to board-room discussions for many organizations. Speed to solution leads to great proof of concepts, but pop culture has conditioned us to Tony Stark's Jarvis-like AI, which is far from reality. In real world enterprise scenarios, data still matters: to teach and test systems which include human training and interactions, as well as for validation of models, and transparency of recommendations. Enterprises today serve millions of users, generating billions of transactions, which involves processing trillions of data records. Add to that connected devices, security and surveillance, worldwide research activities, scientific experiments, government outreach and initiatives, and other untraceable activities which are information driven. Imagine the amount of data being generated every single moment; and organizations will have to integrate, manage and secure all this information. For such data-intensive scenarios, the Cloud is emerging as a quintessential resource. The kind of storage capability an organization

needs depends on multiple factors viz. the industry use case being addressed and the need to make real-time decisions. For example, a credit card company that uses AI systems to detect fraud needs extremely low latency storage architectures and high-value neural network ecosystems. Enterprises can deploy and manage massively scalable and reliable services using Cloud to address unprecedented growth in the volume of data. AI in its true sense is only as good as the data behind it, and hence organizations also need to worry about the source of their data and how do they make it intelligent for use in AI applications. Ensuring data quality is a critical activity for AI. Inaccurate, incomplete or redundant data fed to an AI system, leads to incorrect, biased and irrelevant outputs. Automated data quality tools, that assess data for errors using rules or algorithms, are in demand among organizations, particularly those in data-driven industries. Data accessibility through a variety of touchpoints viz. mobile devices via wireless networks, raises several privacy and security concerns. Enterprises must look at authorization and data encryption tools as part of their data management and governance strategies. Therafter, leverage intelligent network Leveraging networks is key to AI's success. The human brain is a network of connections, and similarly, an intelligent enterprise needs to create knowledge from its data and meta-data. Businesses can easily rely on intelligent agents for specific individual activities, thereby reducing costs and avoiding human errors and biases. However, companies will need data scientists, data engineers, cybersecurity SMEs, network professionals and developers with a gamut of skills, coupled with business acumen, to handle their infrastructure to use AI technologies - such as computer vision, machine learning, natural language processing and deep learning. Thus creating an intelligent enterprise network. Hence, training and building a skilled workforce of versatilists (professionals capable of holding business, as well as technology-related roles) will also remain vital for enterprise success. Large enterprises also need to enhance their infrastructure to support the AI overhaul. The success of AI, and the value it can generate, has a direct correlation with how amenable the enterprise technology ecosystem is to handle such powerful applications. AI needs abundant computing power. Deep learning involves massive data sets, and deploying scalable, neural network algorithms for which traditional computing resources are insufficient. Organizations need to turn to Graphics Processing Units (GPUs), Tensor Processing Units (TPUs) and Deep-Neural-Networks Processing Units (DPUs) which can drive rich and sophisticated self-learning algorithms to process massive amounts of data, much faster and more accurately, on a massive scale. For smaller enterprises, much of AI is being done through APIs – with the infrastructure and hardware residing with the cloud service provider. However, irrespective of the size of business, the digital transformation of enterprise systems is a non-negotiable imperative for the success of AI. Lastly, take intelligent business decisions Enterprises need to pick their battles intelligently by identifying the specific problems they want AI to solve, thereby making existing processes, products and services smarter. Essentially, target use-cases, where Natural Language Processing (NLP), Image Recognition, Machine Learning (ML) and other such technologies within the arsenal of AI could deliver measurable business benefits. For example, if an enterprise is into BPO, an NLP based chabot adds a lot of value by solving basic problems without human intervention; classifying customer issues in predefined

buckets for faster identification and resolution - thereby improving BPO productivity. To prioritize on these use-cases, businesses should drive ownership of initiatives by establishing KPIs for the entire line of business - for the success of AI, and along with it focus on the value potential of the use-case and its implementation viability. Exponential business value is the most important measurement litmus test for a successful AI initiative. This may not be an exhaustive list of activities which can guarantee the success of an AI initiative for businesses, because a lot remains to be explored on this front. As Larry Tesler puts it, "AI is whatever hasn't been done yet." However, we intend to break some (A)Ice and help enterprises look at AI, not as a threat but as an efficient and effective way of becoming more and more intelligent. Juby Jose - Senior Engineering Manager, Wipro Ltd. Juby currently leads the Artificial Intelligence Research Group for Wipro's Data, Analytics & Artificial Intelligence Business. He has extensive experience in driving enterprise digital transformation and product management in artificial intelligence and machine learning. Juby has done a Masters in Computer Science, and holds a double major in Mathematics & Statistics from BITS Pilani. Palash Acharya - Senior Consultant (Strategy & Planning), Wipro Ltd. Palash is currently responsible for building value propositions and driving cohesive strategies for Wipro's Data, Analytics & Artificial Intelligence Business. He has significant experience in strategy consulting and has been instrumental in driving business strategies for India & Middle East geographies at Wipro. Palash is an Information Technology Engineer, and holds an MBA degree from Pandit Deendayal Petroleum University (Gandhinagar). To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. Data: The magic pill for the healthcare industry

----- Arcticle source ----- https://www.wipro.com/analytics/data-the-magic-pill-for-the-healthcare-industry/ ----- About the Authors Related Articles Contact Wipro Please fill the required details to access the content Data: The magic pill for the healthcare industry Like all other disciplines, the healthcare industry is overwhelmed with the explosion of data and the ever-growing need to deliver insights. Increased focus on pay for performance, patient-centric care, and the limitations of Randomized Clinical Trials (RCT) to predict the real world performance of drugs are driving this industry to harness observational data to provide compelling arguments for drug effectiveness. However, the unique nature of such data poses its own challenges. First, data is available in diverse forms including patients'

narrations, electronic health records, adverse event data, and claims records. Secondly, different terminologies are used to describe the concepts. In order to process this multi-modal data, traditional approaches are not adequate. This paper explores an approach to effectively manage and integrate clinical data to assess real world performance. A day in the life of a patient Jane, a middle-aged law enforcement officer, visits a clinic complaining of a headache. The physician prescribes appropriate medication after basic health assessments. Jane then visits a different physician to report symptoms of urinary incontinence. Pelvic exercises to strengthen the bladder are recommended. While the patient's symptoms have been efficiently treated, the two incidents put together tell a story that places Jane in considerable danger. These symptoms, in alignment with other conditions, could indicate Jane might be suffering from diabetes. This scenario highlights the risk of the prevalent approach to symptomatic treatment without accounting for the 'whole' health of patients. If the physicians could have looked at Jane's historical records of symptoms, diagnosis, prescriptions and the results of tests conducted across hospitals, they would have arrived at the conclusion that Jane needed treatment for Type 2 Diabetes. This is where technology can help improve patient care with a more holistic approach for consistent outcomes. Real world evidence Real world evidence is the clinical evidence regarding the usage and potential benefits or risks of a medical product derived from analysis of the data relating to patient health status and/or the delivery of healthcare routinely collected from a variety of sources. Real world evidence data can also be used for designing more efficient clinical trials, understanding a drug's benefit/risk profile, helping market access teams in economic model building and value demonstration, and understanding the market for launch planning. Furthermore, it could be used to understand adverse events alerts and drug compounding effects to help pharma companies reduce product cycle time and investment. In other words, data being captured can help pharma companies answer questions like which molecules treat patients of a certain disease better? What are its side-effects? Which combination of drugs could have a negative impact? Besides, after the drug enters the market, continuous real world evidence plays a critical role. As data keeps filtering in, pharma companies can change drug molecules, issue warnings or even withdraw the drug. From a pharma company's perspective In order to understand the effectiveness of drugs for patients like Jane, pharma companies are looking at an integrated view of patients' journeys across treatment regimens. With the help of comprehensive analysis of real world data, it would have been easier to understand Jane's case better. Another area of interest for pharma companies and regulators is drug safety. While clinical trials do help identify any side effects of a drug, it is hard to determine adverse side effects of concomitant drug usage for all possible combinations of drugs in such controlled trials. Additional channels of information such as adverse events and social listening for patients' comments are useful. A Real World Evidence (RWE) platform would help collect and process all observational data, develop tools and technologies to help analyze and take interventional measures as soon as such events are detected. Moreover, pharma companies may be drawn more strongly—and more immediately—to use the data to gain a competitive advantage. For example, patients may require a 21-day course of a certain drug, costing (say) 100 USD. A competitor may claim to provide treatment for the same

condition at half the price, but RWE could show that the course of treatment with the competitor's drug takes twice the time and has several side effects. On the commercial side, the market access team could use the data to understand competitive intelligence and which type of drug would work better in a certain geographical location. Brand managers can deepen their understanding of customer sentiments and strengthen brand loyalty. On the research and development end, the medical affairs team could use real world data to find out more about the ways to meet regulatory requirements by linking clinical and scientific results to real world data. This is also invaluable to biostatisticians and scientists in optimizing their research. From a payer's perspective The steep rise in drug costs coupled with finite healthcare budgets is a major challenge. New medicines—some for life-threatening diseases—cost tens of thousands of dollars a month. Many of these medicines prolong lives but in many cases, the data from conventional trials is ambiguous, and it is hard to determine if the medicines are providing real value relative to their costs. RWE about the drug's effectiveness can justify this for both the pharma company and the patient. Integrated RWE and RCT models also help generate meaningful evidence of a drug's risk/benefit and cost/benefit profile, which is in line with payers' expectations. Need of the hour Fortunately, there is no dearth of data in the world of medicine and pharma, just waiting to be leveraged. Physicians create electronic medical and health records, noting symptoms and recording their diagnoses using natural language. There are cross-sectional and longitudinal databases, which increasingly offer prospective 'add-ins' such as on quality of life. The use of health registries is growing and data of registered patients treated at a particular center for a particular condition can be easily analyzed. The FDA has an adverse events database, coded using the Medical Dictionary for Regulatory Activities for drug and therapeutic products. Academic literature has information about special characteristics of different medications and drug-drug interactions. Such data has been in existence for quite some time now. What is really required is the ability to link this data together through a common vocabulary so that analysts can use it for actionable insights. The solution is to translate records into a common language and tag ontologies for drugs (generic names, indications, contra-indications, formulations) and medical conditions (symptoms, diagnosis, treatments, outcomes) so that the right meaning is captured across disparate records. Real world data involves a lot of unstructured information like lab and imaging data, and this requires a specially designed platform to store and give actionable insights.   What it takes to create a RWE platform The core component would be a powerful data platform to build and host clinical ontologies and link data to them. Researchers will need to find ways to standardize collection of data from more than 1 million volunteers from hospitals and clinics nationwide and find efficient ways to store large amounts of data. Privacy and the confidentiality of patients' health information is another challenge. There is also a need to support ingestion of a variety of data types like documents, images, electronic medical records and other observational data from various sources like care providers, patients and third-party data providers. The ability to extract information from these data sources and link it to the clinical vocabulary is key. Real World Evidence platform capabilities: We need a cloud agnostic platform that enables customers to focus on their drug efficacy and drug safety study rather than managing and maintaining a

complex data platform. "As the breadth and reliability of RWE increases, so do the opportunities for FDA to also make use of this information." —Scott Gottlieb, M.D., Commissioner, FDA Beverly Chen Principal Consultant, Wipro Ltd Beverly is a thought leader in real world evidence. As part of the Health Business Unit strategy group, she is helping clients transform their business through outcomes-based models. A recent graduate of Wipro's Global 100 leadership program, she has worked across functions and business units globally with rotations in consulting, delivery, and sales. She holds a Master of Science degree in Biomedical Sciences from UC San Diego and an MBA from INSEAD. Vivek Wandile Practice Head, Wipro Ltd With 25 years of experience, Vivek is currently part of Cloud computing team supporting deep learning research. He also supports solution development team that trains large scale neural networks. His areas of interest includes large-scale distributed systems, GPU accelerated computing, performance monitoring, information retrieval, knowledge construction and Machine Learning application. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

The Machine Learning approach to data

quality

----- Arcticle source ----- https://www.wipro.com/analytics/the-machine-learning-approach-to-data-quality/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content The Machine Learning approach to data quality The world of data is expanding at an unimaginable pace. Researchers estimate that by 2020, every human would create 1.7MB of information each second. The true power of data can be unlocked when it is refined and transformed into a high quality state where we can realize its true potential. Many businesses and researchers believe that data quality is one of the primary concerns for data-driven enterprises and associated processes considering the pace of data growth. Repeatedly, bad data is sighted as one of the root causes for failure of data-dependent initiatives. Most of the operational processes and analytics rely on good quality data for being efficient and consistent in output. Data preparation tasks take up more than half of the data managers' and data scientists' time. Data quality is not new, but has undergone constant makeover with time. Manual data quality assessment, cleansing and deduplication processes have gradually passed on the baton to rule-based

automation, which uses data quality tools. This has relieved, to some extent, data preparation tasks but a huge scope of improvement still exists. One question that stands tall is "What saves cost emanating from poor data quality, is scalable to match up with unprecedented data growth and solves the time conundrum too?" The answer is "Multifaceted, insights-driven and new age solutions like Artificial Intelligence (AI)/Machine Learning(ML) that learn from situations and condense the efforts spent towards data quality management and also reduce the process time by leveraging distributed enhanced computations." Data quality - The Machine Learning way Data quality process has evolved in its capacity but the demand for pace and efficiency has been proliferating extensively. Data management experts believe that data quality remains a bottleneck that creeps repeatedly to bother the data management and business fraternity due to proliferating data volumes and the complexity involved to derive quality insights. Innovative technologies such as Big Data, AI, ML etc. have made the application of large scale advanced data analytics more tangible than before. A transition in data quality process is noticeable from static rule-based approach to a dynamic, self-adapting, learning-based ML approach in various domains. ML has the potential to assess the quality of data assets, predict missing values, and provide cleansing recommendations, thereby reducing the complexity and efforts spent by data quality experts and scientists. Some businesses already use ML models to identify and eliminate fake customer records to target their marketing at genuine customers through reliable data. Also, ML partially substitutes the role of data stewards by flagging the data points based on probabilistic ratings as per learning from training set of past data steward decisions and categorizing duplicate, vacant, incorrect or suspicious entries. This reduces manual effort and governance activities. It is always beneficial for the organization to have a good hold of what data is being procured and consumed, and the business purpose it would solve. ML provides assistance in deriving a data quality index score to assess data sets' quality and reliability in real time based on deviation from predicted parameter values. It also has a marked ability to predict trends and identify outliers if trained properly and can make suggestions or take actions on the go. ML algorithms can learn from human decision labels in the training datasets and replicate the scenarios in real-time. However, ML algorithms are also prone to biases that may reflect in these data sets and are learnt through fresh data sets. These biases could lead to erosion of data quality. External validity testing and audits on a regular basis will help in avoiding such situations. The road ahead Most businesses look for fast analytics with high quality insights to deliver real time benefits based on quick decisions. They consider this a top priority and means of competitive advantage. To enable this, there is an opportunity for the organizations to fine-tune and enhance current data quality approach using ML techniques. Most leading data quality tools and solution providers have ventured out into ML territory in anticipation of increasing the effectiveness of their solutions. Thus, it has the propensity of being a game changer for the businesses in pursuit of improved data quality. ML can complement the contemporary rule-based solutions, and synergistically and gradually lead to process evolution around data quality. Although the current maturity level of the use of ML for data quality assessment and enhancement is low, it has promising future prospects to churn large data sets and enhance data quality. Humanized AI for analytics that matter

----- Arcticle source ----- https://www.wipro.com/analytics/humanized-ai-for-analytics-that-matter/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Humanized AI for Analytics that Matter Imagination, ideation and the ability to create world-changing innovations are a result of human cognitive abilities. Human beings have the innate gift of sensing their environment, interpreting what they see, hear and feel, responding to stimuli, and empathizing with the environment and with other fellow human beings. Empathy allows us to take complex life-altering decisions with as little harm to other people as possible. It allows us to say the right words to cheer someone up. It helps us prioritize the needs of a helpless child. It teaches us to detect pain in other human beings and provide prompt aid. Most importantly, it teaches the cost and value of life. The capacity of humans is, however, limited in case of high number of computations and in repetitive tasks. Humans inherently develop bias towards certain people or environments, which impairs their judgement. Artificial intelligence has risen to the fore today to extend the skills of humans by learning to perform and automate tasks in manners designed by humans. In healthcare, a manual diagnostic error or inconsistency can spell doom in a person's life. However, with AI improving the accuracy to near 99.999%, the diagnostics will be far more robust. Hence, human medical experts, who front-end the service delivery machinery, will have more confidence in sharing the results and ensuing treatment plans. Similarly, AI-based assessment will likely be far more fair and free from human bias, likes, and dislikes (for e.g. teachers to different

students). Therefore, the assessments will be far more acceptable. At the same time, when students need a teacher's emotional support, in such scenarios, AI equations should be smart enough to step back and let the human empathy take precedence. What does AI lack? A Human Touch. While AI has come a long way in providing massive computational powers, it has not yet quite grasped the concept of emotions. AI still performs tasks in a robotic fashion – delivering fixed responses irrespective of context, or providing insights for business decisions without truly understanding the end user's emotions and needs. This prompted, a few years ago and more so today, the need to design AI that adds the human touch to tasks and can recognize times when it needs to take a step back. The widely popular Alexa, too, wants to understand human emotions and feelings and captures this information every day. By letting it know that you are happy or sad on a particular day, you help it build your emotional profile so that it can detect your mood in the future without the need to ask about your mood. This prompts longer conversations with the AI, enabling better responses to your behavior – ranging from simple conversations to contacting your family in case of interventions. AI, with the understanding of human emotions, can not only recommend you movies and shows to watch based on your browsing history, but also can detect the presence of early stages of depression and recommend you self-help tips for overall well-being based on your viewership. Woebot, a start-up specializing in natural language processing, assesses the mood of the user through questions. Having been trained in Cognitive Behavioral Therapy, a chatbot prepares an emotional profile of the user and based on the assessment, provides tips to manage anxiety. This is an example of Behavioral Analytics that matters. These kinds of insights are possible only when an AI has been taught to recognize the signs of a psychological problem by allowing it to study human behavior in real time and by teaching it to associate the usage of certain words by the end user to particular behaviors through Text Analytics and Natural Language Understanding. So what exactly is Humanized AI? Anything that affects humans, as opposed to just other machines, requires a humanized approach. AI is no different. Humanized AI is that which understands human emotions like happiness, stress, urgency, anger and pain when humans display them through speech, facial and physical expressions, and has considerable empathy to respond to the end user in a human-like or natural manner. This is different from traditional Behavioral Analytics. Humanized AI not only derives insight from the user data but also responds to the user in a manner and language best suited to his/her emotional profile. True Humanized AI, for instance, is able to understand the criticality of the tasks scheduled in your calendar and prioritize them based on importance and urgency. It responds to you in natural language very much like a human friend. The three sectors in which analytics and Humanized AI is currently seen as highly relevant and prevalent are Education, Healthcare, and Banking & Financial Services because each one of these affect certain aspects of human life directly and very closely. For any individual, these sectors and the corresponding services influence their social, physical and economic well-being. Different touchpoints of these services to different customer and user personas show how AI affects it. Healthcare - Researchers in MIT say that they have developed an algorithm that can predict depression in a person based on subtle cues in voice. Using neural network, the algorithm can identify and categorize the level of depression through a study of

characteristics of speech such as pitch, amount of breath, word choice etc. that are symptomatic of depression. Taking into account that depression is one of the most widely suffered and undiagnosed conditions in the world, this is an AI solution that must be considered for further development. Another emotion measurement technology company is able to detect emotions like laughter, anger and arousal, through the tone of voice. It serves Fortune 1000 companies. This is particularly helpful in interventions enabled through AI in cases of untold situations of child abuse or domestic violence. Voice Analytics is also used in the military forces to detect post trauma stress disorder (PTSD) in its personnel. Banking - AI algorithms can detect urgency and stress through the tone of your voice and through the choice of words you use. By assessing the level of stress, they can allow you to bypass the automatic IVR or chatbots and connect you to a human counterpart. The AI algorithm has developed the understanding that in a stressful situation, the end user might want to speak to a human rather than hassle with the algorithm. The algorithm also helps the customer service personnel quickly assess the customer profile and provide solutions most suited to the particular customer. This is especially seen in the case of wealth management where a human expert, rather than an AI counterpart, is received well by the customer. The benefits of emotion detection in customer problem resolution is another area where AI's ability to understand when to step back and let the human take over matters. Many financial multi-national companies are experimenting with AI in finance to bring more benefits to customers. Education – Personalized learning through analytics and artificial intelligence has been enabled for several classrooms by pioneers. When students use their touchpads or mobiles to go through study material, by performing simple analytics, it is possible to understand the subjects that the child is most comfortable in and those where he/she is stressed. AI can be used to engage with the child in solving difficulties with a question or a material. In addition, AI can be taught to understand when it is time to let the teacher know that the student might need a little more attention and compassion than the rest of the class based on the time spent on a question or stress expressed through facial expressions. Text Analytics also assists teachers in grading and evaluation, leaving them with enough time to provide personal care to children who will value the human interaction more. Carnegie Learning's Mika is one such AI solutions that provides real-time insights to teachers about the student's ability to comprehend and apply concepts learnt in class. How can we humanize AI to deliver analytics that matter? Artificial Intelligence needs a lot of intimate information about an individual that includes but is not limited to gestures, facial expressions and browsing data, to be able to truly understand the person's physical or mental limitations and design optimal responses accordingly. This information includes every touchpoint of the individual with the world through personal devices and physical movement. Half the people in the world consider AI intrusive when collecting such information. It makes them feel vulnerable of being under constant scrutiny. Algorithms, too, develop inherent one-sided decision-making when overly trained with particular data sets. However, AI improves its ability to empathize or humanize only with the availability of data. This puts a unique responsibility on research and business organizations to be responsible with the data collected and the algorithms built to provide life-improving analytics. Organizations must employ a 'human-first' methodology in building and

running artificial intelligence solutions. This methodology ensures that the human employing the AI services has the ultimate control over the algorithm. The algorithm, without the exclusive permission of the end user, cannot trigger automated actions after decision-making. This ensures that the human end-user can exercise caution where the machine's empathetic intelligence ceases and the human can supersede the artificial intelligence with his reliable human intelligence. Such a model where the human is always ahead of the machine and where the machine simply extends his capabilities and not replaces it, will see better success. This also ensures in building a trustworthy AI solution that receives buy-in from people and reduces the fear around data gathering. Organizations and people of the world are dealing with difficult conversations around data privacy and security today, but to build trustworthy and dependable artificial intelligence, these conversations are surely worthwhile. Tapati Bandopadhyay General Manager and Global Practice Head, Wipro HOLMES AI & Automation   Tapati is responsible for defining roadmap for the Wipro HOLMES AI platform and solutions. A Ph.D. in AI, Tapati brings to the table over two decades of experience on ITSM and expertise in AI and automation-related consulting, training and global advisory services. Sravya Bharani M Consultant for Strategy & Planning, Data, Analytics and AI, Wipro Sravya provides advisory and thought leadership strategies with an understanding of the digital and analytics industry including market view, competition landscape and related ecosystems. She holds a Master's in Business Administration from Indian Institute of Technology (Madras) and B.E. in Electronics & Communication Engineering. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Revolutionizing Enterprise Planning

with AI

----- Arcticle source ----- https://www.wipro.com/analytics/revolutionizing-enterprise-planning-with-ai/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Revolutionizing Enterprise Planning with AI Traditional enterprise planning approaches, software and technologies such as spreadsheets, legacy software systems, and in-house applications, seldom meet the complex needs of modern enterprises. It is easy to see why. They collect information in silos and require significant manual effort to consolidate, increasing the possibility of

data errors and inconsistencies. The need to understand business performance in real time in order to manage the modern enterprise makes it important to overcome existing planning systems bottlenecks. There is, therefore, a shift towards an intelligent enterprise, where systems augment management decisions with an accurate real-time view of business performance, creating a connected value chain. Planning for the intelligent enterprise requires an integrated platform that can acquire and assimilate data from any source, analyze it at a detailed level, and provide output in the form of actionable plans for the right people, at the right time. Such a cloud-enabled platform can help users across business functions, including finance, HR, sales, supply chain and marketing, collaborate with each other in real time to develop strategic plans and drive business success. The role of connected EPM in a modern enterprise Connected Enterprise Performance Management (EPM) is cloud-based, enabling advanced analytics using sophisticated models and integration across platforms and functions. The objective is to automate the management of enterprise performance across a multitude of functions to augment human capability. Figure 1: Evolution of EPM What is the impact of EPM across the enterprise? From a financial viewpoint: One central view of pipeline, order book, revenue, cost, and profits. From an HR perspective: A unified view of average time for recruitment, retention of talent, compliance, star performer promotions and so on. For supply chain: Single view of performance, and demand and supply alignment. For sales: Comprehensive view of sales performance across geographies and accurate forecasts. For marketing: A holistic view of marketing performance for leads, cost per lead, and resources per lead. Connected EPM systems provide businesses with the ability to integrate data, create hierarchies, develop formulas, deliver dashboards, and include complex time dimensions. Together, these components can be defined and adapted as the business evolves. Connected EPM systems enable several benefits such as enabling real-time capture of all data that a legacy EPM system captures and fostering quick analysis of the captured data to generate actionable insights that lead to business outcomes like improved efficiency. They also enable significant up-front cost savings through faster time to value as compared to on-premise solutions. Most importantly, they eliminate redundant workflows, yield faster response times and provide enhanced data governance. Figure 2: Connected EPM AI-based EPM for the Intelligent Enterprise The intelligent enterprise promises to bring automation and augmentation to activities and decision making across an organization. Activities such as detecting patterns, performing predictions, analyzing enormous amounts of market intelligence are useful in creating operational scenarios and identifying groundbreaking paths. Today, EPM vendors are working with several ML techniques to produce pilot studies and proof of concepts (POC) to understand the true application of augmented intelligence in planning use cases. The POCs are designed to improve planning for specific areas such as supply planning, revenue forecasting, sales predictions, workforce optimization, and demand sensing. They are run in 'supervised' learning mode and can draw on internal data such as transaction records or promotion information, as well as tap into a range of external data sources such as weather or demographic information. ML algorithms iterate multiple times through the data sets with the goal of improving the accuracy of predicted outcomes. The result: deep insights for creating informed planning models. Figure 3: Benefits of AI/ML The AI/ML

techniques help address three critical issues faced by business users across business functions – complexity, quantity and accessibility issues that make transactions time-consuming. Complexity: As data grows in volume, it becomes increasingly complex for varied reasons. EPM systems must be upgraded to acquire information from multiple data sources coupled with unique protocols - an expensive and time-consuming process. With AI/ML, systems acquire the ability to adapt themselves, as needed. Quantity: IoT and Big Data technologies are here to stay and it is clear that the volume of data will grow exponentially as usage of these technologies accelerates. Addressing this diversity of data to extract meaningful insights in a cost-effective way will require automation. AI/ML guarantees elimination of mundane, repetitive, manual, task-based, non-value-added work required in connected EPM systems. Accessibility: AI/ML addresses data-accessibility challenges in two ways: by making it easier to search and use information in the system, and making the information more accessible to users across the organization. The EPM market is witnessing the rise of many entrants who are adding AI/ML capabilities to their EPM platforms. This is creating competitive distinction between incumbents and entrants. Despite the growing capabilities across market players, major challenges exist: • Companies need to ensure their most important asset - their people - are given enough time and resources to adapt and become equipped with requisite skills for the new opportunities that AI will create in connected planning. • Moving into a fact-based decision-making mode changes the nature of an organization. Organizational changes are tough to manage and the intelligent enterprise will be able to absorb the changes by deploying a structured approach for workforce augmentation. • Data quality forms the crux of successful use of AI. This means organizations will need to have better control on their data. Data mining, cleansing, integration, and management will become more important than ever. Leveraging EPM revolution to create an intelligent enterprise Organizations that are in the process of transforming need the support of a new EPM solution that is responsive to the needs of business users. At the same time, the EPM must keep an eye on emerging technologies like artificial intelligence, machine learning, integrated analytics and business intelligence, to accelerate data understanding and augment decision-making. Organizations in need of reliable, accurate and adaptive planning and performance management systems should proactively assess connected EPM solutions underpinned by AI to power their enterprise growth strategies. The current revolution in the EPM marketplace addresses the ways organizations want to minimize and rationalize IT footprints and infrastructure while delivering greater value and insights. Cloud adoption, investments in emerging technologies, TCO reduction, and securing data and systems to ensure compliance must therefore become key management priorities for IT leaders looking to enable an intelligent enterprise for business leadership. Shishir Saxena Global Head of EPM Analytics, Wipro Shishir with over 18 years of consulting experience helps enterprise customers across areas such as business forecasting, planning and budgeting process strategy, and its optimization. Shishir has deep domain expertise in finance and sales. Ajinkya Pawar Consultant - Strategy & Planning function, Data, Analytics, and AI, Wipro Ajinkya with a deep understanding of the digital and analytics industry, including market insights, competitive landscape and related ecosystems, provides advisory services and thought leadership for building

value propositions and driving cohesive strategies. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Accelerating time to insight with automation and cloud

----- Arcticle source ----- https://www.wipro.com/analytics/accelerating-time-to-insight-with-automation-and-cloud/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Accelerating time to insight with automation and cloud In the digital age, digital data lakes have replaced file cabinets, and every organization is sitting on an astounding amount of data. With this increase in generation of data, businesses are reeling under pressure to reduce time to garner insights from this data for a definite competitive edge. There is 2.7 Zettabytes of data existing in the digital universe today1. At any given minute, US alone generates more than 2,657,700 gigabytes of data2. This is the golden age for data scientists and engineers, as there are a host of things to accomplish and an overwhelming amount of data at disposal. One might think this to be an ideal situation where organizations have what they want and know what to do with it. But it's far easier said than done. For starters, there is a huge dearth of qualified professionals in the business to deal with the data. Mckinsey believes there will be shortage of 250,000 data scientists by 20243, and Forbes opines that it takes 51 days on average to fill a position of data scientist or advanced analyst in professional services4. The demand-supply mismatch remains a pivotal challenge for business leaders everywhere. To add to this challenge, analytical teams are unable to build and test big analytics projects as fast as they would like. This can be attributed to the fact that the data with any enterprise is both complex and unique. The exploratory data queries by data scientists tend to include advanced statistical methods, which are repetitive and time-intensive. Having a meaningful impact with data involves innovation, thorough experimentation and time. Whereas majority of the time is consumed in tasks that serve as a precursor to actual data analysis such as making the data fit for analysis, identifying important variables etc. These two aspects of demand-supply mismatch and time-consuming tasks need to be addressed to unravel the full potential of big data. There is now, more than ever, the need to accelerate. The primary focus is to accelerate productivity of data scientists by providing them a user-friendly data platform that can help analyze datasets quickly. Speeding up the data-to-insight journey The start can be with automating and simplifying all repetitive tasks such as data

ingestion, schema recognition, automated variable selection, model creation and validation. The automation of above processes provides more time to the data scientists for application of their thought to reach actionable insights. The models created can be stored and reused by citizen data scientists as and when the need arises. Combined with the power of the Cloud to easily scale based on the amount of data, models can be trained effortlessly, and deployment can be automated. This will dramatically accelerate the time needed to build, scale and deploy a data analytics project. These steps are not exhaustive by any means; innovation knows no bounds but starts with a simple step. For the world of data science, things have started to move in the correct direction, it is now upon the big data fraternity to accelerate the processes to be future-proof. He has been actively involved with various analytics-based projects essentially finding actionable insights from Big Data. His area of work includes social media analysis, text mining and natural language processing. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption ======================

The power of three

----- Arcticle source ----- https://www.wipro.com/analytics/the-power-of-three/ ----- About the Authors Contact Wipro Please fill the required details to access the content The power of three Harnessing advanced analytics and AI to optimize the value from IoT The Internet of Things (IoT) is enabling businesses to evolve into a data-driven enterprise. The value of IoT lies in making operational processes more agile and efficient by utilizing data to enable decision-making through advanced analytics. However, with analysts expecting around 50 billion connected devices by 2020i, how can enterprises tap the humongous reservoir of IoT data to generate value? The answer lies in leveraging Artificial Intelligence (AI) to unlock value from IoT. While it is critical for an enterprise to sense and act, it must think and learn too like an intelligent enterprise. AI is the basis for this cognitive ability and this is the reason many startups and established companies are investing in building a cognitive future. This transformation requires apt architectures, applications, data, and tools. Enterprise Cognition: The fulcrum of the IoT

revolution The IoT ecosystem comprises a separate layer of devices (or 'things') that needs new architecture that includes communication protocols as well as information management and governance for building trust in data and Insights. The defining aspect is the generation of insights, as analytics is a key driver of success in IoT initiatives. Advanced analytics and AI together breathe life into a network of connected devices. They enhance operational value, driving business outcomes such as enhanced customer experience, improved operations and productivity, real time decision making, and recommendations for the next best action (NBA). This is made possible by harnessing the Big Data that becomes available from sensors and devices such as drones, autonomous vehicles, and traffic signals that record transactions, movements, environmental conditions, and other situational events. Consumption of such data to generate actionable insights is essential to providing more meaning to a network of connected things. With organizations around the world realizing the need to deliver exceptional customer experiences, Analytics and AI must become the focal point of the IoT strategy in the quest to become a customer-centric intelligent enterprise. The ability of an organization to collect, store, analyze and squeeze actionable insights out of data from various disparate systems/ things will be the deciding factor in obtaining the high value of cognition that is necessary for an intelligent enterprise. Enablers of an Intelligent Enterprise While there is no one-size-fits-all solution to enabling enterprise cognition, some common components are (See Figure 1): Figure 1: Enablers of Intelligent Enterprise Stream processing: Data is generated continuously and an efficient stream processing system or platform is essential to effectively leverage the data for better decision making. It is imperative that the streams of data are consumed to generate real-time insights using sophisticated analytical algorithms as the value of these insights is short-lived. Predominantly, as data from an IoT ecosystem is in the form of time-series data, pattern detection and anomaly (events) detection algorithms are employed in conjunction with other models. Complex event processing (CEP): An emerging network technology called CEP is triggered when an 'event' occurs and is used to translate incoming events data to provide timely insights into what is happening and recommends the NBA. An event could be a rise in share price, drop in heart rate, blood pressure, sensitive social media posts, customer activity on websites and so on. CEP is used in applications that require real time monitoring, and managing and predicting events. This provides any company with the ability to react quickly to critical situations to influence business outcomes and potentially save thousands of dollars - or impact patient outcomes and save lives. IoT orchestration: The key to scaling a successful IoT solution is a full-stack dispatch and orchestration layer. An orchestration layer ensures interoperability, data management and coordinated communication between different 'things' within the IoT infrastructure. It involves integrating different applications with IT systems, cloud platforms and other entities to enable seamless real-time data synchronization. Addressing a business need generally requires multiple IoT solutions to work together, and significant value lies in such cross-vertical integrations. Advanced analytics and AI: Analytics on IoT data produces actionable insights about customers, assets and business operations. Organizations are increasingly leveraging analytics and Robotic Process Automation (RPA) to build automated systems that improve productivity and ensure seamless business operations. Machine Learning

algorithms are used to make sense of the vast data that is available as well as to build algorithms for control systems. Advancements in research on AI techniques like deep learning, cognitive learning, natural language processing and computer vision have made interactions between things meaningful, while enabling task automation and work augmentation. With the increasing adoption of such emerging technologies, every industry is going through disruption faster than ever before. In the manufacturing industry, preventive asset maintenance and fleet management have delivered transformational business outcomes. Insights into when a particular asset might reach the end of its lifecycle and when maintenance has to be scheduled are resulting in cost savings in maintenance and downtime that significantly increase the profitability of organizations. Similarly in the healthcare sector, AI is revolutionizing healthcare delivery by enabling faster diagnoses, drug administration, case management and even remote healthcare service delivery. Such transformational outcomes lead to product and service innovation, in turn leading to the emergence of newer business models across industries. However, certain challenges stand in the way of organizations trying to harness the power of IoT fully. Roadblocks to realizing value from IoT Key challenges that prevent organizations from realizing complete value from IoT implementations include: Moving Ahead: Appreciating the potential and the complexity of IoT   IoT is more than a next-gen technology. It has become a strategic priority for businesses today. It is becoming increasingly clear that analytics at the edge of connected devices and AI applications will be a major future success driver. To succeed in the new environment, organizations must have a clear vision on how an IoT ecosystem is likely to transform their organization into an intelligent enterprise. This requires taking stock of the current maturity of end-to-end technology systems. Sufficient importance must also be given to aspects that will enable real time actionable insight generation – a critical factor in powering an organization's journey to becoming an intelligent enterprise. While there are major challenges for organizations in building an end-to-end IoT ecosystem, the potential gains far outweigh the roadblocks as IoT holds tremendous opportunities for sustainable business success. Kunal Ojha Principal Consultant – Data, Analytics & AI, Wipro Kunal has 15 years of experience in AI Thought Leadership, Advanced Business Analytics, Decision Systems and Data Science. He has been actively involved in building products, creating solutions, formulating strategy and executing analytics program in-house and for customers. He has worked on creating analytics content strategy for world's first industrial internet platform. He helps customers build/enhance/modernize their AI platform and governance strategies. Area of work includes: Text Mining, Predictive Modeling, Machine Learning, Deep Learning, Algorithms, IOT, AI and Blockchain Praveen Kumar Strategy Consultant – Data, Analytics and AI, Wipro Praveen has a deep understanding of the analytics industry and the digital ecosystem. He has extensive experience in designing solutions and offerings in the advanced analytics space. He provides advisory services and thought leadership for building value propositions and driving cohesive strategies.
=====================

Leveraging predictive maintenance for

higher profitability

Leveraging Predictive Maintenance for Higher Profitability Predictive maintenance is a popular application of predictive analytics that can help businesses in several industries achieve high asset utilization and operational cost reduction. It is designed to help determine the condition of in-service equipment in order to predict when maintenance should be performed. This approach promises cost savings over routine or time-based preventive maintenance, since tasks are performed only when warranted. Unscheduled equipment downtime can be detrimental for any business. It is critical to keep field equipment running to maximize utilization and minimize expensive, unscheduled downtime as well as health, safety and environmental risks. The goal of a predictive maintenance strategy is to extend the useful service life of equipment and prevent failures. Anomaly detection is a common approach because it identifies when a device is behaving differently than expected. Predictive maintenance leverages data from an individual asset to predict failure. This way, repairs can be done when needed (and avoided when not). Business case for predictive maintenance Businesses require critical equipment to be running at peak efficiency and utilization to realize their return on capital investments. These assets could range from aircraft engines, turbines, elevators, or industrial chillers—which cost millions—down to everyday appliances like photocopiers, coffee machines, or water coolers. Predictive maintenance in business areas This was implemented in the electromechanical shovels industry to monitor and predict the failures upfront, so as to estimate and eradicate failures for smooth machine flow. Challenges Traditionally, it has been difficult to apply condition monitoring and predictive techniques to these electromechanical shovels due to inadequate analysis algorithms and equipment, as well as the harsh environment. Traditional vibration analysis (the main tool for predictive maintenance on rotating machines) performed by conventional equipment is based on the Fourier transform, which assumes constant rotational speed. This is not adequate for the shovel, and hence, a different approach is needed. Solution Predictive maintenance as a process flow with 3 steps, as illustrated below: Collect: First, you'll need to gather relevant data that can help you predict time-to-failure. This is often done by adding vibration IoT sensors to get "indirect" data, for example. However, a far more direct method is to tap into the run-time data the machine uses to operate. All vehicles—and most industrial machinery — operate using a combination of transducers (sensors and actuators) and control units. The control units implement algorithms that determine the behavior of the machine. The run-time data is continuously transported,

often using wires and communication protocols. A popular transportation method is "CAN bus" (Controller Area Network) that is used in automotive to allow communication between ECUs and sensors, which is standard in all vehicles. If a vehicle or machine uses CAN bus wires for data transportation, it's often possible to safely tap directly into the run-time data stream. This can be done using an IoT CAN bus data logger, which opens up the full scope of your asset operational data. Your CAN logger can then transfer this data to the cloud via a WiFi hotspot (WLAN, 3G, 4G) in near real time. Predict: The collected data is processed in the cloud. For CAN bus data, this includes transforming the data to scaled engineering values. Once ready, the data can be used in a predictive model. These range from simplistic single-variable thresholds to advanced machine-learning algorithms. React: The model provides estimates of the time-to-failure for an asset and its components. From here, it's 'simply' reacting on the insight: Auto-schedule maintenance, send push notifications to warn staff of potential breakdowns and optimize your spare part inventory. Conclusion Machine learning is a natural fit for predictive maintenance, which involves failure classification using huge amounts of sensor data. To build a failure model, we require enough historical data that allows us to capture information about events leading to failure. In addition, general "static" features of the system can also provide valuable information, such as mechanical properties, average usage and operating conditions. However, more data is not always better. When collecting data to support a failure model, it is good to ask questions like: a) What are the types of failure that can occur? Which ones will we try to predict? b) What does the "failure process" look like? Is it a slow degradation process or an acute one? c) Which parts of the machine/system could be related to each type of failure? Kalyani Vuppalapati Technical Lead, Data Analytics & AI, Wipro Limited. Kalyani is an expert in multiple analytical tools and data mining methodologies. She has also worked on various analytics projects in Manufacturing and Technology, Energy and Utilities and Healthcare domains. Her experience includes data analysis, proposing analytical solutions, generating dynamic reports and other data preparation components like data pre-processing, profiling, cleansing, validation and transformation. =======================

Serverless data integration:

The next big thing

----- Arcticle source ----- https://www.wipro.com/analytics/serverless-data-integration-the-next-big-thing/ ----- About the Authors Related Articles Contact Wipro Please fill the required details to access the content Serverless data integration: The next big thing With the growing client expectation of faster time to market, most of workforce efforts in the IT industry are spent in maintaining the infrastructure of the project instead of focusing on the actual work items. Managing the servers round-the-clock not only has an economic impact on the entire project but also introduces several issues of security vulnerability. Serverless concepts help to increase the performance, reduce operational cost, and implement auto scale-up

based on the workload without any manual intervention. More often than not, conventional practices are preferred because of their vast acceptability and reliability but best practice and conventional practice are two different things. The term serverless is in actuality a deceptive and misleading term. The servers still exist in some shape or form with the code being deployed and executed on the server but the responsibility shifts from the developer to third party vendor and in turn, the developer focuses more on the code and less on the servers, hence the significance of the term 'serverless'. Advantages of serverless computing in data processing The realization of the Extract, Transform, Load (ETL) process often requires uninterrupted use of virtual machines. The servers still need to be up and running even if the code is not being executed. Any slight interruption or shut down in servers especially production servers can wreak havoc on the entire process. Such persistent use of servers also increases total cost incurred and the additional hassles of infrastructure management. These unwanted outcomes can be easily dispensed by migrating to serverless technology and integrating data integration tools with the cloud services. Outsourcing servers to third party vendors not only reduces the existing complications of the project but also comes with added benefits. With the shared responsibility of the servers, the service is stationed in dedicated hands who handle the tasks of receiving requests from clients, responding to clients, capacity planning, monitoring of operations, and scheduling tasks. It also provides the benefit of scaling down the cost of the project since the charge is on the execution time and the resource used, and the payment is based on per second. Integrating data with serverless also adds agility to the system. How serverless works   Instead of having physical server to execute process, serverless is events-based. When a file is uploaded, and it requires the execution of a certain job to perform the intended function, serverless architecture comes into play. The trigger can vary from an HTTP request to API trigger or Files based trigger. Various sources provide different definitions of serverless. The key tenets required to define a serverless platform are: It is not necessary to have an integration server to perform data integration jobs. In serverless data integration, a function is triggered for job execution via HTTP/SOAP request. However, all cloud services support a number of programming languages to write the function code, and the compatibility varies significantly. While the full-fledged shift towards serverless may take time, a significant movement towards it has already begun. With serverless, you manage your apps (not your servers), which in turn simplifies your dev-ops and provides faster time to market. Ganesh A Senior Architect - Data, Analytics & AI, Wipro Ganesh has over 19 years of data warehouse experience. He is currently focusing on open source integration technologies and has successfully executed large engagements for global companies. He is a TOGAF certified Enterprise Architect. He is also certified in different database technologies and supports the practice in managing cloud native ETL tools. Sujata Yadav Project Engineer - Data, Analytics & AI, Wipro Sujata graduated from the National Institute of Technology, Jalandhar. She focuses on various data integration tools and is currently working for a client leveraging a new age technology embedded with big data solutions. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk

Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. Data Science Accelerator:

Empowering citizen data scientists

----- Arcticle source ----- https://www.wipro.com/analytics/data-science-accelerator-empowering-citizen-data-scientists/ ----- About the Authors Related Articles Contact Wipro Please fill the required details to access the content Data Science Accelerator: Empowering citizen data scientists Organizations are rapidly adopting advanced analytics to enable data-driven business decisions. As a result, the demand for data science experts is growing. However, there is a huge gap between the demand and supply of data science talent. McKinsey confirms that 12% annual growth in demand for data scientists outpaces the supply of 7% data science graduates per year, which would lead to a shortfall of some 250,000 data scientists by 2024[1]. Hence, there is a need to fill the current skills gap by enabling citizen data scientists in the organization. Citizen data scientists, though not experts in the field of data science, can leverage analytics and statistics while delving into the data to derive additional insights. Citizen data scientists complement expert data scientists by bringing in their own expertise and unique skills to the process. Technology is a key enabler of these non-specialists (citizen data scientists). Data Science Accelerator empowers the citizen data scientists to extend their reach to data and analytics via approaches that automate data science stages for insight discovery. This paper explores an approach to accelerate data science by providing automated predictions on dataset via automation workbench and reusable modules. Data science acceleration platform Data Science Accelerator (DSA) powers automated predictions on dataset via automation workbench to empower citizen data scientists and reuse modules that make data scientists more productive. It leverages open-source technologies in a cloud environment to create a user friendly workflow. Figure 1 highlights the key features essential to a data science acceleration platform. Figure 1: Key features of data science acceleration platform Figure 2: Workflow of data science accelerator Features and functionalities The key features and functionalities of DSA across different data science phases are: 1. Data analysis: Provides a quick summary of the dataset and highlights the underlying data patterns and relationships. a. Univariate analysis: DSA has additional features viz. Automatic schema recognition for smart detection of data type and ID variable, which enables creation of right univariate distribution based on the variate type detected. b. Bivariate analysis: Distinctive techniques such as Weight of Evidence (WoE) at decile level, chi-

squared test, cross tabulation and tukey test are used to explain association or disassociation between a pair of target and explanatory variable at pre-defined significance level. 2. Feature engineering: DSA provides a user-friendly environment to: a. Drop column(s) via single click button b. Impute missing values c. Cap outliers based on position and influential value in the range scale d. Provide data transformation options such as split variables, standardize or normalize data, flag creation e. Auto-discard variables basis Strength of Association (SOA) and Variance Inflation Factor (VIF) Thus, it reduces process time for transmutation, screening and ensembling data features, leading to significant effort and cycle time reduction in model development stage. 3. Model creation: Allows user to build a model as per requirements using the provided options: a. Test-control sampling - User creates development and validation data from the modelling data using user-defined algorithm by choosing sampling method and train ratio b. Expression split - Helps create hold-out samples based on chosen partition option 4. Model selection: Recommends the most suitable model for solving the problem viz. classification or regression for the chosen target variable. This feature provides guided assistance throughout the journey of model development. Further, model performance is validated via confusion matrix, Mean Squared Error (MSE), concordance value, etc. 5. User control options: Provides the following additional options to scrutinize the model generated: a. Download scored data b. Download transformed train and test data c. Score model with new data d. Download validation charts e. Rebuild and save model 6. Model catalogue: Stores and enlists all the models created by the user. This provides a quick glimpse of the various models created using diverse set of variables for the same dataset, thereby enabling user to compare performance of different models via accuracy, precision, R squared value, F1 score etc. Thus, DSA not only helps improve productivity of data scientists by reducing process time through automation of repetitive tasks, but also empowers citizen data scientists via code-free analytics. It provides guided assistance through a series of statistically robust steps with minimal supervision from specialists. The future roadmap Unlike other automated data science tools, which are essentially "black boxes", wherein most of the intermediate techniques are hidden and beyond the control of the analyst, DSA provides transparency and control to experienced data scientists to understand under-the-hood rationale at every analytical process and override recommendations, if any. Further, based on the data and the semantics, it auto-suggests the most suitable model for solving the problem viz. classification or regression for the chosen target variable. This feature is pivotal for citizen data scientists, as there is a guided assistance provided by the platform. In addition, it has an in-built ability to scale and process large data volumes through distributed execution on Spark clusters which enables easy implementation. DSA capabilities can be further enhanced by: Reference [1] https://mck.co/2KKhr3s Bavya Venkateswaran Consultant, Wipro Limited. Bavya is currently responsible for solution design and implementation of advanced analytics and artificial intelligence-based use cases on Data Discovery Platform (DDP), Wipro's proprietary Insights-as-a-Service offering. She has been instrumental in delivering turnkey solutions in Energy & Utilities, Human Resources, and Healthcare domains. Harish Kumar Chauhan Project Lead, Wipro Limited. Harish leads Engineering division of Platform and Solutions in the Analytics group at Wipro. He is responsible for creating, developing and implementing various analytics

solutions. He has experience in designing big data architecture in cloud environment and ideating for automation in the industry. Dipojjwal Ghosh Principal Consultant, Wipro Limited. Dipojjwal is currently involved in the development of analytical apps for Consumer and Utility domains on DDP, Wipro's proprietary Insights-as-a-Service offering. He has around 10 years of research and analytical experience in Manufacturing, Energy, Natural Resources, and Retail domain. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption

How to address shortcomings in AI to build trust

----- Arcticle source ----- https://www.wipro.com/analytics/how-to-address-shortcomings-in-ai-to-build-trust/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content How to address shortcomings in AI to build trust Amazon successfully used automation and artificial intelligence for order recommendations and fulfillment in their ecommerce platform and warehouses, but when it came to evaluating job candidates, the scoring engine failed[1]. Built-in biases in the real world were amplified in the machine world with recruiters realizing that scoring results for technical positions like software development were not gender-neutral and qualified women candidates were not being recommended. Amazon scrapped the project. Facebook shut down its AI system meant to learn negotiation skills, after bots created their own language that was nonsensical and difficult to debug2. Microsoft had false starts with a chatbot that learned racist and profane terms in interactions with consumers[3]. Artificial Intelligence holds great promise, but the challenges in implementing this technology has far-reaching implications. It has blind spots that are obvious when bot behavior is part of the solution (profanity) but more difficult to address when processes and cultural behavior influence the technology (racial, gender, socio-economic variables). Lack of trust in AI In spite of all the technological advances, people still lack complete confidence in automation and predictive insights, and the underlying relationships organizations have with consumers. A large part of this relationship is built on the data organizations collect from consumers. Is the data accurate? Is the data private? Is there recourse to correct data? Google was in the headlines when it shutdown Google+ after a software glitch in the social site holding personal consumer data was found to be susceptible to hacking4. There is no evidence that this data was improperly accessed but it caused some PR issues. Bias is a societal issue and because

humans program systems, those systems are susceptible to existing bias. And since the data to teach and test systems comes from human action, the bias can be built into the data.The decisions that AI makes is sometimes highly intuitive. Since it undergoes a host of calculations with the data along with variables, it gets difficult for a human to understand the basis of the decision. This is the 'black box' problem with AI. With the lack of transparency, humans are not able to understand what goes on inside AI, which causes anxiety and ultimately distrust. It is clear that organizations embarking on a data-driven journey must understand the basis of trust in systems and data that consumers expect. Creating transparency Research suggests that using AI to augment human decision-making will allow the AI system to learn from human experience and improve trust. Assembling stakeholders from diverse backgrounds can address the challenge of human bias through governance and other research to understand how algorithms make choices. An effective data governance strategy is essential in order to address error and bias in a data model. This is a key component of an AI system framework since it not only offers a simple way to use the right data but also flags the errors in the data. A framework for evaluating data fit for AI: The core of data governance is not only about high quality data but also about the legal requirements of handling consumer and personal data combined with an organization's digital ethics. Regulations like GDPR allow consumers to keep a tab on their personal identifiable information (PII), rather than it being floated around without their consent. Digital ethics is the foundation for how algorithms are created, tested, and deployed. Furthermore, well-organized data will increase consumer confidence in a company's brand when consumers understand who owns their data and why. Making AI more insightful AI is the 'black box' that crunches a vast amount of data to identify hidden patterns and underlying signals through its complex system, whereas human trust is often based on how people think. It is pertinent to open the black box of machine learning and be translucent if not completely transparent to the user on its working. Some of the analysis performed by AI will inevitably be probabilistic based on incomplete information. It is therefore important that an organization recognize the limitations and explain this to its customers through a compelling user experience. The future of integration From ETL to API-based EAI

----- Arcticle source ----- https://www.wipro.com/analytics/the-future-of-integration-from-etl-to-api-based-eai/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content The future of integration From ETL to API-based EAI The Web API or API in short, is not a new technology. It has been there for more than a decade and today Programmable- Web directory lists more than 20,000 public APIs available for consumption. Transactions over billions of dollars are executed successfully in this technology every day and the volume is growing every passing quarter. Though initially developed with system integration over HTTP protocol in mind, the recent developments have spilled over to various other peripheral areas. The growth of API and related technologies are influencing the established market players in these areas to modify their strategy to incorporate API in their product offerings, if not completely re-doing their product strategy around API driven architecture. In this article, we will explore how the traditional on premise data integration approach is changing towards API based integration of both on-premise and cloud based systems. The integration battleground System integration is not a new concept. Humankind have discovered the power of collaboration in prehistoric ages and utilized the concept in every domain since, only constrained by the available technology of that point in time. Divide and conquer strategy ensured that the systems continued to be developed independent of each other, while business survival compulsions forced them to get connected more and more. In the process two broad categories of high-level integration emerged—application integration and data integration. Applications started talking to each, mostly driven by the usage requirement—either asynchronously via messaging or synchronously via HTTP and other online protocols. The availability of bandwidth and processing power constrained them to use minimum amount of data for processing. The predecessors of current day web APIs trace their root in this type of Enterprise Application Integration strategy. Figure 1 gives the relative advantages of each strategy - ETL vs EAI. Figure 1: Relative advantages of ETL and EAI Development drivers for API based integration There are six major drivers pushing towards the convergence of application and data integration via API. Cheap bandwidth: Advances in fiber optics are enabling wires to carry terabytes of data at the speed of light, whereas 4G (and imminent arrival of 5G) are sending gigabytes over ether to mobile devices. The abundant supply is driving down the effective cost of bandwidth

to the point of insignificance. Sensors, systems and data explosion: Increasingly, we are living in a connected world, filled with various sensors and systems, generating enormous amounts of machine data. The maturity of a global IT manufacturing supply chain has lowered the cost of IT Hardware significantly, allowing collecting, collating, processing and making sense out of this humongous data load via artificial intelligence, completely removing the human bottlenecks in the process. Privacy and security: Deployment of cheap biometric devices for identification by various government organizations worldwide have necessitated foolproof data protection legal framework. The advent of social network has sensitized the masses about the danger in lack and/or loss of privacy. Cloud—private, public and hybrid: While on-premise systems are not going away anytime soon, every organization worth its name are spending significant amounts of effort on their hybrid cloud strategy to cut down their operational costs. Other than optimizing idle capacity, the 'pay as you go' model of cloud is inherently more suitable for the business, driving towards its adoption. Handheld devices everywhere: Cheap bandwidth combined with significant processing power available in handheld devices have increased the appetite for real time data of the data consumers. The information latency of traditional batch processes is no longer acceptable. Enriched data must appear for user consumption as soon as the event occurs and tracked till the logical closure in all four space-time dimensions. Everything has an app for it: The data consumer is ready to pay for the on-demand service, giving rise to the 'subscription' model of instant revenue generation for the data. Taking advantage of this, an ecosystem of connected apps has come up, providing every kind of service at every corner of the world. The data they use are not always their own. The interaction patterns and the data generated by them changes rapidly. This necessitates a different kind of agile tool that is lightweight, fault tolerant and horizontally scalable. IPaaS: The wholesome integration In the last few years, Integration Platform as a Service has gained significant traction. Taking advantage of increased security over public networks, cheaper cost of connectivity and larger on-demand capacity of cloud, they are steadily gaining ground over traditional on-premise ETL tools. The current global revenue has already crossed a billion1 and can only go up since all the traditional ETL vendors are increasingly focusing on this space. Using their existing customer base, existing vendors have either retained strong presence or regained the initial lost ground. Simultaneously new players have come up with their own niche. There is still entropy in the market and it will go through a consolidation phase in future but today's business can ill afford to wait it out. A. The first advantage the IPaaS tools have is their dual capability of API connectivity and data processing. Today's SaaS offerings are not simple. Take for example ServiceNow, SalesForce, Ariba or Office365; each provides significant capability at the cost of a very complex and complicated API. They also need to transfer huge amount of data back and forth. With the deep inroads by them in every domain, an organization has a serious business disadvantage if it is not ready to consume the relevant ones in its own business process. However, the design and development of an API, its gateway or even the development of a public or B2B API client in bespoke manner is not simple and can quickly turn into an expensive and time-consuming proposition completely outweighing its benefit. Another consideration is the adaptation of own API by the outside world. In case of

no or low adaptation, the entire expense goes out of the window without any return. Given the diverse nature of the public and B2B APIs, the tools already have significant capability of transforming data. Traditionally there has been three patterns of data transform which every ETL tool excel in: a. Movement with enrichment from one system to another b. Synchronization of data in multiple systems - either uni or bidirectionally and c. Aggregation from many systems into one B. The second advantage of IPaaS tools are their tight integration with high performing messaging platforms. While the traditional ETL tools have developed connectors for them, the cloud native IPaaS tools have distinct advantage in streaming mode for better near real time asynchronous performance. The combination of high throughput and low latency allows creation and deployment of new architectures like hybrid transactional analytical platform. C. Typically, the on premise ETL tools have a perpetual license model with upfront payments connected to number of CPUs. The IPaaS, on the other hand, typically uses a subscription model tied to actual usage. This gives optimized cost of capability and business prefers this model more. Conclusion The days of ETL are far from over. The current customer base is still an order of magnitude more than the nearest IPaaS offering. Nevertheless, there is no denying that IPaaS is steadily gaining ground and is the way to the future. Given such a scenario, the prudent approach would be to retain the existing ETL solutions but simultaneously prepare a 'to-be' state involving an IPaaS tool. For any new development, a due diligence should be done based on the following key considerations: Reference 1 https://www.gartner.com/doc/3885665/market-share-analysis-integration-platform Swagata De Khan Senior Architect - Data, Analytics & AI, Wipro Limited. Swagata has over 19 years of data warehouse experience, and has successfully executed large engagements for global MNCs. He is an AWS certified Solution Architect and currently focuses on solutions involving Cloud, Integration Technologies, Artificial Intelligence and Machine Learning. Prasanna Raghavendran Head of Data Integration - Data, Analytics & AI, Wipro Limited. Prasanna has over 18 years of experience in the IT industry and is currently leading the enterprise data integration practice in Wipro globally. He has performed several leadership roles in the area of data & analytics including sales, pre-sales, consulting and portfolio management To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Empowering retail through customized, role-based insights

Empowering retail through customized, role-based insights March | 2019 The retail industry, now, has access to a wealth of data across a customer's lifecycle. The data helps predict customer behavior, assesses needs for new products, and triggers buying decisions. But the data is scattered and in different functional silos. What the industry needs is visibility into insights across the stages of a customer's lifecycle. This can be enabled by a suite of connected applications that extract actionable insights and share them across stakeholders at speed and scale. For instance, the Chief Marketing Officer should be able to monitor and measure marketing campaign effectiveness/ROI and ensure tight cost controls. The Marketing Manager should be able to track specific campaigns from lead T generation through to revenue won, analyze conversions, and identify gaps within campaigns. The Category Manager should be able to track category performance, understand the success of promotions, identify trends in market basket, compare changes in buying patterns over time, and get alerts for problem areas. The data-information-insights-outcomes process is different for each role in the retail organization. Most retail organizations face hurdles in delivering these role-based insights. In other words, there is a requirement for applications tailored to specific retail roles. Based on the needs of the role, the applications must generate insights that are descriptive, diagnostic, predictive and prescriptive in nature. Designed for personas A Customer Insights Platform (CIP) addresses the rising challenge around generating role-based insights. The CIP connects data and insights across the customer lifecycle enabling a multi-channel experience. The CIP has ready-to-use data ingestion engines, data transformation components, analytical models, predictive indicators, accelerators, machine learning algorithms, stream computing and natural language processing capabilities. These are bundled with industry-specific data models and frameworks. The models and frameworks give the CIP an extraordinary ability to generate advanced, highly intelligent and role-specific insights and visualizations. While it sounds complex, the CIP is relatively simple to roll out. The CIP helps retail executives eliminate complex time-consuming analytical processes and bolster their business acumen with data-driven insights. Additionally, the CIP doesn't require extensive or specialized user training to become useful. It has an intuitive interface that anyone can begin to use in hours, without the need for intervention from IT. The CIP goes a step further. It places a variety of levers in the hands of each role, putting people in control of actionable outcomes. An additional reason the CIP finds easy traction within

the enterprise is its ability to monitor and provide insights aligned with the KPIs of a role. Making retail better The CIP addresses five clear themes that are critical to retail: Know your customer: Understand purchase behavior, analyze current spend and basket, understand preferences and needs, understand purchase frequency and affinity, analyze social behavior and signals Effective engagement: Understand customer preferences for products and channels to build SKUs/ bundles/ cross-sell/ up-sell, determine path to purchase and engagement, assist in store layout optimization, determine visual displays and their effectiveness, and improve product placement and uptake Target results: Analyze online purchase intent using clickstream data to improve campaign response, personalize and optimize offers, enable Next Best Offers and increase conversion, identify new market segments for potential customers Right product, channel and price: Analyze historical performance of campaigns, develop new campaigns, increase customer awareness of products, surface new opportunities for sales, build brand loyalty, show product availability and allocation, enable price elasticity, provide single view of inventory across channels, personalize bundles Drive retention: Analyze social behavior and signals to improve customer retention, analyze feedback to improve products and create post sales engagement to improve experience, understand drop outs and target them for retention, build high-value relationships and reputation management, improve Customer Lifetime Value The CIP is highly effective because it provides interwoven insights, is simple to use, and is aligned with the KPIs each role visits to understand how the business is doing. The key benefits of the CIP include: Smart decision-making: Each stage of a customer's lifecycle is mapped and delivers role-specific visualizations of the output. This means executives don't have to rely on gut feel or experimentation. Instead they can confidently and quickly take outcome-based decisions that improve organizational agility and competitiveness. Acquire 3600 view across customer lifecycle: The CIP takes siloed organizational data and unifies it. This gives a complete and reliable view of customers so that no opportunities are lost. It then allows the organization to share those insights. For example, insights from campaign management can be used by other functions to improve customer loyalty or identify unproductive market segments. Worry-free access to decision science: The organization can focus on its core competency and use the CIP to take decisions confidently. For example, data science can be used to accurately measure customer sentiment (something that researchers can take ages to determine) and offer appropriate interventions where required; it can be used to analyze customer lifetime value and recommend the level of investment to be made in retaining specific customers. Data science is a mature practice that is proving to be a critical aid in decision-making across industries and retailers must learn to leverage it. Fully integrated with enterprise systems via APIs: The CIP offers the ability to use a wide variety of data to simulate complex scenarios around decisions. This places unprecedented capabilities in the hands of managers to weigh options, determine optimal outcomes and take decisions. Leading retail organizations that want to leverage data are examining systems that deliver customized, roles-based insights. It is the logical path to take for shifting heavy lifting out of analytics and placing more power in the hands of executives to take fast and accurate decisions. Dipojjwal Ghosh Principal Consultant, Wipro Limited. Dipojjwal currently develops analytical apps for consumer and

utility domains on Data Discovery Platform (DDP), Wipro's proprietary Insights-as-a-Service offering. He has 10 years of research and analytical experience in domains such as manufacturing, energy, natural resources, and retail. He has an MTech degree in Quality, Reliability and Operations Research from Indian Statistical Institute, Kolkata. S.Jayaraman Consultant, Wipro Limited. Jayaraman is a business analyst for consumer apps on Data Discovery Platform (DDP), Wipro's proprietary Insights-as-a-Service offering. He has 9 years of retail domain experience in merchandise planning, assortment planning, segmentation strategies, in-stock management, supply chain optimization, video analytics, JDA forecast & replenishment, and allocation strategies. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption ======================

Bringing together Six Sigma and analytics for process excellence

----- Arcticle source ----- https://www.wipro.com/analytics/bringing-together-six-sigma-and-analytics-for-process-excellence/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Bringing together Six Sigma and analytics for process excellence The Six Sigma methodology is not new - it has been around since the 80s. What is interesting is its long shelf life. It continues to be relevant to modern day operations despite rapid technological advancements. A data-driven approach, it helps reduce defects in products and services, while increasing customer satisfaction through continuous process improvement1 2. As the key focus of Six Sigma is process improvement, organizations can apply Six Sigma principles across various initiatives and activities, including data science, business intelligence (BI) systems and data quality. Every process has one or more independent input factors f(Xs) that are transformed by a function to produce an output. Six Sigma is calculated as $Y = f(x) + \mathcal{E}$ where 'Y' is the desired outcome or the result of the process which depends on the f(Xs). Here $\mathcal{E}$ represents the error factor or how accurately the f(Xs) are transformed, to create the outcome. To ensure accurate results using the Six Sigma formula, it is important to focus on the causes, i.e. the f(Xs) and not on the result 'Y'. By identifying causes and negating them, users can automatically improve the result as the objective of Six Sigma is to improve process performance by reducing variance. The more variation a process has, the lower will be the quality of the output. However, to achieve process improvement breakthroughs, it is critical to minimize the input variable variance in order to minimize the output variable variance. Marrying Six

Sigma and analytics for optimal process performance Let's take a deep dive into how Six Sigma and analytics work together to improve quality outcomes in the age of Machine Learning (ML) and Artificial Intelligence (AI). Measuring phase: The first step is to determine data quality for accuracy and precision, and clean it for further use. In a typical scenario, governed data quality initiatives are conducted at a global or regional level, as opposed to specific analytics projects.3 The next step involves descriptive analytics that answers the question "What happened?" This step explores the data to visualize and understand what the data is saying. To do this, we use the $Y = f(X) + \mathcal{E}$ equation. Analyzing phase: Once users understand the variables and features, it is easy to diagnose factors and root causes that affect the problem outcome. The variables are represented as the Xs in the $Y = f(X) + \mathcal{E}$. equation. Often, in ML, the number of features can be reduced without affecting the result through the analyzing phase of Six Sigma. The next step in the process involves using predictive and prescriptive analytics to answer questions such as "What could happen?" and "What should we do?" For successful results, it is important to select the right models and conduct several experiments to determine which model produces the best results. When applied to ML, Six Sigma ensures that a process reaches its target with accuracy (centering), and precision (spread) for optimal and sustainable process performance. For example, in the game of archery, if a target is reached without variance control (the spread around the target), there is no guarantee that the shots will be centered. However, if variance is reduced, it will result in a much tighter cluster (see figure.1). Figure 1: Using the example of archery to understand how SS contributes to Machine Learning It is only by consistently hitting the center and keeping the variance small that one can improve performance. In archery, the wrong stance, an inconsistent anchor point or lack of sight adjustment, can result in poor performance. Similarly, in an ML model, reduction in Six Sigma variance can improve the accuracy of supervised and unsupervised ML models. Processes contain variance because of bias and normal randomness. So it follows that if input variables or factors have variance, the output will also have variance. The result: inaccurate ML models. It is important to note here that ML data cleansing is not the same as Six Sigma variance reduction. In Six Sigma, users analyze the business process to find the source of variance in the input variables and reduce the variance or eliminate the bias. In ML, users do not analyze the business process. Instead, they only correct the data or eliminate the data that does not make sense. But data cleansing does not actually reduce variance. This means that if variance is not well understood, the ML model will not perform well. For example, in Figure 2 the chart on the left represents data after it is cleaned while the chart on the right represents data after variance reduction. It is clear that after variance reduction, the ML model results are much more accurate. Figure 2: The process of Six Sigma variance reduction In essence, data cleaning needs to include variance reduction of Six Sigma for an accurate, reliable, and effective ML model, be it a supervised or an unsupervised learning model. Leveraging the power of Six Sigma and analytics in healthcare Six Sigma is especially beneficial for processes that manage, collect and analyze massive sets of data. For instance, in healthcare, the massive sets of data include patient records, doctor's visits, medications prescribed, and other treatment procedures.4 5 The data also includes information on patient wait time, down time of diagnostic

equipment, and the time spent by staff on medical procedures and paperwork. Organizations can collect data at every step of a process, and through analytics, find the root causes that impede the delivery of a product or service and determine variance, or eliminate unnecessary steps in the process. Predictive analytics can also be used to search for hidden trends in historical data, and relationships between dependent and independent variables. For example, an ML model can analyze and predict when surgical equipment need replacement, how many people visit a healthcare clinic each day, the type of treatment prescribed, and the average wait time. The Winship Cancer Institute, for instance, used Six Sigma and predictive modeling, to reduce wait time from about one hour to less than 15 minutes.6 By looking at the predictive model in 15-minute increments, they are able to staff the Institute with the required number of healthcare professionals, at the right time. Six Sigma and analytics join forces to boost business predictability Even with constant technological advancements, the core principles of Six Sigma continue to make an impact on businesses across industries. Analytics coupled with Six Sigma helps build a process-focused business that can rapidly meet changing market demands. It is only by gaining predictability that an organization can maintain processes that achieve real and measurable results, that meet and exceed customer demands. How to ensure privacy protection?

----- Arcticle source ----- https://www.wipro.com/analytics/how-to-ensure-privacy-protection/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content How to ensure privacy protection? Anonymization of data at rest and in transit As data volume and

transactions continue to grow, every organization is concerned about data management and security. In the digital world, data is moving from on-premise to cloud at a faster pace to reduce operational cost and to increase scalability. The biggest concern is around personal data protection. There are regulations that exist for data protection like GDPR, PCI, HIPAA, etc. In addition to these, we need to protect/mask personal data in non-validated environments like training, development and testing. There are multiple tools and technologies available in the market for data masking/ anonymization to avoid misuse and to be statutory compliant. Effective data protection process: A data protection process encrypts the data and removes personally identifiable information from data sets, so that the actual people whom the data reflects remain masked. Every organization sets its own methods to mask the data, based on the data types and data sources. Below are the best practices to follow for data in transit and data at rest. When data in transit: For data which is in movement from point to point either on premise or cloud, the original is replaced with dummy values. This is also called as dynamic data masking so that the end user can't view the original data. Follow the process below for data in transit: Figure 1: High level data-masking ETL flow of data in move When data in rest: PII data which are in rest either on-premise or cloud which are mostly used for analytics or training purpose, can be protected through proper data access governance process or by masking the data when user sends any requests through Reports or SQLs. Follow the process below when data is in rest: Figure 2: High level data masking of data in rest Purushottam Joshi Senior Architect Data, Analytics & AI, Wipro Purushottam has over 20+ years of data warehouse and ETL experience. He is currently focused on open source integration technologies and has successfully executed large engagements for global companies. He is a TOGAF certified Enterprise Architect. He is also certified in different database and ETL technologies and supports the practice in managing both, cloud and on premise native ETL tools. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

The promise and reality of AI

----- Arcticle source ----- https://www.wipro.com/analytics/the-promise-and-reality-of-ai/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content The promise and reality of AI Competencies needed to execute the AI magic Today, AI to most businesses is a technology that aids in the automation of tasks and augments decision

making by providing insights to key leaders and decision takers. There has been a rise in the use of AI technologies for data-driven decision making for numerous business goals revolving around customer experience and operational efficiency. For instance, profiling of customers for personalized marketing campaigns, faster and accurate detection of tumors in millions of EMRs, efficient maintenance of inventory and manufacturing plants, early detection of defaulters of loans, and development of smart cities and smarter infrastructures. In all of these use cases, the role that insights play is crucial; be it in better campaign designs, quicker and timely detection of tumors to prevent late-stage complexities, huge amount of savings due to smart plants, or connected citizens for better citizen services. Companies are trying to become insights-driven organizations that can think better and act faster. Two technologies – Cloud and AI have risen to the fore as the go-to technologies for such organizational transformation. Insights-driven organizations 'Sense' data from disparate data sources and assimilate that data into valuable data sets. They 'Think' and contextualize the problem statement to derive an understanding of the environment. They then 'Respond' to the business problem with reports, actionable insights and recommendations, automatic interventions and finally, 'Learn' to optimize the entire journey based on feedback from the various units along the journey and the end-user reactions to the response provided. Consequently, by preparing the right kind of data and then driving insights through technology, these organizations are transformed into intelligent enterprises that can function autonomously or semi-autonomously for better benefits to key tracks such as customer experience, operational efficiency, governance and trust. While for many people, AI is playing the role of an enigma that creates magic with everything it touches and promises an intelligent insights-driven solution, it is important to note that companies must work on certain pre-requisites and competencies for AI to fulfil this promise. The reality is that AI is one foundational element of the enterprise transformation journey apart from other elements such as data, talent, or ecosystem. It is imperative to address many of these elements, pre-requisites or competencies for successful AI implementations. Barriers for successful AI The adoption of AI has seen growth largely due to its ability to automate repeatable tasks and to process information of massive volumes in a matter of seconds but organizations have not quite grasped how to implement AI successfully for enterprise-wide effects. AI is comparable to a machine that needs maintenance at certain time intervals and has every reason to fail. The reasons for slow or unsuccessful AI implementations range from obvious to the ignored. Four key reasons are -   Understanding these reasons for failure, and bringing together several components of Data and Model Management requires a well-thought AI Strategy and Journey blueprint. The AI Journey blueprint will provide a high-level view of steps that an organization experimenting with AI can follow as a checklist to ensure all competencies needed for AI to fulfil the enterprise transformation promise. What steps must an organization follow for successful AI implementation? Organizations must develop an AI Journey blueprint that will call out the approach that they would follow for solution development. The journey blueprint could include a variant of the below steps that is best suited to that particular organization. Succeeding with an AI Journey blueprint The challenge for business leaders is to ensure that the business has the right strategy to enable and support AI capabilities along with the

right infrastructure to support AI implementation. Both AI innovators and adopters need to develop and use AI technologies in their business processes, as it will enable businesses to work smarter and faster. AI blueprint is a template for businesses that allows them to systematically create the right infrastructure and ecosystem to build, train, and deploy machine-learning models for use cases while minimizing side effects on existing processes. While data is one of the most valuable assets for a business, when coupled with the power of AI, it can offer organizations a unique competitive advantage via AI-driven analytics. The approach AI blueprint advocates is to observe, learn and experiment with AI, evaluate benefits and build core processes to scale up and drive efficiency – fuel AI engine with innovative pipeline, measure the impact, and, extend the scope as and when organizations mature for further transformation and thus, enable new offerings and change landscape. Saurabh Aggarwal Managing Consultant, Data Analytics & AI Consulting, Wipro Saurabh is a data scientist involved in driving business value by using AI/ML techniques in diverse industry use cases. He is passionate about solving real business problems using data science and AI/ML techniques. Saurabh holds Professional Doctorate in Engineering from TU/e, Netherlands and Masters of Technology from IIT Kanpur, India. Sravya Bharani M Senior Consultant for Strategy & Planning, Data, Analytics & AI, Wipro Sravya provides advisory and thought leadership strategies with an understanding of the digital and analytics industry including market view, competition landscape and related ecosystems. She holds a Master's in Business Administration from Indian Institute of Technology (Madras) and B.E. in Electronics & Communication Engineering. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption

Cloud and the connected economy

----- Arcticle source ----- https://www.wipro.com/analytics/cloud-and-the-connected-economy/ ----- About The Authors Related Articles Contact Wipro Please fill the required details to access the content Cloud and the connected economy Customer-centered digital transformation through connected and always-on cloud services Businesses have stepped up their pursuit of transformation in the age of industry 4.0, digital disruption and connected economy. Cloud has been a great enabler in this race towards digital, building a connected ecosystem that is essential to not only satiate the need of customers but also partners, vendors, employees and things. Cloud has made connecting with consumers and businesses, at the speed of thought, possible by enabling real time insights via the complex landscape of 'big data' processing and computing. Today's consumer mindset is not a

reflection of any isolated event: our generation observes a network effects pattern and our behavior is influenced by the actions of others. Every second, there are billions of events triggered by individuals from multiple devices and locations, producing a chain of events. Understanding of behavioral events, correlating them and extracting insights involves managing and mining massive scale datasets. Cloud, with its unparalleled compute and other data and analytics tools, has made behavioral economy a reality through network effects at scale, and introduced game-changing platform business models. No organization today can say no to this disruptive force that will potentially alter the course of business and economics. Cloud has had far-reaching impact across industries Cloud-based ecosystem for a customer-centered, connected economy Speed of business transformation is the new metric for cloud. Cloud is more of a business transformation accelerator than a technology transformation driver (See Figure 1) that enhances: Cost efficiency: Smaller companies having limited IT budget and resources use cloud-based technologies, which provide them cost-effectiveness in operations. Large scale firms often offload non-mission critical and non-complaint workloads. Time to market: DevOps, coupled with cloud on technologies such as IoT, Big Data, AI and ML, brings forward improved speed of innovation by faster access to development environments and thorough developer processes. Automated processes enhance security and eliminate possible errors and elimination of downtime that enable the building of stateless applications, ultimately leading to business reliability and customer satisfaction. Business model: Cloud ecosystem allows firms to adopt platforms or become a platform business itself, in the age of platform economy. There is improvement in the economics of integration and delivery of services which ultimately enable new platform based models and sources of value creation. Planet-scale compute: Data on cloud models, trained through feature engineering and clubbed with AI, simplifies collaboration and enhances customer experience. Some AI applications leverage boosted models and deep neural networks, which are extremely compute intensive, requiring long feedback loop and training time. Machine learning (ML) IaaS platforms, purpose-built compute instances, and high performing AI capable chipsets, are affordable latest generation compute acceleration technologies. Cloud platform has made finding 'Neverland' a magical reality. Figure 1: Cloud as the business-transforming agent The cloud strategy To deliver the connected economy, the cloud ecosystem needs to be ingrained into the technology of the organization. The transition to the ecosystem can start with low-level workloads being transferred to cloud followed by the customer-facing applications. To deliver the cloud ecosystem effectively, an organization needs to look into: Fitting cloud into the vision and curating future strategy Understand the future business needs and liaise with stakeholders to chalk out the cloud ecosystem strategy by exposing them to cloud platforms. It requires a systemic thinking where the cloud services are cogs in the larger enterprise machine, which optimizes the machine to provide competitive advantage. This will show the bigger picture and consequently remove qualms about transforming existing processes using new age technology. Opting for public, private or hybrid cloud Cloud strategy needs to consider aspects such as compute power, fast scalability, changing app/tooling, robust security. Eg. Public cloud provides potential for innovation and collaboration where an app can be developed and the code can be shared with other partners seamlessly. But this requires a better

understanding of target state commercial software and app usage. Using a multi-cloud approach entails using the right database tools that can move the workload to cloud without abandoning reliable and familiar on-premise solutions. The ultimate motive should be that businesses and stakeholders are able to access data with equal efficiency, reliability and speed. Data sovereignty and governance With Privacy First being ingrained among organizations, it is imperative to use cloud services with clarity on data sovereignty and residency without compromising data security and customer trust. Choose the right cloud tools that enable data governance proactively. Implementation of policies is important so that they help every employee understand which type of data can be shared. This ultimately gives builds confidence among employees that their data is secure and encourages a culture of sharing. Investing in next generation skills that cater to platform engineering support Cloud savvy architects, developers, designers, analysts, data scientists and engineers are the skills that need to be invested upon either through reskilling or partners providing the relevant talent. This talent pool would cater to platform engineering and development teams to implement and run critical elements of the cloud ecosystem. At the same time, DevOps, DataOps and agile approaches to managing data reduces data friction, accelerates insights and results in innovation. Personifying business with Cloud In the age of digital disruption, business models need to cater to customers' ever changing needs. Anything-as-a-service (XaaS) has emerged as the enabler for the next-gen business models. With the right cloud strategy and technology portfolio – that employs artificial intelligence and machine learning – to support gigantic volumes of data at the speed of thought, along with a pool of talented spectrum of skills, organization have the advantage to stay relevant and grow with new business models. Soumen Chatterjee Partner - Analytics and AI Consulting, Data, Analytics & AI, Wipro Ltd. Soumen is a data adviser for a data-driven business journey. He helps organizations become data-centric and adopt the right technologies like cloud, advanced analytics, ML, AI, and the IoT to improve their business performance. Roshan Wilson Consultant-Strategy & Planning, Data, Analytics & AI, Wipro Ltd. Roshan is currently responsible for building value propositions and driving cohesive strategies for Wipro's Data, Analytics & Artificial Intelligence Business. Roshan is a Computer Science Engineer and holds an MBA degree from FORE School of Management, New Delhi. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption
========================

The need for AI to sense, think, respond and learn without bias

The need for AI to sense, think, respond and learn without bias Growing adoption of Artificial Intelligence (AI) in systems that assist, rate, and offer advice on how people are treated and what opportunities they are offered is resulting in broad discussions on how to build objective systems. Advanced analytics and AI are being increasingly used to recommend products to consumers, offer pricing tiers to shoppers, manage supply chains and operations, and approve customers to financial products and even automate driving. Therefore, it is essential that the recommendations of machine learning (ML) algorithms are not compromised in any way. The need for objective AI Intelligent enterprises leverage AI and analytics to sense, think, respond and learn (Illustrated in Figure 1). It is essential that the ML algorithms that enable this capability are devoid of anomalies. Figure 1: The sense-think-respond-learn paradigm for an intelligent enterprise Hence, to ensure objectivity and accuracy in data-driven and AI-led insights and decisions, it is essential that ML algorithms are tested multiple times prior to deployment. Here are a few techniques to do this effectively: Despite the availability of mechanisms to measure and tune the accuracy based on historic training data, the uncertainty of how an algorithm would behave under real-world conditions is a critical unknown, especially given its interaction with other predictive algorithms that can make it even more complex. Moreover, some of the ML algorithms such as neural networks are akin to black boxes that are impossible to test exhaustively. Ashby's law sounds a clear note of warning here - "If you have complete knowledge of a system, only then it is possible to control it"1. How can one control the solution if the system has some hidden properties or your information is incomplete or inaccurate, or if uncertainty abounds about the system's behavior? The business impact, and costs of inaccurate algorithms on human life are too high and hence an ethical framework needs to be setup to remove bias, improve algorithm accuracy, and minimize risks. Dealing with misuse of AI The emerging trend of AI and ML algorithms aimed at harming or tarnishing a brand's or a person's image is turning out to be a big social threat. The World Economic Forum considers the viral spread of digital misinformation to be among the biggest threats to human society today2 - especially with algorithms such as the Generative Adversarial Network (GAN), an image and data generation AI system that performs face and object generation and can even manipulate faces in videos, increasing the scope of misuse. Widespread adoption of machine learning models requires a clear understanding of the reasons behind predictions. ROC curves,

confusion matrices, and error measures are the de-facto industry norms before a ML model is deployed. The Local, Interpretable, Model- Agnostic, Explanations (LIME) is one such framework that explains the predictions of any classifier. LIME works by modifying a single feature and observing its impact on the model output3. This helps answer the typical questions a decision-maker might have, such as why was this prediction made or which variables caused the prediction. For instance, in the case of cognitive software and algorithms that assist doctors in the detection of cancer or other life-threatening illnesses in early stages, the understanding afforded by the LIME framework further provides insights into the model, thereby turning a black box model or prediction into a more traceable and reliable one. This provides the decision maker added confidence when he/she takes a decision based on the algorithm's output. Tackling machine bias Bias in a system can lead to a high level of false positives, in turn resulting in low levels of customer satisfaction and acceptance. Algorithms often exhibit the bias of their creators or the input data fed into them. This machine bias happens when certain hypotheses get eliminated from the hypothesis space or certain hypotheses are preferred over others. For instance, COMPAS, an ML software used to determine criminal defendants' likelihood to recommit crimes, was biased in how it made predictions. ProPublica found that the algorithm (used by judges extensively in over a dozen US states to make decisions on pre-trial conditions, and sometimes, in actual sentencing) was two times more likely to incorrectly predict that defendants belonging to a particular race were high risk candidates for recommitting a crime4. New machine learning techniques called ensemble learning such as bagging, forests etc. make use of the concept of averaging of models and as a result can significantly reduce bias. They are also designed to increase the stability and accuracy of the classification and regression results. Community groups such as the Algorithmic Justice League, founded by Joy Buolamwini, help promote crowd-sourced reporting and the study of bias in ML and other technologies5. Ensuring the involvement of diverse populations in the ethical creation and consumption of ML predictions will lead to further progress in ethics. These developments clearly indicate a distributed, autonomous means of achieving the goals of de-biasing algorithms. The future of AI There are ethical and legal consequences of bias in decision making. Machine learning, based on past unfair decisions to a particular race, gender, or sexual orientation, deliver similar biased decisions. Some researchers have gone on to develop a framework for modeling fairness6. Then, there are aspects of ethics and even empathy that must be considered by all vendors and users of AI. This could perhaps be addressed by something on the lines of GDPR, perhaps an AIMR - Artificial Intelligence and ML Regulation7. AI systems due to their inherent nature may have a trust deficit8 and this will need to be addressed soon to allay unintended harmful consequences and fears. Beyond specific evaluation techniques for measuring the accuracy of ML algorithms, what we need is hardware acceleration, structured analytics frameworks, and concerted efforts to root out unintended bias and establish objective AI and ML systems. Analytical model selection framework for asset failure prediction

----- Arcticle source ----- https://www.wipro.com/analytics/analytical-model-selection-framework-for-asset-failure-prediction/ ----- About The Authors Related Articles Contact Wipro Please fill the required details to access the content Analytical model selection framework for asset failure prediction Over the years, asset-intensive industries like energy, utilities and manufacturing have witnessed several service failures and safety incidents around machines and structures - without warning. Consultants estimate that typically manufacturers miss 5% to 20% of their productive capacity due to downtime[1]. Even though organizations understand the cost implications of downtime, fewer than 24% of operators use a predictive maintenance approach based on data and analytics to handle asset failure proactively[2]. Shifting from calendar-based maintenance to data-driven asset management can help anticipate problems based on asset health condition, enabling optimal usage of asset life and increased reliability. Rigid physical laws govern assets that make inherent patterns, which are repetitive in nature and easy to decipher using machine learning algorithms. However, the patterns and failure behaviors are specific to asset type. Hence, a single predictive model cannot solve the issues of multiple devices used in these industries, which will own completely different characteristics and would demand exclusive treatment. The proliferation of failure detection systems for thousands of assets in large organizations has imposed an increasing burden in terms of cost and effort. Lack of availability of a generic framework is thus a major shortcoming in the current state-of-the-art failure prediction systems in large enterprises. This paper will judiciously provide the business with an expansive guideline to select an appropriate analytical

framework to predict asset failure based on the component type, failure modes and asset failure information. Asset types and failure modes It is critical to understand the similarities and distinctions of failure patterns and their sources across asset types. Firstly, we would begin with asset classification followed by analysis of key failure causing parameters across different asset types. Further, we drill down to component level failure modes to comprehend the pattern of the root cause. Lastly, we would arrive at a logical methodology to choose an appropriate analytical framework to build a model for asset failure prediction. Figure 1: Asset classification basis energy type Asset-specific failure parameters To create a robust technique applicable to multiple asset failure scenarios, it is critical to understand the component failure modes in different asset types and corresponding parameters viz. pressure, temperature, moisture etc. Figure 2 highlights some of the key parameters causing major failures in transformers and pumps. Figure 2: Asset specific failure parameter Asset-specific component-level failure modes To understand the impact of failure parameters, we performed a detailed sample analysis of the different types of component failures in Transformers, Centrifugal Pumps and Progressive Cavity Pump (PCP) systems. It was noted that while causes of failure is a function of operational parameters in case of static assets, it is a function of time in case of rotary assets. Hence, a failure-time distribution model is more relevant than a cross-sectional event prediction model for the rotary class. Thus, mechanical behavior plays a significant role in defining the model framework. Table 1 enunciates the systematic procedure of the analysis performed. Table 1: Major component failures in transformers, centrifugal pumps and PCP pumps Framework for analytical model selection According to Jerald F. Lawless, two sets of choices in analytical models are whether to use discrete or continuous-time models, and whether to use parametric or nonparametric assumptions[3]. The model should effectively capture features of the lifetime distribution that are seen from empirical data. Large samples are often required to substantiate the superiority of one model over another in terms of goodness of fit. Censoring schemes are extensively used for comparison of models and their usability. This leads to use models that are computationally useful, and to an extensive use of Weibull, log-logistic, and log-normal models. As the number and complexity of fixed covariates increases, the emphasis on distributional shape reduces, the primary focus being on location and dispersion aspects. Nonparametric and semiparametric methods are more robust with respect to assumptions than fully parametric methods. It allows more information to pass from the current set of data to the model at the current state, to be able to predict any future data. Several models may provide a description of the observed data. However, use case objective and actionable insights help explain characteristics of data much better. Thus, the generic framework for asset failure modeling takes into consideration the asset type and failures as a function of time or operational parameters. Environmental parameters have a snowballing impact over time, which helps determine the probability of occurrence of failure by analyzing how particular circumstances or characteristics increase or decrease the probability of survival. However, on the other hand, numerous other operational parameters could trigger asset failure. For these scenarios, causal modeling is required for the identification of lead indicators instigating failures. Figure 3 illuminates the comprehensive approach to choose an analytical framework in case of asset

failure modeling. Figure 3: Generalized approach to choose analytical framework for asset failure prediction modeling Real-life application of analytical framework A leading Oil & Gas major based out of Australia enabled PCP pump failure prediction by leveraging this analytical framework. The challenges the organization faced included inconsistent view of assets and their operational status. Also, manual intervention was slowing down preventive maintenance and leading to inaccuracy. The analytical framework enabled the prediction of the expected time for pump failure through the insights gathered by identifying influential parameters with survival analysis. Table 2 showcases additional issues that were addressed using the analytical framework. Table 2 – Framework application in resolving real-life business challenges Use of Bayesian methods as future trend With the advent of sophisticated computational capability and integration of analytics in key business processes, Bayesian models are going to be the need of the hour for the future of reliability analysis. They have a very important advantage of using information from different studies, prior information based on previous experience and engineering knowledge alongside the appealing Machine Learning (ML) characteristics of versatility and statistical properties. Advancements in the implementation of Bayesian paradigm and computer hardware have opened the doors of a new horizon in front of analysts to marry the engineer's knowledge with statistician's theory. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies

leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption ======================

Five best practices to keep your data lake healthy

Five best practices to keep your data lake healthy The volume and variety of data available to organizations in the digital age is enormous, giving rise to the need of expanding their data-management infrastructures considerably and rapidly. Data lake, a new class of data-management system, holds a strong potential to achieve success in this area. The humongous growth in computer processing power, increase in cloud storage capacity, its usage and advanced network connectivity are transforming the existing data flood into an infinite stream of comprehensive information about customers' preferences and buying habits, product attributes, sales and e-commerce data, email and web analytics, survey and feedback. These datasets are acquired from a range of sources and across all formats, including Internet-of-Things (IoT) devices, social-media sites, sales and CRM systems, etc. Today, with the increased growth in number of data sources and the pervasive nature of analytics, a huge demand for strong analytics capabilities is surfacing, just to keep pace. To gain maximum value out of data in this extremely competitive environment, organizations are emphasizing not just on using analytics, but are transforming themselves to build an insights-powered enterprise. Growing relevance of data lakes In industry parlance, data lake refers to a repository of data that brings together variety of data available, such as structured (relational), semi-structured (XML, JSON, etc.) and unstructured (Images, audio and video). It provides a way to store all the raw data together in a single place at a low cost. Distributed file systems such as Hadoop file system (HDFS) often serves this purpose. The adoption of Hadoop as the platform created the first version of data lake. The use of cloud based data lake i.e. the latest version of data lake, gained momentum in the market because of the challenges in storage flexibility, resource management, data protection deep-rooted in Hadoop-based data lakes. Industry experts anticipate that in the coming years, majority of large organizations will experience more data flowing from data lakes to data warehouses. This prediction shows the change in the mindset of organizations which were typically driven by enterprise data warehouse as the de facto standard for their data need. As the popularity of data lakes grows, organizations face a bigger challenge of maintaining an infinite data lake. If the data in a lake is not well curated, then this data lake may turn into a data swamp, flooding an organization with information that is difficult to locate and consume. How to keep data

lakes relevant Digital transformation requires identifying authentic and accurate data sources in an organization to truly capitalize on increasing volumes of data and generate new insights that propel growth while maintaining a single version of truth. Following are some of the ways to keep data lakes dynamic, immaculate and viable: 1. Identify and define organization's data goal: One of the most important preemptive steps in avoiding an organizational data swamp is to set clear boundaries for the type of information organizations are trying to collect, and their intent of what they want to do with it. Amassing a lot of data should not be the sole aim of organizations. They need to have a clarity on what they want to attain from the data they are collecting. An enterprise with a clear data strategy shall reap benefits in terms of avoiding data silos, incorporating a data driven culture to maintain customer centricity, scale up and meet demands of the modern day data environment. 2. Incorporate modern data architecture: The old data architecture models are not sufficient and may not satisfy the needs of today's data - driven businesses in a cost effective manner. These workflows give a primer to ensure modern data architecture: 3. Build sound data governance, privacy and security: Data governance and metadata management is a critical step to keep a healthy and effective data lake strategy. A well-curated data lake contains data that's clean, easily accessible, trusted and secure. As a result, this high-quality data can be easily consumed with confidence by the business users. It is of utmost importance to establish responsibility for data. 4. Leverage automation and AI: Due to the variety and velocity of data coming into data lake, it is important to automate the data acquisition and transformation processes. Organizations can leverage next generation data integration and enterprise data warehousing (EDW) tools along with artificial intelligence (AI) and machine learning that can help them classify, analyze and learn from the data at a high-speed with better accuracy. 5. Integrate dev/ops: DevOps processes will go hand on hand with building and maintaining a healthy data lake. Ensure clear guidelines are established on where and how data is collected to prevent "data wildness," and make sure those standards are always followed. Take time to evaluate sources as "trustworthy," and take preventive steps to ensure it stays that way. A little work on the front end will prove highly valuable when it comes to putting data to use. Figure 1: Reference architecture to avoid data lake failure The reference data architecture, given in Figure 1, represents an efficient process that includes data zones starting from the data foundation layer to providing insights in conjunction with the essential measures viz. data governance, security, data archival and backup, automation and DevOps to keep a data lake pristine and clean. A large medical device manufacturing company, struggling to garner value from its data, leveraged a data lake solution based on this architecture. Over a short span of a year, the new data lake became a potent digital transformation tool for the company and is being used across the organization for building more than 40 analytics use cases. Conclusion The use of big data has no boundaries. It can help businesses create new growth opportunities, outperform existing competitors and provide seamless customer experience. However, to get the best out of data and thrive in this digital world, enterprises should possess well-curated, good quality data lakes. A clear data strategy, modern data architecture, proper data governance combined with automation, security and privacy measures, and DevOps integration will not only prevent any data lake from becoming a data

swamp but also transform it from simply being a data repository to a dynamic tool that will empower digital transformation across an enterprise. Neeraj Verma Managing Consultant, Data, Analytics & AI, Wipro Limited. Neeraj brings over 13 years of experience in envisioning and building large scale enterprise data warehouse solutions for fortune 100 Retail, CPG and Pharma clients across the globe. He has deep domain and analytics expertise in CPG and Retail. Ajinkya Pawar Consultant -Strategy & Planning, Data, Analytics & AI, Wipro Limited. Ajinkya with a deep understanding of the digital and analytics industry, including market insights, competitive landscape and related ecosystems, provides advisory services and thought leadership for building value propositions and driving cohesive strategies. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

The smarter water utility

----- Arcticle source ----- https://www.wipro.com/analytics/the-smarter-water-utility/ ----- About the Author Contact Wipro Please fill the required details to access the content The smarter water utility The acute need to become an insights-driven enterprise Water utilities are at a difficult juncture in business. In the UK, they have invested over $170 billion in the last10 years in a bid to maintain and improve assets. In the US, capital expenditure on clean and waste water infrastructure will exceed $683billion over the next decade. These costs are unsustainable. To add to the cost challenges, traditional solutions have begun to fall short of the expectations. The situation calls for the adoption of next generation solutions that go above and beyond traditional solutions. Situation on the ground The problem that water utilities find most frustrating is with their ageing below-ground assets. There is a lack of visibility into their performance due to opaque operating conditions. Failure to fix problems related to assets can result in non-compliance and hefty penalties. In addition, water utilities are under tremendous pressure from growing customer expectations. Customers are used to services like Amazon and Uber, where everything happens in real time and they have complete control over the service. Utilities have to match the experience. Finally, the unforeseen impact of climate shifts and the ineffective management of a distributed field workforce are sending costs spiraling. These are monstrous challenges. But they also present the perfect opportunity to examine technological advances and solutions that can transform the face of water utilities. Some water utilities have already made remarkable progress in their efforts to leverage technology. For example, the water utility inJapan's Fukuoka city uses an unsupervised class of Artificial Neural Networks (ANN) named self-organizing maps (SOM). Sensors attached to distribution pipes are continuously monitored, helping

regulate pressure through remote motor valve operations. These sensors also help reduce the dependence on operators with experience in managing distribution. Utilities like the one in Fukuoka are discovering just how useful these systems can be in the event of leaks and damage to pipes that require immediate and precise responses. The systems also help determine precise flow to consumers based on real-time demand. An US-based water company replaced primary in-pipe inspection method that uses manual CCTV analysis with artificial intelligence (AI) and neural networking to monitor below-ground assets. The water utility leveraged open source neural networks and a code framework to hone its AI and Machine Learning (ML) applications in the field of pipe inspection for automated cracks, structural deformations, blockages, debris etc. This enabled proactive maintenance, wherein more pipes could be inspected in a shorter span of time, maximizing budgeting allocation, and ensuring overall system stability. The number of utilities that deploy technologies like ML and AI, to forge a path into a real-time insights-driven future, are bound to grow. Groundbreaking technologies Traditional systems have major gaps in addressing asset management KPIs. Fortunately, the proliferation of sensors, real-time monitoring devices and video/image feeds is changing this. Advanced asset-centric technologies, aimed at generating water insights, are taking the guesswork out of leak detection, pressure management, work order distribution, etc. Technologies like the Internet of Things (IoT), ML, AI, Deep Learning, data and analytics make a difference by targeting asset management KPIs. The question before smart water utilities is: Should they invest the next few million dollars in identifying and servicing leaks after they have impacted consumers or in insights and predictive systems that help minimize leaks, flooding and incidents before they impact customers? The answer is self-evident. Smart utility built on the right technology A predictive system/insights tool, specifically built for water utilities, will allow utilities to stay one turn ahead of issues at each stage of clean and waste water supply, distribution and management. The tool will use data leveraged using extraction and analytical processes, algorithms, models and best practices that are specific to water utilities. The insights, decisions and recommendations will be provided to business users and applications across a variety of devices. (See Figure 1 for the reference architecture of the insights tool) Figure 1: The building blocks of the insights tool The insights developed by the predictive system, in the form of support for decision-making and action, will be crafted for different personas and roles. For example, water quality analysts, asset maintenance engineers, heads of HSE, compliance management, billing and customer service executives will be able to quickly access information and support on interactive dashboards relevant to their roles. In effect, the tool will be a one-stop solution for comprehensive water insights aimed at improving business outcomes across clean and waste water operations. The business outcomes addressed by the insights tool for clean water will include: Abstraction: Treatment: Distribution: Supply: The business outcomes addressed by the insights tool for waste water will include: Collection: Transfer: Treatment: Discharge: The insights tool will be more effective when it works jointly with the IT team of the utility. The IT team will be able to provide a nuanced understanding of the critical business, operational and technological factors typical to the utility. These should then be leveraged to create sharper and deeper contextual insights. Making everything smart A few select use cases will help understand the

relevance of the insights tool. For instance, data from sensors will be pulled in to monitor various stages of water treatment processes. IoT analytics will be used to deliver automated dashboards with insights related to asset and network performance. Co-relating data from different external and internal sources will provide alerts about supply disruptions or demand spikes. Similarly, AI can be applied to waste water sensor data to analyze effluent parameters and drive decisions on treatment. ML and domain-specific algorithms can be applied to predict sewer flooding and to design/optimize management processes. The overall benefits of the insights tool will include increased asset availability, work order planning, cost optimization, product quality improvement, and increased customer satisfaction. These are the fundamental challenges that water utilities have been trying to address for decades. Water utilities stand to benefit most when they are able to access the insights based on their needs. Such insights create a smarter, intelligent and future-ready water utility. The right AI strategy to deliver superior customer experience

----- Arcticle source ----- https://www.wipro.com/analytics/the-right-ai-strategy-to-deliver-superior-customer-experience/ ----- About the Authors Contact Wipro Please fill the required details to access the content The right AI strategy to deliver superior customer experience Technology is changing

the way any industry operates today with organizations investing heavily on digital transformation to stay relevant. Companies realize the importance of maximizing the value drawn from data to make informed decisions. Industry leaders are looking towards Analytics and Artificial Intelligence (AI) as engines that would transform them from a digital enterprise into an intelligent enterprise. The potential of analytics and AI to add business value cuts across the value chain. In many instances, it is transforming the functions of procurement, operations and logistics, marketing and sales and customer service. However, it is customer experience (CX) where the opportunities are huge for AI. Unfortunately, customer service is traditionally looked at as a cost-driver, not as a revenue-generator. The truth is that companies globally lose more than $75 billion each year due to poor customer experience1. Customer engagement includes various touchpoints with customers, right from the Zero Moment of Truth to the Ultimate Moment of Truth. It is imperative that enterprises are able to engage with customers with the right message at the right time through the right channel at each touchpoint. With technological advances in AI, companies are revolutionizing the way customers engage with them. Advanced analytics, AI-driven content personalization and conversational systems like chat-bots provide value through revenue generation and cost optimization. How enterprises should approach AI for CX Enterprises should adopt a three-pronged approach to deliver on the business outcomes that AI and advanced analytics promise – right process, right technology and right capability (See Figure 1). Right process: Need for imbibing a Sense-Think-Respond-Learn (STRL) process in solutions that convert raw data into actionable intelligence Right technology: Technology landscape driven by AI, automation and cloud adoption with right skillsets Right capability: Engineering customized solutions built through a research-based approach to deliver innovative solutions at scale   Having the right set of processes ensures consistency in delivering promised business outcomes through intelligent systems powered by the right technology and right capability. Businesses will have to invest in the right technology across the data value chain from data engineering to data consumption. Right capabilities with focus on business outcomes and in building innovative solutions at scale will prove to be a differentiator for businesses. The focus of this paper is on the right processes that will ensure organizations obtain maximum value out of their AI initiatives for building great customer experience. Enterprises should adopt a Sense, Think, Respond and Learn (STRL) Framework to tackle business challenges through AI. On identifying the customer experience-related business problem that the enterprise would like to address through advanced analytics and AI use cases, it should Sense: As a first step, it is imperative for organizations to take stock of the current situation by acquiring and assimilating relevant data and by preparing accurate and efficient datasets that could feed predictive models. This step generally leverages techniques for data preparation, descriptive analytics, text and speech analytics, video and image analytics to provide a view into what is happening currently. For instance, in the CPG or Retail industry, organizations could gather complete customer information by analyzing web metrics, social media profile updates, customer purchase patterns, cart abandonment and category spend analysis. Think: As a next step, organizations should identify the appropriate analytical models and the statistical/machine learning algorithms that drive these models to facilitate

insight generation and cognitive intelligence. This step involves making use of advanced analytics and AI techniques to explain and predict customer behavior, and provide recommendations for next-best-action scenarios. For example, organizations need to apply AI/ML techniques to analyze search patterns and customer behavior to predict when a customer is going to churn out; how much a customer is likely to spend and which product is a customer most likely to buy etc. AI techniques like image recognition and computer vision help in revolutionizing product discovery through AR-enabled visual product searches. This enhances the experience of an online shopper and provides an offline experience online. Respond: Based on the actionable intelligence obtained, businesses should strategize their plan of action to deliver business outcomes. This step involves delivering personalized customer engagement leveraging new digital capabilities. For example, organizations need to design personalized campaigns based on the insights to engage with customers and enhance customer experience and loyalty. Organizations must leverage AI techniques like Natural Language Processing, and Generation, Speech and Text Analytics to build intelligent chat-bots and virtual assistants to deliver high impact business outcomes in customer service through voice-based shopping and product discovery. Learn: The key to making this framework actually work is ensuring the system continually learns through feedback systems during the Sense, Think and Respond stages. The network effect applies perfectly here as with more and more usage of intelligent systems, the systems become more intelligent. AI challenges and the way around Fundamental: Given the possibilities of leveraging AI to deliver excellent CX, organizations are contemplating ways to tackle one major barrier – Gaining user trust on technologies like AI. AI gone wrong can have huge repercussions. Design plays an important role here. Organizations must have a design-thinking led approach, which places the user at the center of it all, while engineering the CX. Key principles that enable trust in the end-user should be incorporated. These include transparency and explainability aspects of the recommendations thrown by the AI system, testing of extreme cases, and availability of holistic training data sets to avoid ingrained biases. Organizational: With data-driven customer experience taking the driver's seat and being seen as a critical differentiator in gaining online market share; the CMO and CIO organizations need to work hand-in-hand to sync market requirements with organizational technology maturity. Technology: Legacy and latency issues could impede new rollouts. Back-office systems need to be upgraded before charting a roadmap for the future. Stakeholders need to be careful of leaving latency loopholes within existing systems. Conclusion Today, CIOs are being measured on the impact they bring to the business. CX improvements across the ecosystem (supply chain partners, marketing value chain and back office systems) will now be more closely measured on improvements to benchmarked bottom-line levels. The times ahead are exciting for enterprises that leverage AI to create meaningful experiences for the customer. The coming together of data, algorithms and design will catapult CX, which is geared for disruption. Key considerations for ETL modernization

----- Arcticle source ----- https://www.wipro.com/analytics/key-considerations-for-etl-modernization/ ----- About the Author Contact Wipro Please fill the required details to access the content Key considerations for ETL modernization Efficiency and agility in business processes drive the growth of any successful organization. ETL (Extract, Transform and Load) tools plays a critical role in delivering the speed an organization requires to access its data efficiently. In the digital age, ETL modernization is becoming a must to keep pace with the growing data and data sources. The need for modernization of ETL platforms As the data landscape of enterprises increase exponentially, traditional ETL tools do not work best to handle the complexity of the data from various sources: today, data could be stored on cloud or on premise; it could be static or stream data, and may be stored in repositories sitting in different countries with different data protection laws. Traditional tools were created at a time when the requirement was to manage lower volumes of data and processes. These tools do not meet the modern data landscape requirement. Traditional ETL product licences cost millions to organizations and hence they seek to employ open source frameworks to perform ETL operations, which enable similar and better functionalities as traditional ETL products. Legacy ETL tools also face issues while handling real-time data processing from various social media channels. Scalable, faster and flexible environments for new age digital applications ensure data processing is done in real-time. Existing ETL data pipelines need to be modernized to support real-time data in addition to transactional and analytical data workloads conversion. Existing ETL tools have challenges in providing efficient and flexible metadata management and lineage across systems for robust regulatory and governance needs. Embarking on the modernization journey Many large enterprises have been exploring ways to transform traditional ETL platform data pipelines and workflows leveraging open source processing frameworks. Traditional ETL data processing pipelines, predominantly meant and built over decades for batch processing, are under pressure while open source processing frameworks are catching up with the momentum. Also, these frameworks are well aligned with the Big Data applications for processing and managing huge amounts of structured/semi-structured/unstructured data being generated from several new age and existing enterprise systems. Open source processing frameworks predominantly supported by Scala/Java/

Python programming languages and equipped with out-of-box libraries and utilities, and scalable for huge volumes of data processing on cloud, on-premise and hybrid environments, are taking the centre stage for catering to the digital and innovative re-imagined business scenarios. The right approach to ETL modernization There is no easy path or way to convert and migrate thousands of legacy ETL jobs developed over decades in the organization's landscape to modern approaches such as Spark and microservices based processing frameworks. Some of the key considerations while embarking on the ETL modernization journey are: To conclude ETL modernization with its cost-saving approaches to transactional and analytical data processing is becoming a key strategy for organizations' IT estate rationalization. ETL modernization help businesses reimagine their business processes and integrate their enterprise applications data with external systems such as merchants and channels in real-time in a more flexible and scalable manner. Open Source ETL frameworks helps in building numerous business use cases such as developing customer knowledge graphs for better understanding of the prospects/customers, payment processing of billions of transactions, real-time fraud analytics, compliance and regulatory related data processing pipelines, among others. A right ETL modernization strategy aligned to the enterprise's digital strategy and the IT estate rationalization roadmap, and an implementation framework and execution approach with the aptly-skilled resources are the key success factors of the ETL modernization journey. Mohan Mahankali Practice Leader and Principal Architect - Information Management, Data Analytics & Artificial Intelligence, Wipro Ltd. Mohan has 20+ years of business and IT experience in the areas of information management and analytics solutions for global organizations. In his current role, he is responsible for practice vision and strategy, solution definition, customer advisory, consulting, competency development, and nurturing of emerging trends and partner ecosystem in the areas of data and information management. Mohan is the co-owner of a patent in data management and governance awarded by USPTO (United States Patent and Trademark Office). =====================

The 3 tenets of an intelligent enterprise in the financial services industry

----- Arcticle source ----- https://www.wipro.com/analytics/the-3-tenets-of-an-intelligent-enterprise-in-the-financial-services-industry/ ----- About the authors Contact Wipro Please fill the required details to access the content The 3 tenets of an intelligent enterprise in the financial services industry The financial services industry, mature in terms of digital transformation due to strict regulations and compliance requirements, is now geared for AI disruption. The top players in the industry are working towards transforming themselves into Intelligent Enterprises. An Intelligent enterprise is one that is nimble enough to make quick data and insights-driven decisions to deliver superior customer experience, become

operationally efficient, and manage risks well. AI plays a crucial role in this regard. The insight-driven transformation will make the core of the organization stronger with data-driven perspectives and technological innovations already facilitated by digital age. If the organization is not agile enough to adapt to disruptive technologies, it starts losing competitive edge over top three important levers (See Figure 1) in the organization: Customer experience More customers are demanding personalized and curated experience. Risk and compliance With stringent compliance and increasing competition, balancing portfolio risk vs return is challenging. Internal process efficiency Smart and efficient processes with intelligent automation provide the much needed productivity boost over competitors. Organizations need to invest in innovation-led data and insights transformation through applied AI in their quest to become an Intelligent enterprise. Siloed one-off customer-facing analytics implementations will not provide adequate business value; a roadmap for an end-to-end transformation is the key. Figure 1: Three tenets of an intelligent enterprise in the financial services industry AI for customer experience Customers now expect all brands, including banks, to provide meaningful and empowering experiences throughout the entire customer and employee journey. Experiences are core to any best-in-class brand as it is a leading driver of brand perception. Bank's customers want to experience the brand seamlessly across all online and offline touchpoints, be it while using their app, their products, experience with the contact center or in one of their branches (See Figure 2). Brands are now defined by experiences, which require marketers to shift from a product-centric marketing to creating resonant brand experiences. In order to do this, banks need to use the right marketing technology and processes to drive marketing success. In addition, with an unprecedented amount of data in banks, marketers need to be equipped to use insights to drive superior brand experiences and demonstrate the value that they create.   Figure 2: Enabling simplified experience for banks' customers Brands are now defined by experiences, which require marketers to shift from a product-centric marketing to creating resonant brand experiences. In order to do this, banks need to use the right marketing technology and processes to drive marketing success. In addition, with an unprecedented amount of data in banks, marketers need to be equipped to use insights to drive superior brand experiences and demonstrate the value that they create. There is a need for Customer 360 intelligence (See Figure 3) at an individual level using customers'risk profile, net worth value, usage behavior, price sensitivity, brand sentiment and propensity outcomes. This enables individual pricing capability to overcome delayed time to market for any price change opportunity. Enterprises are realizing the value in integration of external data to drive more effective and competitively priced products. Lack of advanced propensity models – those based on siloed product data with long lead times for deployment don't add significant value. Most acquisition offers are used for both retention as well as acquisition purposes and the lack of specific retention offers also lead to loss of business. Figure 3: Connected ecosystem for a singular customer view throughout the lifecycle AI for operational efficiency One of the major priorities for leading banks that have invested in AI has been to drive operational efficiencies. Intelligent automation will replace labor-intensive repetitive manual tasks and augment human decision-making. The enterprises of the future will comprise of a hybrid workforce where humans

and bots work together. AI has the potential to drive sustainable growth in top-line and bottom-line. The use of advanced analytics and AI to generate insights, automate and manage various backend processes will result in achieving operational excellence and superior customer experience. Some examples of how AI is used to improve business operations are: Insights generation Contract intelligence – Supervised and unsupervised machine learning (ML) algorithms can be used to parse and summarize commercial agreements like contract and loan documents, and interpret financial and legal details that would have otherwise required huge manual effort and time. It uses unsupervised ML techniques like topic modeling to identify the key points. It can also summarize a document based on specific keywords using supervised ML techniques. Intelligent automation Cognitive assistants – ML algorithms like NLP and NLG enable cognitive assistants to help customer-facing employees find answers to customer questions. This results in improved TAT and reduced count of employees leading to huge cost savings. KYC – AI is making the end-to-end KYC and customer onboarding process faster and more efficient. Technologies like NLP and facial recognition enable intelligent bots to process various documents and validate the same removing the need for a manual backend processing team. AI for risk and compliance management Banks and other financial service providers, as guardians of financial assets, are liable to put risk control as the foremost priority to foster trust among customers. If responsibly applied, AI can be leveraged to ease up adherence to compliance regulations, reduce costs and free up teams to focus on more valuable tasks within their organizations (See Figure 4). The key applications of AI in the risk and compliance domain are: Operational risk analysis AI enables financial institutions to control fraudulent behavior and delinquency using scoring techniques and real time alerts across different steps of customer lifecycle. These cognitive fraud detection systems focus on customer's features driving fraudulent behavior to detect and prevent fraud. The ML based system continues to learn, and gets stronger with time to detect more complex fraud. The appropriate usage of ML algorithm could result in the reduction of false positives that improves the efficiency of the acquisition quality, fraud prevention and collection effectiveness. Credit risk assessment Data driven credit scoring models help portfolio experts to take conscious decision on credit risk exposure powered by ML algorithms. A credit scoring model, based on information about the potential customer (e.g. credit history, payment defaults, age, number of previous loans, etc.), would be able to distinguish potential defaulters with fair bit of accuracy and estimate of the propensity of default. It also helps to come up with optimized pricing strategy differentiated by risk behavior to control overall portfolio risk exposure. Analytics can further improve regulatory compliance process of credit risk evaluation using assessment methods like default risk models, loss given default, and exposure at default. These models help to assess the overall risk exposure and take the required measures to mitigate liquidity risk. Figure 4: Advanced analytics and AI use cases for risk management Conclusion It is vital that the leadership understands the potential impact of AI across the value chain and drives the AI adoption initiative. Intelligent automation of specific business and IT processes coupled with quick data-driven insights are some of the low-hanging fruits that enterprises can target as they keep an eye on an end-to-end roadmap for AI transformation. The key to intelligent transformation is to look beyond short-term efficiency

and identify visionary and innovative business models delivering superior customer experience and driving revenue growth using AI. Shamit Bagchi Managing Consultant Data, Analytics & AI, Wipro Shamit is a data scientist specializing in predictive and prescriptive analytics, machine/deep learning and AI consulting. He brings to the table both technical acumen and business consulting expertise based on over 15 years of experience in the big data and software industry, building value propositions for clients in Europe, US and India. He holds an MS degree in Complex Adaptive Systems from Chalmers University, Sweden, and an MBA in Marketing & Strategy from the Indian Institute of Management, Bangalore. Praveen Kumar Strategy Consultant Data, Analytics & AI, Wipro Praveen has a deep understanding of the analytics industry and the digital ecosystem. He has extensive experience in designing solutions and offerings in the advanced analytics space. He provides advisory services and thought leadership for building value propositions and driving cohesive strategies. He holds an MBA in Operations and Strategy from the Indian Institute of Technology, Madras. Satavisha Mukherjee Practice Partner Data, Analytics & AI Consulting, Wipro Satavisha drives analytics consulting practice in the Middle East region. She is a consultant with 14 years of experience in advanced analytics domain. She specializes in use cases consulting, data consumption strategy, and data science use cases delivery across domains. She has worked extensively on B2C analytics with a focus on financial services and retail, as well as in supply chain analytics across industries. ======================

Why we need Unified Data Management

----- Arcticle source ----- https://www.wipro.com/analytics/why-we-need-unified-data-management/ ----- About the Authors Contact Wipro Please fill the required details to access the content Why we need Unified Data Management Most organizations today follow a data-silo model with disparate systems catering to specific business segments with nil or very less correlation between them. These individual systems often engage different data integration and management frameworks and toolsets to cater to its segment-specific data interface and transportation requirement, which results in Under these circumstances, Unified Data Management(UDM) framework lays down a process to consolidate data from disparate data sources of an organization by identifying the integration factors among those and storing the unified data in a common data repository within a data warehouse. This in turn, initiates rationalization of system-specific data integration and management framework into a single organization-wide framework and optimization of multiple Data Integration (DI) teams into a single Data Center of Excellence (CoE) using an optimized DI tool landscape. UDM drives interdepartmental cooperation by providing a common storage-base where data across different applications of an organization is cleansed, parsed and transformed using unified data dictionary. In a UDM platform, different data governance processes (Data Quality, Transformation, Metadata Ingestion, Data Lineage mapping, Data

Discovery etc.) work in cohesion to retrieve the maximum business insights and to drive organizational transformation and regulatory compliance through enterprise wide data assets (See Figure 1). Figure 1: Unified Data Management platform What are the business drivers of UDM? UDM includes both strategic and technical aspects. The success of UDM is determined by its ability to effectively align the upgradation of the organizational data management framework with the agreed business goals. UDM should cater to these two requirements: 1) Enable coordination of disparate data management principles: This revolves around collaboration and integration of development efforts among different data management teams and interoperability of the corresponding server, network and code artifacts. It also enables sharing of data management architecture and infrastructure components among different teams. The final product will require the amalgamation of the individual data management team for each of the disparate source systems/applications into a single lean one that can perform the data quality, integration, management and governance activity on the resultant unified centralized data repository. 2) Support strategic business objectives: UDM should enable an organization to utilize its corporate datasets for extracting business insights and channeling the information obtained to support business goals. A business should first identify and prioritize the goals and communicate to the technical data management team the data-driven requirement for targeting those goals. Thus, UDM has evolved from being the technical data integration framework for organization-wide data to the alignment framework between data management and information-driven business goals. UDM stands vindicated and holistic only when the unified data framework caters to the strategic business goals of the enterprise. What does an efficient UDM framework look like? 1) UDM is a best practice framework for data integration of enterprise wide data 2) UDM is a solution framework, not a specific tool 3) Adoption of UDM framework is benefit driven 4) UDM can be a discreet program in the data consolidation part of a company or it can be included as a subprogram for a larger program of IT landscape centralization, application rationalization, enterprise data catalogue building, and IT-to-business alignment 5) UDM integrates data as well as teams What does UDM enable? Conclusion UDM is the driver of success for the organization that wishes to benefit from the enormous dataset (master and transactional) being hosted in any of its larger application landscape. UDM brings to the table business insights of the enterprise data by consolidating, integrating and standardizing the data across disparate and sometimes, siloed systems. It also drives business goals and contributes in the success of data-driven business initiatives (including BI, CRM, legal and regulatory compliance). It also lays down the platform for people optimization by consolidating multiple data management teams into a single and leaner data competency team, thus saving the OpEx of the company. Sugata Saha Lead Consultant - Data, Analytics & AI, Wipro Ltd. Sugata has 14 years of experience in the field of data warehouse, data modeling, data integration and business intelligence architecture. He is currently working as a Data Architect and Automation Consultant for a leading client. From IM Practice perspective, he is also involved in solutions focusing on data integration and cloud data warehouse. Krishnakumar Aravamudhan Practice Director - Information Management, Data, Analytics & Artificial Intelligence, Wipro Ltd. Krishna has over 19 years of business and IT experience in the areas of information

management and analytics solutions for global organizations. In his current role, he is responsible for practice vision and strategy, solution definition, customer advisory, consulting, competency development, and nurturing of emerging trends and partner ecosystem in the areas of data and information management. =====================

Product Information Management – The core of great digital customer experience

----- Arcticle source ----- https://www.wipro.com/analytics/product-information-management-the-core-of-great-digital-customer-experience/ ----- About the Author Contact Wipro Please fill the required details to access the content Product Information Management – The core of great digital customer experience September | 2019 Relevant text and multimedia content is a key expectation of customers irrespective of the touchpoint. Organizations understand the need to meet this expectation of their digital customers. Product Information Management is where digital experience originates. It helps enterprises to become faster, consistent, compliant by enabling easy and efficient circulation of product information. In the digital age, businesses must re-analyze their product information management processes and capabilities and adjust to the changing reality to stay relevant. Today's product information management (PIM) solution must provide good governance of product information, offer contentthat is consumer friendly (both internal and external), and support automation of dissemination of data and assets to all channels of marketing and sales. It should be well integrated with other enterprise systems to provide best digital experience to both, internal as well as external stakeholders. Why is PIM important? Engineering and manufacturing organizations responsible for creation of new equipment, machines or devices have multiple product lifecycle stages (Concept to Shelf) before the final product is created. These product lifecycle stages are typically handled by different functions/groups and different systems in a large organization. The PIM system provides a platform to store and manage all product related information across business functions and multiple channels from a single unified dashboard. A product manager, who is typically responsible for managing marketing and sales of multiple products, has a big challenge in tracking the product in its lifecycle stages, as most of the tracking may need to be done manually. A PIM solution provides an ideal platform that will have a unified view of this process across all systems and help track the stages in the product lifecycle. The data model of PIM can easily capture status of each of these stages. Integration with the systems maintaining this information can bring in status data to PIM whenever the step related to that system is complete. A dashboard created on top of the data will easily represent the step pending in the overall process. This can greatly reduce the manual efforts needed by the product manager and his/her team. Marketing content added for a particular product may be applicable for other products as well. A good PIM solution allows easy availability of this information across multiple business

functions and product lines and therefore, allows for better collaboration and reuse of content. A workflow-enabled mechanism will allow the marketing content to be added and reviewed by other groups including the product manager before it is approved for publishing. The PIM data can be used to create an Augmented Reality (AR)-based interface for a mobile or web page. For example, Wayfair helps customers project a piece of furniture in 3D in their rooms to get a better feel of how it may suit his/her home. L'Oréal also uses AR to help customers interact with their skin products on a smartphone based app. A PIM solution also maintains relationship between multiple products. These relationships may be like alternate product, accessory, additional component in a configurable product, etc. This information can greatly enhance the digital experience for a buyer as well as reduce the time required to list various possible configurable options. Alternate product suggestions can come in handy when a particular product is unavailable or goes out of production; this can potentially reduce downtime for an assembly line. This information can initially be fed to the system and later a machine learning-based bot can be used to improve on these relationships based on buying patterns of users. For instance, consider a laptop manufacturer who sells laptops online. While the manufacturer can come up with certain base models with variants based on the type of display, processor speed, type and size of RAM etc., it will be difficult to list all the possible configurations and prices for all possible combinations. While it is time-consuming for the seller, the buyer experience also gets cumbersome, as he/she has to carefully search for the exact required combination. A more optimal experience for the buyer will be to provide a limited number of models, which can be further configured based on the list of supported upgrades. The relationships established between products in the PIM ensures only the right workable combination is available for a change in configuration. The core product information, combined with the pricing information gives the buyer an instant update on the overall cost impact of a configuration change and therefore helps her decide the optimum configuration based on her needs and budget. PIM solution can also help enhance the digital experience in the retail industry and can potentially increase the cross-sell and upsell opportunities for the retailer. Most retailers collect the digital footprints and profiles of the customers and can combine this information with the product information stored in their PIM solution to target the right product to the right customer. Integrating the PIM solution with a web-behavior analytics solution can greatly improve cross-selling opportunities. Consider a customer looking for a dress. If the retailer has the right set of accessories linked to this dress in the PIM solution, which may include a matching pair of shoes or a pair of earrings etc. and can present this as a combination, there is a high probability that the customer may end up buying all of them. Also, machine learning can be used to make better product recommendations based on user behavior. A bot may be fed with the data of user journeys and future product relationships can be fine-tuned based on this input. Similarly, there is a great opportunity to combine the online and the offline experience for the customer. Let's consider the instance of a customer who searches for a particular product online and then goes to the store to get a physical feel of the product. The online store can process the online browsing history from the cookie, add that to the details of the customer and when he/she visits the store, present interesting offer on the browsed product using a beacon. A

Chat bot can be used to deliver real time customer support. A PIM solution automates the categorization of products into different segments. While a product should belong to one primary hierarchy, it can also be part of multiple hierarchies. Depending on the usage, an organization may have multiple hierarchies like product line hierarchy, financial hierarchy, product category hierarchy, project hierarchy etc. Creating a business rule engine to automatically classify a product to multiple hierarchies and thereby representing them in appropriate nodes of the hierarchy and showing relationships across these hierarchies can greatly help product owners and end customers. As an example, a retailer may classify a product like antiseptic liquid as part of multiple hierarchies. It may be personal care, health, disinfectant etc. An end customer must be able to see these products as a part of each of these categories. This is also relevant in case of manufacturing customers that are required to maintain multiple hierarchies and undergo multiple changes in the hierarchy structures because of organization changes or product realignment or in a merger and acquisition scenario. Market researches show that a customer is more likely to buy a product with good user reviews. PIM can allow digital feedbacks and comments of a product to be displayed alongside a product. These positive reviews and feedbacks when posted on social media can also help build better brand awareness. Since these feedbacks are coming from customers' known circles, it can drive other users to buy the same product thus improving product sales. Vendor catalog management is a complex process. Using Blockchain in PIM helps authenticate product changes made to product sheets and master data. It helps by allowing smart contracts to authenticate changes made to master product data sheets. Blockchain helps PIM with an additional layer of security In summary Product Information Management solution delivers to organizations strategic advantages that greatly enhance the digital experience of both, its internal as well as external stakeholders. Integrating the PIM solution to other enterprise software packages helps in realization of multiple digital goals in terms of efficiency, better collaboration and reuse, enhanced cross-selling and upselling opportunities, and significantly-improved customer satisfaction. Combining it with some of the latest technology trends like AI, ML, Blockchain, AR etc. can greatly enhance the experience of the end users. Images and videos have a greater impact in conveying product features and people expect to see how a particular product will suit them. Managing these content, and making them available to the right channel will surely enhance customer experience and conversion rates. Chandan Roy Architect – MDM and Data Governance Practice of Data, Analytics & AI, Wipro Chandan has about 15 years of experience in Information Management. He has worked with customers across geographies and industry verticals to help them realize business benefit from their Master Data Management and other Information Management solution implementations.
======================

The importance of DataOps:

Why it matters and how to get started

----- Arcticle source ----- https://www.wipro.com/analytics/the-importance-of-dataops-why-it-matters-and-how-to-get-started/ ----- About the Authors Contact Wipro Please fill the required details to access the content The importance of DataOps: Why it matters and how to get started September | 2019 Data management has been facing challenges since the early days of web development and IT. The nature of the challenges has been changing from procurement to storage, to high volume storage, and from transaction to deriving insights, to making the whole process fast and efficient. Gaining agility to imagine real-time insights from fast burgeoning data in an automated manner is the need of the hour and the focus of many experts in the field of data today. This focus has resulted in the emanation of DataOps. DataOps draws parallel with a similar yet different practice in software delivery and SDLC management practice called DevOps, which uses large scale automation to quicken the software release cycles and improve the quality of output. DataOps is the amalgamation of various processes and practices supported by relevant technology that uses automation to boost agility with respect to data and insights. It thus augments the speed and quality of data, information and insights, and supports continuous improvement culture of businesses. Data challenges and the DataOps code DataOps as a practice tries to address some of the data management challenges to ensure quick and quality analytics for the end users. Data and related insights tend to lose the value that they possess with each tick of the clock. The requirements in the data and analytics space fluctuate: sudden changes in requirements are common. Also, the constant quest to ask more questions and counter questions from data keeps the analytics process on its toes. The number of data pipelines have grown with requirements from data analysts, scientists, and data-hungry applications resulting in data silos with no connect to other pipelines, data sets and data producers. The data resides in different systems and platforms; gaining access and control over different systems and identifying the right data becomes a daunting challenge. Bad data quality causes lost credibility in the entire analytics setup and leaves the whole program in jeopardy. The data formats may be different in different systems depending on the datatypes and schemas. Data errors can creep in due to numerous events like duplicate entries, schema change and feed failures. These errors can be difficult to trace and deal with. Also, there are constant updates in the data pipeline in terms of say, schema changes, added fields new/updated data source etc. Making and validating these changes is a constant and time-consuming task. Manual processes in the data pipeline from integration to testing and analytics are overbearing and time consuming. Some teams work long hours to make sense out of the data analytics efforts, some commit less and take more time to be watchful in their approach, while others try to be quick by

compromising on parameters. So, overcoming the data-related challenges requires not just tools but also changes in the underlying processes that handle analytics. DataOps helps overcome the hurdles and complexities and deliver analytics with speed and agility, without compromising on data quality. It derives inspiration from the practices of Lean Manufacturing, Agile and DevOps. It emphasizes on integration, cooperation, collaboration, communication, measurement and automation between data engineers/ETL engineers, IT, data analysts, data scientists, IT and quality assurance. Thus, it focuses on getting fast insights by leveraging the interdependence of every chain of the analytics process by focusing on people, process and technology. Implementing DataOps DataOps can be accomplished by accommodating a few changes to the as-is process being used in the data setup. Automated testing can help save a lot of time and curb manual efforts. The data should be constantly monitored for quality issues and test cases should be added incrementally for every added feature or change to the input data records. The corresponding errors in the statistical process control should be projected as alerts to the appropriate stakeholders to keep the quality of data high. Use of Version Control Systems wherever possible will help keep artefacts in a structured manner, enhance reusability and support multi-developer environments. Essentially, each step of the data analytics pipeline is accomplished by tools which are nothing but code i.e they produce underlying scripts, config files, parameter files etc. which if versioned in version control systems like GIT, SVN, customized version control tools/systems etc. will enhance reusability and reproduce a state in the pipeline when required. Also, multiple developers like ETL developers or analysts creating models can work on the same piece of code in parallel through branching the trunk and merging it back by testing and incorporating the changes. This will save development time and speed up analytics. Isolated environments will prevent chaos in the production database systems and Cloud environment can fulfill the separate data needs of developers. A data engineer making changes to data can cause issues if done in production directly or an analyst creating new model can be puzzled with constantly-changing dataset. Thus, isolated environments can be provisioned on the go. Code, configurations, parameters, tools or environments in the data analytics pipeline can be reused by effectively utilizing containerization technologies like Docker containers. Also, certain complex operations/steps in the pipeline can be enabled through containers (calling custom tools/API, downloading files, running a script e.g. python/ shell script execution, FTP file to another system). This will enable the teams to execute the container wherever required instead of performing them from scratch and deploy it easily without understanding the underlying tools and configurations. Flexibility is an important characteristic that must be present in the data analytics pipeline. The changes in approach or control of the process must be with the data engineers/analysts to make minimal changes/tweaks and get desired results. E.g. which version of datasets to use, which environment to consider, what condition to use for processing and so on. This can be effectively realized through use of parameters, by which the changes can be adjusted and incorporated on a case-to-case basis with minimal manual changes. DataOps in action A DataOps streamlined process encompasses tool chain and workflow automation when data enters the systems from sources and keeps on changing with time to feed the downstream systems for transformation, models, visualizations and reports.

This can be taken as the production environment that directly exploits existing workflows, tests and logics to derive value and keep the quality of data in check at all times. So, the code or toolset remains constant and data keeps on changing and updating the downstream, keeping the insights live and active. This can be done with a good orchestration tool with automation as its credo. Another activity that happens simultaneously is the generation of new code, tests, models and features to the existing code/tools that play with the data. This can be well handled by using fixed datasets and containerized environments with parameters and versioning to enable developers, testers and other stakeholders speed up the changes to production. Thus, it speeds up analytics and strengthens the feedback mechanism of the pipeline (See Figure 1). Figure 1: A unified approach to analytics with DataOps Conclusion Imbibing promising changes is a cultural phenomenon. A culture of reduction in timelines and improvement in quality that scaffolds constant improvement in metrics is a must-have for bringing about tangible gains out of a practice like DataOps. Every task/step in the process needs to be evaluated in terms of how automation and intelligence could sink in to make it better. The culture of constant improvement in both data and insights in terms of quality, agility and collaboration could be a right step in the direction of DataOps. Continuity in efforts is required as there is no one thing that could make an organization DataOps-compliant. An understanding and sense of collaboration between the stakeholders (data engineers, analysts, scientists or stewards) involved in every step is required to ensure a streamlined process. Constant promotion, transformation, release of data should be coupled with constant application of models to derive insights and simultaneously improve analytics on a regular basis. Also, the analysts and developers should get a constant feedback on the quality and profile of data and insights which would quicken the process of taking corrective measures to ensure a robust process. This will be the direct implication of getting in DataOps in the scheme of things. Pratyaksh Arora Consultant, Information Management – Data, Analytics & AI, Wipro Limited. Pratyaksh has experience in the field of DevOps, Information Management and Analytics. He holds an MBA from the Department of Management Studies, Indian Institute of Technology, Delhi and finds keen interest in new age practices like DevOps, DataOps and Data Management in general. Mohan Mahankali Principal Architect, Information Management - Data, Analytics & AI, Wipro Limited. Mohan has 20 years of business and IT experience in the areas of Information Management and Analytics. He is the co-owner of a patent in Data Management & Governance awarded by USPTO (United States Patent and Trademark Office).
=======================

Data governance organization

----- Arcticle source ----- https://www.wipro.com/analytics/data-governance-organization/ ----- About the author Contact Wipro Please fill the required details to access the content Data governance organization The foundation for high performance analytics September | 2019 Data Governance is a crucial agenda in organizations that want data-driven business decisions and operations. Data-driven enterprises offer excellent digital experiences to

their audience groups, and increase CSAT, employee satisfaction, revenues, productivity, and profitability. The crucial question is how to implement effective enterprise-wide Data Governance (DG) and what benefits to expect from it in the medium to long-term. DG, as most practitioners would readily agree, is a complex long-term program encompassing people, new roles and responsibilities, virtual organization, organizational policies, data standards (global, regional and local), operating processes, procedures and last but not the least, the implementation and adoption of multiple platforms, systems and tools. To rollout a new DG program or optimize an existing DG program across all its dimensions, following questions need to be deliberated. 1. What can an organization expect to gain from the rollout of a DG program? DG initiatives can combine with analytics modernization initiatives to offer integrated high-quality data discovery. This will lend capabilities to data scientists, data analysts, business analysts to ask questions, formulate hypothesis and get answers that can be trusted as a single version of the truth. This evolution will enable efficiencies like: 1.1 What are the steps to rollout a DG organization? The above set of activities need to be plotted on a Gantt chart showing parallel activities, dependencies and estimated timelines leading to go-live of the enterprise DG program. 1.2 When can the expected benefits from the DG program accrue? Stabilization Phase: lasts 9-12 months after the go-live 3 months after the go-live following benefits can start accruing (based upon the 4hr/week time allocation mentioned) 2. How to incentivize the DG organization members? Upon go-live, considerations of additional remuneration should come into effect. These considerations can work at two levels - BUs and individuals. 2.1 At the level of BUs 2.2 At the level of Individuals DG roles should be calibrated based on the extent of their engagements in slabs of 50-100%, 25-50%, and less than 25% of their available time for DG work. The slab of 50-100% will need new head count, who will need to be assigned with additional work by the respective BU, slab of 25-50% will also need new head count with more diversified work, and individuals in the lowest slab should be offered a package that includes a premium on top of current CTC. To conclude For any analytics program implementation to succeed and yield business value, optimum data quality is a pre-requisite. Enabling data quality at enterprise scale requires multi-faceted approaches, enablement and technologies that make up the enterprise-wide Data Governance program. Therefore, well conceptualized and executed DG organization and program are essential to enable high-performance analytics to deliver insights that will be trusted as single version of the truth and will support business decisions and actions across the enterprise. Rahul K. Srivastava Lead Consultant- Information Management Data, Analytics & AI Wipro Limited. Rahul has over 19 years of work experience including Enterprise Data Strategy & Governance, Master Data Management, Business Intelligence & Analytics, and Cloud platforms. He has built and run successful business transformation programs in these domains for diverse sectors. He holds a B.Tech degree from Indian Institute of Technology Varanasi (IIT BHU), India and MBA in Marketing (Research). =====================

Art and science of model size optimization

----- Arcticle source ----- https://www.wipro.com/analytics/art-and-science-of-model-size-optimization/ ----- About the author Contact Wipro Please fill the required details to access the content Art and science of model size optimization Best practices for managing Anaplan model space November | 2019 Every business needs to have a scalable, reliable model in place that addresses all business functionalities and enables understanding of business performance in real time. With business processes going agile, and the exact ask being seldom clear, it is difficult for the solution architect to size the business model accurately for addressing the requirements. Anaplan connected planning platform, a Cloud-native solution that supports detailed models, delivers the potential to achieve success in this area. Anaplan models offer desirable levels of module capacity and flexibility to address business needs. Though Anaplan allows high levels of capacity, it is crucial to ensure optimized size while designing models. Excessive model size costs more and involves overheads like data duplication. Anaplan flexibility can enhance the model, but at the same time, can give a tough time to the architect or model builder in terms of controlling the right size for the model. Hence, it is imperative to follow certain methods meticulously to bring model to the right size that meets the requirements. Points discussed below, followed in chronological order, will drastically reduce the model size and ensure that model builders have followed the most optimized approach to designing and building models. 1. Check on the time settings Native time dimension settings works best in most of the cases, except for a few. For instance, if the business would like to view data weekly but compute the month totals based on days and not on weeks, Anaplan has no time settings to address this scenario. Hence, either a custom or a fake time scale has to be created with custom mapping of days to month separately in module to use model calendar settings. Another possible solution is to use Week General Settings but this would not allow certain functions such as Month Value. Best approach in this scenario is to use 4-4-5, 4-5-4 or 5-4-4 time distribution. 2. Take the POC approach Proof of Concept approach should be followed as part of design or initial model building to cover the basic functionalities. For e.g. to prove which time dimension settings would work fine, best approach is to do it. Certain pertinent questions that should be answered are: 3. Evaluate usage of custom lists for versions Use native versions wherever possible. However, you cannot create subsets against them. There can be certain modules whose dimensionality depends on What-if versions and not actual version. Idea is to create a subset against the custom list of versions. In Figure 1, a subset named s-simulation is created to limit the weekly module size to 151,792,040 Cells (1.43 GB). Actual version being included would increase model size. 4. Go for hierarchy pruning There are many instances wherein unnecessary transactional level details are brought into Anaplan. Business should be challenged with questions regarding the relevant list members to be included in Anaplan. If there is a requirement to drill back to the transaction data from the model,

then there is a valid reason to hold transactional data. For instance, a company reduced the number of service business units from 19 to 5, leading to 70% space reduction. They were pruned as they were not needed in the Anaplan model. In Anaplan, all the modules will not contain all the lists, it is a careful selection of the lists that would determine the size of the module. The intent should be to bring data that is absolutely relevant and useful rather than copying from the source. 5. Do not cross big lists – Manage dimensionality There can be instances where numbered lists which have 200K+ members are required to be built. Anaplan is capable of handling such huge lists, but there could be an issue when the lists crosses other bigger lists for e.g. weekly view for two years (53*2 = 106 Members). This can cause module size to increase. The approach should be to use numbered list with limited line items. This will bring in control. Identify independent numbered lists to use in separate module to reduce the model size. 6. Use numbered lists Usage of normal lists should be encouraged as maintenance issues are less and providing selective access is easier. In many cases, performance and maintenance is much better if you allow sparsity. However, there are situations where user needs control in terms of adding members to the lists. Numbered lists are one of the ways to control sparsity. It also provides flexibility to roll up against the different parents and create virtually a shared instance of the members. Creating multiple levels within numbered lists will help reduce sparsity. For e.g. Country->#Territory->#Sales Rep can help to map the right sales rep against right territory. Maintenance around numbered list should also be developed to provide foolproof system to the users. 7. Use numbered lists in combination Above example states that not all sales reps belong to all territories. A combination list created between #Territory and #Sales Rep that is dynamically maintained using Actions will reduce sparsity. Dynamic hierarchy management of two numbered lists as combination of lists can be time consuming to implement in some cases but worth implementing in addressing changing needs. 8. Use subsidiary views in a controlled manner Ideally, modules with same dimensionality should be kept separate but there are such scenarios in any engagement where not all the line items in a module follow the same dimensionality, but you are bound to keep them in the same module due to functional reasons. Subsidiary views should be created by changing any one of the following:- Generally, if the module is a weekly module, monthly level of data has to be captured in line item leading to change in the Time scale for a line item and hence subsidiary view. Imagine the impact of reducing the cell count to 12 from 53 (Month to Week) leading to close to 80% cell count reduction. If the relevant lists are kept against relevant line items, this can create wonders in terms of size reduction. Careful visit to all the modules should be made at the development stage itself. 9. Quick check online items Few quick checks on writing complex formula in single line item should be encouraged when working with larger modules. More line items = More cell count. Check the following:- 10. Use time range as much as possible Modules that hold history can be separate from the modules that do not. It would be effective to use time range in such cases. Cut down the module size by using only past years for history module and current year for the planning module and future years for AOP and Forecasting modules. Not all the modules need all the time range and hence this feature is always the easiest to enable model optimization. Conclusion Model space optimization is not just a science but

also an art that requires careful consideration and execution. Optimization should not be an exercise post implementation but should go hand in hand with implementation. Proper check on time settings, evaluating usage of custom lists for different versions, POC approach, hierarchy 4pruning, managing dimensionality, controlled use of subsidiary view, quality check on line items, maximum usage of time range are the best practices that deserve incorporation in the model to bring it to its optimum size. Business consultancy and customer convincing skills of architect also play an important role in this process. In short, keep it simple! Mahesh Damani Manager - Anaplan Practice,Wipro Mahesh has close to 14 years of experience in EPM suite of products. He is PMP® and TOGAF® certified and has sound knowledge on requirement gathering, architecture, system design and green field implementations. ======================

Data monetization opportunities with IoT, 5G and AI

----- Arcticle source ----- https://www.wipro.com/analytics/data-monetization-opportunities-with-iot-5g-and-ai/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Data monetization opportunities with IoT, 5G and AI January | 2020 How Telcos can rise to the occasion IoT, 5G and AI are ushering in a new era of customer and citizen engagement. This is a monumental data revolution that is driven by the smartest of solutions to make consumer lives better, improve people-to-people connect and enable enterprises to grow. According to Gartner, 66% of organizations plan to deploy 5G by 20201. Meanwhile, 59% say they will include IoT communications in the use case for 5G1. IHS Markit estimates that the number of IoT devices will rise from 27 billion in 2017 to 73 billion in 20251. All of this will result in a massive increase in data volume. IoT is pervasive and controllable, which has added a new dimension to information collection. The application of IoT data is virtually limitless. Combined with AI, IoT data will help uncover new avenues for revenue and increase the net value for Telcos, banks, and other enterprises. IoT with AI will also help government agencies to engage better with citizens. Globally, IoT monetization is expected to reach USD $542.92 billion by 2023, at a CAGR of 52.95%2 5G is up to 100 times faster than 4G speed3 and this enables improved IoT connectivity and usage. The introduction of 5G will cause the Telco data volume to increase manifold. This presents a tremendous opportunity to derive insights out of data for enterprise collaboration and monetization. Telcos: At the helm of the connected insights space 5G investments by Telecommunications carriers will power the IoT revolution. With the predictive capabilities of AI, Telcos will now be able to connect, monitor and monetize in real time - personal devices, autonomous cars, static sensors, cameras, kiosks and more - to give a unified positive customer experience to subscribers. Telcos can now be the focal points of campaigns, not just to offer better Telco services but also to become the hub to offer products and services across industries. Some use case options include: Conventional Telco customer experience drivers - network experience, device experience, product experience and location,

will be augmented by a digital touchpoint experience including App experience, and IoT-enabled multi-touchpoint experience. This means that not only will the customer engage the Telco on the Telco products, but Telco will be central to the subscriber's lifestyle including smart personal devices. Monetization of smart data will benefit subscribers, (by getting better home or health insurance, vouchers from Telcos), Industry (banks, insurance, retail) and of course the Telco itself. Hurdles in the data monetization journey Winning with a solution built on IoT data pipeline and AI-driven decision engine Telcos can leverage Wipro's Data Discovery Platform (DDP) to unlock greater potential across the IoT value chain. DDP's High Performance Event Processing and Deep Learning platforms come with pre-built Data Science applications. The Data Science Framework in DDP allows Data Scientists to leverage rich IoT data to generate potential revenue generating insights (See Figure 1 & 2). Figure 1 - Data Discovery Platform – Building analytics apps Figure 2 - Data Discovery Platform - IoT with 5G analytics reference architecture Wipro has partnered with leading institutes of excellence in India - Indian Institute of Science, Bengaluru – for Advanced Research and Innovation in autonomous systems and robotics in 5G; and Indian Institute of Technology, Kharagpur – for Advanced Research on 5G and AI. Telcos can leverage their expertise to build innovative capabilities to enable better monetization of 5G data and offer greater customer experiences. Conclusion 5G networks powered by AI will revolutionize the revenue-making opportunities for Telcos. If operators pursue new business models to improve data monetization and unlock business opportunities, global revenues will grow at a CAGR of 2.5% during the 5G era to $1.3 Trillion in 2025.4 Majority of monetization opportunities will be in the B2B space, and Telcos can market and campaign on behalf of other enterprises (B2B2X) using the insights generated from data. Current data analytics and AI capabilities of Telcos will be put to severe strain due to the extremely high volume of data involved, and the need for real time insights and capability to generate deep insights from the data. It is crucial for Telcos to reinvent themselves by building apt capabilities to maximize value from 5G. The Edge AI factor

----- Arcticle source ----- https://www.wipro.com/analytics/the-edge-ai-factor/ ----- About the Authors Related Articles Contact Wipro Please fill the required details to access the content The Edge AI factor Building smart cities and smart healthcare with edge analytics and 5G February | 2020 Edge Analytics with 5G holds a transformative potential for humanity, impacting human health and safety and enabling smarter cities. The transformative potential The disruptive potential of 5G with Edge Computing (EC) and Edge Analytics (EA) may be more impactful than the Internet and Mobile combined (See Figure 1). The internet changed the way we discovered and utilized data, the mobile phone changed the way we interacted with each other and the data. 5G with EC and EA, will combine both of these changes and with an exponential speed and accuracy. Figure 1: At the intersection of industries, transformative initiatives and 5G capabilities lies the true transformative potential of Edge Analytics The race for smart cities is as much a business opportunity, as it is a humanity challenge. Technology has always shown most impact when addressing

humanity challenges at scale. With the advent of 5G+EC+EA, exponential benefits could be derived for smart cities across the globe, which could address not only the economic divide but also enable solutions dealing with safety (pedestrian and traffic), and human health (proactive and reactive services). Tech foundation for transformation 5G edge analytics will drive revenue and lead to newer business models. 5G networks offer increased cell density, higher data speed and lower network latency. In 5G, more processing is being pushed to the edge of the network, enabling the implementation of low latency applications. In addition, cell site densification provides increased network capacity, more data bandwidth and higher mobile data speeds to the consumers. This network densification will enable advanced analytics for real time decision-making. The idea is to reduce performance bottlenecks on network bandwidth by storing and processing the data near the data-generating, end-user devices or the edge. This can enable innovative new applications and business models, uniquely powered by mobile edge computing. Gartner predicts that there will steady increase in the embedding of sensor, storage, compute and advanced AI capabilities in edge devices. Edge Computing Edge computing removes the dependency on a centralized data centre. Instead the applications, data, and services are decentralized and at the edge of a network. With edge computing, it is feasible to push flavours of AI and functions that formerly required big data centres into micro data centres (µDC) and AI processors closer to the user—at the originating device, at the enterprise or in an operator's local access network. Related read: Edge computing in a 5G network Edge AI Edge analytics and Edge AI adds analytics processing and AI to the edge. It utilizes the data on the edge including historic data for predictive scenarios and use cases and for optimizing end-services. Edge analytics application use-case spectrum is very broad including wearables, smart home, smart cities, autonomous cars and industry automation. The health industry stands to benefit greatly by using EA with wearables to monitor, identify issues and prescribe remedies affecting human health as early as possible. Some unique application areas include: Audio Analytics Audio Event Detection: Detecting sounds such as that of a blast, a baby crying, or glass breaking will trigger an alert. Recognizing specific sounds from within overlapping sound sources is a critical ask that AI can fulfil. Hands-free read and write facilities can be enabled by means of AI at the edge. Inertial Sensor/Environmental Sensor Analytics Inertial and environmental sensors in smartwatches and fitness bands with deep-learning-on-the-edge trigger faster response to local circumstances. Wearable devices collect data on human activity, location, pulse etc. and alert their wearers. Video analytics Video Analytics within automobiles help in detecting and alerting distracted and drowsy drivers through the eye position and the state of the eye. Smart Cities The advent of 5G means that cities will be able to use artificial intelligence to analyse the massive amounts of data being collected in a city; and then use that data for • Utilities and Infrastructure Edge analytics can enable a smart city municipality to better manage and conserve precious resources like energy, water and fresh air. Analytics on top of IoT sensors in water systems and waste management systems will enable better monitoring and management. Innovative electric grids will increase energy efficiency for businesses and consumers alike. Edge analytics will also help in the monitoring and controlling of building operations like HVAC, lighting, and security to enable

best possible living environment to the building occupants. • Economic Development and Civic Management Traffic flow, parking space availability, utility usage and public streetlight management can be monitored by using IoT sensors on 5G network. Authorities can leverage edge analytics to find practical solutions to conserve energy, optimize water and power resources, and reduce environmental impact. Gradually, minimum traffic congestions and improved waste management will entice new residents and hence increase economic opportunities within the community. • Public Safety and Crime Control Edge analytics and Edge AI enable advanced and secure video, sensor and communication systems to proactively monitor public spaces and law & order. Using Edge AI, crimes or other disastrous events can be prevented or de-escalated before they jeopardize public safety. Sensors embedded in critical infrastructure such as bridges and power plants can monitor structural data to identify potential dangers, protecting citizens and the economic well-being of the city. Sensor-equipped drones can monitor vehicular traffic, crowds, construction sites and disaster areas to help monitor conditions continuously and support first responders. Overall, communities benefit from increased trust in law enforcement and disaster management. • Intelligent Transport and Autonomous Intelligent Vehicles Edge analytics will be the key enabler for the connected Autonomous Driving (AD) vehicles revolution using the Internet of Vehicles. Road vehicles will communicate with each other and with road infrastructures, improving overall road safety. It will also lead to reduced traffic congestions and enhanced driver comfort. Edge computing based Vehicle-to-Cloud solutions enable edge cloud capabilities for different levels of autonomous driving through different services (e.g., high definition real-time maps, real-time traffic monitoring and alerts). Distributed AI application in car will send video data over 5G radio to an edge computing site inside the Telco network. Video data will be processed in near real-time by Machine Learning algorithms at the edge cloud. Results of real-time image processing will be sent to the car, where comparison to local analysis will be done, leading to the final decision: i.e. instruction to the driver or the autonomous car. Smart Healthcare Healthcare is seeing a huge surge in the number of connected devices. EC and EA can reduce this burden to a great extent. A clinician's mobile device can capture patient data into a connected analytics platform at the edge in real-time. Patients will no longer need to wait for analysed results, which would significantly reduce their number of visits. The concept of the collaborative edge will be another enabler wherein geographically dispersed data is fused into a combined and edge device consumable view. For example, deep learning has recently gained relevance in ophthalmology due to its ability to detect clinically significant features for diagnosis and prognosis. This has resulted in various deep learning systems to be embedded within ophthalmic imaging devices, allowing automated image acquisition. The same can be performed at a smartphone-based device level, for instance by using a hi-resolution fundus imaging system attached to a smartphone. Conclusion The transformative potential of edge analytics will be realized. The speed of 5G networks coupled with the fact that local processing can be offloaded to the edge nodes/network makes the proposition of edge analytics very strong. Reduced latency, and connected, intelligent devices speaking to each other make for an invaluable leap from the current paradigm that requires sending large chunks of data back to the cloud for analytical processing and insights. Autonomous decision-making

and cognitive intelligence at the devices or the edge network cut down both, processing and decision-making latency. Edge analytics in 5G will not be restricted to traditional descriptive analytics and basic BI reports but will evolve to an extent that it will learn from the context, predict what will happen next, prescribe the next best action or decision, and learn from the past behavioural patterns for taking the most optimal decision. For fully autonomous applications, edge analytics will automate the next action in real-time. With the speed of 5G, more information will be collected and processed, and edge analytics generated insights will increasingly drive decision-making, leading to cognitive intelligence applications (See Figure 2). Data consumption naturally

----- Arcticle source ----- https://www.wipro.com/analytics/data-consumption-naturally/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Data consumption naturally March | 2020 The world of data and analytics strives to deliver data to the consumer in the right form at the right time. While analytics has enabled the data consumer with various capabilities like Standard Report with KPIs, Dashboards, Reports delivered through Alerts & subscriptions, Self Service Analytics – users still need to understand the tool, get familiar with the report names and learn which report will help them find answers. The KPI definition and reports need to be designed as per the user profile - otherwise the user will have to run the report, put the right filter and find answers to

questions. The artificial intelligence (AI) maturity and capability to learn about the consumer sets the future in the right direction – Voice Digital Assistant brings the entire AI capability into action, where it answers questions and conveys what it can process along with its thoughts in simple Natural Language conversation. Voice Digital Assistant can learn about the enterprise user while it picks up new capabilities (like setting meetings, sending emails, status of various business processes, read KPIs). The art of possibilities with Enterprise Voice Assistant is endless as we get introduced to Voice User Interface (VUI). With Digital Voice Assistant at the forefront of AI, let's fast forward few years from now and look at some real-life examples given in Table 1. Use Case Example Morning brief Sales is up in USA and North Europe. France & Italy are down compared to last month. Revenue realization report is ready for review... shall I bring it up? Setting up meeting Voice, setup meeting with France & Italy Region Managers. Show me the Revenue Report and send a copy to my team Send mail with message and link Send a mail to the contracting company saying, tomorrow schedule is cancelled and share the new schedule. Review the schedule of individual or store or depot 2 deliveries scheduled for today. First at 8am and another for 6pm Answer specific question Store Manager: Voice, how's the inventory levels compared to last month? Voice Assistant: Stock on Hand is 10% less when compared with last month Bring up specific content on the device or screen Senior Executive: Show me the revenue report Voice Assistant: Showing the revenue report Make calls Voice bring up the stock report and call the Inventory Manager Table 1: Voice Digital Assistant use cases & examples Voice: Reshaping data consumption and user experience Typically, users are forced to learn or change when any new application or user interface is launched. User needs to learn how to login, the menu structure, how to deal with the messages, the different clicks and status, etc. Voice User Experience (UX) implementation is the other way around -- the designers should build a voice product for the humans that can interact naturally. There is always a collection of data sets and large number of use cases per role. Traditional reports and dashboards try to generalize these use cases and deliver them periodically. Here the user must define the problem statement, find the right data set and derive the answer for the business question. This is time consuming - the effectiveness of data and decision mostly depends on the user skill level. The Digital Voice Assistant will learn over a period and will truly be an assistant who understands the user needs. From checking if the data is available to printing the required charts will be just a question away. For eg. Voice (Voice assistant), print the sales forecast once the data is ready. (as simple as saying "Voice, set a reminder for 5 minutes") Future-ready Enterprise Voice Assistant Voice Skill will evolve over time. The voice assistant will run Business Intelligence (BI) reports and query the database. It will happen as the developer enhances the skill to add more Intents and Utterances, and each role is defined better. This needs to be seamless to the data consumer. Development and Deployment models of Voice Skills will mature rapidly. Going beyond the Voice Skill, BI & Visualization tools will continue to serve the data consumer and will need better integration with Voice Skills. Most of the tools are already talking about Natural Language Processing (NLP) within their tool capability, which is a good sign. Data needs to expand beyond tables and charts - Industry is moving towards specialized storage for every type of data like Files, Images, XML, NoSQL and any other unstructured data. Data

Virtualization, aptly called "Information Fabric", is going to take center stage in delivering the data across enterprise. BI tools fail when the user needs anything that is unstructured - that need will be served by the Data Virtualization technology. This will serve data in any form, from any part of the enterprise, from any location - where the user just consumes without connecting to multiple systems. Coming back to Voice Skill - If Cloud platform adoption is complete, the capability to build a server-less function in any Cloud and integrating this with any BI tool and Data platform is already available (See Figure 1). This high-level architecture for any enterprise brings all the capabilities together and delivers a seamless experience to the user through the Digital Voice Assistant. Developing Voice Skill to access various capabilities across the enterprise can be classified as 2 categories – Access the BI tools in the enterprise, Access the Data in the enterprise. In the architecture, Voice Skills can directly access all the BI components and similarly access all forms of data through the Data Virtualization Layer - so it only needs to understand the data (Not where it is coming from or how to access). Adaption and implementation of a Data Virtualization Layer will enable the Voice Skill to deliver the experience even if the underlying source system changes. This simplification of access and focus on Voice Skill will deliver the most effective consumer experience and answer the questions in the right time. Figure 1: High-level architecture of enterprise voice assistants To demonstrate the approach to implement a simple skill like Total sales – a simple query like below can be attached to the Sales intent & utterance. This will deliver the most important KPI just like telling 'Today's weather'. Future of Voice and natural conversation Speech Synthesis Markup Language (SSML) Version 1.1 is already in action and is emerging as the standard XML based language for Voice User Interface. Few years back, cloud was looked as being locked in with a vendor and now it's considered as only Internet - accessible to everyone from everywhere. The same evolution will happen for Voice Assistant as well. In the next few years, integration across voice assistants is inevitable. Recent developments from the voice assistant providers are in-line to the above expectation: How to drive enterprise Voice strategy and adaption User interfaces have evolved from Command line interface, Graphical, Touch and now more humane Voice Interface. Enterprises needs to define a User-focused Voice Strategy with clear objectives and strong organization structure to deliver it. Following are the aspects that should construct the Enterprise Voice Strategy Voice product should deliver most of the common features that are commercially available in the market to excite enterprise consumer and drive adaption. Below are the most important features and this is not the exhaustive list. With improvement of cloud, processing power, 5G and power of Data & AI – Voice is set to take the human-machine interaction to the next level very soon. References Karthikeyan Subramaniam Managing Consultant, Analytics and AI Consulting, Wipro Karthikeyan has 16 years' experience in designing, developing, and delivering innovative data solutions across merchandising, supply chain, vendor management and store operations. He helps large enterprises embrace data and transform into business outcome-driven organizations. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with

technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

The man-machine paradigm in AI

----- Arcticle source ----- https://www.wipro.com/analytics/the-man-machine-paradigm-in-ai/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content The man-machine paradigm in AI Creating value by combining the best of the two May | 2020 You may have read about 'Dark AI', 'Light AI' or even 'Strong AI' and 'Weak AI'. There is another way to lay down the complexities of AI use cases. Table 1 shows categorization of Analytics & AI use cases in terms of three levels of human intelligence: Let us look at one use case, say a self-driving car along the three levels mentioned above: Iconic: The odometer displays the speed. This is an accepted normal. Indexic: The car is driving itself in traffic on a freeway. The new normal, but will work only in a given set of circumstances (for instance, the car cannot drive on dirt roads or spaces without clear demarcations). Symbolic: On a snowy day, if there is an old person shivering at the side of the freeway, waiving his hands frantically, what would / should the self-driving car do? This scenario would open up so many questions around morality / ethics, civility, safety and so on, which in my opinion, will take a very long time for the machines to learn and implement. Synergy of man and machine On May 11, 1997, IBM Deep Blue beat chess grandmaster Garry Kasparov. In 2016, Alphago beat Lee Sedol, the world champion of Go, a game many times more complex than Chess. There has been considerable improvement in use cases ranging from facial / voice / image recognition. One reason could be the abundance of labeled input data sets. We have as many photographs of human beings, cats, or dogs as we can. The more the machine can play and learn, the better it gets. The same as what happened with chess or Go. The more players signed up to play with the machine, the more practice it got, the better it became. AI is becoming stronger and better at learning and decision making, a process known as reinforcement learning. The keyword is "perfect information". Rules, boundaries, inputs and expected outputs are given. Let us say, a player cheats in Chess. How would a machine realize and respond to that? These are the complex and unanticipated scenarios where it becomes extremely complicated to train machines. To appreciate the wide chasm between man and machine, one would need to appreciate the jaw dropping evolution of the human brain over hundreds of thousands of years. Most of us cannot even fathom the way we think, learn, communicate, improve and adapt. Language is but one big differentiator, for it enables human beings to relate to one another and understand emotions, and creates infinite possibilities of thought and expression. So, what does all this mean for organizations today? Getting AI right By combining the machine's superior "Indexic" skills with a human's "Symbolic" skills, organizations could create significant value. This is the "Man-Machine" paradigm. How to identify these scenarios? Instead of academic debates around whether one should use deep learning or neural

networks, addressing the two fundamental issues could help: If there are lot of documents with different formats but with the same or similar information or there are high volume of transactions / complex processes / incomplete or incorrect information, these are good candidates for the "Man-Machine" paradigm. The machine can do the grunt work of going through hundreds and thousands of documents, images, audio files, identifying patterns, outliers while the Human can focus on the seemingly unconventional issues, making sense of the machine output and connecting the dots. Some examples could be: Solving these use cases could create value in terms of improving customer experience, saving costs, building new revenue models or creating new products and services. Good Luck! References To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

4 Ways Artificial Intelligence Powers

the Fight against Pandemics

----- Arcticle source ----- https://www.wipro.com/analytics/4-ways-artificial-intelligence-powers-the-fight-against-pandemics/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content 4 Ways Artificial Intelligence Powers the Fight against Pandemics May | 2020 The rapid spread of COVID-19 poses a global threat in an increasingly interconnected world. It has already disrupted the supply chains of 94% of Fortune 1000 companies1. As the virus continues to have significant human and economic impact, it is crucial to rapidly combat its spread through tracking and preventive measures, even as researchers work on discovering a possible vaccination or cure. Underpinned by data science and genetic applied science, Artificial Intelligence (AI) can help understand the cause of the disease while enabling better management and prevention. Here are 4 ways in which AI technologies can help fight Coronavirus. An AI model can leverage data from health organizations, commercial flights, livestock health reports, climate and news reports to correlate data points, focusing on the movement patterns of people affected by the virus. Combined with human expertise in analyzing and interpreting the data, AI can predict the start of an epidemic as well its spread. For instance, natural language processing (NLP) and machine learning (ML) algorithms can help scan data for early signs of the COVID-19 pandemic. As more and more medical information becomes digitized, it can be leveraged to make accurate predictions while ensuring data privacy and cost

optimization. However, predicting patterns and potential outbreak in non-human host carriers can be a challenge. The Cary Institute of Ecosystem Studies2 classifies species that are reservoirs of human diseases and uses AI in animal surveillance to predict likely outbreak sites in future. Infections such as the Coronavirus can be detected in large scale through computer vision algorithms. This enables frontline healthcare workers to detect and monitor the disease while efficiently managing patient volumes. For instance, an AI system using cameras equipped with computer vision and infrared sensors can measure people's temperatures in public areas. Such a system can screen up to 200 people per minute and flag anyone who has a temperature above 37.3 degrees. Similarly,AI systems that take advantage of a deep learning algorithm based on 45,000 anonymized CT scans3 can differentiate between COVID-19 and ordinary viral pneumonia. Right now, the only way to prevent the spread of the novel Coronavirus is to reduce contact with infected patients. Automating interactions and procedures with medical staff will help perform contactless diagnosis while minimizing the risk of cross-infection. Robots can check people for fever and deliver food and medicines to patients, and even disinfect rooms, reducing the need for nurses' presence. For instance, AI can assist ambulances to speed through traffic while reducing time to provide medical assistance. In fact, doctors can take advantage of robots to communicate with patients remotely to minimize exposure with infected people. AI can also help analyze sewage and help map the pandemic through an early indicator of disease spread before people seek care. AI can also tackle the spread of inaccurate and fake news by moderating information and increasing accuracy. Developing a vaccine against the Coronavirus is critical to contain its spread. But developing new drugs and medicine is a lengthy and costly process. Deep learning is the key in finding new information about the structure of proteins associated with Coronavirus for developing the vaccine formula. ML can be leveraged to determine the protein structures that can probably mask the virus from seeking healthy human cells4. Similarly, predictive ML capabilities can identify compounds that can effectively block the cellular pathway that allow the virus to find its way into the cells5. AI systems can also successfully identify thousands of molecules for potential medications and use simplified chemical sequences to predict the strength of a molecule to bind to a target protein. In a similar manner, AI can accelerate drug discovery. A resilient future with AI AI and data-driven approaches can help track and contain the spread of the Coronavirus faster and also provide deep insights on the epidemic, helping in the process of finding a cure. These truly herald the advent of contact-less diagnostics in healthcare sector. Organizations that use AI to their advantage will not only be able to accelerate the drug discovery process but also be resilient to face any such future outbreak. Machine Learning for B2B Pricing

----- Arcticle source ----- https://www.wipro.com/analytics/machine-learning-for-b2b-pricing/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content Machine Learning for B2B Pricing The strategy for optimizing pricing and maximizing profits May | 2020 The article discusses   The adoption of machine learning started in the consumer space almost a decade ago, but B2B organizations have been rather slow in embracing machine learning algorithms for their pricing. However, the scene is changing. Trends driving AI/ML adoption in B2B Pricing B2B companies are realizing the potential of machine learning (ML) in making right business decisions including pricing. There are several trends driving adoption of ML in B2B Pricing (See Figure 1). Figure 1: Trends driving AI/ML adoption in B2B Pricing Data & modelling challenges in the B2B space and their solutions Reluctance to adopt ML-based pricing originates from two main sources i.e. data related challenges and the complexity surrounding the pricing as a business process (See Figure: 2). In this section, we have tried to address some of these. Solution - This stems from the common perception is that ML models need a large data set. While it is true that some of the more sophisticated models like deep learning cannot be trained without large volumes of data, there are multiple algorithms in ML e.g. Decision Tree or Generalized Linear Models (GLM) that do not really need huge data sets. In fact, the first few areas of applications of statistical modelling were clinical trial and agriculture where data volume is even less compared to some of the B2B organizations. Solution - We advocate ML models to be a supplement to human decisioning and not a substitution of the same. The human amendments to the model's recommendation should be sent as a feedback to the model. It should be captured as an insight that can be leveraged in subsequent pricing decisions. Solution - Over the years, most organizations have made significant investments in their applications like ERP, CRM as well as enterprise data warehouse. Additional checks like multi-level reconciliations across systems, investing in a master data management systems will just not help pricing but the overall organization. Ultimately a good model needs good data. It is strongly recommended to treat data enrichment as a continuous process to reap benefits from any analytics initiative.   Solution - Techniques like Bayesian Hierarchical Models or Decisions Trees can be leveraged to model such scenarios. Let's say, you are selling a product in a territory and you don't have any past history of selling the same product in the same territory, hierarchical models intelligently roll up the data to the next level in hierarchy where you have available historical data and generalize those insights. Solution - The focus of the modelling should be to

compute the Bid Price vs. Win Probability and not estimation of price elasticity i.e. demand as a function of price. The outcome in a B2B sales cycle consists of multiple phases but the advantage here is the seller has the option to revise the quote according to the response from the buyer. The different stages in the B2B sales life cycle can be modelled as state transitions that can be factored as an input to the model so that accurate prices can be determined earlier in the flow. One advantage while modelling pricing in B2B is the buyers and sellers in a B2B environment are expected to behave rationally compared to their consumer counterparts, and models need not really factor in the behavioral pricing that are frequent in the consumer space. Figure 2: Data & modelling challenges in B2B pricing ML framework for B2B pricing recommendation Pricing can have several objectives beyond winning the bid. One of the most important being profit maximization. In addition, based on the strategy, an organization would like to maximize the revenue through cross-sell or up-sell. Elsewhere, increasing the customer trust to maintain long-term relationship with the customer may be the priority (See Figure 3). Figure 3: Objectives of pricing Figure 4: B2B Pricing Modelling framework Figure 5: Bid Response vs. Price Ratio. Bid Response is depicted by 1(Win) or 0(Loss). Price ratio in Figure 5 indicates the net price the customer will pay to the actual listed price. A price ratio of 0.2 indicates 80% discount i.e. customer pays only 20% of the listed price. Bid response of 1 indicates the win while bid response of 0 indicates a loss. It is suggested to use probabilistic algorithms e.g. logit, power etc. while estimating the bid response function. Unlike algorithms that give a binary outcome, probabilistic models produce the probability of winning the deal at each price point. Also, they are more interpretable and the influence of price and other variables can be illustrated to the field sales force. Complex black box models which produce a binary outcome of win and loss (not probability) and not interpretable should be avoided. Modelling process should follow the model development lifecycle comprising of exploratory data analysis, model training and performance evaluation in a holdout data. The performance of various algorithms across a set of parameters like accuracy, precision, recall, AUC, ROC etc. should be compared to choose the best performing model. Once the Bid Response function is estimated i.e. the relative importance of the variables on the deal outcome (win/loss) is determined, it can be used to simulate the probability of win at different price points (See Figure 6). Figure 6: Win Probability vs. Price Ratio at different price points Bid response functions should be estimated for each pricing segment separately if estimating individual functions gives performance advantages compared to a single model across pricing segments. However, due consideration should be given to the availability of data in a particular pricing segment. If the number of records are significantly less for a given pricing segment to effectively train/test the model, a single model across pricing tiers may prove to be a better option. Figure 7: Profitability % vs. price ratio to depict the profitability % at different price points. Once the probability of win and profitability, both are determined, the profit can be estimated at different price points. Estimated Profit = Probability of winning the deal * profit The price point that generates the highest estimated profit will be recommended to the field sales persons. Bringing together people, process and technology In order to reap the benefits from the implementation of an ML-driven pricing program, organizations should ensure they have the people, process and technology

policies aligned to: People Process Technology If you are starting your ML-enabled pricing journey, creating the pricing analytics platform is the first and the most important step. The pricing analytics platform will have the following four components. References To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

How to Get Infrastructure Requirements for

Artificial Intelligence Right

----- Arcticle source ----- https://www.wipro.com/analytics/how-to-get-infrastructure-requirements-for-artificial-intelligence-right/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content How to Get Infrastructure Requirements for Artificial Intelligence Right First, take control of your data May | 2020 With advancements in Artificial Intelligence and Machine Learning techniques, organizations across the globe have realized the potential of AI in enabling quick and informed decisions. They are moving towards rapid adoption of these technologies for survival and subsequent favorable outcomes. Due to this growing demand for AI across industries, infrastructure decisions are increasingly being based on this workload. However, before deciding the infrastructure solution for AI platforms, enterprises should gain insight into the data lifecycle from an AI model's perspective. Data can be the key challenge for implementation of AI and ML. Here are some key pointers that enterprises need to know about data before defining infrastructure for AI: Efficient management of data for enabling AI Data is crucial for modern AI and ML algorithms. Collection of data in raw format, managing these big chunks of datasets, and labeling them with related information to help train an AI model are the major data challenges. A data architecture that describes how data is collected, stored, transformed, distributed and consumed is essential to implement AI solutions. Datasets have to go through multiple processing stages before being used to train the AI model. Let's see what happens to data at each of these stages. Data Collection and Ingestion - This step involves storing data from multiple sources into a data lake. The data here is a mix of structured and unstructured data. The data lake needs to be scalable and agile to handle every type of data. The datasets will have Inferences, which must be saved to be processed in the further steps. Data Preparation (Clean and Transform) - Data stored in data lake post ingestion isn't suitable for utilization in training AI models as it

needs cleansing and required transformations. Thus, transformations are performed in data lakes. Explore - Next step is to feed these processed datasets from data lake to the AI/ML tools in the AI based platform, which possesses high storage with GPU and CPU servers. Initially this platform conducts testing with a smaller set of data and then full-scale model training is enabled through multiple iterations. Training & Evaluation - At this stage, random data sets are taken from data lake and fed into the AI platform for training and updating the model. Infrastructure requirement at this stage is to have high performance storage to compete with high processing speed of GPUs. Scoring or Prediction - After training and evaluation of AI models, they are circulated in production as PMML (Java) file, model objects (Python flask, RServer, R modelObj) for prediction (scoring). The business application needing prediction invokes the objects in accordance with the algorithm. After completion of data processing and training of models, the data becomes redundant or cold and is no longer needed. But sometimes, the cold data may be needed to refer back for problem-solving. Hence, cold data is mostly stored in a low-cost storage area. Infrastructure selection criteria for AI To make the right choices about compute and storage, it is vital to understand the requirements of storage and compute at multiple stages of the data lifecycle.Figure 1 maps the storage and compute requirements with the phases of data lifespan. However, this might vary on a case-to-case basis. Figure 1: Infrastructure storage and compute requirements during data lifespan phases Storage selection criteria In case of standardized and small scale ML requirements, one can go ahead with scaled out shared storage across all phases. For large scale ML requirements which also involves deep learning, throughput differs radically throughout different stages and hence separate fit for storage becomes a better and cheaper solution as compared to having a solitary shared storage. Compute selection criteria The requirements for compute performance depends on the phase of data lifespan and inclusion of deep learning. Depending on the usage and storage advances, the data lake deployment can be on discrete servers or servers with storage. In discrete servers, single server provides storage plus computation, while in the latter, a committed storage box offers storage and servers provide compute. Public cloud selection Public cloud acts as an alternative to on-premise structures as they offer key features that are quicker and easier to leverage. These include scalability, agility and hybrid usage of infrastructure. Moreover, public cloud offers readily accessible data lakes, thereby reducing overhead costs. However, the choice between public cloud and on-premise structure is dependent on additional factors like setup size, business needs, landscape of applications etc. Container platform Container platform helps on-premise structures to achieve the functionalities of public cloud. With the help of containers and server-less computing (quickly scalable), ML models are able to act independently, hence being more cost-effective with less overheads. On-premise containers can be deployed as a platform. But, the methodology, compatibility, and AI platform and ML tools used need to be confirmed. Various AI applications / use cases like language translation, face detection, financial risk stratification, route planning and optimization, dynamic pricing and autonomous driving have come up but there is one common feature that drives them all – their dependence on hardware. All these applications have different compute requirements that result in varied chip compatibility. Factors like processing speed, hardware interfaces, flexibility, backward

compatibility, need for technical capabilities decide the type of chip that is needed per application. For e.g. for a face detection use case, the possible AI chips for training phase could be a GPU or FPGA (Field-programmable Gate Array), whereas inferences can be achieved with the help of CPU or an ASIC (Application specific integrated Circuits) chip. Right infrastructure matters AI is the next wave of digital disruption - the global business value derived from AI would be huge with its impact felt across the value chain. Enterprises need to figure out the infrastructure that facilitates AI and ML to leverage its potential. The high performance workload in today's era requires modern infrastructure that can provide better performance, scalability and agility at a lesser cost. Raju Singh Mahala Raju Singh Mahala is a Sr. Architect at Data Center & Cloud Practice in Cloud and Infrastructure Services at Wipro. Refine Demand Prediction, Personalize and

Optimize Offerings in a post COVID-19 World

----- Arcticle source ----- https://www.wipro.com/analytics/refine-demand-prediction-personalize-and-optimize-offerings-in-a-post-covid-19-world/ ----- About the authors Related Articles Contact Wipro Please fill the required details to access the content Refine Demand Prediction, Personalize and Optimize Offerings in a post COVID-19 World June | 2020 Executive Summary As COVID-19 transforms the way consumers behave, it will affect demand estimation, customer targeting, and product and service fulfilment strategies. Executives that refine demand predictions with search trends,

personalize targeting by continuously sensing customer responses and optimize product fulfilment by injecting local market intelligence will emerge stronger in the post-crisis world. This paper looks at how Analytics & AI can help companies transform into Intelligent Enterprises by adjusting demand and supply strategies in response to changing customer habits and sentiments. A Three-Part Action Plan to Demystify Demand Forecasting As COVID-19 becomes the new normal, companies are facing unprecedented challenges to rapidly forecast demand based on new customer needs and preferences. Consumers are shifting the way they purchase, what and how. The traditional inside-out view of customer needs and anecdotal outside-in view of the market is no longer enough to improve business performance post the crisis. As an immediate response to this crisis, companies should refine demand predictions, improve targeting and optimize product fulfilment based on area demand. Here is a three-part action plan that can help get it right: Combining continuous feed of outside-in intelligence into the existing inside-out view of the customer helps create a holistic view of the demand for enhanced business decision-making (see figure.1). Figure 1: Outside-in and Inside-out views unite to form a holistic view Figure 2: [Asset 1] Market Impact Monitor to flag changing preferences Fine-tune targeting by continuously sensing customer response Once companies have refined search trends, they should shift focus to fine-tuning the brand messaging based on today's fluid geo-political-social situation. Online forums and group communications are emerging as viable ways to understand the right consumer attitudes, services and brand positioning that companies need to adopt. The classic sender-receiver approach (test and learn) helps position the brand based on the ground reality that considers consumers' fear, uncertainty and doubts. In addition, a survey based approach combined with real-time monitoring of the Web and social media-verse helps personalize services and products by monitoring sales performance and customer preferences. For instance, Wipro's Return on Spend Studio leverages modular AI based accelerators to help companies sense consumer preferences through a lab setup.The studio uses Google trends data for understanding demand and service requests such as Google, Apple Mobility and COVID-19 case time series. This helps get insight into the affected areas with enhanced ability to understand the possibility of stabilization (see figure 3 and 4). Figure 3: [Asset 2] Return on Spend Studio - Performance View Figure 4: [Asset 2] Return on Spend Studio - Customer View At the same time, companies should plan to rapidly utilize financial indicators and stock markets data for competitive trending. Marketing spend should be allocated to sentiment and brand analysis for improved customer targeting through social media. It is also crucial to analyze Google trends for revamping the brand. Companies can use Google trends analysis Natural Language Processing (NLP) to categorize tweets and their emotional variance for improved targeting across brand categories. Similarly, advanced technologies such as Mobility Exploratory Data Analysis, Google BERT based conversational AI system, Facebook Prophet and predictive monitoring can help companies to better understand the geographic impact, query articles and papers, and forecast COVID-19 infections. All these actions can help companies optimize their spend, continuously monitor return on their marketing and advertising spend, and refine messaging to customers to boost traction. Optimize product fulfilment by injecting local market intelligence As most countries shift their attention to reopening

economies post lockdown, companies will need to take a strategic approach to business recovery based on industry-specific demand-supply drivers (see Figure 5). This will equip companies to re-target their customers with the right products, at the right time, in the right location, and through the right channel. A market recovery monitor that considers Figure 5: Unique data sets for uncovering local market intelligence Figure 6: Market Recovery Monitor to assess market strength Figure 7: [Asset 3] Market Recovery Monitor to understand success of social distancing Figure 8: [Asset 3] Market Recovery Monitor to assess mobility levels Figure 9: [Asset 3] Market Recovery Monitor to assess consumption per local market Redefining demand prediction, personalization and product optimization in the post-pandemic normal Companies that systematically integrate local market intelligence based on an organic open data ecosystem will gain access to a much better view of demand. They can then target better and optimize fulfilment. Companies that fail to do this will miss the boat as far as understanding where the demand lies is concerned, in the uncertain post COVID-19 world. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption
=====================

Smart Farming powered by Analytics

Smart Farming powered by Analytics The future of agriculture in India June | 2020 1. Indian Agricultural Sector On the face of it, the Indian agricultural sector presents some staggering numbers. It provides livelihood to 58% of India's population with a Gross Value Addition of 265.51 billion USD(agriculture, forestry & fishing combined)1. At 283.37 tons, India had a record production of food grains in 2018-191. While these numbers may seem impressive on an absolute basis, they fail to promise if we delve a little deeper. Although this sector employs(directly/indirectly) about 58% of the population, it contributes only about 15.87% to the country'sGDP2. This brings us to a key parameter, that is, agricultural productivity. The most popular metric to measure agricultural productivity is agricultural Value Added per Worker. A comparison of the top 20 economies on this metric reveals that India's agricultural productivity has great scope of improvement(Illustrated in Figure 1). All the countries with the lowest agricultural value-added per worker are mostly developing/underdeveloped economies with high population densities viz. India, Indonesia, China, etc. India fares the lowest amongst the top 20economies (by GDP) in terms of agricultural value-added per worker. Clearly, there are certain problems that need to be addressed. Now, let us look at the key problems faced by the Indian agricultural sector. Figure 1: Agricultural Value Added Per Worker* (2018) 1.1 Key problems faced by the Indian Agricultural Sector A number of factors curtails India's agricultural output – while some of them are systemic or historical in nature, the others are environmental or technological (See Figure 2). The systemic factors have evolved over centuries of agricultural activity dating back to ancient times while the geographical features of agrarian land and weather patterns primarily dictate the environmental factors. The technological factors have emerged primarily due to lack of advancement of agricultural techniques, and affordability of machinery and equipment. Let us look at all these factors one by one: Systemic factors a. Cropping pattern: In many areas, continued application of obsolete cropping patterns inhibits agricultural productivity. Practices like mono-cropping not only lead to lesser output but also lead to soil degradation. b. Land ownership/ Fragmented land holdings: The average size of landholding in India is less than 2 hectares. This makes it difficult to achieve economies of scale and introduce new technologies and machinery c. Land tenure: Due to absentee landlordism (despite the abolished zamindari system), the tenure of land holdings for farmers is not secure. This makes it an adverse environment for the application of modern farming techniques, crop rotation, etc. d. Agricultural credit: There is lack of systematic financing provisioning for farmers. Co-operatives and other financial institutions have not been able to eliminate village money lenders who lend money at exorbitant interest rates, thereby making finance unaffordable for farmers. Environmental factors a.

Erratic Monsoon: One of the key factors influencing agricultural productivity in India is the unpredictable behavior of monsoons. This problem is aggravated due to the lack of irrigation facilities across India. b. Soil infertility: Increasing pressure on agricultural land in India has led to overuse of fertilizers, increase in tillage, abandonment of traditional organic soil revival techniques, and insufficient rotation of crops. This has resulted in soil degradation and loss of fertility. c. Water sources: Water sources are not effectively linked to fulfill demand for irrigation to all farming areas. d. Topography: The diverse topography of India's land makes it essential to identify the right crops for the various soil variants and climatic conditions. Technological Factors a. Lack of farm equipment: Farm mechanization in India is low despite growth over the decades. A good measure to gauge mechanization is power availability per hectare, which is low in India. b. Lack of new farming techniques: Due to lack of awareness regarding new farming techniques and over-adherence to old traditional ways of agriculture, farmers in India have not been successful in widely adopting new farming techniques. c. Lack of water supply: There is lack of efficient ways of water supply for irrigation. Groundwater supplies more than half of India's demand for irrigation mostly by flooding through open channels. This, however, is an inefficient means of water supply as it leads to depletion of the water table. 39% of wells in India are already showing decrease in groundwater levels. d. Lack of storage facilities: Even if production factors are enhanced, lack of storage facilities inhibits production. Estimates suggest that about 1.35 billion USD worth of food grains are wasted in India every year due to lack of storage facilities. Other factors a. Lack of agriculture marketing: A number of factors lead to the unorganized nature of the agricultural industry, for example, the small scale of operations managed by small households, over-dependence on monsoon and other natural water sources, etc. This makes proper marketing of Indian agricultural products difficult. b. Agriculture pricing: Unlike other industries, here, the farmer is more often a price taker rather than being the price maker. This is because of the ownership contracts, people involved in logistics as well as other intermediaries. Illiteracy among farmers is also a key factor that makes it difficult for farmers to get a fair value for their produce. Figure 2: Factors curtailing India's agriculture Typically, in the Indian context, a single rural household with all its members are dependent on farming as their single source of livelihood. In such a scenario, it becomes even more necessary to tackle the above-mentioned problems with a comprehensive strategy. While addressing most of these factors need policy interventions, but tackling some of them can be easier through the adoption of Analytics & Smart Farming.In the subsequent sections, we will explore Smart Farming, and how it can alleviate some of the problems discussed above, with the power of analytics in conjunction with IoT & Cloud. 2. Smart Farming Smart Farming refers to the application of modern Information and Communication Technologies (ICT) in agriculture. It promises to revolutionize the world of agriculture through the application of solutions such as Internet of Things(IoT), actuators and sensors, geo-positioning systems, drones or unmanned aerial vehicles(UAVs), precision equipment, robotics, etc. backed and powered by technologies such as Big Data, Analytics, and Cloud. Smart Farming has a real potential to deliver more efficient and sustainable agricultural production, through data-driven insights and decisions, and better resource management. From the farmer's

point of view, Smart Farming will provide the farmer the means for better decision making and more efficient operations and management. Smart farming is associated to three fields of technology, which are inter-related: As is evident from its very definition, SmartFarming is closely interlinked with IoT, cloud &analytics. IoT is one of the pillars of smart farming. Primarily, it's utility lies in generating data from various sources pertaining to environmental conditions, seed quality, and quantity, etc. However, amongst all its use cases, four of them are most prominent (Shown in Figure 3): Figure 3: IoT & Smart Farming Figure 4: High-level architecture of a Smart Farm Edge Analytics and Computing is a promising alternative to cloud as it tackles all of the three above-mentioned challenges by eliminating the need for all the data to be transferred to the cloud and back. This reduces cloud-computing costs, additionally, edge analytics and computing enhances network efficiency, which leads to increase in processing speed. 2.1. Role of Analytics in Smart Farming Analytics has a wide span of use cases and application areas across the agricultural value chain. However, for the sake of simplicity, we will confine our discussion only to crop production and agricultural financing and insurance. Analytics solutions leverage Big data, IoT, Cloud Computing, and GPS technologies to generate relevant data, which in turn is used to derive actionable insights. This helps farmers andfinancial corporations make better data-driven decisions. To unlock the power of analytics, basic information from Management Information Systems should be requisitioned. This will ultimately help in driving precision agriculture and better decision making to realize benefits. The framework given in Figure 5 describesAnalytics-enabled Smart Farming and its benefits. Figure 5: Role of Analytics in Smart Farming Figure 6: Analytics skills relevant for Smart Farming 2.2 Use cases of Analytics in Smart Farming Analytics in smart farming has a number of use cases in conjunction with IoT– some of which are: 3. Putting it all together – 'Smart Farm Operating Model' A highly effective Smart Farm Operating Model is illustrated in Figure 7. The day-to-day monitoring and control of crop and environmental parameters affecting the crop, plus the regular data-driven crop planning is classified into the core SmartFarm operations, while other ancillary activities associated with the farm such as marketing, inbound/outbound logistics, and crop finance and insurance are bucketed into 'other Smart Farm operations'. Together, these two buckets constitute what we perceive as a Smart Farm ecosystem. Typically, there would be sensors and IoT devices placed across the field to collect environmental and crop health parameters which would be relayed to the data cloud via a gateway. The data cloud, is primarily responsible for data storage, processing and analytics. Reporting dashboards allow farmers/ decision-makers view the data and key insights. At an immediate level, this can help them use a User Interface or an app to trigger on-field smart devices like actuators/motors or temperature controllers. At a macro level, analytics helps them use the production data, the environmental data along with demand data to plan for the future. Given the wealth of data that the on-field sensors provide, when demand-related data is added to it,it can help reveal more insights, which are relevant for the marketing function. This data is also relevant for inbound logistics (supply, procurement as well as storage of seeds, fertilizers, manure, etc.) as well as outbound logistics (distribution to the market). Basically, it helps enable decisions on when to store and when to sell. Last but not the least, the plethora of production,

climate, crop health, and demand data and insights can help financial institutions and insurance companies gauge risks better to come up with better propositions for farmers. Figure 7: Smart Farm Operating Model 4. Global implementations of Smart Farming solutions There have been several initiatives across the globe in the implementation of Smart Farming Powered by Analytics. Some of the solutions and their implementation details are listed in Table 1 . Table 1: Global Smart Farming solutions and implementation details 5. Key challenges in Smart Farming adoption 5.1 Commercial viability Figure 8: How to address key hurdles in Smart Farming adoption 7. Conclusion Looking at the various aspects of Smart Farming, we can infer that while Smart Farming powered by analytics can be a boon to agricultural productivity in India, there are, however, areas that need attention. A key area to be worked upon is the strategy to ensure economic feasibility and ease of adoption. Taking cues from implementations across the world, a prudent approach would be to start small– with pilots in small farming districts. Even though every market is unique, there are learnings from every implementation that can be taken forward. Once, a robust framework is developed, the solution can then be scaled across regions. When it comes to affordability, which prima facie, seems like a big challenge, it must be noted that the global implementations mentioned in this paper are spread across both developed and developing economies. So, with the right framework and roadmap in place, it is likely that smart Farming will enable Indian farmers to produce more and better with less, and thereby earn more and enhance their standard of living. In 2018 Europe's General Data Protection Regulation (GDPR) went into effect, and many other countries are right behind them. Now, under the Private Data Privacy Act, country's residents are entitled to the opportunity to consent to - or opt-out - the collection, use, and distribution of their personal data. And in order to give consent, they must do so in writing. To help businesses needing to adapt to these new regulations, we've put together a free download. Our quick guide will cover important facts, including: Don't miss this chance to learn more about not only how the Private Data Privacy Act will affect businesses going forward but also how to comply, protect customers, and thrive. =====================

How Analytics Can Help with Supply Chain Planning

----- Arcticle source ----- https://www.wipro.com/analytics/how-analytics-can-help-with-supply-chain-planning/ ----- About the Author(s) Related Articles Contact Wipro Please fill the required details to access the content How Analytics Can Help with Supply Chain Planning August | 2020 The UK government has mandated that energy suppliers install smart metering systems across Great Britain by the end of 2024. Regulators estimate that energy suppliers will deploy 53 million smart meters during this period — a volume five to ten times higher than a supplier's typical deployment numbers. To achieve this, suppliers will need to ensure high supply planning performance during the SMETS2 (second generation of smart meters) installation ramp-up. This paper explores how energy suppliers can succeed in this effort by bringing together all aspects of their end-to-end supply chain planning, such as demand or deployment, asset ordering and procurement, inventory management, and financial analysis. Supply planning challenges Managing asset procurement and logistics is one of the key challenges in supply planning. The reason: To scale up supply planning operations, energy suppliers need to forecast asset orders across asset types provided to the meter assets providers, manufacturers, and DCCs. At the same time, long lead times for order fulfillment, stocking challenges and policies, storage and delivery frequency limitations, likelihood of late delivery and orders, and the overutilization or underutilization of the warehouse or depot makes calculating the number of required assets difficult. Eliminating the threat of stock outages is, therefore, a significant

operational challenge. These operational aspects translate into financial challenges, such as increased warehouse costs, asset rental costs, working capital utilization, and stock outage costs. Additionally, regulatory penalties, including GSOP (guaranteed standard of performance) liabilities awarded by OFGEM, need to be avoided by ensuring that the supply planning helps meet the targeted ramp-up smoothly. An efficient and effective supply planning function that considers the entire breadth of supply chain operations is of paramount importance. (See Figure 1.) Figure 1: Supply chain operations   Need for advanced analytics-driven supply planning In the smart metering business, the supply chain drives a significant amount of costs for the suppliers. Despite this, 70% of business users still rely on spreadsheets1 and manual intervention for asset order forecasting. However, this approach is error-prone, expensive, and doesn't support any scenario analysis or traceability. Therefore, innovative ways of supply chain planning are needed to minimize cost while achieving possible business benefits. No wonder companies in mature markets invest in asset data management and analytics platforms and capabilities as they generate value-added business insights for asset ordering and increase consolidation and collaboration to achieve end-to-end supply planning. One of the key challenges with this approach is the availability of data with the right granularity. Leveraging advanced analytics in the supply planning function helps in calculating accurate asset order forecasts with the lowest granularity and aids in identifying policy requirements, realizing additional business benefits, and improving the overall efficiency of the asset-planning team. Additionally, strong scenario modelling capabilities or simulations can help the business understand the impact of deployment shifts (demand changes), inventory changes, non-delivery situations, and transportation inefficiencies on asset order forecasts in the run-up to ramp-up. Scenario modelling helps organizations make informed decisions by evaluating operational and financial impacts. Advanced analytics can, therefore, integrate supply chain planning functionalities, such as near real-time planning, by seamlessly bringing together deployment, supply, inventory, and finance, and continuous optimization. (See Figure 2.) Figure 2: Supply chain planning functionality   Supply planning business objectives At a high-level, the objective of supply planning (see Figure 3) is to minimize cost, while ensuring regulatory compliance and avoiding GSOP failure, by producing highly accurate asset order forecasts at the lowest level of granularity. Expenses here can include different aspects, such as warehouse costs (including storage, handling, and transactions), aged asset rental costs, inventory costs, stock outages, and late delivery. Figure 3: Supply planning business objectives   Solution Overview Based on deployment profile or demand forecast, inventory information, and parameters such as stocking levels, contract lead times, non-delivery, transportation inefficiencies, and many more, an advanced analytics solution can generate optimized asset order forecasts for different asset types, fuel types, and MAPs. Advanced statistical analysis capabilities can provide business insights into key variables, such as delivery frequency, buffer stock, pallet size, order forecast flex, and late delivery. Optimization techniques can provide the supply plans by minimizing cost parameters while considering technical, operational, and financial constraints. For instance, while minimizing storage costs (including late delivery penalties), capacity plans and thresholds (related to workforce and logistics) can be considered

possible input constraints. Figure 4: Supply planning solution factors Performing scenario modeling and what-if analysis as part of the planning process can provide businesses supply flexibility over frequently changing deployment plans (created due to shift to the right, sensitivity analysis), and inventory costs. Additionally, estimating the impact of changes in different parameters can inform policy decisions. Multiple scenarios can be compared for operational and financial impacts, and the baseline can be set after a cost-benefit analysis. Similarly, KPI reporting from the analytics platform with a consolidated data view can help identify the root causes for issues and assist with supply planning to generate business insights, visualize trends, and provide specific patterns. Alerts to internal and external stakeholders for certain cases, such as exceptions, late orders, and over- or under-used warehouses, can also be enabled. Thus, integrated supply chain planning functionality (e.g., near real-time planning) can enable unified planning across deployment, supply, inventory, and financial aspects. Business benefits Supply performance issues during deployment peak periods of smart meter deployment can be immensely costly. For instance, stock issues can hamper engineers from installing meters or taking customer appointments, resulting in missed MAP revenues and GSOP failure penalties. Warehouse cost also involves storage, handling, and transactions and is closely tied to buffer stock and delivery frequency. At the same time, the stocking principles applied in logistics operations drive aged asset rental costs. Advanced analytics can help reduce aged assets from 30% to 10% of the available stock, saving millions in cost over the course of a few years. It can also expedite tactical asset planning activities, thereby improving planning efficiency and sparing more time for strategic planning where advanced scenario modeling can drive value-added insights for deployment ambiguities. Driving value through collaboration By investing in advanced analytics and platforms, a business' maturity in supply chain planning can evolve from a "siloed" or "reactive" state to a "collaborative" or "integrated" state by bringing together demand, supply, inventory, and financial aspects of planning on a single platform and driving further value through advanced analytics. Integrated supply planning can help businesses overcome operational and financial challenges while mitigating risks and driving cost savings in millions over the course of the deployment period and associated ramp-up of smart meter volumes. Furthermore, integrated supply planning can help make policy decisions and improve the overall efficiency of the asset-planning process. DataOps – An Antidote for Data Value Chain Challenges

----- Arcticle source ----- https://www.wipro.com/analytics/dataops-an-antidote-for-data-value-chain-challenges/ ----- About the author(s) Related Articles Contact Wipro Please fill the required details to access the content DataOps - An Antidote for Data Value Chain Challenges September | 2020 Abstract Over the past decade, we have witnessed an unprecedented technological disruption in application and data functions. They are now enabling enterprise-wide digital transformation initiatives to empower customers and colleagues. This evolution, coupled with the avalanche of data, creates a wonderful opportunity to establish data-driven enterprises, while simultaneously poses challenges around managing, governing, monitoring, and improving the value of data. Enterprises need to re-imagine how they deliver data and analytics programs, as current processes often fall short of meeting the rapidly evolving demands of business. A DataOps framework acts as an antidote to address data-related challenges, enabling a shift towards agile and reliable delivery of data and analytics programmes. This paper discusses the significance of DataOps and leveraging it to alleviate problems faced in data analytics programs. It also provides a framework to implement DataOps successfully in enterprises. Challenges abound in the data value chain A typical data value chain comprises the following stages: Acquire, Process, Publish, Consume, and Act. Typical challenges in this value chain include (Ref1): Figure 1 illustrates several key statistics on enterprise data value chains (Ref2). Figure 1: Enterprise data value chain statistics Six steps to leveraging DataOps to mitigate challenges DataOps (see Figure 2) brings together the best software engineering and data engineering tools and methodologies, coupled with cultural changes and monitoring controls, to create trust in data and accelerate analytics delivery. It puts analytics at the heart of an enterprise. DataOps acts as a bridge between data providers and consumers by facilitating bidirectional communication flow to improve the quality of the data value chain. DataOps combines Agile, DevOps, and statistical process controls to provide delivery efficiencies and increase the value of the data value chain. Figure 2: DataOps architecture Let's delve into what it takes to implement a successful enterprise-wide DataOps strategy (Ref3). The six key steps are as follows: #1 Establish the DataOps function with a culture of deeper collaboration It's critical to establish the DataOps function with senior stakeholders of the enterprise with representation from both business and IT. Define the operating model, establish KPIs across the data value chain pertinent to the DataOps function and the enterprise as a whole, track through DataOps implementation, and continuously refine the KPIs to further increase the data value. It is important to establish an enterprise-focused strategy. Key stakeholders, such as the Chief Information Officer (CIO), Chief Technology Officer (CTO), Chief Data Officer (CDO), Chief

Digital Officer, Chief Analytics Officer (CAO), Chief Data Architect, Chief Data Scientist and Head of Business Functions and Finance representatives, must be included. #2 Leverage/set up Enterprise-level Agile and DevOps capabilities Most modern enterprises have either built or are in the process of building Agile and DevOps capabilities. Data & Analytics teams should, therefore, join forces and leverage the enterprise's Agile and DevOps capabilities to: #3 Automate the provisioning of data, analytics, and AI infrastructure One critical principle of DataOps is the ability to scale IT infrastructure in an agile manner to meet the rapidly evolving business requirements. Many commercial and open-source tools are available to automate infrastructure. Regardless of the hosting environments (cloud/on-premise/hybrid), enterprises should rely on infrastructure as code to set up, configure, and scale Data & Analytics platform services. Version control the code similar to the application code or analytics code. Ensure automation in security and compliance requirements as well. Examples of data infrastructure automation include: #4 Establish multi-layered data architecture to support a variety of analytical needs Modern-day data platforms are complex with varied needs, so it's important to design your data platform in alignment with business priorities to support myriad data processing and consumption needs. One of the proven design patterns is to set up multi-layered architecture (raw, enriched, reporting, analytics, sandbox, etc.), with each layer serving a different purpose, and increase the value over time. It is also important to establish the owners across different layers. Register data assets across various data layers to support your enterprise data discovery initiatives. Set up data quality controls across various layers to create data assurance and trust. Set up appropriate data access controls so that data providers and consumers can safely share and access data and insights. Containerize and scale these services across various analytical engagements as reusable services. #5 Build data value chain orchestration pipelines Orchestration plays a pivotal role in stitching together the data flows from one layer to another to bring "ideas to operationalization." Leverage containerization capabilities to ensure that the sub-components of these orchestration pipelines are scalable and reusable across the enterprise. Key pipelines supported by DataOps are: #6 Define and implement a holistic monitoring and alerting framework Build a comprehensive monitoring and alerting framework to continuously measure how each stage of your data value chain responds to the changes. Socialize these KPIs with the DataOps function to take the right course of action and build reusable artifacts where possible. Benefits of DataOps DataOps is the future of data management Given the rapid and constant changes in data, enterprises need a comprehensive solution to bring together every part of a business into one pipeline. That's what DataOps enables. It drives companies to use data more efficiently, leveraging the right tools, technologies, and skill-sets.   With better end-to-end data pipeline visibility, automated orchestration, higher quality, and faster cycle times, DataOps enables data analytics groups to better communicate and coordinate their activities. Clearly, DataOps is the antidote that organizations always wanted to address data value chain challenges, and it will become a critical discipline for those who want to thrive in the new age data landscape. References Ravi Varanasi Partner, Data Analytics and AI, Wipro Ravi Varanasi has more than two decades of experience in data, analytics, cloud, architecture, innovation, and thought leadership. A data-driven decisioning roadmap for retailers in COVID era

----- Arcticle source ----- https://www.wipro.com/analytics/a-data-driven-decisioning-roadmap-for-retailers-in-covid-era/ ----- About the author(s) Related Articles Contact Wipro Please fill the required details to access the content A data-driven decisioning roadmap for retailers in COVID era The questions on everyone's mind September | 2020 While COVID-19 has had a catastrophic impact on health and the economy, it has also fundamentally changed how people live and work in the foreseeable future. Successful retailers often take great pride in their deep understanding of the consumer's psyche and buying behaviour. In the last decade or so, they have leveraged troves of data for successful decision-making. However, such institutional knowledge has lost its relevance in a matter of few weeks. Each part of a retailer's value chain is impacted. Let's first talk about customers and demand. The first major shift is the decline in consumer spending owing to uncertainties in the job. A recent survey by London Business School indicates that household spending has declined by almost 40-50% [1] in the UK, and similar trends are emerging across the globe. This will have a significant impact on the Retail industry overall. Similarly, the 'Work from Home' model will impact the Fashion and Hospitality business. The economies of scale that big-box retailers leveraged have been constrained to a large extent. Retailers would have to learn to optimize their operations in order to maintain their bottom-line. Density or footfall used to be the key measure in brick-and-mortar retailing. Most retailers measure the efficiency of stores by sales per sq. ft. This will change to comply with government guidelines and ensure safety. Customer and Patient safety and compliance related to public health are added to day-to-day operations. Figure: 1 – Impact of COVID on the retail industry These uncertainties have made

demand functions and operations strategies void. Since the past is no longer the best predictor of the future, retailers need to start afresh and learn from the present as if they are starting for the first time. When governments around the world are poised to ease restrictions, retailers have several key questions to answer before they fully operationalize. Figure: 2 – Questions to which retailers are looking for answers Key Challenges that Data & Analytics Organizations Need to Solve for Retailers Data & Analytics have been embedded across the Retail Value chain. The evolving situation has certain constraints and is challenging the solutions built using Data & Analytics. New Normal for Retail Analytics The new normal for Retail Analytics should start WITH identifying relevant use-cases across THE Retail value chain, AND Setting up the appropriate Analytics framework THAT can deliver required insights Using the right data. Re-Imagine the Retail Business Process An Analytics Framework to Deliver The decision of reopening should start with a clear set of objectives. The objective can vary from getting back to your most valuable customers as soon as possible to clearing the stocks before the start of the next season. We advocate granularity as a key trait for successful decisioning at times like these. In a rapidly evolving environment like this, it may not be realistic to set targets for months and quarters ahead. The time horizon for decisioning needs to be daily or weekly. Figure: 3 Decisioning framework Once the objectives are agreed upon and communicated, simulations can be developed for different likely scenarios and the outcomes of the decisions on the objectives. This can be made visible to executives and decision-makers through interactive dashboards to enable efficient decision-making. Each decision should be treated as an experiment. The data related to outcomes should be collated centrally and the insights should be shared with relevant stakeholders. This is indispensable in the context of decentralized decision-making as the learning from the decisions from one area / product category are made available to others in a consumable fashion. Sourcing the Right Data The foremost challenge that the Data & Analytics organization is confronted with is to source the data related to the spread of the pandemic. There are several third parties, government agencies, research organizations, and technology providers that have already collated the data related to COVID, which can be sourced and used. The covid dashboard[2] prepared by Johns Hopkins University contains a wealth of information. The United States government[3] and National Institutes of Health[4] have made several data sources public, which can be leveraged to understand the spread of the pandemic. Figure: 4 - Sources of data that can be leveraged Amazon (AWS) has created a data lake specifically for COVID[5], consolidating information from multiple sources and made it ready for computation. Similarly, Tableau has created multiple COVID dashboards[6], which are accessible to the public. In addition, several organizations are making COVID-specific data available through APIs. In times like these, when historical data alone does not serve the purpose, it is a good idea to reach out to customers directly to seek their opinion. Surveys are a very potent way to sense customer demand and buying preferences. Customer surveys can be conducted to get a sense of their expectations on assortment and price points, and potential disposable spending. Frontline employees often have an intuitive understanding of the customer's pulse for a product category in a region. Employee surveys can be conducted to consolidate this knowledge in a centralized way and present it for the entire organization. Employee surveys

are also a great way to understand the potential health risks because associated with COVID. Data from social media feeds is another channel to understand customer sentiments and product preferences. The response to COVID needs to be dynamic with access to real-time information. Retailers, over the years, have built data platforms e.g. Operational Data Stores for low latency and granular data. Such platforms can be augmented with additional COVID and survey data to make data available in real time. Accelerating Data & Analytics Strategy during COVID The data & analytics organization is critical to the reopening and revival of the retailer. Therefore, it is paramount that the business objectives be aligned with technology objectives. In addition, technology initiatives must deliver outcomes within resource and time constraints. The knowledge contained within the existing resources and teams should be leveraged to find creative solutions to data and technology challenges. While ideas can be sourced from each, separate cross-functional teams can be formed and entrusted to deliver on specific objectives. Securing any additional funding for new technology investments at this stage can be extremely challenging. The team should leverage the existing technology stack to the maximum extent possible. As the longevity of the solutions are not known, the developer's time should be spent on actual development rather than documentation, review, and approvals. As the situation is extremely volatile, with new information coming up every day, all developments must go through an MVP-based iteration. The cost should be moved from capex to opex. It is often said that crisis brings the best out of human beings. So while trying to respond to COVID, data and analytics organizations should not lose sight of the future. In fact, they can use the time to resolve operational silos that prevented sourcing of data, thereby improve the efficiency within the team, and innovate. How Cloud is Disrupting the Financial Services Industry

----- Arcticle source ----- https://www.wipro.com/analytics/how-cloud-is-disrupting-the-financial-services-industry/ ----- About the Author(s) Related

How Cloud is Disrupting the Financial Services Industry September | 2020 Financial institutions have been slow at adopting cloud technologies primarily due to concerns around security, regulatory compliance, and governance. As a result, they have been facing business model-related challenges like legacy technology, high running costs, and lack of scalability. Adoption of cloud is becoming the norm now and analysts expect about 75% of the financial institutions' infrastructure and data to be processed in the cloud by 2022. In this paper, we will look at the current needs of Banking, Capital Markets and Insurance industries and how moving to cloud helps them build the foundation for digital transformation. Financial institutions: The changing paradigms and needs Banking Banks have been evolving to business models that are digitally focused. They are having to do so as "digital-only" banks are tapping into their market, offering consumers digital banking tools such as mortgage calculators. Traditionally, customers have gone to the megabanks to obtain access to different banking accounts that offer flexibility in areas such as overdraft fees. This is no longer the case as the digital-only banks now offer checking account services while providing competitive overdraft fees. Megabanks are having to adapt their business models to catch up. Previously, business models relied on the customer looking at the number and location of branches to bank with. As we see now, across all income levels, branch location is not a significant factor. The rise in digital banking and innovation requires banks to offer services to their customers at an affordable unit product cost without impacting operational efficiency. Technology and data platforms that are versatile and instant are paramount. Capital Markets High capital expenditure costs on technology have for long constrained the capital markets industry. A standard use case has been around the buying and selling of trades that can rapidly increase/decrease during peak hours in real-time. The collection of trade data and the need for real-time analytics has traditionally meant expensive technologies deployed in data centers that provide permanent, extensive processing capabilities even though they are only required during peak hours. Besides, large IT teams need to be on standby during these peak hours to ensure platform availability in the event of an issue. Insurance Let us focus on an example within the Property and Casualty (P&C) Insurance industry. Traditionally, claims management has involved customers interacting with call centers over phone calls (single channel) and then completing paper-based forms sent by post/emails. The claims process has been known to take several weeks involving multiple phone calls, leaving the customers with a negative experience. According to the Claims Journal, claims servicing within the P&C industry has the lowest positive experience across all insurance lines of business. Yet, it is the most crucial factor in customer retention. Millennials use multiple channels to communicate. Enabling an omnichannel approach has become the norm for creating an integrated customer experience, leading to their retention. Financial institutions are facing issues with expensive legacy platforms, the growth of digital / omnichannel demands, and the need to process vast volumes of data in real-time. All of this is occurring at a time when they are looking to reduce IT spend to focus on delivering value to their customers. The drivers of cloud adoption Financial institutions are looking for technology and data platforms to support their focus on the customer. We will use the P&C Insurance example cited earlier to illustrate the drivers of cloud adoption in insurance.

The three key drivers are: 1. Move from CapEx to OpEx models Taking the P&C Insurance claims example, traditionally, being able to grow business across geographies has required high upfront CapEx. Moving to cloud-based technologies frees organizations from such constraints. They can adopt flexible OpEx models that can free financial institutions to focus on driving innovation and delivering excellent customer experience. 2. Deliver digital customer experience at minimal cost Digital banks, with their innovative and connected customer experience, are successful in driving customer acquisition, new marketing opportunities, retaining customers, and growing revenues. Therefore, technologies and data platforms need to be digitally scalable in engaging customers without introducing massive cost base. Again, taking the P&C Insurance claims example, the millennials are expecting: Financial institutions need to provide their customers with on-demand technology to meet their demands better. 3. Be elastic to meet changing customer demand Increased number of customers and demand for immersive experience add complexities within the banking infrastructure. It gives rise to the need to address continuous explosive data growth at the same time adhering to higher service level objectives and agreements. Typically, when demand is lower during non-peak hours, the cost of technology usage should also reduce. As in our P&C Insurance claims example, the need of omnichannel approach means that peak hours are becoming more varied (unlike fixed opening and closing times of traditional call center) and require significant compute power at different times throughout the day. Toward digital transformation with cloud Financial institutions' have stepped up their pursuit of transformation in the age of Industry 4.0 and digital disruption. To become an Intelligent Financial Hub, business thinkers are looking for possibilities and changing their existing business models through the vast amount of information integrated across various sources. Cloud ecosystem unlocks financial institutions' capability to manage and mine massive scale datasets of their users involved in billions of transactions. Figure 1 depicts how cloud is disrupting the evolution of the financial institutions. In addition to digital customer experience, financial organizations are disrupting and introducing new products and platforms. Let's consider how cloud is changing the claims business model for insurance. Sophisticated machine learning-based fraud detection models can crunch through large volumes of varied data such as photos of the damage, previous customer claims, social media status etc. to assess fraudulent claims. This allows effective "Auto-Approvals" of claims as well as the identification of ones that need "Manual Investigations". It speeds up the overall claims time, improves accuracy, and results in higher retention rates. Figure 1: Cloud-native financial institutions Infrastructure as a Service (IaaS), Platform as a Service (PaaS) and Software as a Service (SaaS) are the backbones of cloud offerings. Figure 2 shows how many data services are being deployed using these cloud offerings. Figure 2: Examples of service industry cloud offerings As insurers continue to adopt cloud technologies, their focus will move towards PaaS and SaaS services to deploy such fraud models. This would remove reliance on internal technology resources so that the business can focus on adding value to its customers and evolving business models. Figure 3 summarizes what part of your organization could start moving to the cloud and start reaping the benefits from day 1. Figure 3: Cloud Strategy: Which part of your organization could move to the cloud? Institutions that have started by

moving core systems onto the cloud, plan to carefully follow with a move of their data platforms (including fraud models, reporting and data quality) onto the cloud. The future of "Cloud Only" technology and data platforms is inevitable; it will lead to innovative and efficient ways of solving business problems. Reimagining the future with cloud The success of banking and financial institutions are often constrained by its legacy business models. With the advent of advanced, cutting-edge cloud computing technologies, big data, advanced analytics, social data, IoT, AI, conversational bots, financial institutions have changed. They have become more responsive and at the same time, converting cloud investments into a palatable price and product offering advantage. Smart and virtual banking, digital wallet, mobile payments, P2P lending and investments and many more have raised digital transformation to a new level. Cloud technologies and edge computing, together with geo-location and real-time assets monitoring capabilities have given significant new dimensions. As a result, the entire financial risk and decisions can serve their consumers better at an affordable price. Cloud helps in laying the computation and operating model foundation for the new digital business model. Embracing the evolution of application design, behavioral profiling and significant rise of AI-fused process and products, cloud ecosystem helps to tame the increased demand for specialized ML IaaS and PaaS platforms. Technology and data platforms, founded by a well-defined cloud strategy, that follows innovative platform OpEx models and is digitally scalable and elastic, will reimagine the financial institutions' success in the future. Are you facing issues with expensive legacy platforms, the need to process vast volumes of data in real-time, and meeting customer demand for digital / omni-channel experience? Click here to connect with us and find out how we can empower your journey towards being an intelligent financial hub. Sukhvinder Phalora Director with the Data, Analytics & AI Consulting practice He has more than 18 years' experience within the Financial Services Data domain. =====================

Banks Need to Build Alliances and Supply Open Banking APIs to Drive Strategic Business Outcomes

----- Arcticle source ----- https://www.wipro.com/analytics/banks-need-to-build-alliances-and-supply-open-banking-apis-to-drive-strategic-business-outcomes/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Banks Need to Build Alliances and Supply Open Banking APIs to Drive Strategic Business Outcomes March | 2021 In today's changing environment, banks should prepare for open banking to address the threats of rapidly growing competition, and embrace the innovative technologies and customer insights that will come with this new way of doing business. Banks must focus on building an architecture that is Application Programming Interfaces (APIs) powered and data rich, and allows plugging into the bank's eco-system while managing safety risks. It must reconsider its role and supply APIs as products enabling business outcomes. It is these interfaces or compatible APIs, that will transform the traditional banking model. What is Open Banking? Open banking is an emerging financial technology where regulated financial institutions share some customer financial data to permit competition, innovation, and better financial products. While traditional banking has relied on a private, 1:1 relationship between the bank and the consumer, open banking allows banks to provide 'open access' of its core services to third parties, partners, and key customers. Open access to some customer data challenges the normal model of banking as new players take a bigger role within banking value chains. Benefits of Open Banking The benefits of open banking will be felt by consumers and banks. As financial institutions collaborate with financial technology (FinTech) companies, innovation will drive better products and services for new and existing customers. Benefits to customers include streamlined digital experiences and simple, innovative products. Why should banks address Open Banking Now? In Europe, regulation is driving open banking by requiring banks across the EU to adopt. Some of the bigger EU banks, Lloyds, Rabo bank, HSBC, and Natwest have already made significant investments for open banking. And while international growth of open banking regulation has started, it is not level in every country. This technology is in the early stages. The UK is leading the way in defining a framework, but additional regulation is needed to install multiple layers of tight security as more banks and FinTechs come online. In addition, there is regulatory pressure from Second Payment Services Directives (PSD2), forcing banks to standardized interfaces. In the United States, customer demand is pushing the effort. The escalating call by customers for better digital experiences, easier ways to conduct financial transactions, more personal control over their financial data is moving US financial institutions to adopt open banking. How Open Banking Works Open banking allows a customer's financial data to be shared by regulated financial institutions

through the use of application programming interfaces (APIs). These APIs will shift the paradigm from traditional banking to open banking, gradually leading to the development of strategic ecosystems. Through association of key financial partners, banks will distribute, aggregate, and consume open API services enabling competition, innovation, and better products to be introduced in the market. On a small scale, open banking has already begun. Examples include an agent issuing mortgages or consumer loans on behalf of a bank. The customer must explicitly provide consent for the banks to share their details to the third party and the customer can opt out or withdrawal anytime. Industry Journey to Open Banking As the industry moves toward Marketplace Banking and Coreless Banking, it is critical that agility is infused into the IT and business architecture to be able to address future needs. The decoupling of a bank's systems and services from core banking enables the rapid creation and distribution of new products into the market through collaboration with third parties. Regulatory mandates may require banks to comply sooner rather than later. To prepare for this new trend, there are things to consider that will improve an open banking strategy. Open banking is not as complicated as it sounds. The changes have to be based on two pillars: expanding ecosystems and extending current reach. There is a huge potential in API development and Cloud strategies leveraging open banking opportunities." Anmol Grover, Global Practice head, Open Banking, Wipro As a first step, banks should strategize their overall objectives and decide on the avenues where open banking can fit their model. Some of the pertinent questions that will help banks build a strategy are included in the table below. Don't just blindly adopt open banking. Think about how it fits into a bigger strategy to provide better customer experiences, extend reach and strengthen the brand, whether you build it or partner with FinTech to expand your offerings. Work is underway in many countries to adopt open banking. While each approach may vary in the defining technical standards for implementation, it is increasingly clear that uniform API standards will be a key driver for adoption and quality of available innovative products. Countries that have begun defining their frameworks include the United Kingdom, European Union, Hong Kong, Singapore, and Australia. For countries such as the United States and others that lag behind, market forces like customer demand for streamlined experiences and innovative products will drive adoption. Build an architecture that is API powered and data rich, allowing leading FinTechs to plug into the bank's eco-system while deliberately managing the safety risks. Reconsider the bank's role and supply APIs as products enabling business outcomes. How is Wipro Uniquely Positioned to Offer Advice? Wipro was involved in defining Open Banking Standards in the UK as part of the Open Banking Implementation Entity (OBIE). We are also a member of the Banking Industry Architecture Network (BIAN), a nonprofit industry body aiming to standardize banking. Through these affiliations, Wipro is uniquely positioned to guide financial institutions through the move to Open Banking. In addition, Wipro has invested in an open banking platform, Wipro's Open Banking API, that includes a comprehensive set of offerings across regulatory compliance, data standards, governance, open ecosystems, and co-innovation to enable a seamless transformation journey for banks and financial institutions. This platform helps banks comply faster and create new financial products that will add additional revenue streams. In conclusion Market forces and regulatory mandates will drive open banking.

Through the use of open banking APIs, the paradigm shift from traditional banking to open banking is gradually leading to the development of strategic eco-systems. Through association of key partners, banks are ready to distribute, aggregate and consume open API services. As financial institutions embrace open banking frameworks, they need to realize managing an open banking eco-system is much more than just exposing a set of APIs through associated knowledge-based content and providing some level of developmental support. Banks need to leverage a "development first mind-set" strategy to nurture their eco-system through a comprehensive approach that covers API framework, delivery, support, and innovation. Open banking is part of the digital adoption that is underway worldwide and will pave the way for the next generation of banking for everyone. Karthik Markandan Principal Consultant, Wipro Karthik Markandan is an experienced managing consultant and has anchored various compliance and regulatory assignments for multiple global financial institutions. He specializes in leading diverse range of data, analytics, business intelligence, and cloud transformation programs. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

IP Management in the Landscape of Disruptive Technologies

----- Arcticle source ----- https://www.wipro.com/analytics/ip-management-in-the-landscape-of-disruptive-technologies/ ----- About the Author Contact Wipro Please fill the required details to access the content IP Management in the Landscape of Disruptive Technologies April | 2021 Change is the only constant. And what drives change is continuous innovation. The technologically driven life in the 21st century is the outcome of inventions and discoveries that happened over time. Advancements like access to big data, machine learning applications, and computing hardware improvements are ushering in a new paradigm of technological shift. Consequently, intellectual property (IP) has become a subject of growing importance globally. The economy of a developed nation relies, largely, on the innovative solutions developed by researchers, and lawmakers have since long recognized the need for IP rights to protect the inventive work of individuals and firms alike. IP rights also enable firms to recover their research and development costs. IP protection tools, like patents, encourage businesses to develop new solutions and be assured of protected IP rights. Patents on software-related inventions are no less than a reward for the time, effort, and monetary investments put in by the researchers. With IPs helping generate path-breaking solutions to global challenges and contributing to

the growth of business entities, there is a significant growth in IP applications in the global economy. Around 182,218 patents were granted in FY 2000 in US alone, which increased by 100 percent to 399,055 in FY 2020. Given the importance and value of patents and, more generally, intellectual property, many firms are increasingly realizing the value of IP Management. IP Management is one of the ways to protect IPs. Making sure that IPs are adequately managed is extremely important for a firm or individual success. Innovators feel assured that their investments and returns on the solutions are protected and managed well, which further translates into incentives for their employer firms to increase investments in innovation since most innovations are profit oriented. Modern technology like AI is transforming the way IPs are managed. The use of AI in IP Management is already occurring and is poised for even greater adoption. Disruptive technologies are disrupting innovations Across industries, new age technologies like Artificial Intelligence and Machine learning have taken a leading position in driving innovation that has effectively disrupted various aspects of life. Artificial Intelligence and Machine Learning have given a boost to the demand for new forms of intelligent solutions in IP management. Wipro brings immense value to customers through its AI based solutions with Wipro HOLMESTM, Wipro's artificial intelligence and automation platform. These solutions accelerate digital transformation using contextual and business-focused AI/ML capabilities. Wipro's IDP (Intelligent Document Processing) is also used as an IP management tool that extracts intelligence in real time by comparing, processing, and validating complex contracts like Patents by using artificial intelligence algorithms (E.g. NLP, image processing). Often IP lawyers are engaged in analyzing large IP portfolios and trying to draw an insight from the available contracts. The traditional method of analyzing and reviewing these contracts like Patents, Copyright, and others involves going through hundreds of documents and doing manual research. This is a long and tedious work. But with Intelligent Document Processing all this can be done at a faster pace. It helps in formatting, drafting, and reviewing patent applications with the technologies that are well-established in knowledge management, including text analytics. IDP also helps in risk assessment by identifying the clauses in the documents that are of high-risk or are relevant. It also saves time for lawyers in search by pinpointing and directing them to where specific phrases appear in lengthy contracts. This solution for contract review benefits both the lawyers and the clients by saving both time and money. Hence, it is an efficient way of managing IPs. Wipro is working on more such intelligent solutions with other partners like IBM, AWS, Microsoft, Google. Through such intelligent solutions it is evident that the disruption of traditional approaches is inevitable in the face of increasing demands of innovative solutions across the world. Towards an innovation-led future The ongoing pandemic has accelerated the adoption of emerging technologies and digitization. Towards the close of 2020, the IP landscape witnessed a high magnitude of innovation. There is an increased demand for IP rights enforcement as it also acts as an assurance on the authenticity of the solutions. An effective system of IP management can catalyze economic development and socio-cultural well-being. The future belongs to an effective IP management strategy, which can help steer the global economy towards higher and assured investments in innovations. Wipro's leading edge IP solutions can redefine your IP strategy and outcomes. For details,

connect with our experts at Wipro Products and Platforms Mukund Kalmanker VP & Global Head – AI Solutions Mukund and his team collaborate with leading enterprises across industries to drive revenue growth through competitive business insights, deliver experiences aligned to emerging digital behaviors, and drive efficiencies by leveraging technologies such as Artificial Intelligence, Machine Learning, RPA, and Big Data. He is a well-known industry thought leader with more than 21 years of experience in these areas. =====================

The Four-Pronged Approach to Maximizing Business Value with IT Automation

----- Arcticle source ----- https://www.wipro.com/analytics/the-four-pronged-approach-to-maximizing-business-value-with-it-automation/ ----- About the Author Contact Wipro Please fill the required details to access the content The Four-Pronged Approach to Maximizing Business Value with IT Automation April | 2021 As organizations race towards digitization, it is imperative that the underlying infrastructure keeps pace. The need for 'anywhere, everywhere and always-on' IT infrastructure calls for a paradigm shift in this space. Today's CIOs are faced with a hybrid ecosystem of fragmented technology landscape that comprises legacy as well as emerging technologies with multiple providers and toolsets, siloed functional units with SLAs clearly depicting a watermelon effect, high cost of operations owing to tribal knowledge, inability to map business SLAs to IT SLAs and redundancy. Moreover, social media, which intricately links the world, has elevated 'customer experience' as a top-most driver for digitization. Covid-19 has only increased the need for automation. The recent years promoted 'automation' in various forms as the ultimate solution to digitize IT infrastructure. However, time has shown that organizations are still struggling to extract value from their investments. Now, the big question is, how to sail through these challenges and achieve value from the investments in technology and automation. The right approach to IT automation At Wipro, we believe that automation is not just about tools and technologies and hence we advocate a four-pronged approach to capture maximum value from our investments. Toward a harmonized future We envisage future organizations to employ a hybrid workforce of human and digital colleagues working in harmony in order to promote a cohesive organization where the robots perform repetitive tasks based on learning and humans' ability is amplified to strategic, decision-making roles based on contextualized recommendations provided by automation, as depicted in Figure 1. This will also help in eradicating human errors and judgement-based reasoning. Figure 1: Hybrid Workforce Model in Integrated Infrastructure Operations Wipro's wide experience in infrastructure space, strength in execution and excellence in governance makes us an ideal partner to organizations seeking transformation. We offer technology-agnostic solutions and maximize packaging of readily available tools in the client landscape into our solutions. Our automated analysis of incident and service request data

enables quick deciphering of automation patterns. Our compendium of 1000+ automation use-cases is the secret to our speedy deployment. Wipro's expertise in predictive and proactive sensing, coupled with self-healing automation use-cases have averted many high-priority P1 incidents. We cater to the end-to-end infrastructure management landscape with a comprehensive set of automation touchpoints including various day-to-day operational processes making us a strategic partner.   For more information on how Wipro can help you achieve value from your investments in technology and automation, connect with us here. Priya Bakthisaran Global Head of Automation - Cloud & Infrastructure Services, Wipro Priya has 25 years of experience in IT industry across application and infrastructure space. She has deep acumen in AI and automation space and has contributed to many market-focused automation solution for strategic clients. She provides ideation for engineering of automation solutions for key market problems. Priya believes that superior user experience along with enhanced efficiencies and optimized economies must be considered while designing automation solutions. =======================

Leveraging AI - Predictive Analytics in Healthcare

----- Arcticle source ----- https://www.wipro.com/analytics/leveraging-ai-predictive-analytics-in-healthcare/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Leveraging AI - Predictive Analytics in Healthcare June | 2021 The technology landscape is full of solutions that can parse historical data, but modern businesses increasingly want to predict the future. What are the risks? What are the opportunities? Where will the market – and revenue – be five years from now? Using predictive analytics, organizations can take steps toward answering these future-focused questions. Predictive analytics is a statistical technique that analyzes current and historical data to produce forecasting results. For instance, data analysis can determine associations between various behavior factors. From these associations, a variety of models can then be designed. Using a specific set of conditions for each model, businesses can gain valuable insights that lead to better decision-making. How can predictive analytics be leveraged in healthcare? The healthcare sector has a long history of keeping one eye on the horizon. Considering recent advancements in Artificial Intelligence (AI), many people have wondered how predictive analysis can benefit the medical space. With big-data analytics, AI and machine-learning models can be a key resource to improve healthcare services in high-risk areas. For example, a combination of AI and predictive analytics can help data scientists gain deeper insights into disparate factors affecting human health. Consider just a few areas where AI can improve population healthcare management: Today, health data comes from multiple sources – medical notes, electronic recordings from medical devices, laboratory images, physical examinations, and even smart devices that capture and track a variety of health data. Leveraging AI, these data can be continuously assessed and analyzed to provide healthcare practitioners and researchers boundless resources to improve diagnoses and

treatments. Machine learning has become a mature technology. Combined with AI, it can provide powerful, actionable insights. This advancement in technology, combined with modern data sets, can be utilized in population health management to achieve the ultimate goal – better health outcomes. References: Kalyani Vuppalapati Technical Lead, Data Analytics & AI, Wipro Limited. Kalyani is an expert in multiple analytical tools and data mining methodologies. She has also worked on various analytics projects in Manufacturing, Technology, Energy and Utilities, and Healthcare domains. Her experience includes data analysis, proposing analytical solutions, generating dynamic reports, and other data preparation components like data pre-processing, profiling, cleansing, validation, and transformation. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

Revolutionizing Contact-Center Automation with Conversational AI, Cognitive Search and Machine Learning

----- Arcticle source ----- https://www.wipro.com/analytics/revolutionizing-contact-center-automation-with-conversational-ai-cognitive-search-and-machine-learning/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Revolutionizing Contact-Center Automation with Conversational AI, Cognitive Search and Machine Learning July | 2021 Customers today engage with companies on multiple channels – calls, text, email, chat, and social media – and expect quick responses and fast resolution. In this omni-channel environment, enterprises have turned to chatbots to listen to customers' voices and connect, but these solutions will quickly fall short if not proactively managed and upgraded. Conversational AI bots are one evolved way to address customers' needs quickly and with empathy. More contextual and personalized than simple chatbots, Conversational AI bots are trained to dynamically make decisions and help businesses engage with customers 24/7 using real-time tone and sentiment analytics. This is particularly important in the ever-changing world of contact centers. So how can enterprises begin to leverage this technology to improve their efficiency, productivity, and sales? It begins with a hyper-personalized customer experience. What is Conversational AI? Conversational AI is a set of AI-based technologies that enable systems to simulate human-like conversations. While the technology is similar to chatbots, which have been around for years, Conversational AI extends

chatbot capabilities by including all technology beneath the bot umbrella, like voice bots and voice + text assistants, whereas chatbots have "text-only" functionality. This makes the technology truly conversational, thus providing a more-natural and customized user experience while collecting detailed information that enables the contact center to gain actionable insights. Conversational AI-based virtual agents understand the customer's speech using natural language processing (NLP) to parse and interpret indirect phrases, incomplete sentences, and even context. These virtual agents also use pattern recognition and contextual analysis to make more intuitive perceptions and judgments for a better understanding of human speech. And, although it can handle repeated queries like member authorizations and product details, Conversational AI agents can transfer calls to human agents for more-complicated inquiries, transmitting real-time analytics (including tone) that allow the human agent to respond appropriately with the best-suited product, offer, or solution. Conversational-AI-based-Virtual-Agent-Architecture Take it to the Next Level with Cognitive Search and Predictive ML By layering-in cognitive search, structured and unstructured data can be pulled from various enterprise data sources, helping the chatbots provide faster and smarter responses and elevating the entire customer-service experience. Think of it as an advanced version of enterprise search powered by AI that brings together numerous data sources while providing automated indexing and personalization. The cognitive search solutions currently available use AI capabilities such as natural language understanding (NLU) and ML to ingest, understand, and query digital content from multiple sources. They also use ML to understand and organize data, predict users' search queries, continuously learn, and improve answers based on user feedback. Conversational AI powered by cognitive search makes it possible to derive insights from a consistently growing collection of data that can be used across the company. This gives it the potential to greatly improve how an organization's employees discover and access relevant information. For example, agents can enter a query in natural language, and Conversational AI will understand the context and invoke cognitive search to find more insights. To improve the AI engine, these insights can be presented to the agent, who can visualize the selective options, and give feedback on the retrieved information, which in turn improves adaptive learning. One such Conversational AI-based cognitive-search solution was implemented for a healthcare client's contact center. The solution provided sales agents with access to widespread digital content including enrollment options, medical supplement details, etc., allowing quicker, more-efficient responses and resolutions. As a result, the company saw reduced average call handling, faster information access, improved sales opportunities, and dramatically improved users' call-center experience. Yet to drive business outcomes, companies need customer insights to become more personalized and predictive in nature. Using these insights, businesses can proactively pitch the products that align with each customer's needs. For example, McKinsey reports that as much as 35% of Amazon's revenue is generated by its recommendation engine. Combining predictive ML models and cognitive search with Conversational AI can deliver precisely the type of hyper-personalized customer experience necessary to capture these opportunities. Intelligent product recommendations provide natural and logical upselling and cross-selling opportunities that resonate with the customer. The product-recommendation

tool automatically identifies the customer's interest through historical data and provides the right suggestions. Customers with no purchase intention suddenly find themselves interested in doing so – and small purchases can pave the way to larger ones. Data-driven predictions make customer interactions more meaningful, while helping Conversational AI deliver hyper-personalized, intuitive experiences to customers that also improve the quality and efficiency of operations. The Importance of training the Machine Learning Model Ensuring a contact center's ability to leverage this powerful combination requires a seamless, intelligent system built for the enterprise's specific needs. This, in turn, requires training the models to perform appropriately. The detailed steps to train the model include: Five Key Benefits of Conversational AI Conversational AI powered by cognitive search and predictive ML delivers more personalized, intuitive customer experiences while improving the quality of business operations and workflows. In practical terms, this combination of technologies brings five key benefits: Conversational AI infused with cognitive search and predictive ML will enable a more-personalized virtual assistant that can address every user request. Multiple chatbots will converge to a single, more efficient, and decisive virtual agent, paving the way for a more-interactive user experience. The ability to identify a user's mood with voice modulation, body language, and emotional signals makes it possible for evolved chatbots to handle complex questions and carry out multifaceted conversations. Additionally, using big data analytics, companies will be able to predict customer churn and provide recommendations from user data available on multiple data sources including social media. In short, by revolutionizing their contact-center automation, companies can drive efficiency and revenue by moving beyond the scope of simple chatbots. References Sumalatha Subramanian Principal Consultant & Practice Manager, Wipro AI Solutions Sumalatha is a technologist and innovator. She architects and delivers AI solutions for various customers from a variety of domains and identifies opportunities to deliver significant business benefits by applying cutting edge techniques in machine learning. She is also focused on building Conversational AI solutions on the Wipro Holmes platform. Sumalatha holds a Bachelor's degree in Computer Science and Engineering from N. S. S College of Engineering. Electric Vehicle Battery Health Forecasting

----- Arcticle source ----- https://www.wipro.com/analytics/electric-vehicle-battery-health-forecasting/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Electric Vehicle Battery Health Forecasting August | 2021 Modern vehicles predominantly run on fossil fuels, the reserves for which are fast depleting. As a result, electric vehicles that only require battery power are quickly emerging as an eco-friendly alternative. According to a report published by Fortune Business Insights, the electric vehicle battery market size is projected to reach $82.20 billion by 2026, exhibiting a CAGR of 6.6% and a significant leap from its $71.83 billion valuation in 2018. Other drivers behind the shift to electric vehicles include increased emission regulations, EV technology maturity, and declining prices for the electric vehicle battery, among others. Soon, electric vehicle battery charging will become the new "fuel" for the automotive industry, and monitoring and regulating battery health will become vital. Measuring EV Battery Health: The Challenge With electric vehicles rapidly permeating the automotive sector, monitoring EV battery health has become paramount. Electric vehicle battery parameters and status must be continuously reported to vehicle owners, as the EV battery charge status is equivalent to the fuel gauge for an internal combustion engine. Drivers need this information to plan their routes and/or visits to the nearest charging station for EV battery recharging. However, measuring these parameters like state of charge (SoC), state of health (SoH), and remaining useful life (RUL) isn't straightforward. The batteries in electric vehicles are subjected to multiple charging/discharging cycles and exposed to varying weather conditions. These issues can impact the performance of an electric vehicle, causing unreliable estimates on battery health parameters. Electric Vehicle Battery Health Prediction: A Solution One solution for analyzing battery parameters is gaining traction. It uses a data-driven approach that leverages advanced AI/ML techniques and can effectively measure battery health parameters by capturing all variables of electric vehicle battery use over time (for example: environmental effects, vehicle load, and driving pattern). By leveraging this battery usage data, more accurate battery health forecasting estimates can be achieved. Wipro's Data Science practice, having enabled AI/ML-based predictive asset maintenance and other asset-failure prediction solutions across industries, has developed an electric vehicle battery health prediction model. This ML-based solution predicts electric vehicle battery health parameters with 96-97% accuracy. The solution is available via open source on the IBM Watson platform and uses the advanced capabilities of Watson AutoML for rapid prototyping. How Does it Work? Figure 1: Solution Overview Data Preprocessing: As shown in Figure 1, the electric vehicle battery pack has close to 15 cells and allows approximately 1,100 charging cycles. The solution uses the data of one cell with all charging cycles to train the AI/ML model, which is later trained and tested on the remaining cells individually. Multiple advanced statistical techniques (e.g. ZScore and Hampel Filter) are

then applied to clean the training data and remove outliers as shown in Figure 2. Figure 2: Data preprocessing to remove outliners that cause noise in results Model Development: The solution leverages automated machine learning (AutoML), a process of automating manual tasks that data scientists must complete as they build and train ML models. These tasks include feature engineering and selection, choosing the type of machine learning algorithm, building an analytical model based on the algorithm, hyper-parameter optimization, training the model on tested data sets, and running the model to generate scores and findings. AutoML helps data scientists build predictive models without having deep ML model expertise. It also frees data scientists from the routine tasks involved in building an ML pipeline, allowing them to focus on extracting the insights needed to solve important business problems.   Figure 3: AutoML System Architecture The AutoML system includes a meta-learning component that leverages cleaned historical information for training models. The ML framework is responsible for automatically choosing data processor and feature preprocessor algorithms and selecting the models. In deep learning (DL), this model selection is typically replaced by Neural Architecture Search (NAS) that performs additional post-processing by combining multiple models together, as shown in Figure 3. Model Deployment: On the platform, a deployment space acts as a registry to manage the assets associated with a model deployment. The deployment assets may include a serialized model, scoring script, schema of the inference dataset, and more. This model can be accessed via REST endpoint to send the test date and get the model predictions. Leveraging the AutoML approach for solution development results in reduced time and effort. The system takes care of data preprocessing, partitioning, feature engineering, hyper-parameter tuning and more, running multiple ML algorithms in auto-pilot mode to churn the best fit model and deliver the most optimal performance while predicting EV battery health with 96-97% accuracy. Leveraging the Solution for More Than EV Battery Health Prediction While battery health prediction is a horizontal capability, this solution can be augmented with other technologies and be leveraged for other uses like customer support, inventory optimization, and product quality. a) Enhanced Customer Service For instance, the solution can predict electric vehicle battery health and display the status on the vehicle's dashboard. If the battery needs servicing, this information can be easily integrated with geographic information systems to help the driver locate the nearest charging station or service center. If the driver fails to immediately address an alert, s/he is advised on the next best action using a voice-driven chatbot (via mobile phone or head unit) to avoid the hassle of delayed support. If the DIY approach fails via chat support, the chatbot could then spot the nearest service center and initiate human assistance by creating a ticket in the system. The dealer could then look at the ticket details for vehicle location, spare parts required, etc. and automatically dispatch a service engineer to remedy the breakdown issue. b) Inventory Optimization Orchestrated from the central server, it is possible to send notifications/alerts to EV dealers such as the predicted/reported electric vehicle battery health issues for EVs within the dealer's geographic area. Based on these alerts, the dealer can anticipate service volumes and optimize its EV parts inventory accordingly. c) Product Quality Improvement By conducting a periodic review of all predicted malfunctions, the solution can decipher defect trends in electric vehicle battery health and

performance and provide meaningful inputs for battery health and quality improvements at the production level. R&D teams can inspect the defect trends and determine the root causes, over time improving the overall quality of the electric vehicle battery. The adoption of AI/ML for predicting EV battery health is gathering momentum. With a data-driven model that addresses the entire EV battery lifecycle across different charging and loading cycles, battery health forecasting can be much more reliable. Platforms leveraging AutoML help fast-track development cycles by automating the routine data-science activities without compromising prediction accuracy. Wipro's EV battery health prediction solution can be further leveraged to realize multiple uses including customer experience, dealer inventory management, product quality improvement, and more. Manish Okhade Practice Lead – Predictive Asset Maintenance, AI Solutions, Wipro Limited Manish Okhade has more than two decades of industry experience in different domains e.g. ER&D, Digital and Artificial Intelligence. Manish has been involved with development of Wipro's AI platform Holmes since inception and developed multiple AI/ML use cases across the industries. Manish is presently leading the Predictive Asset Maintenance (PAM) Practice in Wipro's AI/ML solutions group. His current focus areas are building accelerators, thought leadership and forging partnerships with niche startups in the PAM domain. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption =====================

The Importance of Data Fabric in 2022 And Beyond

----- Arcticle source ----- https://www.wipro.com/analytics/the-importance-of-data-fabric-in-2022-and-beyond/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content The Importance of Data Fabric in 2022 And Beyond January | 2022 The 12 strategic technology trends for the coming year per Gartner shouldn't surprise anyone; they focus on automation, security and AI. The technicalities go deeper, of course: hyperautomation and autonomic systems, increased security through mesh and privacy-enhanced computation, generative AI, decision intelligence and AI engineering. But the larger issues are generally familiar. One trend is particularly familiar – the use of data fabric – because of its recurrence on Gartner's list. Data fabric's return is both notable and important; it underscores the need for a unified view across the democratized and ever-growing landscape of technology offerings in data storage and processing. The technology-trend predictions reflect companies' demand for process optimization and better

use of available technology. The goal, per Jayant Prabhu, is that 80% of business leaders want to move to an intelligent enterprise, which as he notes, is more than merely technology. It's the people who are the differentiator – and having the ability to use a company's data assets is key. Building an intelligent enterprise therefore means "…investing in a journey that pays as much attention to cultural and process changes and it does deploying new tools." Advances in AI engineering, hyperautomation, and total experience are just a few of the tools available, with the Data Fabric acting as that layer of accessibility. With the wealth of data technologies available for storage and processing, upskilling the workforce across each technology to analyse output means a large upfront cost, not to mention time. These inherently mean the organization will struggle to get executive buy-in for key initiatives. But by creating a single layer of accessibility through data fabric, companies can accelerate ROI – and therefore buy-in — for cloud initiatives and other strategic ventures. So, what is the Data Fabric? The data fabric is the overarching data-management solution across data uses, from centralization of data assets to a single point of access for analytics and AI. The fabric is more than just a data layer but is an insights portal with numerous uses. By enhancing the data fabric to become a "shopping cart" of data and analytics assets, enterprises step into the world of the data marketplace, one in which data objects can be bought and sold figuratively or literally. The concept of a data fabric was coined by NetApp in 2016, where they defined it based on five core principles: control, choice, integration, access and consistency. In short, data fabric is a single layer that enables data users to collaborate and share information and value across any number of platforms, cloud or on-premises. Considering its clear value, why is it still a trend going into 2022? The industry has been talking about this for some time now; why hasn't it become table stakes? Data Fabric Enables Companies to Overcome Technical Debt As companies embrace the cloud for revenue and growth, there's a clear need to reduce technical debt (per Gartner). It would appear the peaking of data fabric is actually the result of technical debt accumulated over years of increased technology adoption, rather than the reduction of that debt. Enterprise data transformations today include a multitude of technologies – and an equally dizzying number of skills needed to support those technologies. No longer are we considering the use of relational stores like MS SQL Server, Oracle, or PostgreSQL; but now we have NoSQL options like MongoDB, Cloudera, Neo4J, MarkLogic, and others. On top of this, we are adding cloud options to the stack, with AWS Redshift, GCP BigQuery, MS Synapse, Snowflake and more. We are comparing and adopting numerous solutions of awesome capabilities and thus becoming dependant on their features. Yet they can't move everything at once to achieve value, let alone manage all those disparate resources. Data fabric brings a single management layer to help businesses take advantage of all the value these technologies bring. This not only allows domains to continue with their own technology roadmap, but it also enables end users to take advantage of what other domains have put in place. This concept then allows for a multi-layered management and governance landscape by advancing Data Mesh capabilities across an organization, where governance and transformation are pushed back and democratized at the domain level. Bring on the Future Centralizing the data fabric allows for democratization of domain-level processes and data. Monolithic can't be the answer anymore. As Gartner notes, large-scale lift

and shift is on a downward trend, and cloud-native services are on the rise for 2022. However, cloud-native service doesn't simply remove the hurdles of an organization's past technology adoption. Having a single point of insights and accessibility has become fundamental for organizations to achieve value from their data assets and lay a foundation for their cloud-everywhere futussre. Enter the data fabric. David Tuppen Chief Data Evangelist and Chief Architect for Wipro Europe David is the Chief Data Evangelist and Chief Architect for Wipro Europe. He has over 20 years' experience in IT Services & Technology from within Sales and Consulting and works closely with leading technology vendors and analysts to understand technology changes and trends in the market. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption ===================== ----- Arcticle source ----- https://www.wipro.com/analytics/wipro-wins-three-2022-microsoft-partner-of-the-year-awards-analytics-power-bi-and-compliance/ ----- Related Articles Contact Wipro Please fill the required details to access the content Wipro wins three 2022 Microsoft Partner of the Year awards— Analytics, Power BI, and Compliance July | 2022 The prestigious Microsoft Partner of the Year awards recognize partners who have demonstrated client delivery excellence. We are proud to announce that Wipro has been chosen 2022 Microsoft Partner of the Year award winner or finalist in four important categories: "Wipro is thrilled to be recognized by Microsoft in these three categories. This is a testament to our investment in data analytics, data management and data security and highlights a strong commitment to providing our joint customers with data-driven insights," said Don McCormick, Wipro VP, Global Microsoft Partnership Lead. Working across Microsoft Azure data services domains and Power BI, Wipro helps clients build intelligent secure ecosystems, enabling the creation of sustainable and innovative products and transforming experiences through AI, actionable insights, and trusted data. Wipro also drives positive business outcomes by developing enterprise IT/OT systems with IoT, data platform, and analytics capabilities, while maintaining compliance. Microsoft announces Partner of the Year awards annually prior to the Microsoft Inspire global partner conference, which took place on July 19-20, 2022. The awards recognize Microsoft partners that have developed and delivered outstanding Microsoft-based applications, services, and devices during the past year. They are presented in a variety of categories, with honorees chosen from over 3,900 nominations across more than 100 countries worldwide. To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk

Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption ======================

Unlocking CPG warehouse management innovations with edge

----- Arcticle source ----- https://www.wipro.com/analytics/unlocking-cpg-warehouse-management-innovations-with-edge/ ----- Contact Wipro Please fill the required details to access the content Unlocking CPG warehouse management innovations with edge February | 2023 In response to the ever-changing digital landscape, the consumer-packaged goods (CPG) industry has directed its focus to edge computing, a distributed IT architecture transforming how businesses process data. It not only reduces the amount of data travelling around a network, leading to lower latency and faster overall speeds, but also minimizes security threats because of its decentralized structure. Edge computing optimizes internet devices and web applications for faster performance by moving computing resources from clouds and data centers as close as possible to the originating source of data. The pandemic's mandatory containment measures and health and safety compliances have put huge pressure on remote operations covering warehouse management processes, resulting in the rising need of edge data centers. With the vast amount and variety of data being handled daily in supply-chain management processes (as shown in Figure 1), CPG enterprises require greater levels of efficiency and speed to analyze processes and make quick improvements, as well as identify inefficiencies. Edge computing can deliver these kinds of benefits by bringing the storage and processing of data closer to the equipment, allowing teams to gather and analyze data on equipment performance from IoT sensors. Automated analytical computations on the edge data center generate real-time insights that enable operations to run at a required efficiency while reducing data transmission costs and downtime, and they're also governed by compliance and data security needs at the edge. In an edge-based intelligent warehouse management process for CPGs, which have limited shelf-life and are intended to be used quickly, a significant amount of data is generated. Stakeholders then analyze the data to derive valuable insights, resulting in effective real-time inventory monitoring and decision-making. For instance, cosmetics typically deteriorate if exposed to extreme temperature fluctuations and thus require temperature-controlled environments from production to consumption. A warehouse's IoT temperature sensors can measure humidity, temperature, and light levels to ensure the data points do not exceed the defined threshold. With edge-driven continuous monitoring and reporting of these conditions, quality products can be shipped, compliance can be met, and unexpected expenses can be avoided. The impact of edge computing on warehouse management A deeper look into the supply chain, from transport and logistics to shipping to a trading partner,

reveals that edge can enable a smooth and efficient process flow: Advancing equipment maintenance with edge-driven predictive analytics In addition to enhancing inventory monitoring, adopting IoT and edge-based analytics can transform how organizations manage equipment maintenance. The performance of predictive analytics models locally optimizes and enhances the speed and performance of predictive equipment maintenance. The implementation of predictive analytics solutions not only attenuates data storage costs, but also facilitates real-time updates. Various machines and equipment connected to sensors, actuators, beacons, and cameras produce a huge amount of operational data, as shown in Figure 2. Analytics and computational capabilities integrated into these devices can analyze the collected data at the edge layer, providing real-time insights that enable operators to make informed and prompt decisions. Within this edge layer, edge devices such as smart phones and PCs communicate to the edge data center through gateways. The synchronization of these databases installed on the edge devices helps prevent any loss or corruption of data. Edge computing also improves the performance and speed of ML predictive models, which are implemented locally, overcoming the dependency on network connectivity for transferring data from a device to the cloud. AI and analytical models can then aggregate and analyze the data from the various devices. With the resulting data-driven insights, organizations can develop more efficient operations and improve asset lifecycle management, helping lower processing costs and strengthen their bottom line. In addition to the vast advantages that edge computing delivers, it provides transparency across the supply chain by assuring real-time product and pallet matching while alerting staff to fraudulent barcodes or wrongly placed pallets. This not only eliminates the need for traditional hand-scanning barcodes, but also reduces error rates and enhances warehouse process optimization. With these benefits, the CPG industry can utilize edge computing to boost operational efficiency as well as offer a unique customer experience, determine customer trends, and promote security and compliance. Edge, in combination with 5G networks, will further optimize functionality, modernize processes, and deliver new cloud-driven experiences. Data processing in closer proximity to end users, enabled by edge and 5G, can reduce costs and latency, further enhancing operational performance. Authors Sources ======================

How to Safeguard Business Interests in Generative AI Applications

----- Arcticle source ----- https://www.wipro.com/analytics/how-to-safeguard-business-interests-in-generative-ai-applications/ ----- About the Authors Contact Wipro Please fill the required details to access the content How to Safeguard Business Interests in Generative AI Applications The field of generative AI has witnessed remarkable advancements in the recent years. It is propelled by ground-breaking innovations like generative adversarial networks (GAN) in 2014, transformer neural networks in 2017 and

reinforcement learning with human feedback (RLHF) in the same year. Accompanied by these algorithmic strides, continuous hardware acceleration has unlocked unprecedented capabilities, empowering the training of large language models (LLMs) on colossal natural language datasets. However, the true turning point came with OpenAI's game-changing release of ChatGPT. This momentous launch, followed by the announcement of GPT3.5 and DALL-E 2 models on Microsoft Azure, Google Bard, GPT4 and Microsoft CoPilot, ignited a wildfire of interest that has rapidly intensified, shaping the landscape of generative AI in an exponential manner. Today, businesses are actively exploring the potential of generative AI, engaging in use case identification, conducting proof-of-value exercises, executing pilots, and integrating the technology into their operational processes. Common Enterprise Applications for Generative AI There are four broad areas in which generative AI finds application within enterprises: Challenges for Generative AI Models Some of the biggest challenges for generative AI models, such as GPT or PaLM, are data privacy and protection, but businesses are also concerned about generative AI models violating regulations and general norms: Key Considerations for a Stronger Generative AI Approach There are solutions to above concerns, some of which may be easy to implement while others may take longer efforts. Considering the potential benefits of generative AI, many enterprises have begun efforts to build stronger solutions. The following considerations can help companies be sure they're addressing critical risks or concerns from an application architecture perspective. Information security To safeguard confidential information, it is crucial to limit employees' direct access to interfaces like ChatGPT. Organizations should provide access to purpose-built business applications that utilize generative AI models within a robust information security framework. This can be achieved by leveraging enterprise-grade frameworks offered by cloud service providers or implementing in-house solutions within the secure enterprise network. The information security framework should cover all aspects of data interchange with generative AI models, including prompts, custom training and fine-tuning data, the trained model instance, and the generated responses. Encryption, access control, and data retention controls must be implemented to ensure the highest level of protection for these data elements. Restriction to purpose General-purpose generative AI models like GPT and Bard are trained on enormous corpora of information across almost every discipline of human knowledge. This makes it possible, intentionally or unintentionally, to elicit responses from the AI that are irrelevant to business purposes and are potentially harmful. Exposing customers or employees to such responses can negatively impact business outcomes, credibility, goodwill and even result in legal liability. To mitigate these risks, businesses should develop specialized individual applications that are restricted to specific business purposes, built on top of the generative AI models. Each request to the application should be programmatically evaluated to ascertain relevance to the intended purpose before providing a response. This filtering process can be achieved using a custom-trained classification model. Implementing this filtering mechanism will establish necessary guardrails to ensure that the application is used solely for its intended purpose and prevent unintended usage. Custom training and finetuning Many enterprise use cases of generative AI can leverage knowledge available within the enterprise itself. This requires custom training or fine-

tuning and provides a higher level of control over the data used to train the models, resulting in increased transparency. Moreover, a transparency framework can be created on top of the enterprise document corpus used for custom training, by storing document embeddings. This framework enables tracing back the responses to the source documents used for training, providing transparency and explainability in the system's responses. Consequently, it builds credibility. Custom training and fine-tuning also help achieve fairness by providing control over the data used to train the models. Response moderation Response moderation is necessary to detect and remove harmful elements in the generated responses, including irrelevant, inappropriate, plagiarized, or copyrighted content. The likelihood of harmful content increases in use cases that rely heavily on the pre-trained knowledge of the model, which comes from training that has happened outside the enterprise. Therefore, the implementation and rigor of response moderation should vary depending on the specific use case. Programmatic response moderation can be achieved using available services that detect different types of harmful content, combined with an ensemble of custom-trained classification models. While these broad principles can help mitigate many of the risks associated with generative AI in an enterprise setting, their applicability varies depending on the use case. For example, a virtual assistant used by employees will have higher adaptability for custom training, thus presenting relatively lower risks when implemented alongside the other principles. On the other hand, a marketing catchphrase generator or code generator relies more on the pre-trained knowledge of the model and therefore has a higher propensity of generating plagiarized or copyrighted content. Businesses should conduct a risk assessment for each individual use case, considering the applicability of these principles, to determine their roadmap of adapting generative AI based on the specific risk profile of each use case. Anindito De Head of AI and Automation CoE and Practice, Wipro Swapnil Belhe Chief Architect of Generative AI CoE and Practice, Wipro =====================

Unleashing the Metaverse: Revolutionizing Business Models and Empowering Data Assets

----- Arcticle source ----- https://www.wipro.com/analytics/unleashing-the-metaverse-revolutionizing-business-models-and-empowering-data-assets/ ----- About the Author Contact Wipro Please fill the required details to access the content Unleashing the Metaverse: Revolutionizing Business Models and Empowering Data Assets June | 2023 The Metaverse is no longer a concept confined to science fiction movies. It is becoming a reality. In the near future, customers could explore and test products in virtual reality, providing a seamless and personalized experience. This is where Metaverse and Master Data Management (MDM) come into play, providing a foundation for personalized experiences. The Metaverse is revolutionizing business models across diverse industries, blurring the lines between the physical and virtual realms. A digital approach holds tremendous potential

in meeting customer experience and engagement needs efficiently and cost-effectively. And businesses from various sectors have embraced this mantra, recognizing the power of digital transformation to deliver exceptional experiences while maintaining affordability and timeliness. Back to Basics – Metaverse and MDM The "metaverse" is a virtual reality space where users interact with computer-generated environments and each other in real-time. It goes beyond traditional VR experiences, aiming to create an immersive and interconnected digital universe accessible across devices and platforms. This seamless and persistent virtual world incorporates elements of AR, VR, and the internet. Within this realm, users can personalize avatars, socialize, explore virtual environments, and partake in activities like gaming, shopping, education, entertainment, and business transactions. As per Gartner Report, by 2026, at least 25% of people will immerse themselves in Metaverse technology activities such as work, virtual class, social media, and entertainment. The Metaverse is set to undergo a transformative journey across three interconnected phases: emerging, advanced, and mature. The current phase draws inspiration from the market and technologies of Web3.0 apps. As we progress, the advanced phase will build upon the emerging metaverse, taking a combinative approach. Ultimately, the metaverse will reach maturity, characterized by immersive experiences and interoperable virtual economies. This exciting evolution is expected to reach its full potential by 2030. However, it is crucial for tech product leaders to begin assessing the opportunities presented by the Metaverse without delay. Metaverse is currently in its emerging phase and will incorporate diverse technologies such as 5G, IoT, AI, blockchain, and more. The technology architecture will evolve and mature over time. However, data, especially master data such as customer and product information, as well as reference data, will be a crucial component for the successful realization of the Metaverse. To ensure a successful metaverse experience, master data must meet higher standards in terms of accuracy, availability, completeness, and compliance. As product leaders innovate metaverse products, solutions and services, it is essential to create a solid foundation of master data in the pre-metaverse phase. The Changing face of MDM to serve the Metaverse MDM is a collection of technologies and processes used to manage and upkeep the master data within an organization. The Product Information Management (PIM) system, an integral discipline within MDM, stores, organizes, and oversees product data, encompassing descriptions, images, pricing, and availability. It guarantees the accuracy, consistency, and uniqueness of data across various channels and touchpoints. Let us consider a simple scenario in a retail store: In the Metaverse, a retail store operates with virtual land as the location. Products and associated digital assets are published in the store as master data. Customers, represented by avatars, explore these virtual stores, trying out products, creating new assortments, enjoying immersive experiences, and making informed purchases. Various currency options are available. Once a transaction is complete, the ERP system generates an order, following the order-to-cash process. The MDM application provides essential master data such as customer details, location information, product data and currency as reference data to the ERP system. While there may be some overlap between PIM and the Metaverse in terms of managing and organizing digital data, they have distinct focuses. PIM primarily deals with product-related data management within organizations, whereas the Metaverse

encompasses a broader scope of virtual environments and experiences, which may or may not involve products. PIM can effectively handle product data in the Metaverse, including existing data management and virtual product creation. Users within the virtual world have the opportunity to explore different product combinations, offering valuable feedback to PIM systems for recommendations on new assortments or product mixes. Regarding customer data, the MDM system can handle information related to customers who have made purchases or it can gather prospect data through sales campaigns. MDM effectively manages customer preferences, digital addresses, transaction preferences, digital bank details, and more. The traditional MDM architecture, implementation styles, industry data models, and use cases must evolve to: Exploring the role of MDM/PIM across various business sectors Here are impactful industry use cases for data product leaders venturing into the MDM/PIM journey as the Metaverse evolves: While the metaverse brings about substantial business outcomes, establishing a solid foundation of master data is crucial. Implementing an MDM strategy becomes a prerequisite for enterprises to establish trust and ensure success in the Metaverse journey. Conclusion The metaverse is poised to revolutionize business models and fundamentally transform the way master data assets like Customer, Product, Service, Partner, Employee, Location, and Supplier interact. In this rapidly expanding metaverse landscape, MDM/PIM systems emerge as the linchpin for success, facilitating seamless data integration. A robust data foundation, governed with precision and completeness, empowers continuous optimization of user experiences. The stage is set for a new era where the metaverse and well-governed master data converge to drive unparalleled business growth and customer satisfaction. ======================

Responsible Design and Use of Large Language Models

----- Arcticle source ----- https://www.wipro.com/analytics/responsible-design-and-use-of-large-language-models/ ----- Contact Wipro Please fill the required details to access the content Responsible Design and Use of Large Language Models Large Language Models (LLMs) have created a lot of buzz in recent years. More often, conversations around LLMs are about its greatness, but sometimes it also delves into how it could possibly harm humans. Some of these apprehensions are not unwarranted, given the rapid influx of biased, harmful or outright fake content floating in the digital universe. With these scenarios in mind, the organizations need to be vigilant to reap the benefits of LLMs by keeping the threats at bay. Our whitepaper outlines a pathway for the organizations to optimally use LLMs and guides on implementing checks-and-balances necessary for responsible usage of LLMs. Our paper provides pathways to solution for a plethora of questions that the industry is hard-pressed to find out: To kickstart your LLM utilization journey download the whitepaper from here. Harnessing the Power of Analytics in the Cloud: An Automotive Perspective

----- Arcticle source ----- https://www.wipro.com/analytics/harnessing-the-power-of-analytics-in-the-cloud-an-automotive-perspective/ ----- Contact Wipro Please fill the required details to access the content Harnessing the Power of Analytics in the Cloud: An Automotive Perspective The automotive sector is currently undergoing a significant transformation driven by new trends such as Autonomous Driving, Connectivity, Electrification, and Shared Mobility. This shift is a result of digital transformation and evolving consumer preferences. These dynamic changes are shaping the automotive industry as it enters the digital realm. With consumer demand pushing for intelligent vehicles, automotive companies are exploring ways to infuse digitalization into their products to enhance their intelligence. The industry has evolved beyond its traditional role of providing transportation and has now evolved into a comprehensive system capable of generating substantial market value through data-based services. Recent trends reveal the following projections for the future of the automotive industry: 5G-enabled cars are expected to represent over a quarter of global connected car sales by 2025 [1]; Autonomous driving is projected to generate $300-$400 billion in revenue by 2035 [2]; Electric vehicle sales are set to more than triple by 2025 [3]; and Shared mobility is predicted to drive $1 trillion in consumer spending by 2030 [4]. These ongoing trends are shaping the industry into a data-driven market, elevating data to the status of the most valuable output. This paves the way for significant opportunities for automobile manufacturers, who can tap into data to extract insights that further fuel the growth of the automotive sector. Figure 1: Provides an overview of the myriad data points generated by these trends. Leveraging cloud analytics can unlock advantages from both operational and business perspectives. Connected car data contributes to passenger safety by enabling the creation of vehicle features that enhance security. For example, Tesla sends sensor and camera data to a cloud server, which subsequently delivers insights to vehicles through software updates, enhancing functionality. Remarkable growth opportunities lie hidden within the enigmatic world of data associated with each of these trends: Understanding Connected Data Modern vehicles equipped with sensors serve as sources of connected car data. Contrary to the notion of transportation as a decentralized process connecting two points, connected vehicles offer a unified experience [5]. Various touch points of connectivity are possible, such as: Vehicle to Infrastructure In this scenario, vehicles communicate with the road infrastructure, generating data related to traffic, weather conditions, road accidents, speed limits, etc. Vehicle to Vehicle This communication system facilitates the exchange of real-time information between vehicles, which can also be leveraged for safety purposes. Vehicle to Network This allows

connectivity with existing cellular networks (LTE, 4G, 5G), enabling the car to function like a device itself and interact with other vehicle devices, much like a mobile phone. Vehicle to Device This is facilitated by a Bluetooth/Wi-Fi connection that can include systems like Google Android Auto and Apple CarPlay, enabling other devices such as smartphones, tablets, and wearables to interact with the vehicle's infotainment system. Cloud analytics harnesses copious amounts of data to analyze and comprehend events like hard braking, real-time traffic intelligence, and historical insights into road incidents [6]. Manufacturers can utilize insights from connected car data to enhance the safety of both drivers and passengers, making the driving experience more enjoyable. Understanding behavioral patterns aids in identifying novel features and areas for investment. Vehicle data also enables manufacturers to optimize revenue through data monetization. A case in point is Ford's introduction of the 'Power Up' over-the-air update, which not only enhances vehicle performance but also monetizes customer data. Enhancing Autonomous Car Data Autonomous driving relies on substantial computing power to analyze vast streams of real-time sensor data [7]. Other autonomous technologies, such as Over-The-Air (OTA) updates, similarly demand high-performance capabilities and intelligent connectivity. To meet these demands, cloud analytics can leverage computing power while ensuring data security and insights to facilitate intelligent connectivity both within and outside the vehicle. The analyzed data, devoid of biases, and hosted within a centralized cloud infrastructure, can be employed to effectively train machine learning models for constructing autonomous driving features. Tesla's 'Navigate on Autopilot' exemplifies this with features that enable overtaking slower vehicles and taking exit ramps through lane changes. Empowering Electrification Data Electrification is gaining prominence in the automotive sector as it strives to reduce carbon footprints and embrace eco-friendly mobility solutions. Electric vehicles (EVs) generate substantial data about both the vehicle and the driver with every mile driven. Automakers can harness the power of cloud analytics to ingest and interpret this data, focusing particularly on battery data—the most invaluable information from EVs. This empowers drivers to comprehend real-time battery health and optimize its usage. Moreover, ecosystem players within the automotive sector can leverage these insights to devise innovative solutions. Sensing Shared Mobility Data Ever-evolving consumer preferences have given rise to shared mobility concepts like car sharing and car rentals [8]. This emerging trend has captured the interest of investors and the automotive sector alike. This shift has prompted automotive manufacturers to reconsider their traditional business models in favour of Mobility-as-a-Service. Leveraging analytics in the cloud for shared mobility data can open up new revenue streams. These insights can be strategically employed to develop innovative offerings, such as subscription models for end-users. Notably, Ola, a proponent of shared mobility, not only offers car sharing but also provides in-car infotainment and Wi-Fi enablement for customers. Deciphering the Automotive Value Chain for Enhanced Outcomes The benefits of cloud analytics extend beyond the immediate. The automotive value chain comprises critical activities performed at each stage, from vehicle design to customer experience. Introducing cloud analytics at various stages of this value chain can yield multiple advantages, enriching the overall outcomes sought by automakers. This includes optimizing vehicle performance, refining business models,

reducing costs, and supporting Environmental, Social, and Governance (ESG) initiatives. Cloud-based analytics can unlock these benefits by harnessing data generated from various touchpoints throughout the value chain. Figure 2: Elucidates the key activities within the value chain and the data-driven outcomes facilitated by cloud analytics. Notably, data-driven insights can enhance safety by predicting failures and anticipating maintenance issues related to brakes, engine oil capacity, and battery health, among others. Embracing a Cloud-First Strategy in the Automotive Industry In the era of a cloud-first strategy, the automotive industry is actively embracing cloud technology to unlock agility, resilience, efficiency, and productivity. The integration of analytical tools within cloud infrastructure continues to revolutionize the industry's outlook, shaping the future of the automotive sector. This unified platform has the capacity to ingest massive volumes of data and generate significant insights, thereby supporting the holistic growth of both the industry and the broader ecosystem. Ecosystem Orchestration Enabling Order Management for Direct-to-Customer Business Model

----- Arcticle source ----- https://www.wipro.com/analytics/ecosystem-orchestration-enabling-order-management-for-direct-to-customer-business-model/ ----- Contact Wipro Please fill the required details to access the content Ecosystem Orchestration Enabling Order Management for Direct-to-Customer Business Model In today's rapidly evolving landscape, brands that fail to adapt to changing consumer preferences risk losing their market relevance or, at best, their customer base. For the Retail and Consumer industry to thrive and endure, it is imperative for brands to continuously monitor their consumers' needs and pain points. Traditionally, brands had limited direct interactions with consumers and relied heavily on third-party intermediaries for accessing consumer data. As a result, brands have been reshaping their business models to establish more direct connections with consumers by embracing the "Direct-to-Consumer (D2C)" approach to sell their products. This approach involves accepting orders directly from consumers. With D2C, brands bridge the gap between themselves and their

audiences, fostering more intimate and direct connections. Today, an increasing number of brands are contemplating a transition to the D2C model. For instance, Adidas unveiled its "Own the Game" strategy, which includes a shift toward the D2C business model, with a projected contribution of approximately 50% of net sales by 2025. However, adopting the D2C business model presents its own set of challenges, with one of the most significant being the order fulfillment process. Figure 1: Order Fulfillment Process Flow As depicted in Figure 1, brands can ask the 3PL provider to pick the item from warehouse or from their retail store or utilize last mile carriers to fulfil orders from retail store. This choice depends on consumer's preferred delivery time and location, product availability, packaging requirements, etc. Consequently, the complexity of choice varies from one order to another, presenting a significant challenge for brands. To operate profitably in the D2C landscape, brands must confront the following related challenges: Distributed Inventory: In the D2C model, brands must locate inventory that is closest to the consumer. This means that brands count inventory as items available not only in their warehouses but also the items present in the nearby retail stores. To process individual orders efficiently, brands must account for all inventory distributed across this network. Order Size Variability: The shift to D2C results in daily processing of orders from consumers, in addition to periodic orders from retailers and distributors. Moreover, order sizes vary from smaller individual parcels to bulk shipments, altering the dynamics of order processing. Local Delivery Partnership: To successfully implement D2C model, brands need carrier partners capable of delivering bulk orders in addition to small individual parcels. Order Processing Enhancements: Processing daily individual orders poses a different set of challenges compared to bulk shipments at regular intervals. Brands must consider various parameters such as delivery region, delivery time, stock availability, and more when choosing the appropriate fulfillment channel for each order. Integrated Ecosystem: In the order fulfillment process, the ecosystem comprises consumers, brands, 3PLs, regional delivery partners, and a network of retailers, all exchanging data daily for multiple orders. Additionally, order cancellations and returns can occur at various stages, from after online payment to after the consumer has used the item for a few days. Different domains, including warehouse, logistics, finance, and customer care, become involved in processing cancellations or returns depending on the stage at which the order is cancelled. Without a collaborative system facilitating accurate information exchange, brands will struggle to implement order fulfillment in the D2C business model. To address these challenges, it is essential to examine all stakeholders involved in the end-to-end process and transform it by considering each stakeholder's requirements and contributions. Figure 2: Order Fulfillment Ecosystem When examining the order fulfillment process within the D2C ecosystem, three primary types of stakeholders emerge, as illustrated in Figure 2 : It is evident that various stakeholders within this ecosystem contribute their data to complete a single process while maintaining their distinct data architecture. However, attempting to manage this disparate data through a centralized system is challenging and costly. Here, the concept of Data Mesh architecture offers a solution. Data Mesh is based on a distributed architecture for analytical data management and revolves around four key principles: The evolving priorities of the industry and shifting consumer preferences necessitate a revaluation of processes

beyond order fulfillment in the D2C model. This includes considerations like enabling KYC, analyzing marketing campaigns, and more, that requires seamless collaboration within the ecosystem while achieving individual KPIs. With our bold vision of enabling Intelligent Ecosystems, Wipro ensures that the entire ecosystem evolves to deliver an enhanced customer value proposition. GenAI Supercharges Data Governance and a Data-Driven Culture for Manufacturers

----- Arcticle source ----- https://www.wipro.com/analytics/genai-supercharges-data-governance-and-a-data-driven-culture-for-manufacturers/ ----- Contact Wipro Please fill the required details to access the content GenAI Supercharges Data Governance and a Data-Driven Culture for Manufacturers Manufacturers have always struggled to balance cost optimization with robust service quality for manufacturing assets. Increasingly, they are turning to data-driven solutions to advance asset efficiency and reliability. These solutions also help to provision asset data for regulatory compliance, health and safety, and integration with other service providers. To achieve optimal data-driven outcomes, manufacturers will need adaptive data governance. Adaptive data governance is an approach to data governance that focuses on flexibility and responsiveness to changing business needs and data landscapes. It recognizes that data governance is not a one-size-fits-all approach. Business requirements, technology, and data sources are constantly evolving. An adaptive data governance framework allows companies to rapidly integrate new data sources and modify their definitions and policies. Employees can leverage an adaptive governance framework to address emerging risks and compliance requirements while enabling proactive and collaborative decision-making. GenAI can accelerate the ROI of adaptive data governance, particularly as all teams within the organization, not just data teams, adopt a data-driven mindset. GenAI analysis and recommendations create a high-value feedback loop between humans and analytics that improves the underlying data ecosystem. GenAI can identify data gaps/breakages and surface opportunities for improvement across different departments and locations, and enable all users to seamlessly harness the value of integrated asset data for decisions and asset triaging. Applying GenAI to Data Governance GenAI automates data discovery, profiling, labeling, and annotation, providing a contextual data quality engine powered by distributed processing engines for speed and scale. GenAI doesn't just analyze data—it creates a feedback loop for employees to improve the data ecosystem. This processing power delivers advanced analytical insights to business users and data scientists. Companies should begin by addressing the real-time challenges of siloed asset data operations. Teams can leverage GenAI to define the parameters of

adaptive data governance and use the technology to add adaptive capabilities and lineage tracking to ensure the fidelity of the asset data, giving companies the reproducibility and traceability needed to audit GenAI output. GenAI-assisted adaptive data governance leverages ML and AI to find critical asset data across structured and unstructured sources. It onboards new data automatically with oversight and control and automatically tags data with business context to help users assess relevance. Using company-defined parameters, it produces recommendations on downtime triggers and equipment failures, provides visibility to underperforming equipment, addresses safety/environmental incidents, and gives teams valuable analytical insights for various functioning assets to aid proactive maintenance. Using GenAI-infused adaptive data governance, businesses can automate and streamline asset data, asset cataloging, data provisioning, data literacy, data control, and data quality. Leveraging a Machine Learning Data Catalog The core of a GenAI-driven adaptive data governance program is a machine learning data catalog (MLDC). MLDCs advance asset health by exploiting machine learning to improve data management, governance, and consumption. Every data catalog function learns from data patterns, user queries, data searches, and annotations. A MLDC delivers: GenAI Helps Companies Becoming Data-Driven With the growth of sensors and smart assets, manufacturers face astronomical asset data growth. The challenge for the industry is implementing data governance that helps them manage their data efficiently and responsibly to drive better decision-making. However, data governance is not a one solution approach. Adaptive data governance infused with GenAI helps organizations respond quickly to changing needs, regulations, and goals. It creates a high-value feedback loop between humans and analytics that addresses unique business requirements as data sources constantly evolve. GDPR Triangulation

----- Arcticle source ----- https://www.wipro.com/analytics/gdpr-triangulation/ ----- Contact Wipro Please fill the required details to access the content Wipro's GDPR Framework Powered by Informatica data management and AWS Cloud Agile GDPR compliance underpinned by Wipro's "as-a-Service" with a unique catalogue based "pay per use", and block chain solution built on Informatica and AWS Cloud platform Wipro's General Data Protection Regulation (GDPR) framework covering the various areas of GDPR compliance is powered by Informatica' s data governance and compliance products in areas such as data governance, data discovery, data masking, data remediation, data archiving and data consent management for GDPR. The solution is hosted on the AWS platform leveraging AWS's industry-leading GDPR compliant offerings. Wipro's GDPR Triangulation offering is a one-stop-shop for services, tools and platform for GDPR compliance. This pre-built solution with pay as you go model and price bundling helps client achieve considerable cost and time efficiencies in achieving GDPR compliance. =====================

Intelligent Procurement Planning

Intelligent Procurement Planning Accelerate operational procurement planning to increase profitability Improve Dynamic Pricing Capabilities, Forecast Accuracy, and Cash Flow Visibility with Procurement Speed Planning One of the six major features of our speed planning solution built on Anaplan software is our procurement planning platform. Its data-driven agile framework enables enterprises to accelerate their procurement planning operations and align strategies across geographies and departments/segments. Our procurement speed planning model unifies business data so that organizations have visibility into each stage of the procurement process and can quickly make adjustments when needed to ensure successful outcomes. The solution also offers critical actionable insights to CPOs via KPIs through its executive summary dashboard. The tool's key analytics features include the following: In addition to our procurement planning platform, our agile XP execution model enables businesses to speed up project deliveries with basic deployment capabilities that reduce delivery times to five to eight weeks. Teams can keep iteration cycles to one to two weeks and customize projects according to their business needs. =====================

Modernized & Efficient Financial Planning

Modernized & Efficient Financial Planning Delivering Stronger Scenario Modeling, Integrated Simulations, Financial Forecasts, and Cash Flow Visibility Wipro's Anaplan-based Intelligent Financial Speed Planning solution provides a comprehensive financial management platform with six major features, including an innovative financial planning component. With its planning capabilities, enterprises can take a more targeted approach to budget calculations depending on business needs and devise plans specific to geographical regions, departments, or teams. As an agile data-driven tool, this financial planning feature enables enterprises to make informed business decisions more quickly and streamline essential tasks. The tool's what-if analysis capabilities and scenario simulations predict the real-time impact of planned changes, whether top-down and bottom-up financial strategies, allowing financial teams to make adjustments when necessary to ensure business goals are met. The tool's key analytics features include the following: These capabilities are part of the larger innovations we offer through our solution, and our agile XP execution model also enables businesses to speed up project deliveries with basic deployment capabilities that reduce delivery times to eight to ten weeks. Teams can keep

iteration cycles to one to two weeks and customize projects according to their business needs. =====================

Data warehouse modernization with Amazon Redshift

----- Arcticle source ----- https://www.wipro.com/analytics/data-warehouse-modernization-with-amazon-redshift/ ----- Contact Wipro Please fill the required details to access the content Data warehouse modernization with Amazon Redshift Organizations are facing a number of challenges in their data landscapes while catering to an increased customer base and their changing preferences. Some of these challenges are: - Increased cost and performance issues with existing enterprise data warehouses. - Delays in onboarding new data sources. - Data warehouses not capable of handling newer types of workloads and the data generated. - Overcoming the difficulties in realizing an organization's vision of enabling real-time insights. Migrating to the cloud-based data warehouse Amazon Redshift offers lower infrastructure and operational costs, as well as lower risks, and it allows enterprises to benefit from storage, compute separation and scale per specific business requirements. Our Redshift migration approach: Why partner with Wipro on your DWH modernization journey? =====================

InspectAI

----- Arcticle source ----- https://www.wipro.com/analytics/wipro-inspect-ai/ ----- What We Think Contact Wipro Please fill the required details to access the content InspectAI Effective Asset Monitoring for Asset-Intensive Enterprises Move beyond reactive maintenance to predictive asset management For asset-heavy enterprises, timely inspections and preventive asset maintenance are key to maximizing asset integrity and profitability. Ineffective management can lead to lengthy inspection cycles; limited inspection coverage; high inspection costs; inefficient data gathering; and health, safety, and environmental risks. Wipro's InspectAI transforms inspection workflows by combining process, technology, and business model elements to deliver an enhanced inspection management service. As a scalable solution designed for the oil and gas, utilities, energy, telecom, and manufacturing industries, its range of functionalities allows enterprises to reimagine inspection tasks through: InspectAI empowers businesses to inspect their assets comprehensively and frequently, and create historical data. Based on an asset's condition and InspectAI's anomaly prediction, real-time alerts can trigger the asset maintenance workflow proactively. By moving from a reactive to a predictive maintenance approach, enterprises can increase asset integrity and improve workplace environments to support worker health and safety.   Organizations can also reduce their carbon footprint by leveraging technologies such as drones to decrease human travel and reduce CO_2 emissions. The solution's automated processes lead to less resource consumption, and since inspections can be done more often,

any performance issues can be spotted quickly, minimizing any environmental impact. Move from reactive maintenance to predictive asset management Asset integrity management is a key activity for energy companies. ======================

Intelligent Document Processing

----- Arcticle source ----- https://www.wipro.com/analytics/intelligent-document-processing/ ----- Contact Wipro Please fill the required details to access the content Intelligent Document Processing Unlock insights from varied documents Ramped up processing of the unstructured information coming in from multiple channels Every organization has large sets of documents, but the reality is that 80% of these documents are unstructured and locked in emails, texts, images, PDFs, videos, and even scanned images. Current systems and technologies require human intervention to handle these documents. In some cases, these are even overlooked, resulting in incorrect insights that may hamper their business decisions altogether. Wipro's Intelligent Document Processing (IDP) adds the power of AI technologies such as computer vision, NLP and ML on the top of these documents. It helps in automatically digitizing documents, classifying them, extracting information from them and enabling cognitive search. It learns continuously and reveals insights that augment CXOs to make the right business decisions in driving their end customer experience. ======================

Cognitive Finance

----- Arcticle source ----- https://www.wipro.com/analytics/wipro-cognitive-finance/ ----- Contact Wipro Please fill the required details to access the content Wipro's Cognitive Finance Creating Intelligent Financial Services with AI AI-led finance transformation brings efficiency, simplification, and drives valued outcomes Mired in the day-to-day challenge of automating manual processes, many CFOs focus on short-term goals and have little time to develop long-term strategies to leverage AI for business outcomes and value delivery. Wipro's Cognitive Finance solution infuses AI into the finance value stream to optimize business operations, drive intelligent business enablement, and strengthen control and compliance. This infusion allows CFOs to operationalize intelligence and, ultimately, enable their finance transformation efficiently and simply. Empowering businesses to manage finance and accounting operations for improved productivity, faster turnaround times and cost savings, Cognitive Finance presents better information access and customer interaction through a comprehensive portfolio of cognitive-led intelligent financial services. Working across the finance and accounting value chain, Cognitive Finance's range of solutions allows enterprises to gain a competitive edge through: The additional AI-based offerings increase operational efficiency through automation and further finance transformation by allowing companies to build and implement innovative use cases for customers and create new revenue streams. To identify and discover AI use cases in a CFO organization, Wipro

follows a unique methodology called Enterprise Intelligent Quotient framework (E-IQ) which uses the five pillars of Sense, Decide, Act, Interact and Adapt, that benchmarks your current E-IQ from a scale of 0 to 10 and provides a roadmap to attain an optimal E-IQ score for your finance organization. Cognitive Finance helps enterprises build intelligent financial services by turning data into information, and information into insights, with AI-driven intelligence infused across multiple financial processes. To learn more about how Cognitive Finance can deliver on real-time insights and on-the-spot future forecasts, contact our team.

Wipro Data Intelligence Suite

----- Arcticle source ----- https://www.wipro.com/analytics/wipro-data-intelligence-suite/ ----- Contact Wipro Please fill the required details to access the content Wipro Data Intelligence Suite A one-stop solution that accelerates cloud modernization and data monetization to unlock business opportunities Data has become a fundamental building block for leading enterprises in today's digital world. It has the power to increase knowledge and drive change. But with the data creation rate continuing to increase, organizations find themselves drowning in data, struggling to determine how best to manage, store, access, use and protect these vast sums of information. The limitations of legacy platforms are an increasing source of frustration across any organization. Forward-thinking business leaders know they need to leave legacy systems behind and move to the cloud to deliver business value. Understanding these challenges and inspired by the opportunities and tremendous value that data puts within reach, our team of data, analytics and AI experts developed Wipro Data Intelligence Suite. Fast-tracking modernization journeys to realize digital transformation ambitions Wipro Data Intelligence Suite focuses on modernizing data estates, including data stores, data pipelines and visualizations, powered by a set of low-code/no-code, AI/ML-infused accelerators, enabling end-to-end automation of the cloud transformation journey spanning across major hyperscalers. By enabling end-to-end automation of a company's cloud migration journey, Wipro Data Intelligence Suite ensures that businesses can gain business value quickly while mitigating migration risks. It delivers an efficient, reliable pathway to cloud-driven modernizations that set the stage for accelerated workflows and enhanced data analytics operations. The platform supports multicloud infrastructures in alignment with an enterprise's strategy and business goals. As a comprehensive modernization and migration solution, Wipro Data Intelligence Suite provides all the necessary technical requirements and is compatible with any cloud service platform. Its innovative suite of accelerators and ready-to-deploy modules allow enterprises to develop an effective strategy for migrating legacy applications and data. Wipro Data Intelligence Suite helps enterprises unlock new opportunities and delivers value across the organization. In addition to avoiding stability, latency and data loss issues, the platform provides increased productivity, reduces migration costs and drives faster time to market. At Wipro, we help clients simplify the complexities of technology to enhance business value and set opportunities free. Are you

ready to fast-track your modernization journey? Contact us to unlock new business opportunities. =====================

migration factory solution using Data Stewardship Platform reduced IT deployment expense by 60% and improved time-to-market by 20% University establishes modern data environment and develops actionable insights at all levels of the organization Data migration to S/4 HANA and native HANA reporting enabled cost savings of $4.5 million per year The bank met compliance obligation with time and effort efficiencies leveraging Wipro's remediation solution Implementation of automation for master data management enables the company to become a strong data-driven organization via continuous improvement The company gets future-ready with a scalable data platform that enables real time data processing and the capability to handle complex computation The company integrated key elements of strategy, price setting, transaction and performance management The network provider leveraged a real-time insights platform with the capability to process 15 billion events a day and a real-time personalized campaign management solution to smart-connect with its subscribers across digital channels Wipro creates an integrated data ecosystem to improve data consistency and user access, driving meaningful insights and intelligent solutions. Wipro enabled $12 Million savings for the IT company, reducing its sales credit cycle time by 50% The client partnered with Wipro to spearhead a large-scale intelligent HR transformation exercise leveraging the power of digital technologies. A large international banks had a long-term strategy of reducing the company's data centre footprint. The global pharmaceutical market is projected to grow at a compound annual growth rate of 13.74% from 2020 to 2027. A multinational investment bank and financial-services company had experienced significant growth, and business projections anticipated the positive trend to continue. The subsequent growth in data would stress the company's existing storage and computing capabilities, and operational risks would arise if the data became too siloed and caused increased on-premise expenses. To accommodate its continued growth through mergers and acquisitions... Wipro's Human Resources Shared Services (HRSS) serves more than 200,000 employees One of the largest telecommunications companies in Australia collected and stored data across more than 20 siloed sources. An Australian energy-distribution company wanted to become more customer-centric VW Credit, Inc. (VCI), a financial services arm of Volkswagen Group of America, provides competitive financial services to its dealers and 1.2 million customers. The credit arm wanted to provide more timely and customized products to its customer base. By collaborating with Wipro, Integra solidified its leadership in the medical device industry and expanded the tech maturity of its organization. Cigna recognizes the importance of quality data for its external and internal reporting for both its business and its customers and has been taking steps to foster a truly data-driven culture throughout its entire organization. Thanks to Analytics Data Discovery Platform which helps a business user to explore this data and generate insights without much training and expertise in any analytics tool Universe of customers doesn't have to be categorized into broad segments any longer. You can now create communication and campaigns that are CUSTOMER SPECIFIC, persuasive and produce winning results. Key differentiator would be an effective discovery environment that would enable rapid decision making and implementation of new offerings quickly in the longer run CAOs can now use data for a variety of purposes. It can help manage operational efficiencies, discover customer needs, identify new markets, give shape to

new products and value-added services and develop defensible differentiators To gain the advantages of new technology, organizations are getting ready to undertake a BI Transformation journey moving from historical reporting to planning and forecasting in a bid to identify and address emerging opportunities Challenges in Risk Management can be addressed with technologies leveraging KRIs, as risk technologies will put Enterprise Risk Management more centrally in organizations CFO's roles have evolved from being official bean counters to that of strategic partners. CFO's responsibilities & experiences make them to most suited to embrace as well as advocate technology adoption Key trends directing future investments in Enterprise Risk Management Wipro offers vendor agnostic approach with consistent experience across a range of Data Integration and Business Intelligence tools with predictive capabilities to overcome failures and delays during data warehouse batch runs Money Laundering is a threat of greater than expected magnitude. The risk associated with poor AML practices cannot be underestimated simply because crime methodologies are getting highly sophisticated and need equally intelligent counter measures. CAOs can now use data for a variety of purposes. It can help manage operational efficiencies, discover customer needs, identify new markets, give shape to new products and value-added services and develop defensible differentiators There is an increasing recognition that CFOs and CROs are not on opposite sides of the battlefield. Instead, it is more appropriate to think of them as two sides of the same coin. But, the question to ask is how can this realization actually add value to the organization? The arrival of the Internet of Things (IoT) introduced a new deluge of data getting processed and used for analytics Data is the genesis for insights but the question is how value from data has indeed created protable avenues, just as it has from oil. All forms of business management, and all studies of management science, require accurate, duplicable and reliable data at their very foundation. Big Data is helping manufacturers achieve the same. Using advanced analytics on top of Big Data, customer data can help retail banks solve business problems by transforming their traditional data warehouses into information delivery platforms Using insights gathered from production-data analysis, two-thirds of companies report annual savings of 10% or more in terms of the cost of quality and production efficiency. Going into the future, a thumb rule would be to bear in mind that investments in database appliances would do better if they had a wide availability of tools – hopefully from the open source space – and were built with industry speci¬fications and standards in mind As businesses change their processes, data structures undergo a concurrent change. This food of complex data is crippling current systems. What businesses need is robust scalability, resource optimization, consolidation and fexibility to meet even unforeseen business needs MDM put in place tools that processes and controls reducing errors, improve data usability, enhance the quality and reliability of master data Smart factories are the future. But they don't have to mean abandoning your current investments in technology, data management and monitoring Through effective and integrated data management and analysis from various manufacturing process, a significant impact can be made to various facets of manufacturing Astute technology companies have relied upon online technical and non-technical communities to help other users with product or service features, highlight glitches, raise red ¬flags, sight early warnings, discuss performance issues, etc. Large volume of processed data start

making more sense only when it is tagged and related to the master data entities of the organization. As the digital wave sweeps the business world, traditional approaches towards managing data are impacted significantly such that methodologies and techniques require an overhaul to support this new digital age data Key differentiator would be an effective discovery environment that would enable rapid decision making and implementation of new offerings quickly in the longer run Clustering techniques can also provide a better view of the customers and enable Utilities to target them better with only the relevant offers. Using the right technology to gather real-time data from internal and external data sources and applying advanced analytics to derive real-time meaningful insights can help decision makers to shift to a more predictive mode of functioning than a reactive one. When the CFO-CRO relationship is strengthened, we can expect to reap the benefits of operational stability, predictability of returns, enhanced reporting, increased compliance and improved profitability. With ever increasing volumes of data, relying on data processes without a governance layer is equivalent to sitting on a bomb waiting to explode. manufacturing industry is leveraging the Internet of Things to collect product and usage data directly and regularly rather than depend on dealers and surveyors to collect and send in the data after a machine or device has broken down Universe of customers doesn't have to be categorized into broad segments any longer. You can now create communication and campaigns that are CUSTOMER SPECIFIC, persuasive and produce winning results. Cloud infrastructure is penetrating fast, and the forecast for the industry looks really sunny. Even industries known for stricter regulations on data confidentiality have embraced Cloud for a variety of processes. A road map for transformation and rationalization that entails an unbiased understanding of the BI Inventory stack, enterprises can unlock the benefits of a cost-effective, agile and intelligent BI platform Retailers can further enhance the in-store shopping experience through advanced video analytics, aggregate analysis of store footfalls, parking lot information and physical characteristics of store visitors to optimize product assortments. An experienced technology partner can ensure that the business identifies the data required to be captured based on business goals and vision and prevent the risk of over inventing and over investing for retailers Insurance fraud detection is a challenging problem, given the variety of fraud patterns and relatively small ratio of known frauds in typical samples. Thanks to Analytics Data Discovery Platform which helps a business user to explore this data and generate insights without much training and expertise in any analytics tool Data Envelopment Analysis is a very powerful technique to evaluate the relative efficiency of business units when multiple inputs and outputs are involved. The benefits of targeted marketing are two-fold: one, the total cost of marketing and acquisition decreases, and two, a well targeted campaign increases the likelihood amongst target audience to respond. This leads to enhanced response rates and Return on Marketing Investment (ROMI) Rising need of a Unified Cloud Brokerage Governance Console - a services hub - to facilitate consumption of an increasing diversity of cloud services Paper guides you in understanding the role of analytics in optimizing Smart Meter rollouts. Financial crime detection and prevention is critical in any organization and how augmenting it with Artificial Intelligence and Machine Learning will help industries Intelligent enterprises are being shaped by the rapidly expanding footprint of Artificial Intelligence Real

world evidence (RWE) is the clinical evidence regarding the usage and potential benefits or risks of a medical product derived from analysis of the data relating to patient health status and/or the delivery of healthcare routinely collected from a variety of sources Machine Learning and Artificial intelligence helping Organizations enhancing data quality for better insights Discover how to humanize AI to deliver analytics that matter? The need to understand business performance in real time in order to manage the modern enterprise makes it important to overcome existing planning systems bottlenecks In the digital age, digital data lakes have replaced file cabinets, and every organization is sitting on an astounding amount of data. Harnessing advanced analytics and AI to optimize the value from IoT With the growing client expectation of faster time to market, most of workforce efforts in the IT industry are spent in maintaining the infrastructure of the project instead of focusing on the actual work items. Organizations are rapidly adopting advanced analytics to enable data-driven business decisions. As a result, the demand for data science experts is growing. Amazon successfully used automation and artificial intelligence for order recommendations and fulfillment in their ecommerce platform and warehouses, but when it came to evaluating job candidates, the scoring engine failed The Web API or API in short, is not a new technology. It has been there for more than a decade and today Programmable- Web directory lists more than 20,000 public APIs available for consumption. The retail industry, now, has access to a wealth of data across a customer's lifecycle. The data helps predict customer behavior, assesses needs for new products, and triggers buying decisions. The Six Sigma methodology is not new - it has been around since the 80s. What is interesting is its long shelf life. It continues to be relevant to modern day operations despite rapid technological advancements. A data protection process encrypts the data and removes personally identifiable information from data sets, so that the actual people whom the data Today, AI to most businesses is a technology that aids in the automation of tasks and augments decision making by providing insights to key leaders and decision takers. Cloud has been a great enabler in this race towards digital, building a connected cosystem that is essential to not only satiate the need of customers but also partners, vendors, employees and things. Growing adoption of Artificial Intelligence (AI) in systems that assist, rate, and offer advice on how people are treated and what opportunities they are offered is resulting in broad discussions on how to build objective systems. Over the years, asset-intensive industries like energy, utilities, and manufacturing have witnessed several service failures and safety incidents around machines and structures without warning. The volume and variety of data available to organizations in the digital age is enormous, giving rise to the need of expanding their data-management infrastructures considerably and rapidly. Data lake, a new class of data-management system, holds a strong potential to achieve success in this area. The acute need to become an insights-driven enterprise Having the right set of processes ensure consistency in delivering promised business outcomes through intelligent systems powered by the right technology and right capability ETL modernization with its cost-saving approaches to transactional and analytical data processing is becoming a key strategy for organizations' IT estate rationalization It is vital that the leadership understands the potential impact of AI across the value chain and drives the AI adoption initiative. UDM is the driver of success for the

organization that wishes to benefit from the enormous dataset (master and transactional) being hosted in any of its larger application landscape. Product Information Management solution delivers to organizations strategic advantages that greatly enhance the digital experience of both, its internal as well as external stakeholders DataOps helps overcome the hurdles and complexities and deliver analytics with speed and agility, without compromising on data quality The foundation for high performance analytics Every business needs to have a scalable, reliable model in place that addresses all business functionalities and enables understanding of business performance in real time. IoT, 5G and AI are ushering in a new era of customer and citizen engagement. Defining migration strategy – Defining strategy for extraction of data from different source systems, cleansing of data, validation and reconciliation of data, environment planning is very tricky and needs a customized approach suiting the project requirement. Building smart cities and smart healthcare with edge analytics and 5G Digital Voice User Interface will take enterprise human-machine interaction to the next level There has been considerable improvement in use cases ranging from facial / voice / image recognition. One reason could be the abundance of labeled input data sets. We have as many photographs of human beings, cats, or dogs as we can. The more the machine can play and learn, the better it gets. The same as what happened with chess or Go. The rapid spread of COVID-19 poses a global threat in an increasingly interconnected world. The strategy for optimizing pricing and maximizing profits First, take control of your data As COVID-19 transforms the way consumers behave, it will affect demand estimation, customer targeting, and product and service fulfilment strategies. Indian agricultural sectorpresents some staggering numbers. It provideslivelihood to 58% of India's population with aGross Value Addition of 265.51 billion USD(agriculture, forestry & fishing combined)1. At283.37 tons, India had a record production offood grains in 2018-191. The Private Data Privacy Act entitles Indonesia residents to even more control over their personal data. Download our quick guide to learn more. The UK government has mandated that energy suppliers install smart metering systems across Great Britain by the end of 2024. Regulators estimate that energy suppliers will deploy 53 million smart meters during this period Over the past decade, we have witnessed an unprecedented technological disruption in application and data functions. They are now enabling enterprise-wide digital transformation initiatives to empower customers and colleagues. The questions on everyone's mind Financial institutions have been slow at adopting cloud technologies primarily due to concerns around security, regulatory compliance, and governance. As a result, they have been facing business model-related challenges like legacy technology, high running costs, and lack of scalability. Open banking is an emerging financial technology where regulated financial institutions share some customer financial data to permit competition, innovation, and better financial products A New Age of IP solutions Led by AI As organizations race towards digitization, it is imperative that the underlying infrastructure keeps pace. The need for 'anywhere, everywhere and always-on' IT infrastructure calls for a paradigm shift in this space. The technology landscape is full of solutions that can parse historical data, but modern businesses increasingly want to predict the future. What are the risks? What are the opportunities? Where will the market – and revenue – be five years from now? Using predictive analytics, organizations can take steps

toward answering these future-focused questions. Driving efficiency and revenue by moving beyond the scope of simple chatbots Modern vehicles predominantly run on fossil fuels.... The 12 strategic technology trends for the coming year per Gartner shouldn't surprise anyone; they focus on automation, security and AI. The technicalities go deeper, of course: hyper automation and autonomic systems, increased security through mesh and privacy-enhanced computation, generative AI, decision intelligence and AI engineering. But the larger issues are generally familiar. One trend is particularly familiar – the use of data fabric – because of its recurrence on Gartner's list. Data fabric's return is both notable and important; it underscores the need for a unified view across the democratized and ever-growing landscape of technology offerings in data storage and processing. The prestigious Microsoft Partner of the Year awards recognize partners who have demonstrated client delivery excellence. In response to the ever-changing digital landscape, the consumer-packaged goods (CPG) industry has directed its focus to edge computing, a distributed IT architecture transforming how businesses process data. Today, businesses are actively exploring the potential of generative AI, engaging in use case identification, conducting proof-of-value exercises, executing pilots, and integrating the technology into their operational processes. The Metaverse is no longer a concept confined to science fiction movies. It is becoming a reality. ChatGPT and Bard have taken the world by storm! In many circles, even in casual conversations, discussions about the huge positive influences of Large Language Models (LLMs) and the sobering risks they pose to our socio-economic fabric are happening in the same breath. ChatGPT and Bard have taken the world by storm! In many circles, even in casual conversations, discussions about the huge positive influences of Large Language Models (LLMs) and the sobering risks they pose to our socio-economic fabric are happening in the same breath. In today's rapidly evolving landscape, brands that fail to adapt to changing consumer preferences risk losing their market relevance or, at best, their customer base. Manufacturers have always struggled to balance cost optimization with robust service quality for manufacturing assets. =====================

Total Customer Centricity

With Wipro's AI Solutions, leaders can integrate AI into their overall strategy and value stream, maximizing their business value. Wipro's AI Solutions partners with organizations to help them transform into intelligent enterprises by leveraging trustworthy AI scaled across business functions, supported by actionable insights and powered by curated data. Combined with Wipro Holmes and a global partner ecosystem, Wipro's AI Solutions enable enterprises to foster innovation and boost their profitability. Stay ahead of the transformation curve and maximize your business value with Wipro's AI Solutions. Learn more or book a meeting with us at aisolutions.contact@wipro.com Mitie, a UK-headquartered facilities management (FM) and professional services leader employing almost 50,000 people with revenues of £2.2 billion in FY20, wanted to drive significant efficiency improvements and cost savings. In the midst of a multiyear transformation program that started before the COVID-19 pandemic, Mitie teamed with Wipro to manage their SAP cloud ERP migration to Microsoft Azure. Driving efficiency and revenue by moving beyond the scope of simple chatbots The pace of growth around the world has led to globally distributed, multi-tiered, large, and complex. Artificial Intelligence (AI) is clearly being adopted by enterprises, with just 15% of organizations saying they are not doing anything with AI. Patient safety is the most critical aspect in the drug lifecycle. =====================

Semantic Data Hub

----- Arcticle source ----- https://www.wipro.com/analytics/semantic-data-hub/ ----- Our Expertise What We Think Contact Wipro Please fill the required details to access the content Semantic Data Hub Build and operate the enterprise brain Extract semantic meaning and relationships, and represent knowledge in computable form to enable new classes of intelligent applications Wipro's Semantic Data Hub (SDH) enables enterprises to extract semantic meanings and relationships from both structured as well as unstructured data sources to build knowledge graphs that would enable completely new classes of intelligent applications powered by Artificial Intelligence (AI) and curated knowledge. The solution helps enterprises manage data efficiently by providing a unified interface to discover data assets spread across the enterprise, including private storage or AWS Cloud

storage. SDH uses powerful AI/Machine Learning (ML) based techniques for text, speech, image and video analytics to enable development of intelligent applications for the enterprise. Undergoing the migration to a new method of storing and managing data is a daunting task for even the most agile insurance organization. Before tackling such a project, it's important to know how an organization will be able to measure the success of their semantic data hub and enterprise brain. ======================

Intelligent planning with speed

Our Expertise What We Think Form Title What We Do Contact Wipro Please fill the required details to access the content Intelligent planning with speed Overcome contingency planning challenges with speed for tactical and strategic outlook Enabling enterprises to react and re-plan/re-adjust faster than ever before Wipro's 'Intelligent Planning' is a unique, integrated and consensus-based collaborative planning solution that addresses business exigencies and economic disruption challenges with agility, leading to higher and faster ROI. As the 'new normal' comes into effect, scenario-based simulation, driven by an integrated and connected planning approach will serve the short- and medium-term contingency planning requirements resulting from increasing customer demand. The six major tenets of our speed planning solution will help transform organizations into intelligent enterprises by providing an agile framework to react and re-plan faster than ever includes Workforce planning for business continuity, SCM planning to manage sudden demand fluctuations, Financial planning to optimize operation and capital cost, Merger & Acquisition planning for scenario planning for cash adequacy, Sales planning to accelerate revenue channels and Operational procurement planning to control cash spend. Key solution features include Business continuity planning, Workforce remote enablement planning, Social distancing & workforce health safety planning, Workload vs. capacity planning, Integrated scenario simulation planning for finance, Cash flow impacts & cash liquidity planning, Supply & demand planning during exigencies, Sales forecasting and quota allocation planning, Operational procurement planning to optimize and control vendor spend. Faster delivery approach with Agile XP execution model, which allows quicker Iterations of 1-2 weeks, reduced the project delivery to 3-5 weeks with basic solution feature deployment, allowing opportunity to further customization in future. The UK government has mandated that energy suppliers install smart metering systems across Great Britain by the end of 2024. Regulators estimate that energy suppliers will deploy 53 million smart meters during this period Accelerate operational procurement planning to increase profitability Delivering Stronger Scenario Modeling, Integrated Simulations, Financial Forecasts, and Cash Flow Visibility =====================

Marketing Sciences Lab (MSL)

What We Think Form Title Form Title Contact Wipro Please fill the required details to access the content Marketing Sciences Lab (MSL) Accelerating value at the intersection of data science and agile marketing Driving rapid exploration and experimentation to improve the top line In today's rapidly changing market, sales and marketing teams want to continuously enhance their customer engagements and remain effective. They are looking for rapid exploration and experimentation capabilities that supercharge their agile marketing initiatives, thereby improving customer experience and the top line. Wipro's Marketing Sciences Lab (MSL) is a repeatable, fast, and business outcome–focused offering that helps businesses accelerate their ability to gain insights using data and AI, delivering short- and long-term business value in sales, marketing, and advertising domains. Built at the intersection of Wipro's human-centric design and data science expertise, MSL propels clients to achieve quicker sales and marketing growth outcomes. MSL helps businesses solve customer- and market-centric business problems using agile marketing methodologies and data science through a test-and-learn lab setup. MSL business solutions enable benefits across a range of topics: As COVID-19 transforms the way consumers behave, it will affect demand estimation, customer targeting, and product and service fulfilment strategies. Retailers today face the unique challenge of engaging with incredibly diverse customers across a range of geographies and digital channels. Customer demands are changing rapidly, and consumers expect far more from retailers than ever before, including hyper-personalized service in near-real time. =====================

Data Platform Modernization with Google Cloud Data Platform (GCP)

Contact Wipro Please fill the required details to access the content Data Platform Modernization with Google Cloud Platform (GCP) The latest innovations in cloud technologies are giving businesses the opportunity to modernize their data operations, gain valuable business insights, and become more resilient as disruptions occur. A Gartner article reveals that over 70% of businesses have migrated part of their workloads to a public cloud platform, and it's expected that further migrations will take place in response to conditions brought on by the pandemic. To ensure organizations can migrate their data seamlessly, Wipro is delivering customized solutions with Google Cloud Platform (GCP) for modernizing data analytics landscapes at an optimal cost and an accelerated pace. With our frameworks, automation platforms, and ability to deliver data insights, we're leading GCP adoptions that transform processes and increase business value, driven by our industry-specific expertise built

from multiple cloud migration and modernization journeys. We also leverage Google Cloud Data Analytics to migrate data from various data sources, transforming them into actionable insights, and leverage AI to drive smarter business decisions and uncover new opportunities. Data Platform Modernization with Amazon Web Services (AWS)

----- Arcticle source ----- https://www.wipro.com/analytics/data-platform-modernization-with-amazon-web-services/ ----- Contact Wipro Please fill the required details to access the content Data Platform Modernization with Amazon Web Services (AWS) Gartner predicts that by 2022, "public cloud services will be essential for 90% of data and analytics innovation." The latest achievements in cloud technologies are giving businesses the opportunity to reduce the cost of their analytics platforms while improving speed, scale, and efficiency. With the new Lake House architecture from Amazon Web Services (AWS), organizations can now modernize their analytics operations and accelerate their ability to gain valuable insights. Its capabilities enable enterprises to directly and seamlessly run queries (through Athena/Spectrum) against data in operational data stores (Relational Database Service [RDS]), lakes (Amazon Simple Storage Service [S3]) or data warehouses (Redshift) while ensuring unified governance controls through services such as Lake Formation. By adopting the architecture, organizations can gain improvements in both cost and performance. Wipro offers an array of data platform modernization services, ranging from assessments, roadmap building, and piloting to industrial rollouts of AWS analytics platforms. Our services are backed by Wipro's years of experience migrating large, on-premise analytics platforms to the cloud. With our frameworks, accelerators, and automation platforms, we can offer our clients a low-risk migration to the cloud while containing costs. Our 4S Levers, outlined below, are the foundation for our modernization approach and our ability to empower organizations to achieve greater business value. ===================== ----- Arcticle source ----- https://www.wipro.com/analytics/wipro-ai-solutions/ ----- Our Offerings Our Success Stories Form Title Form Title Our Success Stories What We Think Form Title What We Think News & Events Form Title Form Title Our Success Stories Analyst Speak Form Title Form Title Form Title Contact Wipro Please fill the required details to access the content AI Solutions Digital disruption has transformed global business. Monitoring for Asset-Intensive Enterprises Creating Intelligent Financial Services with AI Unlock insights from varied documents Reinvent the marketing experience with intelligence driven strategies Expedite ML Journey with Wipro's Amazon SageMaker Offerings Infusing AI to cultivate a superior customer experience The pace of growth around the world has led to globally distributed, multi-tiered, large, and complex. Driving efficiency and revenue by moving beyond the scope of simple chatbots The impact of AI on business-process transformation has had a remarkable impact .. Modern vehicles predominantly run on fossil fuels.... Artificial Intelligence (AI) is clearly being adopted by enterprises, with just 15% of organizations saying they are not doing anything with AI. Patient safety is the most critical aspect in the drug lifecycle. Building tomorrow's mobility and autonomy, today Less than a decade after breaking the Nazi encryption machine Enigma and helping the Allied Forces win World War II, mathematician Alan Turing changed history a second time with one simple question: "Can machines think?" The COVID-19 pandemic drove an explosion of online and social conversations during lockdown. Effective IP management strategies can provide the needed encouragement Asset integrity management is a key activity for energy companies. It ensures safe operations, avoids unplanned downtime, and prevents incidents. Legal systems worldwide have embraced English jurist William Blackstone's idea of letting ten guilty people escape rather than having one innocent person suffer. But, "justice delayed is justice denied" is also a very common adage in the judicial domain. Both raise three important points: ensuring justice is delivered, supporting it with correct evidence, and addressing it in a timely manner. In his book "Homo Deus," Yuval Noah Harari contends that "organizations are algorithms" – processing information through various divisions, departments, and hierarchies to deliver decisions, with their employees and teams working as information-processing agents. As businesses leverage AI and digital to transform into intelligent enterprises it is important that they also reexamine their structures and operating models. The Hackett Group Principal Paul Morrison talks with Wipro's VP of HR and Global Head of HR Shared Services Putul Mathur and VP and Global Head of AI Solutions Practice Mukund Kalmanker about Wipro's AI-led digital transformation in human resources, which won the company a 2021 Digital Award in the Hire-to-Retire category from The Hackett Group. Ecommerce has long been growing in popularity with private consumers and enterprises alike, but the pandemic drove an unprecedented flurry of activity even from segments that hadn't previously embraced online shopping. IDC MarketScape evaluated 19 AI services providers based on a comprehensive framework and a set of parameters expected to be most conducive to success in providing AI business services in both the short and long term. InteractAI

----- Arccticle source ----- https://www.wipro.com/analytics/interactai/ ----- AI Infused Transformation Contact Wipro Please fill the required details to access the content InteractAI Infusing AI to cultivate a superior customer experience for enterprises The emergence of multiple contact channels and

dispersed data makes it difficult for contact centers to meet customer expectations consistently and across channels. To deliver a seamless customer experience, enterprises need a platform that can streamline operations and integrate data from each customer touchpoint. Wipro's InteractAI enables businesses to differentiate themselves by providing a superior customer experience while reducing costs. Leveraging the power of AI, enterprises can deliver a personalized experience and offer services catered to a customer's specific needs via his or her preferred channel. Wipro's industry experience, combined with prebuilt frameworks, prediction models, and conversational AI, bridges the gap between enterprises and their customers. With InteractAI's platform-agnostic compatibility, organizations can seamlessly integrate the platform into any existing contact center system and create customer relationships that build brand loyalty. InteractAI enables companies to find the information they need through integrated guided navigation and assessments of real-time calls, emails, and chat sessions. Executives and agents alike gain valuable insights by retrieving data from the right sources, with a unified 360-degree customer view and an integrated chat interface that delivers a seamless omnichannel customer interaction. InteractAI includes pre-designed industry solutions that follow best practices and targeted business outcomes, and it can be tailored to specific domains or industries. This enables faster, easier adoption and delivers hyper-personalized customer experiences through conversational AI. It also enables any enterprise to transform its customer-engagement function from a cost center to a revenue generator.
=======================

Data Strategy Maps

----- Arcticle source ----- https://www.wipro.com/analytics/data-strategy-maps/ ----- Contact Wipro Please fill the required details to access the content Data Strategy Maps Most organizations are in the process of building a data-driven culture that allows them to analyze or experiment with any volume, variety, or velocity of data and derive valuable insights from it. The key to achieving this is with a data strategy map, a visual representation of an enterprise's data strategy that illustrates the variety of data channels throughout the company. With this in place, organizations can ensure their data strategy aligns with their business needs and make fact-based decisions on how to achieve the next wave of profitability. A well-constructed data strategy map is similar to a city's metro map. Just as a metro map is essential for understanding transportation routes across a city for future development, a data strategy map would enable an enterprise to better understand its data workflows. A Wipro Data Strategy Map offers a unified approach to assessing the current data estate and its maturity by combining a defensive and an offensive strategy (explained below). It ensures the integrated flow of data, as well as its uniformity, security, and enrichment, to deliver quick business benefits. Each strategy is focused on achieving specific goals: Democratize, Secure, Standardize, Monetize, Innovate, and Optimize. A Data Strategy Map shows the pathways and elements covered by the two defensive and offensive data strategies, which help organizations identify their current data maturity and create a robust data strategy for

developing further advancements. The map contains stations, which are the set of defined capabilities required along the pathway, and intersections, which depict the common capabilities required across the various lines. A defensive data strategy focuses on minimizing downside risk, ensuring compliance, leveraging analytics to detect and limit fraud, and building systems to enable control and prevent theft. It's developed to achieve the following beneficial tasks: An offensive data strategy is focused on driving innovation and change, conducting quick experiments, and supporting business objectives, such as increasing revenue, profitability, and customer satisfaction. This strategy gives enterprises the ability to achieve the following tasks: Each of the lines in the Data Strategy Map has a set of questionnaires and artifacts related to them, which helps in assessing the maturity of those lines. This provides an indication of the data strategy's current state and is pivotal for making it more robust in the future. The individual lines also need to be monitored through each set of defined KPIs, including input, process, and output KPIs. Dashboards and videos also demonstrate the key initiatives and their results. Included in our Data Strategy Map offering, the Wipro Command Center periodically records the overall progress of the data strategy in achieving the key functions, such as customer satisfaction, increased revenue, reduced risk exposure, and employee efficiency. With this information on the strategy's progress, Chief Operations Officers can track the growth of their multiple data and analytics initiatives and share it with the larger organization. Data Strategy Maps also provide enterprises with a comprehensive view of their data estates and their impact on the business. To learn more about this solution, please reach out to ask.analytics@wipro.com =======================

AI for marketing

----- Arcticle source ----- https://www.wipro.com/analytics/ai-for-marketing/ ----- News & Events Form Title What We Think Contact Wipro Please fill the required details to access the content AI for marketing Reinvent the marketing experience with intelligence-driven strategies In a world of increased digitization and rapidly evolving consumer behavior, companies must devise new marketing and engagement strategies to account for changing preferences and trends. Artificial intelligence can transform marketing by making campaigns more productive, predictive, and effective at driving customers through the funnel through hyperpersonalization and an omnichannel approach to engagement. Wipro's AI for Marketing optimizes marketing processes, providing valuable marketing insights, omnichannel customer engagement enhancing customer experience, and improved conversion rates at every stage. Bringing the speed and precision of multitouch attribution, AI for Marketing delivers across branding, hyperpersonalization, digital engagement, customer support and dynamic pricing. A comprehensive approach to an AI- infused Marketing discover.IQ Wipro's AI for Marketing ensures companies can reach larger audiences and have a more-qualified, higher volume of traffic by identifying customer needs and providing valuable marketing insights. consider.IQ Develop statistical correlations between customer attributes by analyzing profiles, predicting customer behavior, and identifying and nurturing the most

valuable leads. decide.IQ Real-time user monitoring, easier marketing, future-demand prediction, deep marketing insights into user behavior and interests, generate instant brand awareness, and set dynamic pricing for a competitive advantage. engage.IQ Deliver targeted communication at every touchpoint through different platforms to increase omnichannel customer engagement and earn trust through hyperpersonalization. Gain a deeper understanding of the customer's wants and needs with one-on-one connections, streamline and automate sales interactions and push your prospects through the sales funnel. Assist marketers in identifying high-performing content ideas and increase output quality by targeting the right audience with the right content. Ecommerce has long been growing in popularity with private consumers and enterprises alike, but the pandemic drove an unprecedented flurry of activity even from segments that hadn't previously embraced online shopping. With this rapid growth, and with customers' evolved expectations for timing and delivery, there is a growing need for direct-to-consumer brands to accelerate their marketing capabilities. The COVID-19 pandemic drove an explosion of online and social conversations during lockdown. ======================

Turning ambitions into reality : Banking, Financial Services & Insurance

----- Arcticle source ----- https://www.wipro.com/analytics/services/turning-ambitions-into-reality-banking-financial-services-and-insurance/ ----- Data Monetization in Capital Markets Contact Wipro Please fill the required details to access the content Turning ambitions into reality : Banking, Financial Services & Insurance In the BFSI sector, companies are navigating a challenging environment marked by economic fluctuations, complex financial operations, strict regulations, and the need to turn vast amounts of data into actionable insights. The goal is to improve BFSI services while managing costs, dealing with technological changes, addressing cybersecurity and fraud risks, and ensuring data management and privacy. Data analytics emerges as a key strategy, helping BFSI firms use data to achieve financial stability, enhance security, quickly adapt to technological shifts, and meet customer demands for smooth digital experiences. This shift is critical, leading to more efficient operations, personalized services, clear lending processes, prompt customer service, effective loss and collections management, and the effective integration of AI and technology. To tackle these challenges and capitalize on the opportunities presented by data

analytics, AI, and Fintech, BFSI leaders are turning to solutions specifically designed for their industry. These solutions boost operational speed and efficiency, improve service quality, retain customers, enhance security, and offer proactive, customer-focused strategies, all while reducing costs and complying with regulations. Services BFSI Business Solutions for Data, Analytics & Intelligence Data and AI are revolutionizing the BFSI organizations by combining analytics and AI/ML to address challenges, unlock personalized financial stability, boost customer relations, forecast market trends and client needs, and streamline operations while ensuring regulatory compliance. Wipro's Data, Analytics, and Intelligence solutions play a crucial role in Risk Management and Fraud Prevention. By employing advanced analytics, these solutions detect irregularities and enhance security, and offer deep insights for crafting personalized Customer Experiences. Wipro's Banking Industry Architecture Network (BIAN) offering It's a comprehensive framework for compliance, standardized integrations, providing a unified customer view in the banking industry which helps unlocks future monetization opportunities. Wipro brings vast industry knowledge, Domain driven design and BIAN expertise combined with various technical assets to accelerate the BIAN adoption journey. For Banking platforms based on or gearing towards Microsoft and Databricks technologies, Microsoft's Common Data Model (CDM) can be leveraged to reduce data governance complexity. Our Digital Lending Solutions For Origination The mortgage sector is witnessing a significant shift. Digital lending leaders are solidifying their market stance by prioritizing experience, transparency, and responsiveness. Our BFSI-tailored solutions offer hyper-personalized services, providing a comprehensive customer view. By harnessing Generative AI with Guardrails, we deliver pervasive intelligence across the board. For Servicing The lending industry is undergoing a major overhaul, spurred by digital innovation within banks and financial institutions. This evolution, shaped by changing consumer preferences, technological progress, and new regulatory frameworks, represents a marked change from the past decade. Our use of Generative AI in digital lending automates credit scoring, risk assessment, and customer service, combating silent attrition. Our solutions enable precise customer segmentation, churn prediction, and mortgage analytics, supported by in-depth data analysis for a data-driven, customer-first strategy that adheres to ethical and regulatory standards. For Collections, Loss Mitigation & Default Navigating credit risk in today's market volatility and regulatory landscape demands a digitized, analytics-driven approach. Our solutions offer smart strategies for loss mitigation, loan workout options, and enhancing debt-collection efforts. Generative AI provides effective tools for managing loan defaults, ensuring legal compliance, maintaining operational excellence, and protecting reputation in a constantly connected world. Wipro's BFSI Solution Offering Integrated Digital Lending Solution – A comprehensive app suite for all digital lending needs. This Gen AI-powered integrated solution consolidates various applications, covering customer segmentation, campaign response modeling, LOS analytics, mortgage analysis, and loan default analysis. It identifies key sentiment drivers, allowing businesses to pinpoint factors influencing public opinion, enabling targeted strategies, and facilitating data-driven improvements. Traditional insurance carriers are sitting on a mountain of data. To extract maximum value from this data, they need to embrace innovative data monetization strategies. Featured

Resources Capital markets firms are increasingly optimistic about data monetization as a strategy to unlock additional revenue streams. The journey to successful data monetization is not one-size-fits-all; it diverges significantly across sell-side entities, buy-side firms, and infrastructure companies. Companies must navigate cost management, quality control, and safeguarding IP and data security in the ever-evolving landscape marked by the advent of latest technologies and new market entrants. Data analytics in healthcare serves as an alchemist, intended to help the providers overcome obstacles to the widespread application of data-derived intelligence that aims to enhance clinical care, disease prevention, and treatment effectiveness. This transition is paramount for healthcare and life sciences, ushering in better patient outcomes, personalized medicines, on-demand drug production, and cutting-edge genetics-based and AI-driven treatments. To navigate the challenges and harness the swift strides in science and technology, healthcare and life sciences' leaders embrace industry-tailored business solutions. These solutions facilitate faster and more efficient operations, accelerating the development of both new and established treatments, and simultaneously driving down the production costs while ensuring compliance with rigorous regulatory standards. Services Healthcare Business Solutions Healthcare Business Solutions serves as a key asset, leveraging the power of Generative AI to offer healthcare organizations various comprehensive solutions across its domains. It optimizes Finance through improved billing and forecasting, enhances Risk Management by detecting fraud, tailors services via Customer Analytics, boosts Brand Image by analyzing digital opinions, and optimizes Operations with real-time data access. This multifaceted tool aids in financial stability, risk mitigation, customer relations, online reputation, and operational efficiency within the healthcare sector. Our Value-based Care Solutions For Clinical Trials- Decentralization of clinical trials has emerged as the new paradigm endorsed by the trial sponsors with an aim to accelerating the trials and enhancing patient & physician experience. Our solutions are bringing trial activities closer to the patients through a composable data and analytics framework with a resilient and secure IoT network. Generative AI plays a key role in processing huge volumes of data and providing insights to physicians via conversational experiences. For Supply Chain Management and Predictive Asset Maintenance- The strategic alignment of our value-based care solutions and supply chain management

orchestrates cost-effective, patient-centric healthcare delivery, fostering the alignment of financial sustainability with delightful patient outcomes. Similarly, the synergy between our value-based care solutions and predictive asset maintenance drives operational and cost efficiency in healthcare, ensuring optimal resource allocation for superior patient experience. Generative AI infuses deep intelligence in these processes to enhance community health and well-being. For Patient Experience- The strategic alignment of our data-driven insights with a patient-first approach enables transparent, cost-effective, personalized and quality care throughout the patient journey, resulting in exceptional healthcare outcomes and a delightful patient experience. These tenets constitute the bedrock of value-based care, informed by continuous patient feedback for superior service delivery. Generative AI infuses deep intelligence into the process chain and powers cognitive digital interfaces for enhanced patient centricity. Turning ambitions into reality : Retail Industry

----- Arcticle source ----- https://www.wipro.com/analytics/services/turning-ambitions-into-reality-retail-industry/ ----- ISG Briefing Note: Elevating Retail with Wipro & Microsoft's GenAI-led Intelligent Contact Center Contact Wipro Please fill the required details to access the content Turning ambitions into reality : Retail Industry The power of data analytics has emerged as a critical force driving unprecedented transformation in the Retail industry. Leading retailers across the globe are leveraging data-driven insights to not only redefine customer experiences but also to streamline operations, improve decision making, and foster innovation in product offerings. This strategic use of data analytics is setting new benchmarks in operational excellence and customer satisfaction. While the benefits of data analytics in the retail sector are vast and varied, the journey towards harnessing these benefits is not without its hurdles. Chief among these challenges is the intricate task of data integration. In the digital age, retail companies are inundated with data from a multitude of channels: online sales platforms, brick-and-mortar transactions, social media interactions, and customer feedback mechanisms, to name a few. Each of these channels generates a staggering volume of data, rich with potential insights. However, the diversity and disparity of these data sources pose a significant challenge. Integrating these disparate data sets into a cohesive, unified system is not just a technical challenge; it's a strategic one that requires careful planning, robust technology, and a deep understanding of both the retail landscape and data science. Why for Wipro for Retail solutions Wipro stands at the forefront of retail transformation, leveraging a robust delivery network to drive advisory-led IT transformations. Our strategic alliances with leading tech giants, hyperscalers, and niche

specialists empower us to deliver unparalleled in-store enhancements and innovations. With Wipro, retailers gain access to a sophisticated array of retail-specific tools and solutions, designed to expedite time-to-market. Industry Business Solutions for Retail Unified Customer Intelligence: Revolutionize your customer understanding with our Unified Customer Intelligence. By integrating both external and internal data, we provide a comprehensive single customer view, enabling precise segmentation and behavioral analytics. Overcome the limitations of siloed data to unlock personalized experiences, deeper insights, and foster unparalleled loyalty and growth throughout the entire customer journey. Intelligent Contact Center: Elevate your customer support with Wipro's Intelligent Contact Center. Designed for the digital age while preserving the essential human touch, our solution transforms contact centers into dynamic, strategic assets. Leveraging extensive data analysis, including conversational nuances and emotional indicators, we empower you to refine your services, adapt to evolving needs, and truly connect with your customers. Experience Intelligence: Craft and execute a visionary marketing strategy with our Experience Intelligence module. Utilizing advanced data intelligence, we guide you in setting ambitious yet achievable goals, prioritizing projects, and monitoring campaigns across all channels. Dive deep into market analysis to uncover both challenges and opportunities, ensuring your marketing efforts are as effective as they are innovative. Smart Store Insights: Enhance in-store engagement and boost customer loyalty with actionable insights from our Smart Store Insights module. Dive into detailed analytics on store performance, merchandising effectiveness, customer interactions, and traffic patterns to refine your in-store strategy and create unforgettable shopping experiences. Retail Control Tower: Master your supply chain with the Retail Control Tower. This powerful tool provides critical insights into demand forecasting, inventory optimization, supplier performance, and overall supply chain efficiency. Stay ahead of the curve with real-time analytics and strategic oversight, ensuring your operations are as streamlined as they are responsive.   Featured Resources The analysis provides insights into how Wipro and Microsoft's Intelligent Contact Center, powered by GenAI, is poised to address a broad spectrum of challenges confronting the retail industry. Consulting Services

----- Arcticle source ----- https://www.wipro.com/consulting/ ----- Business Process Services in the Era of GenAI Thailand's Bank of the Future : Will the New Virtual Banks Reshape the Industry? How to Master Cloud Economics and Harness the Power of AI Why Insurance Companies Need to Rethink Loyalty Strategies Data Analytics Transform the Airport Experience An Interview with the Co-Founders of FemTech Lab Global Insurance Survey 2023 Championing the Chatbot Decarbonize and Grow Turning Energy Retailers into Customer-Centric Brands Contact Wipro Please fill the required details to access the content Wipro leverages advanced technologies and deep domain knowledge to help clients drive business transformation and build resilient, next-generation operating

models. The practice provides strategy consulting for financial services, energy, utilities, healthcare and life sciences, sustainability, talent management and change, CIO advisory and consumer businesses. Here is some of the latest thinking from Wipro Consulting, Fullstride Cloud, Engineering Edge, Lab45, Designit and Capco. In today's fast-paced business landscape, staying ahead requires more than just keeping up with the latest trends—it demands innovation. This is particularly true in the realm of BPS, where efficiency, accuracy, and adaptability reign supreme. In our latest special report, we delve into the transformative power of GenAI and its profound implications for the future of BPS. Thailand's banking sector is set for transformation as new virtual banking providers aim to innovate and better serve underserved consumers and SMEs. The impending challenges, opportunities, and changes in customer expectations can inform financial institutions operating far beyond Thailand's borders. Our recent groundbreaking report with Forbes presents new insights about how to approach cloud computing resources in the age of AI. Insurance companies are replacing outdated engagement with innovative strategies that prioritize genuine customer care and satisfaction. Learn about the forces driving change, the foundational pillars for a meaningful relationship model, and the exciting opportunities that lie ahead. Enhancing the passenger experience has become a top priority for busy airports around the world seeking to increase non-aero revenue. They key is finding ways to leverage vast amounts of underutilized data to create personalized offerings that redefine travelers' relationship with the airport. The latest Designit interview reinforces that innovation doesn't happen inside a computer, but inside our minds and imagination. But the pressure to adapt quickly to market changes makes it difficult to focus on the right types of innovation, which presents both opportunities and challenges.   Capco's research sheds light on the role of data and personalization as insurers map their optimal path forward. The insights and recommendations gleaned from input by 13,750 respondents can help insurers navigate an increasingly digitized and competitive marketplace. Chatbots and other virtual assistants will soon be much more ubiquitous across the employee experience. Change management will de-risk their implementation and promote broader acceptance. Carbon-reduction initiatives are expanding in scope and will inevitably evolve further in the future. While decarbonizing the value chain may seem like a burden, viewed through the proper lense and strategic vision, it can bring exciting opportunities for new business models and growth. As oil and gas retailers consider the renewables dominated future, an enhanced customer experience will be key to attracting retail fuel customers, building new revenue streams, and preserving market share. ----- Arcticle source ----- https://www.wipro.com/consulting/connected-source-to-pay/ ----- Contact Wipro Please fill the required details to access the content Connected Source-to-Pay Source-to-pay processes and tools haven't kept pace with broader technological innovations and are dependent on time-consuming manual tasks. Traditional procurement solutions create hidden inefficiencies due to no orchestration across people, functions, and systems. The absence of consolidated data results in a lack of end-to-end process views, creates limitations and errors, and non-compliant transactions. The outcome is low spend visibility, frustrated suppliers and internal conflicts that can significantly impact revenue and profits. Wipro's Connected Source-to-Pay solves these issues. Leveraging Celonis, ServiceNow S2P and Wipro IP and methodology, this innovative solution infuses process-mining technology with source-to-pay capability. It finds inefficiencies, frames quantified opportunities, automates actions to prevent or remediate issues, and captures untapped business value. Connected Source-to-Pay helps companies: Cut the costs of procurement spend, discount realization, people efforts, technology, and infrastructure costs. Optimize working capital by contract enforcement and accurate terms, eliminating duplicate invoices and enabling on-time payments. Improve revenue-generating processes to impact the top line. Enrich the user experience through autonomous and seamless processing. Continuously improve processes and provide insights as your business grows and

changes. In today's fast-paced business landscape, achieving visibility, control, and efficiency in the S2P process requires harmonious convergence of people, processes, and systems. Wipro's Connected Source to Pay solution tackles these challenges without undergoing a full-scale system transformation. =====================

Risk and Compliance

----- Arcticle source ----- https://www.wipro.com/consulting/risk-and-compliance/ ----- Contact Wipro Please fill the required details to access the content Risk and Compliance Eliminate uncertainty in risk and compliance management Make your investments in risk management and compliance initiatives go the extra mile Wipro's Consulting practice helps financial institutions improve the effectiveness of their risk management and compliance initiatives. Our end-to-end solutions include: conducting gap analysis and developing implementation roadmaps, business and technical analysis IT services, data management and analytics, custom applications development, and operations support, Know Your Customer (KYC) and anti-money laundering services. Our risk and compliance consultants comprise ex-regulators who leverage our investments – such as Opus Capital Markets Consultants, Opera Solutions, Vicarious, Vectra Networks and Emailage, and our cognitive AI platform and process automation engine HOLMESTM – to provide clients with strong risk and compliance capabilities. We also run a risk and compliance training program for our clients to build capacity and capability, and operate a regulator-certified processing center in Ireland. Digital Change Adoption

----- Arcticle source ----- https://www.wipro.com/consulting/digital-change-management/ ----- Contact Wipro Please fill the required details to access the content Digital Change Adoption Human-centric, technology driven change Now more than ever, companies are under significant pressure to make transformational changes, not merely to reduce operating costs, but also to remain relevant in a rapidly changing marketplace. The simplification of enabling technologies has made it much easier for small, agile competitors to go head-to-head with large organizations. As such, well-established organizations, in particular, need to adopt new ways of working within a modernized technical landscape, and activate more streamlined operating models. We help organizations identify opportunities to maximize the value of new digital ways of working by first ensuring successful adoption of technologies and optimized processes and then making sure that adoption translates into measurable business improvements and the achievement of overall goals and objectives. Our Digital Change Adoption capability enables us to take an active role in transformation and implementation programs that focus on the human impact of new digital processes, roles, systems and behaviors, and that result in rapid and sustained adoption. Our Organizational Change Management (OCM) framework creates a positive, forward-thinking transformation experience and supports both strategic and technical goals through the enablement of core behaviors. We approach change by: Additionally, we support the technology solutions and ensure that people want to – and are able to – adopt the new ways of working. During the change process, we focus on the employee experience specifically through: Contact us at domain.consulting@wipro.com ======================

Workforce Transformation

----- Arcticle source ----- https://www.wipro.com/consulting/workforce-transformation/ ----- Contact Wipro Please fill the required details to access the content Workforce Transformation Enabling a future ready workforce Humans have an extraordinary ability to continuosly adapt to changing environments and new discoveries. Today, amid accelerating technological innovations market fluctuations, and sustainability demands, organizations need to build adaptability as a core strength that will allow them to continuously enhance, evolve and thrive. This ever-evolving transformation process can seem both overwhelming and challenging. By guiding organizations through a clear, pragmatic and approachable step-by-step process, we can enable organizations to recognize early success, amplify their potential for transformation and meet the future head-on. For us, this process begins with establishing a partnership model, working side-by-side with our clients to evolve their workforce capabilities. Our Workforce Transformation team embeds collaboratively with organizations to understand their business landscape. Wipro works side-by-side with the team to explore their strategic vision. The level of alignment is examined at

the executive, management and employee levels, with particular focus on specific business objectives (KPIs, OKRs, etc.) to ensure alignment with the future direction. We investigate the organizational culture (shapers and manifestations) to determine potential impacts and outcomes. Understanding each client's unique landscape enables us to conduct a comprehensive marketplace and industry-specific assessment that accurately pinpoints the most impactful transformation opportunities. Together, once aligned on a transformation strategy, we work within targeted operational areas to determine competency gaps and upskilling/reskilling opportunities, then curate plans to ensure that team members receive the necessary training to become future-ready. For those clients that want to look further into the future, Wipro provides a unique design thinking experience that envisions potential future outcomes, identifies pathways to ensure operational integrity, and converts those pathways into specific milestones with supporting interactions, activities and owners to achieve maximum value and people potential. Our Workforce Transformation engagements are designed to: 1. Enable a future-ready workforce that is poised to take advantage of emerging technologies 2. Leverage workforce intelligence and analytics within a global data bank to both identify current market trends and skill gaps and forecast future skills needs 3. Curate a better employee experience that builds psychological safety, growth mindsets and enhanced retention. 4. Identify sustainable opportunities to enhance diversity, equity and inclusion (DEI) and mitigate systemic barriers limiting organizational evolution and relevance. 5. Support organizational culture transformation by identifying and elevating norms, values and behaviors that empower great work; engaging employees; and eliminating factors that detract from peak organizational performance. 6. Develop a 'right-fit' operating model and organization design that enables teams to pivot with agility in response to technology innovations and market advancements. CIO Advisory Services

----- Arcticle source ----- https://www.wipro.com/consulting/cio-advisory/ ----- Contact Wipro Please fill the required details to access the content Align business ambitions with technology – define and deliver results. Technology leaders face tremendous pressure to deliver new solutions that support business needs. Unfortunately, many organizations are saddled with legacy technology infrastructure and "keep the lights on" costs, making it onerous to build the business case for change. These leaders need solutions that address their current and future goals while optimizing costs. CIO Advisory Services provides guidance and perspective to solve a CIO's most pressing challenges. The growing global practice has more than a dozen highly experienced consulting partners exceeding collectively 150 years of relevant experience in multiple industries. This breadth of experience has helped CIOs address challenges such as cost containment, innovation enablement, rapid solution delivery, and operating efficiency improvements. Our growing practice has the capabilities, skills, knowledge and tools to offer sound advice and deliver value to our clients. Wipro's CIO Advisory Services team has a solid track record of outcomes. Our purpose-built accelerators expedite execution, and extensive methods provide clients with innovative solutions to solve their most pressing technology-related challenges. As a global organization, we bring a unique combination of domain experience, technology insight, partnership ecosystem and comprehensive offerings to deliver results anywhere in the world. Drive Business IT Alignment IT and business rarely align with their needs and delivered solutions. To make matters worse, often the CIO has no seat at the executive management table, yet technology and its use continue to be a differentiator that provide companies with a competitive edge. Technology organizations face pressure to deliver solutions faster and cheaper. Otherwise, the business will sidestep IT and self-procure technology solutions, leading to fragmented data and operations. CIOs need a better way to align business and IT. Wipro helps CIOs create a strategic vision and provide the capabilities they need to achieve business IT alignment with the Board and the business. Our practitioners help businesses and IT jointly define their goals, desired outcomes and a roadmap to achieve success. With a solution set that includes Enterprise IT Strategy and Planning, Enterprise Business Architecture, and M&A Integration and Divestiture services, IT can demonstrate they understand the needs of the business today and the future and can deliver value-added solutions efficiently and economically. We help CIOs overcome these common perceptions: Find out how companies are

driving alignment between the business and IT. Transform IT Governance CIOs must respond effectively to continuous change – M&A, divestiture, automation, technological advancements, rising costs and macroeconomic pressures. IT organizations are evolving. CIOs must address these challenges by revamping their operating models and organizational design to continue delivering rapidly, understanding business needs and providing the best technology solutions. IT organizations need operating model transformation to deliver higher value and help the business maintain a competitive advantage. Wipro helps CIOs respond effectively with solutions for IT Operating Models and IT Organization Re-design. The solutions assist the CIO to optimize their workforce and build an agile, efficient and forward-looking operating model that grows or shrinks to meet business needs. We help IT organizations overcome the challenges below: Learn how companies are transforming their IT operating models to deliver more value. Simplify and Modernize IT Assets IT organizations are dealing with simultaneous complex issues such as M&A, technology advancements, pressure to deliver quickly and economically, budgetary constraints and technical debt. These challenges have expanded the IT application portfolio unsystematically, making it more difficult and expensive to maintain. Further, many IT organizations rushed to migrate to the cloud and to modernize their IT environment. That adoption has resulted in burgeoning costs due to ungoverned and undisciplined rollouts. In short, application portfolios have become complicated which presents a challenge to adopt, deploy and leverage newer technologies, such as Generative AI, for productivity gains. CIOs must reduce technical debt, reduce duplicity of capabilities and better manage the technology portfolio lifecycle. Wipro gives CIOs the tools to simplify their technology environments, making it easy to modernize their technology assets. The offerings include Technology Portfolio Rationalization, Cloud Adoption Acceleration & Industry Cloud and Emerging IT Adoption. The solution allows IT to reduce technology sprawl, remove duplicity of capabilities, optimize their application portfolios and promote continuous improvement practices that optimize the tech portfolio. Simplify & Modernize IT Assets helps IT organizations overcome these challenges: Optimize IT Spend Technology has continued to evolve, and organizations continue to allocate larger amounts of their organizational budget to technology spend. To boot, a large percentage of technology spend is on run activities versus deploying new capabilities. Technology and Finance leadership at best have fragmented visibility in their technology costs, and there's no line of sight to the business value being delivered from those technology costs. The solution allows organizations to achieve visibility and insights into their technology spend, optimize run and change budgets, demand financial accountability for outcomes, provide an understanding of total costs of ownership (TCO) and support business decisioning based on the value delivered. Optimize IT Spend offerings include IT Financial Management (TBM) and IT Cost Transparency and Optimization which help businesses overcome pressing challenges such as: Learn more about how businesses can optimize their IT budget. Technology Business Management

----- Arcticle source ----- https://www.wipro.com/consulting/technology-business-management1/ ----- Contact Wipro Please fill the required details to access the content Technology Business Management The way IT does business must change through a foundational shift in people, processes, and technology. CIOs are realizing the need to adopt a value-centric approach by creating a new operating model for running IT that delivers business outcomes and partners with IT's clients and customers in a cost-effective manner. Technology Business Management provides a methodology to enable IT to deliver value as defined by its clients, customers, and partners in a cost effective-manner. In order to drive business value and innovation, IT must become a competitive provider of IT services. Conversations and vocabulary need to move beyond just technologies, SLAs, and projects to discussions about the tradeoffs needed to balance cost, quality, and value. These tradeoffs are at the core of Technology Business Management. TBM Journey Map The TBM Journey Map provides a strategy for addressing an organization's transformational challenges and bridges the gap between the

current state and desired TBM objectives. No matter where a company is on its TBM journey, we are here to help define, implement, and optimize TBM design principles that meet your TBM strategy and vision. We pride ourselves on our ability to help our customers adopt the TBM framework across their entire IT operating model by leveraging our TBM Journey Map. CIO Advisory Service Our CIO Advisory services team is a global team of senior IT professionals and former CIO(s). We bring together all the complex dimensions required to run an agile enterprise scale IT organization. This includes Cloud First strategies, Technology Business Management, Mergers and Acquisitions, Portfolio Management and Next Generation IT Services and Strategies. Our approach aims to solve client issues and concerns swiftly while equipping their workforce to tackle future challenges more efficiently. From setting up L&D frameworks to transforming learning practices, we make constant improvement a part of the organization's DNA. Our team of learning and development experts is focused on evangelizing the learning experience and ensuring the continuous development of employees by drawing on both technological and psychological assets to build a culture of learning. We create value for our clients by: To discuss your L&D strategy, get in touch at domain.consulting@wipro.com   =====================

Talent and Change Management

----- Arcticle source ----- https://www.wipro.com/consulting/talent-and-change-management/ ----- Contact Wipro Workforce Transformation Digital Change Adoption Learning & Development Consulting Services Please fill the required details to access the content Unleash your most valuable asset: People As digital disruption and digital transformation accelerate, people remain at the heart of every successful organizational transformation journey. By combining technology expertise with a people-centric approach to transformation, Wipro Consulting helps clients enhance and evolve their capabilities to deliver positive business outcomes and drive growth. Wipro Consulting's Talent & Change practice helps clients define and build a high-performing culture that can quickly pivot to new ways of working, while

attracting, retaining and developing top talent and improving the employee experience. Our solutions are underpinned by real-time analytics that help focus our activities, guide critical decisions, and measure outcomes. Meanwhile, our global network of highly skilled talent and change professionals, with an average of 15+ years of experience, provides the expertise, industry experience and localized knowledge necessary to manage any large-scale business transformation. Humans have an extraordinary ability to continuously adapt to changing environments and new discoveries. Today, amid accelerating technological innovations market fluctuations, and sustainability demands, organizations need to build adaptability as a core strength that will allow them to continuously enhance, evolve and thrive. This ever-evolving transformation process can seem both overwhelming and challenging. By guiding organizations through a clear, pragmatic and approachable step-by-step process, we can enable organizations to recognize early success, amplify their potential for transformation and meet the future head-on. For us, this process begins with establishing a partnership model, working side-by-side with our clients to evolve their workforce capabilities. Our Workforce Transformation team embeds collaboratively with organizations to understand their business landscape. Wipro works side-by-side with the team to explore their strategic vision. The level of alignment is examined at the executive, management and employee levels, with particular focus on specific business objectives (KPIs, OKRs, etc.) to ensure alignment with the future direction. We investigate the organizational culture (shapers and manifestations) to determine potential impacts and outcomes. Understanding each client's unique landscape enables us to conduct a comprehensive marketplace and industry-specific assessment that accurately pinpoints the most impactful transformation opportunities. Together, once aligned on a transformation strategy, we work within targeted operational areas to determine competency gaps and upskilling/reskilling opportunities, then curate plans to ensure that team members receive the necessary training to become future-ready. For those clients that want to look further into the future, Wipro provides a unique design thinking experience that envisions potential future outcomes, identifies pathways to ensure operational integrity, and converts those pathways into specific milestones with supporting interactions, activities and owners to achieve maximum value and people potential. Our Workforce Transformation engagements are designed to: Now more than ever, companies are under significant pressure to make transformational changes, not merely to reduce operating costs, but also to remain relevant in a rapidly changing marketplace. The simplification of enabling technologies has made it much easier for small, agile competitors to go head-to-head with large organizations. As such, well-established organizations, in particular, need to adopt new ways of working within a modernized technical landscape, and activate more streamlined operating models. We help organizations identify opportunities to maximize the value of new digital ways of working by first ensuring successful adoption of technologies and optimized processes and then making sure that adoption translates into measurable business improvements and the achievement of overall goals and objectives. Our Digital Change Adoption capability enables us to take an active role in transformation and implementation programs that focus on the human impact of new digital processes, roles, systems and behaviors, and that result in rapid and sustained adoption. Our Organizational Change

Management (OCM) framework creates a positive, forward-thinking transformation experience and supports both strategic and technical goals through the enablement of core behaviors. We approach change by: Ensuring universal engagement from the outset by actively involving all employees throughout the journey – whether they be C-suite, mid/senior management, technologists, business operations or end users (direct or tangential). Embedding change thinking in everything we do, from design to build to delivery of solutions, ensuring that each cloud transition or change initiative delivers the maximum business benefit with speed and at scale. Encouraging technology teams to challenge traditional thinking by applying a design thinking approach to expose business problems and operational sentiments, while ensuring that disruptive cross-functional impacts are minimized or fully mitigated. Delivering an immediate positive impact by leveraging value realization frameworks that ensure joint business and IT ownership and goal alignment. Enabling seamless transitions and new implementations though a suite of change toolkits (including accelerators and digital assets) that accelerate and embed engagement and user adoption. Additionally, we support the technology solutions and ensure that people want to – and are able to – adopt the new ways of working. During the change process, we focus on the employee experience specifically through: Wipro's Learning & Development (L&D) services leverage recent learning innovations as well as proven principles and methodologies to create custom solutions that enable clients to reap maximum benefits and achieve their objectives. Our approach aims to solve client issues and concerns swiftly while equipping their workforce to tackle future challenges more efficiently. From setting up L&D frameworks to transforming learning practices, we make constant improvement a part of the organization's DNA. Our team of learning and development experts is focused on evangelizing the learning experience and ensuring the continuous development of employees by drawing on both technological and psychological assets to build a culture of learning. We create value for our clients by: Contact Us =====================

Digital Strategy, Operations and Transformation

Invigorate Strategy and Operations Contact Wipro Please fill the required details to access the content Accelerate tech-enabled transformation at speed and scale while achieving breakthrough operational performance improvement Constant and rapid change has become a rule, not an exception. New technologies consistently offer better capabilities for businesses to enhance customer experience and differentiate themselves. Yet many organizations struggle with how to transform digitally to deliver impactful, multi-channel, platform-agnostic experiences while maximizing their operational performance. Wipro's Digital Consulting practice is an innovation-led, enterprise transformation partner

built for today's digital challenges. We focus on the things that matter: insights, interactions, integrations, and innovations that make extraordinary things happen for brands, businesses and their customers. Leveraging Wipro's unique blend of proprietary solutions, data-driven insights and agile execution, global enterprises can embrace digital transformation at speed and scale with reduced complexity and risk. After identifying the Five Moments of Truth in their transformation journey, clients work with Wipro Consulting to accelerate their go-to-market speed and reduce costs, maximizing the business value of IT and empowering the CIO organization to become a strategic partner for the business. Disruptive technologies and new business models are forcing companies to innovate, adapt and transform for a digital, customer-first world. We derive insight, shape interaction, develop integration and unlock innovation — with the customer's journey at the center of everything we do. Wipro's Digital Consulting practice delivers integrated strategy, digital, and domain expertise to achieve breakthrough operational performance improvements across the entire value chain. We help organizations simplify their value chains through proven business transformation methodologies combined with emerging technologies such as Robotic Process Automation, Cognitive Process Automation, and Artificial Intelligence (AI). The result is improved customer service and cost structure competitiveness. Our proprietary Simplification by Design approach transforms business and operating models through smart automation, data insights, seamless experience, and service innovation. The result is an organization that runs IT as a business effectively and efficiently with service management, PMO, PPM and DevOps packaged accessibly as-a-service. This streamlines delivery, optimizes business processes and improves operational resiliency. Contact Us =====================

Is Your Organization Ready for Change?

----- Arcticle source ----- https://www.wipro.com/consulting/is-your-organization-ready-for-change/ ----- Contact Wipro Please fill the required details to access the content Is Your Organization Ready for Change? In the current business climate, change has become the status quo. Increasingly, more pressures (globalization, technology, customer demands) are pushing companies to respond, often requiring a department or organizational transformation. However, many change programs fail to achieve their goals. The irony is that change is necessary to survive and thrive. How do companies break out of this cycle? The answer is determining an organization's change maturity. Effective change management starts with minimizing the disruptions that can negatively impact the success of any type of change program. Change leaders should begin any change management exercise by asking a simple question: Is my organization well-prepared to embrace and celebrate change? What is Change Maturity, and What is Wipro's Change Maturity Assessment? Drawing on more than 20 years of deep experience in large-scale change management, Wipro has developed a model that calculates a company's change maturity – a

company's readiness for change. The Change Maturity Assessment model provides an unbiased evaluation that helps organizations structure their transformation projects for success. The assessment maps out five essential dimensions of successful change (the "5Cs"): The Change Maturity Assessment aims to determine the current maturity level of an organization's change management (OCM) approach in these five dimensions. The 5Cs further divide maturity into granular aspects, each equally important in evaluating preparedness for change. In addition to a ranking in each of the five critical areas, the assessment identifies strengths and weaknesses, proposes short- and long-term goals and points toward best practices and global benchmarks for success. Discover Your Organization's Change Maturity Are you considering a change program? Wipro's Change Maturity Assessment is the optimal starting point. A 45-minute assessment session will provide a maturity ranking across the 5Cs and an actionable plan to improve your organization's change maturity. Change management is a critical driver of business success for all people, process, and technology transformations. Reach out via the contact form below to launch your change management transformation. Contact Us

The Human Element of S/4HANA Implementation

----- Arcticle source ----- https://www.wipro.com/consulting/the-human-element-of-s-4hana-implementation/ ----- About the Authors Contact Wipro Please fill the required details to access the content The Human Element of S/4HANA Implementation While no ERP migration is easy or simple, persona-led engagement and learning delivers stronger return on investment. Slowly but surely, SAP's ECC 6 enterprise resource planning (ERP) solution is being replaced by a new system: S/4HANA. From 2027 on, ECC 6 will not be fully supported and will become costly to maintain. SAP is steering new customers to the S/4HANA system, and all ECC 6 customers will eventually have to find a new solution. Organizations that have already implemented S/4HANA are finding that it brings powerful new capabilities in areas like supply chain and finance. Yet despite the eventual upsides of the migration, no organization relishes the prospect of a major ERP transition. That may explain why, globally, 70–80% of ECC 6 customers have not yet transitioned to S/4HANA. Moving to S/4HANA is no simple upgrade. The shift will transform supply chain, finance and sales/distribution processes in every corner of the organization, impacting ways of working across functions, sites and geographies. Enterprises must be prepared to effectively manage the far-reaching human element of this transformation to ensure rapid return on investment and a steady path to new ways of working. Focus on People to Avoid ERP Implementation Failure No new enterprise technology, however beneficial, creates positive change in and of itself. Organizations can spend hundreds of millions of dollars ironing out a host of technology and process challenges, but in the end, thousands of human beings need to simultaneously and enthusiastically adopt the new solution if it is going to contribute to improved business outcomes. In the

context of ERP implementation, problems can often be traced back to poor change management, which manifests in a lack of executive support, a lack of widespread buy-in, and sometimes even an actively change-resistant culture. A people-driven organizational change management (OCM) approach to ERP implementation actively counters these tendencies in order to drive effective implementation. An OCM approach anticipates the human barriers to change by understanding how the transformation will impact people across the organization. Implementation leaders need to develop and consider a wide range of employee personas, model the impact of change on those various personas, and tailor each user journey in order to incentivize buy-in and create positive user experiences. By targeting the right interventions at the right employees at the right time, persona-led engagement and learning provides all stakeholders with the tools they need to embrace and support the profound shifts required to achieve maximum ROI from S/4HANA implementation. Delivering ROI for S/4HANA Implementation: Seven Change Management Levers No matter the exact implementation approach ("greenfield" vs. "brownfield", moving from a SAP or non-SAP product, cloud vs. on-premises — see figure above), the following seven interventions are crucial to achieving persona-led transformation and maximizing returns on ERP investment. Achieving S/4HANA Implementation Success No ERP implementation will be without its challenge. The benefit of a persona-led approach is that it allows organizations to anticipate many of those challenges, regularly measure readiness and subsequent adoption, and act quickly when necessary to resolve problems before they become systemic. A persona-led focus on each user journey works because, in many ways, the GPOs and end users are best positioned to understand how S/4HANA will impact their own roles and responsibilities. While leaders may best grasp the strategic importance of the change, they need eyes and ears throughout the organization as they seek to assess the state of the transformation in real time. Organizational change management provides the tools to receive and act on that feedback, minimizing the potential for transformation failures while accelerating adoption so that the full benefits of the new system can be realized more quickly. David Lyons Partner, Talent & Change, Europe David has more than 20 years of experience in change management, organization design and HR advisory, and has led end-to-end consulting engagements for many household brands, including programs involving Oracle- and SAP-enabled ERP transformations. Signe Reiser Managing Consultant, Talent & Change, Europe Signe has twenty-six years of international experience in consulting, leading change and digital transformations across multiple industries and functional areas in EMEA & APAC for both SMEs and Fortune 500 organizations. Uncover Banking's Next Cost Takeout Frontier

----- Arcticle source ----- https://www.wipro.com/consulting/uncover-bankings-next-cost-takeout-frontier/ ----- About the Author Contact Wipro Please fill

the required details to access the content Uncover Banking's Next Cost-Reduction Frontier   The next wave of cost-takeout opportunities will emerge by strategically pulling key operational and infrastructure change levers. July | 2023 Amid an economic triple-whammy of new credit demand slowdown, increased delinquencies, and interest rate shock, we've entered a "cost takeout" era in banking. Banks traditionally respond to similar disruptions by cutting budgets for technology and consulting, scaling back on new investments, reducing workforces, pausing hiring, and eliminating high-cost centers such as in-house operations or custom technology with inflexible fixed costs. The cost of technology typically accounts for 12–15% of a bank's revenue; the cost of operations is closer to 30% or even 40%. In this fraught environment, banks need to explore a new frontier for cost reductions that reimagines operational expenses while also creating open, agile and flexible systems that reduce technology expenses. This requires transforming the expense mix from "run the bank" to "change the bank" and redeploying resources rather than simply finding the least-painful areas to trim budgets. The Four-Pronged Approach to Next-Gen Cost Takeout Opportunities to re-think cost takeout span the banking enterprise, from automating lending processes and call center operations to streamlining fraud management and embracing cloud transformation. It should surprise no one to hear that deploying an AI and automation strategy alongside traditional budget reductions can help accelerate cost takeout objectives. What may be surprising is to learn that such an approach can also help avoid the budget-cut pitfalls of reduced productivity and a degraded customer experience. As they pursue impactful synergies between cost savings, improved customer experience, and product innovation, banks will find the most powerful levers in the areas of process transformation, automation, new location and productivity approaches, and technology transformation. Process Transformation For the past 20 years, banks have instituted numerous process transformations on top of largely legacy core platforms. While omni-channel approaches, customer self-service capabilities and decision engines have allowed them to innovate and squeeze efficiency out of legacy systems, efficiency gains from these standard process transformation levers have largely been exhausted. One emerging lever to help banks uncover additional process improvements is process metrics extraction-based analysis and redesign using tools such as Celonis. Generative AI is opening further process-transformation horizons. Some banks have been more comfortable using generative AI tools for internal use cases (for example: agent assistance), but these tools will increasingly evolve to support direct customer interactions through chatbots, voice assistance, and authentication. From there, generative AI will expand to support use cases across the front, middle, and back offices, including employee education and training, virtual banking assistance, know-your-customer (KYC) verification, and even underwriting. Automation Banks have been relying on optical character recognition (OCR) for more than 20 years to reduce the need for costly manual data entry. Recent advances have bought predictive capabilities to OCR algorithms, making OCR more accurate than ever. This increased accuracy allows OCR to work more seamlessly with robotic process automation (RPA) and is solidifying industry confidence that automation and straight-through processing rates are at an inflection point. While some complex products, like home mortgages, will not be subject to complete auto-decisioning any time soon,

30–40% of the home mortgage process is now ripe for complete automation. On the cost-takeout front, this means banks will spend less time hiring and training for roles that involve manually correcting inaccurate data capture and can instead focus on hiring and retraining for higher-level jobs. In parallel to OCR improvements, voice-recognition software has reached new heights and will be able to advance cost takeout insofar as it can be used not just for call escalation and analysis, but also to provide truly automated responses to high-volume customer inquiries. Location and Productivity Until recently, European banks tended to be more comfortable than US banks when it came to business process outsourcing (BPO). In many cases, this hesitancy among US banks stemmed from concern about regulatory requirements and third-party risk management burdens. However, as they battled relentless attrition during COVID and the "great resignation," US banks changed their tune. It helped that new digital monitoring tools gave banks confidence that they could validate the quality of service they received from outsourced contact centers (whether nearshore or offshore). With call center attrition near all-time highs, the most frustrating cost burden on banks is not so much customer service agent salaries themselves as it is the cost of maintaining an HR operation big enough to constantly hire and train new customer service talent amid unprecedented churn. To mitigate these costs, a strategy that creates significant space for BPO can be a lifesaver. At the same time, banks have found more interesting product-based BPO propositions in areas like fraud and dispute management. Particularly in the case of fraud management, a digital platform-enabled BPO approach often ends up being faster, cheaper, and more accurate, and banks can absolve themselves of the difficult task of staying on top of the accelerating volume and variety of digital fraud schemes. Technology Transformation When it comes to technology transformation, cloud migration is the wave of the future in banking. Compared to many other industries, banks have been conservative about jumping into cloud. But recent interest rate hikes and resulting drops in loan volumes have banks seriously re-thinking their investments in expensive data centers, which carry high fixed costs (both technology and people) regardless of processing volumes. Cloud spends, by contrast, are variable and can rapidly scale up or down as processing volumes shift, offering massive cost savings during periods of low activity. Fortunately, cloud is about much more than cost savings. It is also about agility and developer velocity. For example, in a traditional mainframe-based world, building a new capability like a contact center chat function requires a lengthy process of RFPs, requisitions, infrastructure builds, and sourcing team involvement, not to mention large and dedicated operations and technology teams to support the chat servers. A cloud-based solution, on the other hand, can in a matter of weeks be running a functional chat program that supports most major customer support themes. As banks strive to be ever-more product-driven, cloud adoption is one way to ensure that cost takeout is compatible with accelerated product innovation. In conjunction with their cloud journeys, banks are also finally becoming more comfortable with open-source software with software license cost rationalization and new capabilities pushing the banks towards open source. Integrated Cost Takeout: The New Imperative Like every commercial sector today, banks are under incredible pressure to cut costs. As they look for ways to find further efficiency gains, banks need to achieve their strategic cost takeout objectives while also improving the

customer experience — a critical differentiator in this hyper-competitive market. Plus, they need to ensure that their cost takeout strategies don't choke any future potential for growth. An integrated approach to cost takeout focuses on changing the bank rather than just doing the same things with fewer resources. That means reducing technology costs, yes, but also boldly transforming operations to be more agile, so that banks are prepared to seize new opportunities when the winds of change shift. Ashish Shreni, US Banking Practice Head, Wipro Consulting Ashish leads Wipro's banking consulting practice for the United States. He is responsible for CXO advisory, CXO relationships, data and analytics, digital strategy, process and technology transformation, risk management, and partnership and alliance strategies, as well as industry representation and industry relationship management. =======================

Building Blocks for Successful S&OP

----- Arcticle source ----- https://www.wipro.com/consulting/building-blocks-for-successful-s-op/ ----- Contact Wipro Please fill the required details to access the content Sales & Operations Planning is both a science and an art. Like any science, it relies on principles, rules, methodology, and specific measurable outcomes. But an S&OP implementation also calls for creative, incremental thoughts to address challenges. Since the birth of Sales & Operations Planning (S&OP) in the late 1970s, volumes of text have been written about the subject and hundreds of organizations have embarked on implementing S&OP. It has been referred to by a number of names, including Executive S&OP and, more recently, as Integrated Business Planning (IBP). Still, four decades later, organizations struggle to realize the promise of S&OP. In 2010, for instance, Gartner reported that about 70 percent of global organizations are in Stage 1 or Stage 2 of the four-stage S&OP Maturity Model. Most organizations continue to acknowledge the need for a step-change improvement to their S&OP process. Why then do organizations find it arduous to achieve sustained success from S&OP? Lots of rich, intellectual content on S&OP presents valuable insights on strategies to succeed in this game-plan. Yet, there appears to be systemic reasons why so many organizations have had limited success. =======================

Outperforming Capital Delivery Programs in Water Industry

----- Arcticle source ----- https://www.wipro.com/consulting/outperforming-capital-delivery-programmes-in-water-industry-/ ----- About the Authors Contact Wipro Please fill the required details to access the content Introducing Enhanced Supply Chain Collaboration Introducing Enhanced

Supply Chain Collaboration Driven by the need to improve the performance on their capital delivery programmes, water utilities face the challenges of effectively managing complex supply chain networks woven into a number of strategic alliances. In the UK, the new regulatory period for capital delivery led by the Water Services Regulation Authority (Ofwat) and known as AMP6 2015-20, has gained the attention and focus of the UK water utilities to find new ways of managing their supply chains. In addition, the recent introduction of Total Expenditure (TOTEX) based accounting by Ofwat necessitates stronger linkages between operational costs and capital delivery costs. This paper talks about how digital supply chain collaboration platforms can boost operational efficiencies and help water utilities meet their capital delivery commitments to regulators and end users. Growing Investments in Water Infrastructure An ageing Infrastructure continues to be one of the main concerns of water utilities in the UK. Today, the industry is bowing under the burden of antiquated assets, the inability to meet demand from an increasing population, the pressure to adopt smart technology, and the challenges posed by growing urban congestion. Investments in modernization and asset refresh are increasing. There is £44 billion of Ofwat-approved capital investmenti waiting to be delivered in the AMP6 periodii. Given the size of the investments, capital delivery programs are naturally coming under scrutiny. Much of the investments will go to construction companies who will be contracted to deliver large capital projects. A few percentage points shaved off the £44 billion through better capital delivery will translate into substantial saving for the industry. Water utilities have been investing consistently in technology to develop their online customer service, relationship management, customer interactions and payment processes. Some have invested in data and analytics to ascertain asset condition and forecast risk. They have used technology to move to a predictive asset management model and bring down operational costs, improve service resilience and boosts customer satisfaction. However, they have yet to begin applying technology with equal focus and urgency to others parts of the business. Procurement, supply chain management and approaches to support alliances for capital delivery are three such areas that have had little attention. These areas have seen the use of email or Sharepoint for document exchange. At best, they have used modest in-house portals where sophisticated solutions were required. This needs to change. The Need to Outperform Capital Delivery Programs The recent introduction of TOTEX-based accounting by Ofwat into the APM6 regulatory period will increase the focus on managing the relationship between operational costs and capital delivery costs. With an incentive to outperform agreed baseline costs and meet milestones, every capital delivery program will aim for efficiencies in procurement, inventory reduction, resource coordination and overall scheduling optimisation. This will trigger a period of cooperation, coordination and collaboration between partners engaged by a water utility to deliver a capital program. There is a good reason for success being elusive thus far, despite the intent. Capital delivery projects in the industry have too many moving parts. Orchestrating projects with multiple partners and several layers of suppliers – from initiation, program awards, contracting, executing, overseeing, assessing and preparing for long-term operations and maintenance -- is a herculean task. Meeting execution goals, realizing business plans and delivering against shareholder expectations has, historically, been difficult. Can they be suddenly outperformed? Can

water utilities reduce supply chain and inventory costs? Can they become more efficient to meet the goals of AMP6? The answer is "yes". The 'How' of Outperformance Today, executives orchestrating capital delivery programs can lean on advanced supply chain collaboration platforms that are capable of managing and optimizing extended supply chains (see Figure 1: Multi-Tier Supply Chain and Collaboration Processes). Figure 1: Multi-Tier Supply Chain and Collaboration Processes Benefits of Cloud Adoption A cloud-based supply chain collaboration platform can transform their fragmented and disconnected supply chains into a vibrant interconnected digital water value chain. Today's leading edge collaboration platforms allow this level of connectivity regardless of the variety of systems, messaging standards or IT maturity of the trading partners in the supply chain. Such a platform can help keep 'buy-side' and the 'delivery-side' activities fully co-ordinated via a 'control tower'. The control tower manages and oversees the complete project cycle, from planning, fulfilment and invoicing to reconciliation. In addition, the system alerts and flags issues in real time before they become full-fledged challenges and delays. The platform can become the cornerstone for water utilities keen to outperform the AMP6 business planiv. Proven Solution in Other Sectors This solution has been proven in other sectors with similar challenges to water utilities in the delivery of capital programs. For example, in the oil and gas sector critical processes must be kept running for production as well as ensuring critical asset maintenance, refurbishment and replacement processes are fully aligned with production and service plans. In such industries, a "Track and Trace" solution has been deployed, fully integrated with Planning, ERP and PLM systems between partners and across a range of highly productive platforms including mobile, web and fully delivered in a cloud based infrastructure. This enables major oil and gas players to increase their productivity across the complete end-to-end supply chain, reduce their working capital and obsolete inventory as well as increase on-time and on-budget fulfilment for capital projects. Similarly, the aviation industry has benefited from cloud-based supply chain collaboration platforms. These have been implemented to coordinate the on-time delivery of major components from across the globe into the main assembly line of the last generation of long haul airliners. Benefits of a Supply Chain Excellence Platform The benefits that utilities would gain from adopting this type of solution are wide-ranging. These gains include the ability to address some deep-seated issues the industry has traditionally found difficult to optimize and manage: Win-Win for All A strong underlying factor that will propel success is the fact that water utilities will benefit from a supply chain collaboration platform and so will their partners. There is a desire on both sides of the delivery process to stay in control of projects and become efficient in the way interactions are managed between partners. Water utility partners and suppliers would gain from visibility into emerging project needs and delivery schedules. They would be able to improve procurement and minimize logistics costs. If collaboration and analytics can provide value to planning and delivery, such a platform would be a win-win for every actor in the capital delivery program. References Brian Nolf is Partner, Strategy & Transformation – Consulting Practice, Wipro Limited. Jesus Oregui is Partner, Strategy & Transformation – Consulting Practice, Wipro Limited. Get in touch: global.consulting@wipro.com. Slowly but surely, SAP's ECC 6 enterprise resource planning (ERP) solution is being replaced by a new system: S/4HANA. From 2027 on, ECC 6 will not be fully

supported... Amid an economic triple-whammy of new credit demand slowdown, increased delinquencies, and interest rate shock, we've entered a "cost takeout" era in banking. S&OP relies on principles, rules, methodology, and specific measurable outcomes. But an S&OP implementation also calls for creative, incremental thoughts to address challenges. ======================

A Practical Approach to Post-Merger Integration

Please fill the required details to access the content Post-merger integration (PMI) is rarely straightforward, but the approaches most businesses take have made it slower, less effective, and more expensive than it needs to be.This may help explain why, in study after study, so many deals fail to deliver their expected value. The irony is that massive investments of money and time go into most deals. Why, then, do they so often fall flat? In our experience it's because it is much easier to develop the investment thesis justifying a deal than to create a workable plan to transform two companies into one. Even the most well reasoned strategy, thoroughly vetted target, and comprehensive financial model are of little value if you cannot integrate quickly and effectively. The good news is there is a solution. We have seen that structuring decisions up front about how the newly combined businesses will operate makes it much likelier that an M&A deal will deliver the envisioned shareholder value. The Certainty of Uncertainty It would be easy to attribute the failure of past deals to the natural uncertainty that accompanies M&A, as many textbooks do. But such an explanation seems like the pronouncements of armchair quarterbacks who've never really managed a PMI team. Uncertainty is absolutely relevant, but it is also surmountable if you understand its dynamics: it is not a matter of knowing enough, but rather a matter of timing. As soon as a deal is announced, external stakeholders react. Markets immediately pronounce their judgments through share-price movements. Customers and trading partners wonder about possible near-term disruptions and the longerterm implications of the deal. Competitors begin to whisper in the ears of both firms' key customers, hoping to poach a few in the wake of disruption. Meanwhile, internally, and at the worst possible moment, the deal becomes a source of gossip and distraction. Precisely when the rest of the market needs reassurance, employees have astrong urge to look inward. They wonder about new bosses, new budgets, new policies, job security, and a host of other important issues.We believe it is this misalignment of focus at the most inopportune moment that often causes M&A value to dissipate, even more than a lack of good strategy or thorough due diligence. The Siren Song of "Discovernance" Many, if not most, companies try to overcome uncertainty with process, money, and effort. They employ exhaustive process discovery and elaborate program management governance—a one-two punch we have termed "discovernance." Employees descend into the

uncertainty and, despite good intentions, often magnify the drama. Current-state capabilities are exhaustively mapped. Cross-company integration teams and supervisory committees proliferate. Senior management delegates important decisions to these teams, which hesitate to make the wrong call. Accountability weakens the more distributed it becomes. In the absence of clear decision-making authority and accountability, many integration teams focus instead on strict adherence to the PMI process as provided to them by their advisors. Unfortunately, this is a poor replacement for the decision-making that actually fuels integration. All it does is aggregate the complexity of how things operate today. We typically ask clients the following question: "What decisions will you be making during the integration team's kick-off meeting?" Usually, the answer sounds something like this: "Understanding the PMI process taxonomy and methodology, ensuring fully-representative team composition, establishing the template to be used for reporting the team's activities, and mapping all possible stakeholders from whom the team will need to seek input." All are important things to understand, but in and of themselves they do not help you actually do anything. Decision-Centric PMI Rather than cataloguing the complexity of today, what is really needed is a clearer understanding how things will run tomorrow. This would serve the dual purpose of resolving employee uncertainty and improving signals to outside stakeholders. In order to do this, integration planning and execution should be driven by how the newly combined company will operate. Therefore, the paramount activity must be to make the foundational decisions that will define this future operating model. Everything else—especially process and governance — exists to enable this goal. The fundamental operating decisions that comprise the future operating model ultimately boil down to four basic options. Consider the following high-level example: Business Example The Value Chain Gang: Structured Decision-Making in a Large Deal A high-tech manufacturing client had successfully completed numerous small acquisitions but was struggling with a recent large deal. Unlike smaller companies, the larger target could not simply be swallowed into the client's existing business model. Integration teams quickly found themselves in the weeds trying to solve for numerous complexities simultaneously. Using a value-chain structure, the decision-centric approach disaggregated the client's acquisition into its operational piece parts. Each part contained a decision tree for senior leaders to complete: Completed decisions were highly effective for detecting underlying integration risks. Where the target's operating practices were preferred, new capabilities had to be developed and milestones extended. Where leaders designated two strategies, as they did for two geographic markets, integration teams were able to request additional resources. It also highlighted delays due to decisions that had not yet been made. In the course of one afternoon, a group of Senior Managers were able to make "80%-right" decisions that framed the rest of the integration. The decision-centric approach reached beyond just this integration. Many operating decisions led to a richer understanding of the capabilities and weaknesses of their operating model, and shaped future integration that could be standardized for future use.The client was able to achieve repeatability, scalability, and time-to-market reduction in future planning. In non-textbook integrations, managers face many smaller, more complicated variations of the same choices.We advise clients to start by structuring these decisions in an end-to-end, value chain

view as soon as possible. (see sidebar, The Value Chain Gang). This allows them to cluster decisions appropriately, facilitating comparisons between similar functions at both companies, even if the target's business model is vastly different. Each value chain step represents a tree of operating decisions—starting broadly and becoming increasingly specific—that must be made for the new company. We find this early decision making exercise is most productive when it involves only a handful of pivotal client managers. Optimally, they are seasoned, upper-mid-level operating managers—the people who know the most about how things actually get done. We have facilitated such knowledgeable groups tackle as much as 80 percent of key decisions in a single afternoon. As they begin working their way through decisions, the group quickly finds that what may have appeared at first to be a tall challenge reduces itself to a series of discrete choices about a finite list of topics, many of which they have considered before in different contexts. Participants should see up-front decision making as an opportunity to map out a preliminary integration path, defining it by the many decisions that could add friction to the process—over time, in both companies, and within and across functional areas. Decision sessions should focus on identifying potential bottlenecks where integration is likely to take longer, cost more, drive higher risks, or stumble over legacy business processes in need of reengineering. Together, these early decisions form a straw man operating model that actually provides direction. Managers can now tap their staffs to generate targeted analyses that inform specific decisions. Of course, there will be some genuinely thorny decisions that require complex problem solving and iterations to identify the optimal solution. But unlike the "discovernance" approach, in which such analyses are not clearly tied back to a specific purpose, the decision-centric approach harnesses the intellectual horsepower of integration teams to drive toward choosing the future operating model that best delivers value. In the many instances where preliminary decisions have been made, the path is clear and integration can begin.Where doubts remain or bottlenecks exist, governance committees now have a purpose: to oversee and resolve the complexity delaying integration. Perhaps most importantly, clearer goals allow managers to make more accurate financial and resource projections well in advance of the need. To be sure, post-merger integration will never be trivial. But we believe our approach can increase your chances of success. By emphasizing top-down accountability for key business operating decisions early in the process, you can reduce uncertainty and focus integration teams on the work that really matters: getting the combined company back at full stride, competing in the marketplace.
=====================

Finding a New Collaborative Insurance Model in a Commoditized Market

There was a time when customers needing insurance relied solely on insurance agents to break down the differences between providers, policy features and prices. Customer loyalty to a provider or agent was rarely considered, and there were true product features and service distinctions to be considered. Those days are gone. Consumers today view many retail insurance products as much the same. Their focus is on pricing and customer service—information about which is readily available through websites, social media and mobile apps. To compare services, they don't need to interact with providers, let alone an insurance agent. They can tap an insurance aggregator to compare and contrast the features of various insurance company offerings and even buy a policy. One result of this shift is that customer stickiness has become increasingly difficult to achieve, especially now that switching between insurance policies from different providers has become so easy. Moreover, insurance carriers are using much of the same social media and demographic data to match competitor offerings, making pricing advantage an elusive goal. Add the fact that investment yields are at an all-time low and it's clear that many personal lines are struggling to make a profit. There is distinct product polarization occurring in the industry. At one end there are profitable specialized business products driven by case-based underwriting and tailored pricing. At the other end, there are commoditized products that are grounded in population-based underwriting driven by demographics. This commoditization is happening in insurance offerings related to property and casualty, as well as life and pension. Commodity markets often operate with low margins—and to even get such margins requires massively efficient operations and economies of scale. There's limited value play available. The current state of the insurance business means it's time for insurers to take a page from industries like high-tech, telecommunications and automotive by adopting cost takeout strategies focused on the primary expense drivers e.g. infrastructure, labour, R&D. One of the most successful of those strategies has been "industrywide collaboration." Industry-Wide Collaboration For industries that have experienced extreme competition and increased margin pressures—not to mention regulatory encroachments and technology advances requiring huge investments—the options can seem limited. However, by adopting collaboration, businesses can achieve sustainable cost reductions and compete at other levels. We have seen this in the automotive industry where there has been collaboration between leading car manufacturers. Similarly, a weakened U.S. newspaper industry is using

collaboration to fight declining print advertising, falling circulation and smaller newsrooms. Recently, the Boston Globe announced it would take over all printing for its long-time rival, the Boston Herald. Similar publisher-initiated collaborations include NewsRight, an online rights clearance initiative, and Find & Save, a local deals site, both of which generate new revenue for partners. In the global telecom industry, economies of scale and rising infrastructure costs have led to infrastructure partnering among otherwise competing service providers. Sharing sites, antennae and base stations can cut costs considerably. Collaboration is not entirely new to insurers. Indeed, looking back at the original coffee houses of London in the early 17th century, collaboration was what gave birth to the industry. And collaboration continues to be critical to many of the Lloyds syndicates today, where infrastructure and services are shared. A more specific, focused collaboration began in 2006 with the creation of the Insurance Fraud Bureau in the U.K. This not-for-profit organization seeks to identify and prosecute criminals traflicking in illegal motor accident claims, and is now expanding to cover fraudulent property and life claims. This not only benefits participating insurers, it also benefits policyholders by reducing inflationary premium pressure. Candidates for Collaboration Which processes are ideal for industry-wide standardization in Insurance? Non-core processes like policy administration and content management are good starting points. These can be enabled through system aggregators who can offer them as Cloud-based services. With system integration and management of service components like applications, products, infrastructure and business processes, insurers can purchase a virtualized business service. Other processes like input management also have non-core components that can be good standardization and collaboration candidates. Insurers spend millions annually on paper-based regulatory communications, forms and contractual documents. When branding opportunities are limited to the company logo and don't attract much customer attention, it's possible that this content can be standardized in regulator-approved, industry-wide templates for use by all carriers in porting data from customers to their databases. Are You Ready for Collaboration? For many insurers, this kind of collaboration is difficult to imagine and fraught with competitive tensions. But the harsh reality is that many carriers are slowly realizing that traditional lines of business in mature markets are no longer tenable. What insurers must come to terms with is that elements of the business that were once considered critical to success are no longer as important, and are a drag on profitability, if not survivability. In fact, the actual value is contained in a much smaller component of the business. To move ahead and consider collaboration, insurers must first ask themselves the following questions about their processes: Leading the Collaboration Imperative The insurance industry is experiencing a major paradigm shift. Yes, there already has been momentum in driving down costs through economies of scale and performance consistency in operations and infrastructure. However, that approach can be taken by individual organizations only. It is time for insurers to look beyond their internal operations and identify non-proprietary processes and activities that can be shared with third-party companies for standardization and industry collaboration. Trends like social media and digitalization are here to stay, and as consumers focus ever more on price and customer experience, insurers must respond by developing distinctions that

consumers appreciate while collaborating in areas where differentiation isn't as important. At its core, insurance is about taking on risk—at a price, of course. It's time for insurers to examine the risk of sticking with the status quo as compared to the potential advantages of daring to lead in industry collaboration—a collaboration that will drive profitability and generate the returns shareholders expect and deserve. Operational Productivity:

A New Route to Improving

Insurance Competitiveness

----- Arcticle source ----- https://www.wipro.com/consulting/operational-productivity--a-new-route-to-improving-insurance-com/ ----- About the Authors Contact Wipro Please fill the required details to access the content For years insurance companies across Europe have been struggling with an accumulation of bad news. It's been an almost perfect storm of soft markets, low yields, increased regulation, and unprecedented natural catastrophes. The result has been forced mergers and divestitures, withdrawals from markets, and the sale of closed books. In short, the insurance industry has been hammered, and the result is an all too familiar pattern: an announcement of reduced earnings is tied to an announcement of job cuts. Yet, without doubt, once things begin to improve, headcount and expenses will start to creep up, only to get cut with the next troubled earnings report. It's a disruptive cycle of short-term fixes, and insurers know that to escape it they need to make fundamental changes to how they operate—perhaps even a total business transformation. But that's unrealistic at a time when most organizations are struggling simply to stay afloat. Even without a 'big bang' solution, however, there's a path insurance companies can follow to give them more knowledge and control in stabilizing their business—a strategy that also offers a competitive advantage, since improving knowledge and control can allow products and services to be offered more efficiently and at a lower cost. The path to this solution is to tackle operational performance using supply chain operations as a model. From Short-Term Fixes to Sustainable Productivity: Units of Work Talk to any supply chain executive in product industries—from tablets to groceries to shoes—and you'll get an earful about "cost per unit." Let's say you have headsets that cost €10 to produce. By knowing the use and cost of each element in the production process, including FTEs, you can adjust the components of your supply chain to drive effectiveness, efficiency, and productivity. Done correctly, the result is reduced cost, increased profit, and improved competitiveness. Many manufacturers, like insurers, operate at low-margins, and have learned to look beyond financially-oriented industry metrics like Operating Expense Ratios to stay competitive. Instead, they delve into the microeconomics of

their business. They examine processes in each work stage, what we've termed a "unit of work," to understand and improve each of the underlying elements that drive their costs and operating performance. Applied originally to the plant floor, manufacturers have extended this focus to include their entire supply chains. These microeconomic drivers include transaction volume and variance, work structure and required skill levels, cost and productivity per paid hour of both labor and capital, as well as number of hand-offs, process bottlenecks, and re-work. This microeconomics mindset hasn't been pervasive in the insurance industry. Yes, there have been sporadic attempts to apply Lean/Six Sigma manufacturing principles to insurance, but with limited measurable impact on the bottom line. Internal arguments about the unique requirements of insurance, and concerns about preserving critical expertise in the "knowledge work" of insurance operations, usually doomed most of these earlier improvement initiatives. We've also seen many insurers waste enormous amounts of IT capital on automation without achieving sustainable returns from that investment—a pattern that's traceable back to a lack of sufficient attention to the microeconomic drivers of processes and performance. Ironically, insurers stand to benefit perhaps even more than traditional manufacturing by attacking costs through "unit of work" productivity and other microeconomic drivers, since insurance products are virtual. Most of an insurer's cost is in headcount. We have successfully applied the microeconomic unit of work approach in our own firm and elsewhere in the financial services sector, and it is just as applicable to insurance. As an insurance executive you can't simply rely on new products, Process Disaggregation: premium increases, or even emerging markets for higher profits. You also need to know the step-by-step performance involved in delivering services so you can manage them to create a streamlined, responsive, and profitable organization. As you examine performance and drivers in units of work, you'll find that even some of those old "core versus non-core" arguments can be exploded and your valuable and expensive subject matter experts (SMEs) can be focused on driving value and, through that, increased competitiveness. The process starts with digging into your company's operating ratio. Many insurers use this as a key metric, but few use it to focus investment or productivity drives. How does this play out in new business processing for life insurance? By breaking down key steps in acquiring a new customer, for example, you can see there are a lot of hands —and associated costs—involved. At the outset there's the marketing and lead generation, and a needs analysis based on a customer inquiry. Then someone has to create and discuss a proposal with the prospect. Once the proposal is accepted, the application form must be completed, submitted, processed, and vetted. Next comes underwriting, which may be automated or manual. The payment method must be activated and processed, and the system must be updated to include the customer information. Then you bind the policy and send the customer the policy schedule and welcome kit, which must be written, designed, and printed. That's just for one customer. How many FTEs help customers through each of these processes in each branch and central location? What does it cost to recruit and process each new customer through each of these eight steps? Each of the steps represents a "unit of work" for potential improvement. So, let's say it costs €100 end to end to set up a new customer. You can now examine options to bring down the cost to, say, €75. Can the work be structured to be done by

fewer people or a different mix of people? How much of each workday are your SME's actually using that expertise versus performing other less valuable tasks? When you follow the work flow of a single customer setup across all of the units of work, do existing IT systems help or actually hurt productivity (i.e., multiple data sources must be consolidated by a person)? Do some agents require more support than others? Are there issues with different needs assessments? What are the variances between literature costs, given the detailed examination required to ensure that the documents are accurate and compliant with prevailing regulations? In examining your operational processes you will likely discover duplicated efforts and system redundancies, or processes that require more steps than necessary because of aging exception-handling rules. All these inefficiencies are now exposed and correctable. For a sense of how this would work, consider a company whose operating expenses continued to rise even after a 15 percent headcount reduction. The company examined its microeconomics by detailing and reviewing the steps used in the new business process and baselined its costs for onboarding new customers. For each step, the company calculated its productivity and cost per unit of work, comparing it to historical costs and competitive data. Through this examination the company discovered a problem in the application vetting stage. Within this activity, the analysis showed 20 percent of applications were responsible for 80 percent of the effort and cost. Certain types of applications contained significant errors and had to be repeatedly checked. But more interestingly, not all of these applications had the same level of errors, but the same brokers made consistent errors. By focusing on the brokers submitting the erroneous applications, two changes were initiated: Computer Based Training was provided to the brokers involved, and a simple change was made to the forms required for a class of products. With a huge reduction in vetting, the company's unit of work costs for new business dropped from €100 to €88. The company could then look at the remaining new business processes to streamline the unit of work even further; and with these efficiencies and lower operations costs, they could even bring down product prices to attract new customers. This example shows that within the application, vetting, and underwriting processes there are numerous work steps which the unit of work approach categorizes as either transaction or knowledge steps. More often than not, the execution of the transaction steps surrounding the knowledge steps is performed by SMEs. By isolating productivity, headcount costs, and knowledge versus transaction steps, you can increase the opportunity for improvement with even more options for making changes than the simple fixes described above, such as automating transaction steps or "leaning" processes. Or, perhaps it suggests the advantages of making investments in truly differentiating knowledge steps while rethinking core versus non-core activities. The point is that now you can make choices that have both short-term and long-term benefits to the organization instead of being reactive to the markets or the forces of Mother Nature. Two Opportunities Examining your organization's core capabilities and the processes that deliver output gives you a functional understanding that offers two additional key opportunities. You can remove, reduce, or outsource areas that are not at the core of your value chain; and you can create a baseline of your current output production for each area. With actual historical operations data, trending different units of work allows you to zero in on those with declining productivity and make necessary changes.

As you get started, here are the key questions you'll want to ask: Conclusion Insurers have three big buckets of activity that define their business: putting business on the books, managing the business while on the books, and settling the business when it comes off the books (that is, dealing with claims). While insurers generally use their combined operating ratio as the master metric—say, moving from 102 percent down to 99 percent—they tend to just cut the biggest numbers without delving into the precise metrics. By changing your focus to operational productivity you could potentially move your operating ratio 10 to 20 points—doing it rationally and benchmarking yourself using value as your guide. This will help drive your firm's competitiveness. You can reinvest these gains into your pricing and servicing because you will understand precisely how your organization works, know that you're running it without fat, and know that you've made it nimble for when change is necessary. The units of work model may not prevent earthquakes, floods, or new regulations, but it will help make your company better able than your competitors to survive them. Is Outsourcing Just Another IT Project?

----- Arcticle source ----- https://www.wipro.com/consulting/is-outsourcing-just-another-it-project-/ ----- Contact Wipro Please fill the required details to access the content The advantages of IT outsourcing IT are well known. You can transform fixed costs to variable costs, reduce dependence on commoditized and non-core components, and readily access industry best practices. All of which reduce costs and allow you to focus on adding value to core areas of the business. But with so many advantages to be gained by outsourcing your IT, why do companies so often end up being disappointed? In our experience, it's because many executives treat outsourcing as a pure cost-reduction initiative and underestimate the changes that IT teams and business users face. Substantial time and money are spent selecting the right outsourcing partner, including hiring advisory consultants, identifying potential suppliers, creating, evaluating and responding to RFIs and RFPs, conducting due diligence, visiting supplier premises, and, eventually, negotiating the contracts. Yet the amount of time spent on considering the impact on IT teams and end users is comparatively minimal. Once the transition is complete, business users must, among other things, adapt to new service management processes, get used to concepts like self-help and self-heal, and do without long-established onsite IT support. For global companies, cultural differences may also be a crucial factor. You can hardly blame business leaders of specialized functions like R&D, trading, production or customer service for fearing that an outsourcing partner (service provider) may not deliver what they need. If you do not reassure such user groups by bringing them into your project from the start, then you

could face internal resistance, operational disruptions, and even heightened regulatory and compliance risks. What Outsourcing Brings to the Table For IT teams, outsourcing brings new roles and responsibilities based on the specific details of the future mode of operations. There will also be new processes and tools to understand, and new relationships to develop with counterparts from the outsourcing partner organization. For instance, the retained IT team will have to focus on areas such as supplier relationship, governance, and service management, some of which can be completely different from their pre-outsourcing responsibilities. In short, without fully understanding the people and organizational ramifications of outsourcing, you run the risk of creating an experience that could negate your intended IT cost savings and deter your business leaders on further outsourcing. This happened to a global telecommunications company. After a long procurement cycle, the transition to the outsourced model resulted in resistance from business leaders who were unprepared to change the ways in which they used IT services. Previously, end users could approach the IT department directly to resolve technical issues. In the outsourced model, they were expected to call a helpdesk to log tickets. This seemingly small change created frustration, especially because users were expected to use self-help tools without appropriate training. In the end, the company's IT executives were forced to delay the outsourcing program, resulting in significant losses and contractual issues with their outsourcing partner. Turning IT Outsourcing into a Change Management Initiative In our experience, the most successful IT outsourcing projects are designed and executed as Change Management initiatives. That means in addition to the IT specialists required to design an effective technology solution and processes, you need to include Change Management experts to create a partnership with business leaders and users—one that has a clearly defined IT service vision and agreed-upon success criteria. In an effective outsourcing plan, your Change Management experts should work alongside technical team members and company stakeholders to: Making IT Outsourcing Work for You We recently partnered with a global telecom organization that was planning to outsource the IT infrastructure services of its R&D function. Business leaders and end users alike were not too convinced about this as previous attempts at outsourcing had not worked as per plan. Now, the company's IT executives were under intense pressure to deliver the right results. The project team decided to approach the project from a business user's perspective. The company's Change Lead worked closely with the outsourcing partner's Change Management experts from the start. Together, they aligned priorities among the regional leaders of the seven countries in the company's footprint, analyzed the impact of the planned changes on different stakeholders, enabled the retained IT teams, and educated the business users on the new IT processes and tools. The result was the kind of success that had eluded the company in its first outsourcing attempt. Business users readily adopted the new IT service delivery model and started a new culture of collaboration between IT and business users. For decades, organizations have been turning to outsourcing to reduce costs and gain access to the most up-to-date technologies and practices. However, leadership teams in companies have underestimated the impact of outsourcing on their people. For IT outsourcing to succeed, the transition must be treated as both an IT project and a Change Management project. Yes, the technology solution is critically important. But it's by

driving ownership and adoption of the new IT service model between your business users and IT communities that you will ensure your project's long-term viability and gain the competitive edge in the marketplace. ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/state-of-cybersecurity-report-2020/manufacturing/ ----- Contact Wipro Please fill the required details to access the content Manufacturing October | 2020 COVID-19 created spikes and shortages in supply and demand across the global manufacturing industry. For only the third time, Interpol issued a security warning of a significant rise in cybercriminal activity. The vast majority of these cyber attacks targeted healthcare and global manufacturing ecosystems, specifically industrial targets during the pandemic. Although many supply chain and warehouse management leaders recognize IoT and OT technology benefits, they're rightfully concerned about adopting them as a part of their modernization strategies. OT technology has the potential for tremendous positive impact, but without the right cybersecurity framework, it can cause potentially irreversible financial, legal, and reputational damage to global manufacturing enterprises. The mass adoption of cloud-based technologies and remote working technologies has increased security vulnerabilities, making it critical to consolidate access management and security roles to ensure that what matters is secure. Centralizing access and visibility can help global manufacturing leaders reduce costs and gain more visibility into who is accessing what, when, and on which device. To learn how Industry 4.0 is coming to fruition through OT technology and why attacks on R&D environments are on the upswing, and what you can do about it, download The State of Cybersecurity Report. =====================

Dark Web 201: How to Leverage External Threat Hunting to Prevent Cyberattacks

----- Arcticle source ----- https://www.wipro.com/cybersecurity/dark-web-201-how-to-leverage-external-threat-hunting-to-prevent-cyberattacks/ ----- Related Articles Contact Wipro Please fill the required details to access the content Dark Web 201: How to Leverage External Threat Hunting to Prevent Cyberattacks February | 2021 A necessary pillar of an effective cyber defense strategy is the capability to detect and mitigate threats at the earliest stages of the cyber kill chain. While internal and perimeter security solutions are critical to your security program, external threat intelligence gives you the ability to defend forward by eliminating threats outside the wire. This ebook is designed to provide a framework for security professionals on how to conduct effective external threat hunting on the dark web. The dark web is a haven for cybercriminal activity. Accessible only through private browsers, like Tor, that enable anonymous browsing and communication, the dark web allows threat actors to operate in the shadows and maintain relative obscurity and anonymity. While most cybersecurity professionals are well aware of the dangers that lurk across the dark web, many do not have the time, knowledge, or tools at their disposal to identify,

validate, and mitigate threats that are being orchestrated against them. The dark web, by far, provides the most challenging landscape for threat hunting due to its anonymous nature and inherent challenges in enforcing regulations. Creating a game plan: You're only as good as your sources Strong intelligence starts with good sources. Your sources can be found in any place where you hunt for or gather intelligence, including black markets, hacker forums, and instant messaging groups, like Telegram, IQ, and Discord. It's much better to have one source of really strong intelligence than to have thousands that turn up very little. In addition, it's critical to map the threats, attack vectors, and source types that are most important to your unique organization, so you can focus on establishing the right mix of sources. Each organization will have different sources and hunting methodologies based on its intelligence needs, weak points, common attack vectors, industry-specific threats, and more. For example, the ways a bank could be attacked are very different from the ways a healthcare organization might be. Therefore, threat hunters must tailor their efforts to the landscape surrounding their organizations and utilize sources that enable them to find relevant threats. Banks probably don't need to hunt for leaked medical records, and healthcare organizations probably don't care as much about stolen credit card numbers. There are many different types of sources across the dark web where you can find threats, and these source types often specialize in a certain area of cybercrime or information trade. Here are some common "sub-categories" of dark web sources: General Markets: These markets offer almost anything for sale, including drugs, weapons, credit card dumps, miscellaneous services, digital products, counterfeit merchandise, and much more. PII & PHI: These markets sell personal identifiable information (PII), like Social Security Numbers (U.S. Market), mailing and email addresses, and dates of birth. Credit Cards: These markets and forums are dedicated to buying, selling, and sharing leaked or stolen credit cards. They can often be purchased in bulk or individually. Digital Identities: These are relatively new sites on the dark web that sell stolen "digital fingerprints" of a user's web browsing device (i.e., IP address, OS information, time zone, user behavior). These sites enable the purchaser to impersonate a legitimate online user and circumvent standard security protocols. Some examples of these sites include the Genesis Market and Richlogs. Information Trading: This can include stolen databases, leaked documents, trade secrets, and more. Remote Access: These sites sell and trade Shells (exploits) and remote access via RDP, VNC, or other access to hacked servers. Personal Documents: This might include stolen passports, driver's licenses, social security cards, or fake IDs. Electronic Wallets: These sites sell access to stolen or compromised wallets, typically containing Bitcoin or other cryptocurrencies If there's one constant across the dark web, it's change. These dark web sources of cybercriminal activity are never permanent, often being shut down by law enforcement or taken offline by administrators to avoid getting caught. Staying on top of the latest movements and popular hubs is a tricky task given the elusive nature of the threat actors using them. That's why becoming an active member of the community can open the door for threat hunters to stay on top of the constant change and access the most valuable sources across the dark web. Establishing access: Venturing behind enemy lines Cybercriminals and other threat actors are intentionally deceptive, and will try to avoid being identified in any way possible. This makes searching for sources challenging

– where do you begin? To compound the challenge, activity hubs are periodically shut down by law enforcement with no notice, forcing threat actors and threat hunters alike to adapt on the   fly and find new sources for trade and information exchanges. Since most dark web activity takes place on the Tor browser, which anonymizes users and isolates each site, it can be difficult to keep track of forums and black markets, which are often unindexed and only accessible via obscure URLs. During the past year, there have been several notable shutdowns – Altenen was shut down by Israeli authorities in May 2018, and Dream Market voluntarily closed its doors at the end of April 2019, which may or may not have been part of a law enforcement sting. Deep Dot Web, Valhalla, and Wall Street Market were shut down by authorities soon thereafter. Going back a couple of years, AlphaBay and Hansa were shut down in July 2017. The more popular a site becomes, the more likely it is to be shut down or taken offline. These closures and shutdowns of large-scale markets in recent years show there is no singular source of cybercriminal activity. Tracking emerging black markets can be helpful, but the best intelligence is often gathered by assimilation into cybercriminal watering holes. Threat hunters must earn the trust of cybercriminals to become accepted into those communities, which can be a complex and risky task – one that CISOs often outsource to experienced professionals. "What is the Tor browser? Tor is a dark web browser that was originally created by the United States Naval Research Laboratory in 2002 as an anonymous communication tool for intelligence agencies. Ever since, it has become the go-to tool for cybercriminals, cybersecurity professionals, researchers, academics, and law enforcement alike. Tor works by randomly routing a user's encrypted traffic through a series of connected volunteered systems, called relays. This ensures activity cannot be traced back to the end user. Tor users can access special sites with .onion domains, which can only be accessed through Tor browsers. Tor is now maintained by The Tor Project, a non-profit 501c3 organization based in Massachusetts. While funding is provided by a number of foundations, corporations, and individuals, the vast majority of the Tor Project's funding continues to come from the U.S. Government. Despite this, Tor is largely unregulated – in part due to its anonymous nature – allowing cybercriminals and hackers to form a thriving ecosystem." Assimilating into the hacker community Threat hunters are faced with a daunting task: infiltrating advanced hacking and cybercrime communities where the barriers to entry are substantial. In order to be accepted into these communities, new users often must pass a series of tests – both literal tests and tests of character – to prove they are both technically capable and, most importantly, not working with law enforcement or cybersecurity groups or companies. In sophisticated forums, you must demonstrate your technical prowess by passing rigorous, challenging tests that sometimes require a referral just to take these exams. The language barrier is one of the biggest challenges threat hunters face – not necessarily in terms of being fluent in certain languages, but, rather, being fluent in cybercriminal jargon. The slightest slip-ups can expose threat hunters as undesirables and lead to instant bans from the communities they are trying to access. Even worse, if your true identity is discovered, it makes you and your company instant targets for hackers. To further complicate matters, even those experienced with cybercriminal lingo might be considered suspicious if they attempt to gain access using a new avatar. It is therefore critical to spend time cultivating

an active persona, sharing useful information with other users, and contributing on more publicly accessible dark web forums to prove your credibility. It's also important to take part in these forums at odd hours of the day. It's easy for hackers to sniff out a threat hunter via avatars that only log in from 9 to 5. Think of it like tending a vegetable garden: If you spend more time feeding and weeding it, you'll eventually yield better quality crops. If you do the bare minimum and neglect your plants, they will eventually wither and you'll have to start over. Security measures and identity protection Even on the anonymized dark web, identity protection is crucial for threat hunters. Although your connection is anonymous, your device can still be hacked or infected, which can expose your true identity. Before venturing onto the dark web, you should invest in security tools that will help ensure your identity does not risk exposure. Some examples include using a virtual private network (VPN) and/ or proxy, and setting up a virtual machine before connecting via Tor. As always, it's wise to implement multiple layers of security to decrease the chance of being outed (or doxxed, as it's referred to online). Moderators of cybercriminal hangouts are actively searching for threat hunters, law enforcement agents, and other dark web users who are seeking to thwart their efforts. They constantly analyze users to find holes in their backstories or other clues that might expose them as oppositional. Threat hunters must operate with caution to avoid putting themselves and their organizations at risk. Staying on top of new sources The dark web is a volatile place, with new websites, markets, and forums constantly being spun up, moved, and taken down. Hackers like to move around and quickly shift the sites they use in their attempts to avoid law enforcement. To be an effective threat hunter, you need to constantly monitor for – and gain access to – new sources that can be used for intelligence gathering. It can be difficult to search across the dark web, but there are a few popular crawlers that can be used to discover new sites. One of the more popular ones is Fresh Onions, but it often gets taken offline and has limited reach, so it may not be as reliable as Google. Speaking of Google, the clear web can often be used to find entry points into dark web forums. Simply Googling "dark web websites" or "dark web forums" often returns clear web sites that offer .onion links to dark web pages. However, these are often well-known and well-established sites on the dark web, so you likely won't find anything brand new or highly exclusive. Telegram, another channel that's growing in popularity among dark web users, can be used to find new hacker watering holes. Telegram is an instant messaging platform that has both open and invite-only groups. The invite-only groups typically have the best resources (with highly restricted access), but users often post new forums or markets on open channels. If you're active in Telegram and build your credibility, you can sometimes get invited to the more exclusive private groups. Overall, the best way to stay on top of new sources on the dark web is to embed yourself into the community. This takes both time and skill, as you'll need to blend in with other threat actors, and often will have to build your credibility as a "fellow threat actor" to be trusted. If done correctly, this is the best way to find new sources of intelligence as hackers like to share only with people who have been vetted. The stronger your dark web reputation, the more likely you'll get invited to exclusive groups and forums. Generating intelligence: Identifying threats targeting your organization Now that you've identified your sources and established yourself as credible, you need to know what to look for. Much

goes on across the dark web, and threat hunters are often tasked with trying to find the needle in the haystack. But when it's discovered, it can be incredibly valuable in helping you anticipate and mitigate threats before they're used against you. Identifying and validating threats As you can imagine, finding threats on the dark web is not black and white. False claims are often made, data is constantly recycled, intent is not always clear, and validation is often needed to distinguish benign activity from suspicious or malicious campaigns. Think of it as a spectrum, with benign all the way to the left, suspicious in the middle, and malicious to the right. So, how do you assess whether a threat is far enough toward "malicious" to warrant action? Threat hunters often need to piece together separate clues from different sources to understand the full context of a threat. This might involve purchasing or asking for samples of data for sale to validate sources and/ or legitimacy. It's also important to track and record activity over time, as threats often evolve over the course of weeks or months. All of these variables play a part in determining the context and severity of a threat, so it's critical to have broad visibility and sufficient analysis skills to uncover threats in a sea of unrelated activity. Ultimately, intelligence is only useful if you can act on it, so it's critical to find and validate threats that specifically relate to your organization. Automating external threat intelligence Continuous dark web monitoring is a time-intensive – and often overwhelming – task for even the largest teams of threat hunters and researchers. This is why many organizations are embracing external threat intelligence solutions that allow them to automate the monitoring and analysis process for dark web intelligence. This is often complemented with additional manual hunting and threat validation to significantly reduce the burden on security operations teams that are charged with rapidly responding to and mitigating cyberattacks. The key to building an effective intelligence process is to connect it to your existing security initiatives. Take credential leakage, for example. Every organization needs to ensure its employee credentials are secured to avoid unauthorized access to company systems. Leaked credentials are one of the most common digital goods on the dark web, so companies must have clear processes established for how to identify and lock down compromised credentials while minimizing disruptions to employee productivity. Activities should include collecting new credential dumps, analyzing contents, validating credentials against your Active Directory, and orchestrating appropriate action to reset or lock down those credentials. External threat intelligence supports numerous security initiatives. Mapping out the mitigation process is one fundamental way to gain value from your intelligence program. Taking it to the next level: Using HUMINT to bolster threat hunting When cybersecurity teams extend their visibility beyond their perimeters, they often look across the clear, deep, and dark web for indications that they are at risk or may be attacked. There are many tactical elements – like automating the process for discovering leaked credentials – that build a foundation for effective dark web monitoring. But there are more advanced tactics that can be used to go deeper to uncover the threat actors and motives behind attacks. This practice is called HUMINT – or Human Intelligence – and it involves gathering intelligence through interpersonal contact and engagement, rather than by technical processes, feed ingestion, or automated monitoring. It's typically a manual process, requiring a very specific set of skills and knowledge to remain undercover and not raise suspicion. It's the high-tech

equivalent of what an undercover FBI agent does, spending months or years working to infiltrate a criminal organization. It's painstaking and nerve-racking work, and can be a dangerous activity for an individual, regardless of experience and skill. Here are some key use cases for establishing sources and conducting HUMINT gathering: Post-Attack Investigation: Hackers will often make claims or take credit for attacks online. If the attack mentions your company or, perhaps, another in your industry, it may be worth contacting the threat actor to investigate how the attack was launched, what entry points were used, and which tools were deployed. This intelligence can be used to stop further damage and/or protect against a similar attack. Extortion Attack Damage Assessment: If your company is being extorted, you might want to verify what data has been stolen as well as its value. This information can be used to assess the potential impact of a breach. New Attack Vector Discovery: As a part of the threat hunting process, HUMINT can be used to discover new scamming methods, new exploits, and other hacker TTPs that may be used against you. Threat intelligence solutions can provide you with a lot of this intelligence, but supplementing it with your own HUMINT gathering can help you gain an even deeper understanding of current threats. Because sources and avatars take time to develop, you shouldn't wait until after one of the above scenarios happens to begin collecting HUMINT. You need to start developing your HUMINT process now so that you have the credibility and sources in place if you find yourself in one of these situations. If you reach out to threat actors as a new avatar right after a recent security incident, they will immediately be suspicious of your motives. Threat hunting is a risky endeavor for security teams, but the intelligence gathered can give you a significant advantage in protecting your organization. Remember, this is a delicate practice that should be performed only by experienced professionals. The last thing you want to do is be exposed, and immediately and simultaneously, put your personal life and organization at risk. What can IntSights do to help? IntSights provides a comprehensive external intelligence solution that enables organizations to identify and neutralize threats across the clear, deep, and dark web. Using our unique cyber reconnaissance capabilities and multi-dimensional threat analysis, we deliver validated, actionable intelligence and orchestrated mitigation to help you proactively protect your organization. Our platform seamlessly integrates with existing security solutions to eliminate operational vulnerabilities, secure data, and protect resources. Our commitment to marrying automated external threat intelligence with expert threat hunting by our dedicated analyst team empowers security teams to take control of the environment beyond their perimeters and Defend Forward. The dark web poses a risk to all organizations, but it also presents an opportunity. Start using dark web activity to inform a proactive security strategy, and gain an advantage over your adversaries. This article is contributed by IntSights Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. =====================

Context: The Core of a Successful Zero Trust Strategy

Context: The Core of a Successful Zero Trust Strategy March | 2021 The network is no longer the sacrosanct environment where good and bad guys can be distinctly identified and access restricted to ensure security. Defining the perimeter or zones as part of securing the network does not suffice now. With the advent of cloud, remote working, and mobile, the earlier concept is dissolved. Whether it is cloud SaaS applications or running in IaaS, our workloads and users have escaped that perimeter. Zero Trust approach to security moves away from the failed perimeter-centric approach to a model that's more data and identity centric. It is about users who are using devices over networks to connect to workloads. The concept of context surfaces in the whole chain --- what is being accessed, where is the request coming from, which device is involved, and how the access is requested – the key considerations before a decision is taken. This also implies that the network does not hold any specific privilege; the privilege of the trust is no longer rooted in the network. Instead, all access requests whether they are from managed devices or not, come through some kind of an access proxy / gateway supported through single-sign-on, user /group database, and identity provider. Access control decisions are taken using an access control engine, which can infer the trust based on device inventory, device posture, location, certificates and access control tokens. Instead of just looking at the network perimeter and all the things inside as trusted, we need to view all access requests as initially untrusted, and then make those access control decisions based on full context of the access chain. The relevance of context in zero trust At the core of the context in Zero Trust lies the identity of the user or an application process whether it is on-premise, cloud based, or API based. The identities start to melt together because the model combines employees, privileged users , privileged identities, temporary identities of contractors and third parties. The complexity increases with more and more systems being exposed to partners, or strategic partners with specific access requirement than others. The context of Zero Trust is about gathering those metrics that an organization can leverage to assess the legitimacy of an incoming access request. This varies from organization to organization and the primary factor is the context of risk assessment at a business level and then establishing the relevant metrics applicable to the individual metrics. Every organization should start developing their respective framework to build the appropriate context and move from the perimeter-centric model to the Zero Trust model. Concept of context varies between scenarios, threat landscape and business domain. Here is a simple example for understanding context. In any situation, we have network context. However, instead of being the root of all trust and assuming good to go while the user is within the company network, it is worthwhile to authenticate to company Wi-Fi using certificate. The data gathered for orchestrating to device management

add to the richness of the context. We can understand the source of the request and other information confirming legitimacy of the incoming access request. Often, it may so happen that this goes outside the boundary of traditional controls and we can simply ask, have I seen you from this IP before. It is possible that the user is logging in from a remote dynamic IP address and the IP address has not changed in at least a few years. It is also possible that the request is coming from an unknown IP address and in such situations, it can be referred from a threat intelligence source. Have we seen any suspicious login attempts from similar sources? From the example above, we can see that the context can be richer with interesting data leading to a better decision. Organizations can also look at fighting the false positives with enriched context as it helps in gauging the velocity of genuine versus malicious looking attempts. Risk assessment is key for context We focus on the technical risk when we look at our cybersecurity designs, but basis the risk assessment, we know that certain resources and certain systems need to be treated with tighter security controls. With that information, we can act on it, implying the orchestration of the underlying infrastructure for a full stack visibility, and how data is handled and stored etc. This also needs to be backed by an integrated program and the use of analytics, automation and orchestration. A useful reference would be NIST Zero Trust Architecture 800-207. If we sum up all the output from risk assessment and create a progressive journey for Zero Trust, we look upwards in ascending order starting from traditional network infrastructure and software defined perimeters, then servers and workload perspective using micro segmentation. Metrics for context development Starting with firewalls, zoning and data isolation and eventually turning into a strategic initiative with tools and technologies acting as enablers is the correct way to develop all the metrics required to reach ultimate state of Zero Trust. For every organization, this is a maturity journey achieved through tighter integration of tools and technologies, automation of processes, and revisiting respective user roles to achieve the state of Zero Trust. For every organization, the metrics are unique and there is no mandatory sequence to develop these metrics. Common metrics to develop the context for legitimate access request are users' identity, location, device, traffic path/ networks, data and workloads. The metrics can be augmented

through reference decisions from visibility and analytics tools. Let's take the example of an identity centric approach to articulate the process of metrics development. The objective here is to grant the identities and accounts with optimal access rights and verify connections before any explicit trust can be established. In order to make appropriate decisions, we need to know a few parameters such as: Level of resistance (least for a company managed device accessing company SSO portal and most for an unmanaged device from an unexpected location accessing cloud based Jenkins server configuration) Ability to access all of the above information on a run time to make decision is key to developing metrics and context for Zero Trust. Shifting paradigms in Zero Trust The implications when implementing one of these metrics, especially users, groups and the concept of least resistance is analogous to the concept of privilege users. We are familiar with programs where we have selected more sensitive resources, and their users are subjected to prove their identity and authorization through PAM, a system used for managing privilege access with Zero Trust approach. However, enterprises should consider a radical shift in the approach to privilege users.

For example, developing controls within systems where we can elevate the privileges appropriately. We could move away from the concept of privileged users to just users; the users are provided with their actual identity, the right level of access to the resource in the right context at the right time. This also implies that access to those users can be customized based on demand. In essence, we will have a number of systems where there are no more privileged users. Another fundamental shift is how enterprises can move to context-based, metric-driven and time-bound decision to allow sign in. This will allow organizations to move away from insider threats, disgruntled employees, and operational nightmare related to removing unused RDP, SSH session keys from fleets of servers and applications. This way, we can enforce Zero Trust access control decision even for server admins, and more importantly, the control is now universal because the same control would apply to a browser session when they log in to their end user applications like email, SharePoint, file shares etc. Similar to the context of user, groups and access, network also plays a fundamental role in enriching the context data. Assume that the network is compromised with threat actors trying to move laterally within the systems. Architectural decisions start to play a critical role to decide how the infrastructure is following macro segregation and allowing system communications. Here, a tool that allows you to do software-defined networking, or server workload-based micro segmentation becomes a critical asset to our arsenal. In the COVID-19-induced norm of remote working, the wave of unrequested BYOD is far greater than it used to be. This changes our security posture rapidly and the need for context too. Not only are we interested in knowing ease of device management, but also, the device. Can we have something on that device that can give a validation of pattern of access or its current location with respect to time or security state. And, can we verify the application that runs on Mac and Windows and iOS and Android? Metrics like these are driving richer hardware-based context that help us with quick contextual decisions. Understanding the security state of the device needs an integration with an endpoint management framework, including endpoint security detection and response system. This places the technology controls in right order and ahead of the traditional management framework. Enriching the context with further information on software upgrade update policy of the device operating systems can take us directly to the decision point, and to an extent, improve the data for known device beyond the corporate managed fleet to partner and BYOD scenarios. There is also a need to move away from point integrations to a central policy and access control. The value of rich context of data and access control decision is better leveraged with central control plane. In a recent attack on FireEye systems, an elite group took advantage of a vulnerability to implant malware, which then found its way into the systems of SolarWinds customers when they updated their software. Such occurrences are frequent, and when they do happen, with a centralized approach to security controls, organizations can take quick decisions to tackle such adversaries, discover vulnerabilities, and apply automatic mitigating controls for access to all systems. All of this information equips us with necessary data for posing a contextual response, and knowing the exact challenge for the incoming access request. The size or magnitude of challenge depends upon the level of resistance that is applicable in accordance with the business criticality of the applications and nature of access request vis-a-vis the

current user role. Let's look at the development curve and possible architecture solution to integrate all of these components. Zero Trust: Maturity curve and reference architecture Figure 1: Zero Trust maturity curve Starting from stage zero, we have categorized the journey into four stages. First one was mostly perimeter focused with implicit trust, and fragmented identity, where most data was still on active directory on premise; there was little cloud integration and passwords were everywhere. However, with maturity, we witness single sign on across employees contractors, and partners, supported through modern multi-factor authentication, push authentication, whose policies are mostly unified across applications. Hence, over the journey, certain organizations have a bit more of a control point for authentication and authorization, thus a stepping stone of context build towards Zero Trust. Since the year 2019 and 2020, this journey has been through contextual access, automation and orchestration with identity lifecycle management, where the access policies are not fixed based on any particular resource, but the context of the user and the devices. The next step will be how organizations will deploy different kinds of authentication factors for different user groups based on the level of resistance that the incoming request faces. This also is the stage where we often see organizations really starting to pay more attention to APIs, especially with API access management via access tokens. With the disruption caused by COVID-19 and the increase in remote workforce, organizations will have to move toward risk-based access and access policies. This is termed as adaptive workforce in Figure 1. A Zero Trust organization will have to build the context and develop continuous and adaptive authentication, authorization, device security state, resource criticality, application type and network information as part of the key decision making process.   Figure 2: Reference architecture for Zero Trust In Figure 2, we can see that the identity is no longer only about the user; it is also about the device. Figure 2 is a vendor-agnostic reference architecture /framework providing an idea of basic building blocks for zero trust. Zero trust is not about any particular tool, it is about an integrated approach that combines people, process and technology to combat modern threats. The devices and users that an organization recognizes by having the right context is the starting point. Rest of the context can also be provided by other systems. For instance, SSO IDP system can provide time, context of the users and devices associated with the requested access method. Further, the network context can provide inventory of the locations including remote versus on-premises. Then comes the application context, method and type of access being requested. From user context perspective, it is important to draw as much details possible about user's identity for verification. One of the key things to draw inference is the ability to understand whether the request is coming from a compromised user or bot. For example, integration of email security gateways with authentication system allows us to take advantage of the context of user -- type, identity, location, resource and possibilities of phishing attacks or email attacks on the user. From a device context perspective, information available from device posturing and location brings a wealth of contextual data for decision making. From a network context perspective, most organizations are equipped with many tools. For example, existing network edge appliances like load balancers, proxies can provide great context about resource and nature of access. When all the contexts are integrated with identity and device information,

an informed decision can be taken before granting access to the resources. The resource type and access methods play a key role in the architecture. If it's an on premise application that is relying on error-based authentication or using Kerberos tickets, local certificates, we can enforce control through an access gateway and based on the Zero Trust framework to decide the best course for the incoming request. And, if it's a modern cloud application that uses a similar method or identity provider, we can federate based on successful metadata challenge. Similarly, the concept can be applied to any other type of resource, whether it is LDAP or radius based access, SSH, RDP connections or infrastructure components. Next steps are about controlling access to the APIs through the same framework. Organizations should look beyond API gateway to authentication tokens and role definitions for respective APIs. The architecture is similar to NIST Cybersecurity protect framework, however the cycle of total defense is incomplete without emphasis on detect and response strategies. With all the context information, authorization information, rich identity context as an input to SIEM, analytics and store platforms for correlation, analytics and orchestration, we have the outputs for taking informed decisions. Despite compelling integrations available for intelligence and analytics, it is often overlooked. Platforms like Demisto, CyCognito, Siemplify can be integrated into the context decision point. Dynamic user group changes similar to the concept of quarantine can be applied till the incoming request is cleared of any suspicion. The journey to Zero Trust The Zero Trust reference architecture is a vendor-agnostic high-level framework that provides guidance on where and how to leverage different solution building blocks. From a technology perspective, three fundamental principles or properties would be useful when an organization embarks on a journey of Zero Trust. Firstly, an organization should take stock of their current inventory for the potential Zero Trust solution and then evaluate what could be reused from the existing stack. Secondly, what are the gaps that could exist after considering re-use. Finally, what products/technology currently exist in the market to fulfil those gaps. The output of this exercise will determine the properties that can measure the tool or the vendor for a successful solution. Zero Trust is not a single product or solution; it is a combination of people, process and technology applied with the right context considering involved business risks. Begin your Zero Trust journey Schedule a discussion with our experts to understand how we can help you become a Zero Trust organization. Contact us @ souvik.khamaru@wipro.com Souvik Khamaru Cybersecurity and Risk Services practice partner Wipro Souvik Khamaru is Cybersecurity and Risk Services practice partner for UK and EU at Wipro. How to Keep Your Virtual Desktop Environment Secure

----- Arcticle source ----- https://www.wipro.com/cybersecurity/how-to-keep-your-virtual-desktop-environment-secure/ ----- About the Author Contact Wipro Please fill the required details to access the content How to Keep Your Virtual Desktop Environment Secure April | 2021 Due to the COVID-19 pandemic, most of the organizations have their employees operating from home. To reduce the impact of the pandemic on business, to improve operational resilience, and to increase productivity of employees while working from home, organizations started adopting Virtual Desktop Infrastructure. Virtual desktop infrastructure (VDI) and cloud computing are the new generation of end user computing. VDI allows users to remotely access Virtual Machine (VM) hosted with specific operating system through any device and from any location by using VDI agent. Remote operations will not go away even after this pandemic. Organizations have seen the opportunity to improve Employee Value Proposition and reduce real estate cost in the new operating model. Therefore, VDI and remote operations will continue to grow. Components of VDI Main components of VDI are Figure 1: Virtual Desktop Infrastructure The key advantages of VDI infrastructure is that the users can access the organization's data only through virtualized desktop and the VDI is managed through central servers. Centralized image deployment, policy management and patch management, ease of portability, and the flexibility for users to access their desktops from anywhere, are the key differentiators of virtual environment vs physical environment. Risks in VDI Though VDI offers different level of security than the traditional physical server, VDI environment is not free from threats and risks. VDI environment exposes different kinds of risks. Some of the VDI risks are: To avoid such risks, VDI environment controls should be deployed starting from initial planning phase of the VDI environment. A phased approach to secure VDI NIST 800-125 proposes implementation of virtualization controls from Initiation to Disposition phase for secure VDI solutions. Figure 2: Secure Virtualization Planning and Deployment Phase 1: Initiation This phase is a key step in virtualization control framework. The key thing to be developed as part of initiation control is a Security policy that defines what form of virtualization is allowed, which application to be allowed to run in VM, and how data will be accessed in VMs. The task will be to check all other security policies that might impact virtualization policies. Periodic updates to the security policy is vital to keep up with emerging technologies and standards. Phase 2: Planning and design This phase includes major considerations like Architecture, Authentication, Cryptography. Architecture includes selection of virtualization software, storage controls, network topology, bandwidth calculation and availability. Authentication includes separate access controls for each layer of the virtualization environment. Cryptography includes selecting the encryption and integrity protection solutions meeting the compliance requirements. Security incident response

plan should be updated to incorporate virtualization incidents. Phase 3: Implementation Implementation phase includes testing of prototype. Evaluation of the VM includes VM conversion, authentication, monitoring of events, connectivity, and applications performance in VM. Final decision should be sought after vulnerability assessment is performed. All the components should be updated with latest security patches. Phase 4: Operations and maintenance It is a very important step for maintaining virtualization security continuously. Administration access should be reviewed periodically, checking for patches and relevant software upgrades should be done by agreed timelines, time synchronization should be checked to ensure logs are relevant in correlation. Access control review and RBAC (Role base access controls) policies should be updated to keep up with rapid technology changes. Phase 5: Disposition Before disposing any VMs, organization should ensure to wipe any sensitive data. Performing a periodic risk assessment for virtualization environment is necessary to avoid security breaches, revenue loss, business impact etc. An effective VDI risk assessment process VDI risk assessment process should cover people, process and technology controls used to support the cybersecurity requirements of an organization's VDI infrastructure. Risk assessment process will leverage the NIST recommended methodologies and controls (NIST 800-30, NIST 800-53, NIST 800-125) relevant to End User Computing (EUC) Virtual Workspace System (VWS) environment. The various stages, key inputs, tasks and outputs of the assessment process are given in Figure 3. Figure 3: Risk assessment process Table 1 includes the indicative examples of risks and controls in the context of VDI. Focus Area NIST 800-53 Control Family Key Risk Key Controls Process Configuration Management Misconfiguration resulting in inadequate capacity causing availability issues Configuration management policy and procedures, access control, configuration change control Technology Configuration Management Misconfigured systems could be exploited by malicious players to cause security breaches Baseline configuration and configuration change control People Awareness and Training Standards not followed hence allowed insecure application to get provisioned Security awareness and training, policy and procedures Process Maintenance Missing some servers on manual check of server reboot will impact business System maintenance policy and procedures Table 1: Indicative examples of risks and controls in context of VDI Risk register is a guide used by the organization to understand the risks, likelihood, and impact with risk rating. The risk recommendation is evaluated by the risk owner and the same is updated in the risk register. Sample of VDI related entry in risk register is depicted in Table 2. Asset Asset Criticality Rating Threat Vulnerability Control Business Impact Likelihood Risk Rating Risk Risk Recommendation VWS High Hacker introducing malware Insecure system configurations Standard image guidelines with hardening High Medium High Security breach resulting in unavailability of systems Baseline configuration and configuration change control VWS High System failure Mis-provisioned VMs to critical user Training for administrators High Medium High Critical user has incorrect VMs resulting in business impact Security awareness and training, policy and procedures Table 2: Sample of VDI related entry in risk register Toward a secure environment Virtual Desktop Infrastructure is not a new environment or a new technology. Since it has become the standard for many organizations' desktop infrastructure, managing the risks and threats

to the VDI landscape is very critical for business continuity. Planning helps to ensure that the virtual environment is as secure as possible and in compliance with all relevant policies and applicable regulations. Periodic risk assessment to the VDI environment, maintaining the controls, and a firm action plan to mitigate or reduce the impact of the risks identified is very important to have a secure VDI environment. Wipro can enable a secure VDI landscape for you through a comprehensive approach. Our consultants leverage industry-best frameworks and perform in-depth technology assessments. For details, connect with us at cybersecurity.services@wipro.com Kalpana Ramamurthy Principle Consultant – Presales, Risk & Compliance, Wipro Kalpana has over 19 years' experience in IT and cybersecurity across a wide range of global roles. She is an engineering graduate, holding industry certifications like CISA, PCI-DSS, PIMS, Azure, ColorToken, MCITP, ITIL. She has also contributed to various University forums for discussions on cybersecurity.

Overcoming Security and Compliance Challenges in a Hybrid/Multi-Cloud Environment

----- Arcticle source ----- https://www.wipro.com/cybersecurity/overcoming-security-and-compliance-challenges-in-a-hybrid-multi-cloud-environment/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Overcoming Security and Compliance Challenges in a Hybrid/Multi-Cloud Environment Key Takeaways from CISO Panel Discussion April | 2021 Cloud adoption & common security challenges Industries are adopting cloud for various benefits. Some of the key driving factors are: Cloud benefits are being realized everywhere today. However, it also brings some security challenges to enterprises: they have to protect their "crown jewels" data from various sophisticated advanced threats. As per an old school of thought, cloud is insecure, and on-premise-centric solutions are cheaper. This is far from the truth: comprehensive threat visibility and protection to the hybrid/multi-cloud assets and continuous compliance validations can be achieved through unified and integrated security solutions that are designed for public cloud. Many organizations have adopted a cloud-first strategy and try to eliminate on-premise footprint for their applications and infrastructure. However, many legacy applications demand on premise setup due to dependencies, and add complexity and inefficiencies through multiple security solutions for hybrid environments. Highly regulated industries like Banking/Insurance meet compliances likes PCI & GDPR. Their cloud service providers (CSPs) natively support the highest privacy controls and the ability to continuously assess their cloud workloads and applications against compliance standards, and alert the enterprises for the gaps with recommendations. Some countries' (like UAE) laws mandate to keep sensitive data within their regions, and CSPs like Azure provide Geo locations to keep the data within their boundaries to achieve compliance. One of the key concerns most enterprises have today is

"Availability" of their cloud services. In the initial days of cloud adoption, confidentiality and compliance/governance were primary concerns, but with the CSPs' advancing maturity over time, they are no longer a cause of concern. However, now, enterprises are heavily dependent on cloud services for their mission and business-critical applications. Visibility to all cloud workload resources is critical to apply security and compliance policies. In a hybrid and multi-cloud environment, bringing all security alerts to a centralized and modern SIEM platform powered with Extended Detection and Response (XDR) helps in effective monitoring, investigation, threat hunting and incidents response. How you can address these challenges Microsoft provides a comprehensive and integrated security and compliance solution for Azure cloud workloads. Its layered security helps in achieving Defense in Depth strategy. Most of these native controls can be extended to hybrid and multi-cloud environments Figure 1 – Microsoft Native controls for intelligent & integrated layered security Securing the cloud data is #1 priority Enterprises have more control when the data resides within the network perimeter. With cloud adoption, data is stored and processed by many 3rd parties like CSPs and SaaS providers. Though certain level of data security and assurance is provided by these 3rd party providers, it is the enterprise's responsibility to ensure adequate data protection controls to maintain confidentiality, integrity and availability. Encryption at all levels is essential to build a persistent data security strategy for the enterprise. While enterprises need to keep their data on premise or with one specific CSP, key management and protection becomes critical. Azure provides a Key Vault service that can be leveraged to a hybrid and multi-cloud environment through Azure Arc, and supports bring your own key (BYOK) and 3rd party HSMs to protect your master keys. There are concerns that CSPs can get access to customer keys. But, there are many controls available to limit the access to the keys and get visibility to who has accessed the keys for compliance perspective. Enterprises dealing with most sensitive data that demands strictest protection requirements can leverage Microsoft Double key encryption (DKE). In this approach, customer holds one key with full control and Microsoft stores one key. Customers who move their workloads and data to Azure cloud get greater confidence as Microsoft provides a holistic solution to secure organization's sensitive data. Figure 2: Integrated data security controls from Microsoft IAM strategy is key to success Identity and Access Management plays an important role in protecting enterprise users and the applications that are deployed on premises and in cloud. Enterprises leverage CSPs and 3rd party IAM vendor solutions to provide identity lifecycle and access functions for regular, privilege users and system accounts. IAM availability is critical and higher availability assurance from providers like Azure AD (99.99%) ensures business continuity. When enterprises are dealing with multi-cloud environments, privilege identity and access are given highest priority to ensure least privilege principles are in-place. A centralized IAM solution to manage identity and access in a hybrid and multi-cloud environment helps to reduce the complexity and improve the efficiencies. To mitigate privilege escalation attacks, enterprises need to continuously monitor the privilege users' activities, their role/permission utilization, and build a process to remove unused and excessive privileges frequently. Since COVID-19, enterprises are witnessing increased phishing and identity-centric attacks. Risk-aware authentication with real-time protection is essential these days for users connecting through internet.

Most enterprises leverage Azure AD Identity Protection that detects real-time user and session risks and provides various mitigation methods like blocking access or enforcing password reset etc. Microsoft Azure AD helps organizations to adopt single identity approach to provide unified IAM policies across hybrid and multi-cloud environments for B2E/B2B/B2C identities. Azure AD conditional access with identity protection ensures zero trust access for users who access enterprise applications. Figure 3: Single identity strategy for hybrid and multi-cloud Active Directory has been the heart of identity trust for most organizations until now. This is a two-decade old technology designed for on-premise network and systems, but being extended to support cloud workloads. Most of the attacks are targeted to gain control on the enterprise Active directory. Reducing the dependency on Active Directory is one quick ways of reducing the risk. For example, adopting cloud-based authentications for workstations in the form of "cloud joined" devices with strong authentication will greatly reduce the AD exposure to identity related risks. Decentralized passwords through password-less adoption can also reduce various password-related attacks towards Active Directory. Also, cloud workloads that require active directory can leverage CSP managed services like Azure AD Domain Service for reduced complexity and increased security. Unified cloud security posture management and workload protection In a single or multi-cloud environment, continuously monitoring the security and compliance posture, and rapidly detecting and responding to the threats are critical to success. Cloud security posture management (CSPM) solutions help to achieve this. CSPs Native Cloud Security solutions like Azure Security Center offers unified and integrated CSPM functions for hybrid and multi-cloud environments. Securing the workloads, VMs, containers and server-less functions are also critical and cloud workload protection platforms (CWPP) help to achieve this. Azure Defenders provide an integrated security to cover all azure workloads and can be extended to hybrid and multi-cloud environments. Multiple non-CSP/3rd party solutions are also available that provide both CSPM and CWPP for multi-cloud environments. In conclusion To summarize, common security challenges in a hybrid and multi-cloud environments are: Enterprises can mitigate these challenges by: Wipro and Microsoft, together, bring a strong portfolio of solutions and services to help you overcome security and compliance challenges in a hybrid/multi-cloud environment. For details, connect with us here. Prakash Narayanamoorthy Partner & Microsoft Security Principal Architect at Wipro Prakash has over 19 years of experience in the Identity and Security domain, helping multiple large global organizations with their cloud security and compliance transformation. He was one of the presenters from Wipro at this CISOs panel event. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

Realigning Security Paradigm for Successful Devsecops in the Evolving Technology Landscape

Realigning Security Testing Strategy for Successful DevSecOps in the Evolving Technology Landscape May | 2021 Change has been a constant catalyst contributing towards the evolution of information technology. Market trends have been the centrifugal force driving exploitation of technology to meet growing business needs and future innovations. The change to technology landscape arise from two different stimulus, namely technology creation and technology diffusion. The former is the combination of fundamental capabilities enabled by advances in foundational science and engineering research, yielding to a new functionality. The latter is the adoption of these technologies in new products and services and their emergence in new markets over time. Historically, IT landscape has evolved in phases, namely a) Development Process b) Application Architecture c) Deployment Environment and d) Infrastructure Hosting. Phase 1 of development process witnessed waterfall model where priority was given to development activities as market demand was for a fit-for-use product, thus security was of least priority or checkbox item. This phase had a siloed approach with the development, quality assurance, and operations teams functioning in a disjointed manner. Not to mention, security teams weren't taken seriously considering the development priorities. Proactive defect fix was a painful activity as testing consideration were much later in the process. Finally, after 45 years of inadequacy, emerged agile manifesto, which led to Phase 2 of the evolutionary cycle for development process. Agile was a transformative model, which was the proponent of adaptive planning, early delivery, and continuous improvement, and encouraged flexible response to change. Essentially, it was an answer to growing business demand of speeding software development processes by embracing smaller release cycles. Now software development moved from 18-month to 2-3 months cycle where customer had a working product however, security was viewed a technology prerogative. Phase 2 translated to addressing immediate business need of going to market on time. With the increasing agility from development and testing team, operations team experienced bottleneck leading to Phase 3 of evolution. The remedy to common hold up was introducing agile process to operations and infrastructure, resulting in DevOps thus marrying development and operations activities during development process. Automated infrastructure provisioning, enabled developer to move significantly faster, rooting the application development process in an automated toolchain. Security was blamed for stalling the pace of development considering it had become a gating criterion. And until security was collaborating as part of development and operation, it would

remain a bottleneck, resulting in DevSecOps. Figure 1: Changing security precedence with evolution of IT industry On the long road to well designed and secure applications, numbers of tools and technologies have emerged. Static application security testing (SAST) tools enabled detecting security vulnerabilities within Code, detecting defect early in root to live. Dynamic application security testing (DAST) tools enabled simulating hacker vista before code goes live. Then, IAST tools provided instrumentation on analyzing running applications. Finally, RASP tools enabled detection of live attack and self-heal with necessary measures. Application Security Testing essentially aims to deliver secure applications by adopting a proactive and reactive approach during development and operations. Let us discuss what approach and tooling are still relevant and will suit your needs in the development/testing process considering the constant change. Reality of point-in-time snapshot Traditionally, legacy application developed during the waterfall era provided snapshot view of security posture. Before the advent of SAST, pen-testing was considered the holistic approach to vet security postures, however, the challenge was it just provided a point-in-time view of security. Followed by SAST and DAST, which covered, both inside-out and outside-in view. However, it again only provided a point-in-time snapshot of security posture. These approaches worked well for waterfall/agile as application security landscape was playing catch-up. However, with DevSecOps coming into play, the goals has evolved from point-in-time snapshot to continuous feedback in the areas of code level vulnerabilities, hacker vista simulation, and maximizing on automation. Further amplifying the problem, the SAST and DAST tools come with a downside of reporting false positives, which leads to increased dependency on security experts to exploit proper usage and invites manual effort to address accuracy of findings. Possibility of continuous feedback With the new architectural style of software development, software started getting consolidated as small services. With increasing adoption of faster development cycles and changing business needs, microservices are gaining traction in the development world. This has helped organizations to get into the market faster and serve the customer with minimum capabilities, which are modified over time to meet the full demand and work on full scale. With microservices based deployment models, it becomes mandatory to verify the code and check for vulnerabilities with the speed of deployment cycle. Most organizations when they make the move to microservices, opt for DevOps frequent-release cycle. As a result, instead of releases occurring once or twice a year, they can happen once or twice a week—or multiple times a day. This has led to an increase in adoption of tools, which can automate and help to reduce the testing burden for security/developer teams. Moreover, microservices produces small chunks of working code in production, giving a unique and restricted functionality to the application. This creates a smaller attack surface for testing consideration and does not require entire set of services. It gives an accurate information on vulnerabilities developers can focus on rather than scrolling the entire gamut of things in a monolithic application development. Security tooling empowered with integration onto CI/CD achieved the goals of continuous feedback in the areas of code level vulnerabilities, hacker vista simulation and maximize on automation. However, given a firm that has a mix architecture landscape i.e. both monolith and microservice or rather firms migrating from monolithic to microservices and are stuck in between, wherein applications are built on

both traditional and modern architecture. This brings us to the question, "Are these approaches and tools still relevant in the DevSecOps evolutionary paradigm?" or rather "How to leverage the existing approaches and tools to achieve relevance in the DevSecOps evolutionary scale?" Winner combo for application security testing Vendors operating in security domain float varying combination of enterprise tools. Vendor C offers SAST +IAST, a combination of application security testing with a potential to replace DAST (SAST+ DAST). Vendors are leveraging ML algorithms to deliver better results among SAST+IAST findings. IAST adoption requires a mature outlook to application security and is unfit for the traditional way of application development, where the entire application is developed and the CI/CD pipeline is absent, the use of IAST is negligible. Organizations where developers have strong security background are skipping SAST/DAST and going straight to IAST in some selected cases. SAST insights into code level vulnerability providing provides inside-out view desired just before deploying onto QA environment. DAST comes handy to highlight outside-in view, which is desired just before moving code to production. Early testing was the ideal theme, which promoted surfacing DAST issues because it surfaces development issues early within the SDLC before it starts compounding. DAST tools, moreover, unveils vulnerabilities missed by SAST tools. Thus, SAST+DAST is still foolproof application security testing combo. Figure 2 provides a matrix of testing tools that align with different development architectures. Monolithic + Micro services SAST Best fit Best fit Best fit DAST Best fit Good fit Adaptable IAST NA Best fit Adaptable SAST + DAST Best fit Moderate fit Potential fit SAST + IAST NA Good fit Adaptable SAST+DAST +IAST Adaptable Good fit Best fit Figure 2: AST tooling combo for various development architectures Some vendors are offering IAST along with DAST purchase, thus not selling independent IAST. This might demonstrate lower confidence in the IAST solution considering the underlying technology mechanism, which is more of an evolved-DAST, rather than an IAST. There are other vendors who offer IAST with minimal technology (3-4 language) support, as they didn't find momentum in the solution during the launch. Although IAST vendors have experienced less traction in the past, as per Gartner, there has been 40% growth in inquiry volume since 2019, which demonstrates the curiosity in the product with the change in market mood to DevSecOps adoption. Essentially, customers are seeking AST capabilities which can bring together best of both SAST and DAST. DAST cannot scale rapidly similar to IAST to achieve continuous testing. Thus, DAST will be viable option where frequency of test is not continuous, and is mostly point in time even with desirable shift right and left integration into development pipeline. Moreover, some DAST tools are capable of leveraging QA automation scripts or recording their own test, reducing the tester's effort. Some of the DAST tools are providing integration for containerization as well. In addition, many strong DAST tool vendors do not have SAST offering, creating a competitive disadvantage. Conclusion With all types of IAST tooling options in the market, there is an ever-growing debate over the best ones to be procured and deployed. The equally varied development tools curated for specific requirements and solutions aggravates this dilemma of choosing an application security toolset. Based on our analysis from vendor datasheets and internal proof of concept, it's suggested that current offerings in IAST are good for firms, which are heavy on microservices and require continuous security testing

during development cycle. In addition, it's advised to use DAST+SAST combo for monolith-based applications until the firm completely moves to micro services-based architecture. IAST has the capability to replace DAST in the near future, where micro services-based architecture rules the space. However, for now, SAST+DAST can be more helpful and SAST+DAST+IAST complement each other. =====================

Application Security Framework

----- Arcticle source ----- https://www.wipro.com/cybersecurity/application-security-framework/ ----- About the author (s) Related Articles Contact Wipro Please fill the required details to access the content Application Security Framework A Holistic Approach to Application Security and Risk Management June | 2021 Introduction This document details an enterprise level strategy for approaching security assessment to enable assurance regarding the achievement of specific security objectives. The security assessment framework applies across all assessment methods, namely examination, interviewing and testing. Testing is the process of exercising one or more assessment objects under specific conditions to compare actual and expected behaviors. Examination includes checking, inspecting, reviewing, observing, studying, or analyzing one or more assessment objects to facilitate understanding, achieve clarity, or obtain evidence. Interviewing involves conducting discussions with individuals or groups within an

organization to facilitate understanding, bring clarity, or identify the location of an evidence. The underlying significance of security assessments depend on the level of maturity an organization practices. Assessment results are used to determine security control effectiveness over time. In the absence of an overarching strategy to approach security assessment, organizations adopt ready to use methodologies and techniques to cater to ongoing security assessment tasks. This can create gaps, as the approach is not aligned to the business requirements and decision-making processes of organizations. Objectives and principles A Security Testing Framework, developed for Wipro's internal consumption, achieves the following objectives: Security objectives provide an effective basis for evaluating the capabilities and performance of the security testing framework, along with the solutions and the supporting process used to deliver security testing. Each objective defines a business or technical requirement that is derived based on an organization's policy, directives or a formal position that can be measured either quantitatively or qualitatively. A security objective that is supported by a risk-based baseline provides a deterministic guideline to select a testing reference model. Principle Nuts and bolts of the AppSec framework The Application Security Testing Framework derives its guiding principles from NIST RMF and the Cyber Security Framework. The framework's stratum consists of a classification layer, baseline layer, and a control layer, which enable effective utilization of the existing testing methodology and approach adopted by Wipro. Figure 1: The Application Security Testing Framework The Control layer provides the core engine for the application security testing framework. It offfers an industry specific (HIPAA, PCI, ICFR) basis, with a clear structure of cyber security management processes, that are powered by 18 control areas. The Control layers bring in the taxonomy for each function, defining multiple categories and subcategories which an organization can pick and mix, to put together a set of items that correspond to its individual risks, requirements, and expected outcomes. For example, Asset Management within the Identify function is ID.AM, and Response Planning within the Response function is RS.RP. Each category has further subcategories that correspond to appropriate activities. For example, the subcategory of Detection processes are tested under the Detection Processes category and Detect function is identified as DE.DP-3 Listed below are the 18 different controls that fall under NIST SP 800-53. These controls are divided according to their impact scale – low, moderate, and high. Let's apply the controls to web application security, by analyzing five different functions namely Identify, Protect, Detect, Respond, and Recover in the context of an organization's existing and planned security activities and risk management processes. Organizations must select categories and sub categories that are relevant to specific needs, and apply them to their security policies in order to ensure sufficient coverage w.r.t the required cyber security activities. Identify: Protect: Detect: Respond: Recover: The Baseline layer provides the foundation for deterministic security requirements that cater to an organization's vision, mission, and near and long term goals. This layer imbibes the organization's policies, standards, and procedures that are developed in-line with its risk appetite, as this module runs as a central theme for security requirements. Each security testing objective determines its definition from a discrete business or technical requirement that is derived from a policy, directive, or a formally stated position of the

organization. For example, "A cryptography policy states that application traffic needs to be encrypted in transit and at rest." The framework determines its testing and remediation guidelines basis the associate standards and procedures for cryptography policies. For instance, for an asset which has data classification of strictly confidential and hosted external facing, it's mandatory to implement encryption both in transit and at rest. However, for an asset with data classification that is for official use only and hosted as external facing, it's mandatory to implement encryption in transit and but encryption at rest is good to have. Thus the baseline layer is leveraged as the basis or justification factor for supporting the security requirement to perform the required test procedures as part of the security testing engagement. The Classification layer receives inputs to understand the scope, purpose, and approach supported by the guiding principles. This layer determines the security solution portfolio, categorizing the projects into enterprise adhered collections for test procedure selection and suggested risk treatment in the course of security testing. Classification Module Description Module Name Description Strategic and Enterprise level (Tier 1) Provides a high-level architectural definition to describe logical areas to security testing services and capabilities that involve maintenance development/activities, mergers and acquisitions, or compliance to regulatory requirements and domestic and/or international legislation. This involves enterprise wide testing efforts to measure the security posture of applications and infrastructure at a point in time and provide support to strategic initiatives/roll-outs and security direction. For example, the IDAM program to enable BYOD (e.g. MDM products) in multiple business functions that reflect potential organization changes. Results from penetration testing would identify the security posture change of the modified component, which would be compared to the existing security posture in order to determine the effects of such changes. Business and Process level (Tier 2) Provides the architectural basis to define business specific, security testing service and capability that involves ongoing development activities for Operational Systems (MyWipro, HR, Finances, etc.), and vendor solutions supporting daily operations, business and support functions. This involves business wide testing efforts to measure the security posture of application and infrastructure supporting business functions, suppliers supporting the respective business processes on a periodic and on going basis. For example, security testing will be conducted on a regular basis on various infrastructure and applications supporting Wipro business functions such as the MyWipro portal. The testing will be unannounced and will be used to determine the security health of the fleet. The supplier/support function is then required to remediate any identified issues in the set timeframes. IRMC will track remediation activities after testing has occurred. Tactical , Solution and Project level (Tier 3) Provides the architectural definition to define project and technology security testing service and capability that involves new development/maintenance activities for Wipro external/internal customer projects or compliance to regulatory requirements as per the business rule book definition for the end customer. This involves supporting security testing for Wipro's internal/external customer operating from Wipro's ODC setups to identify security vulnerabilities in new or existing applications and infrastructure before changes are released into the production environment. For example, a Wipro external customer project team wants to deploy an internet facing system enhancement or application.

Before the project goes "live", security testing will be undertaken to identify any potential security exposures, and remediated thereafter before deployment into production.   In accordance with the Application Development and Maintenance Policy (ADM 12.04), all Wipro operational systems, systems under development, and systems undergoing major changes are in the scope for Certification and Accreditation (C&A), whether they are hosted in Wipro's internal infrastructure or hosted by external service providers. For the purpose of this document, we have categorized the systems into the following categories: The classification layer embeds a risk-based testing approach as part of the overall C&A process performed by CRS. This approach has two key elements- i) Selection of the information security test procedures and supporting documents required to certify the system and ii) Assessment of residual risks from an information security perspective to make an informed decision in order to authorize a system for operation. The framework requires focus on information security risks that impact the confidentiality, integrity, and availability of the information system in the scope of engagement. While tailoring the procedures to certify the system, various criteria are considered. These include the following risk factors: Based on these factors and the category of the system, the approach is tailored on risk and is focused on assessing vulnerabilities at several layers including, operating system, database, and application, where ever applicable. In addition to performing tests at each of the applicable layers based on risk factors and category of system, the C&A team also validates the following: Conclusion The Application Security Framework, provides a holistic approach to information security and risk management by providing organizations with the breadth and depth of verifying/validating security controls that are necessary to strengthen information systems and the associated environments. In the digital era, where organizations are still embarking on completely moving to an agile vs DevOps journey, a framework of similar shape and form caters to the workload, leveraging both waterfall/agile/DevSecOps. The Application Security framework is the first steps towards a "Building It Right" strategy coupled with "Continuous Monitoring", to empower leaders, making ongoing risk-based decisions that affect mission critical assets. The pursuit we aim to resolve is to combine standard based policies that are tailored to business and compliance requirements with enterprise best practices derived for industry specific frameworks, and superimposed with a risk management framework, to deliver effective security testing guidelines that produce repeatable results. For more information on the application security framework and what it can deliver to your organization, connect with us. How to Make Artificial Intelligence Core to Your Cybersecurity Strategy

----- Arcticle source ----- https://www.wipro.com/cybersecurity/how-to-make-artificial-intelligence-core-to-your-cybersecurity-strategy/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content How to Make Artificial Intelligence Core to Your Cybersecurity Strategy June | 2021 In the post COVID-19 world, businesses are looking for ways to be more agile and reduce latency driven by traditional ways of working. This is not only reflected in their back-office processes but also in their customer facing ones. They are increasingly relying on hyper automation and artificial intelligence (AI) to solve complex business problems. Cybersecurity and risk programs should be part of this AI-led approach. With the need to reduce operating cost across enterprises, AI has become the hallmark for driving the 3Es – Efficiency, Economics and Experience. Understanding what the AI technologies can do for you, how you can get past the adoption hurdles, and how to achieve non-linear growth in speed, scale and agility are some of the biggest challenges we face when considering the use of AI in cybersecurity and risk. In addition, use of AI solutions should not be interpreted as "replacing a team" but instead, complementing your team to increase productivity. As such, the use of AI should be core to your cybersecurity strategy. Common AI methods applied across cyber There are several techniques that are commonly used in AI such as deep learning neural networks, decision trees, Monte Carlo methods, clustering, ranking, linear classifiers (Fisher's method, Support Vector Machine), Bayesian Statistical Inference, Markov chain, Linguistics, and Bias. These are broadly applied across seven methods, described below and in Figure 1: Figure 1: Common AI methods for cyber and their impact Applicability of AI across cyber According to Wipro's State of Cybersecurity Report 2020, 49% of the cybersecurity patent filings were in the AI/ML and data science space. The report also predicted that over a 12-to-16 month period, AI/ML and SOAR (security orchestration, automation and response) will become mainstream to cybersecurity automation. The application of

artificial intelligence should be explored across all facets of cybersecurity from the perspective of process efficiency and business outcomes. This requires reimagining the existing business processes to embrace a robust and effective approach. The matrix in Figure 2 highlights key cyber domains and how they map against AI methods. How can Wipro help you in your cyber-AI journey? Wipro's Cybersecurity and Risk Services partners with the Wipro HOLMES™ team comprising data scientists, stewards, and engineers skilled in AI techniques. Combined with Wipro's rich technology heritage, we can provide our customers a holistic AI-enabled business transformation service. Figure 3: Holistic AI-enabled transformation Considering the factors that make AI enablement a success, Wipro has created a delivery framework for AI-enabled transformation in cyber: Figure 4: Wipro's delivery framework Wipro HOLMES™, Wipro's AI and automation platform, is the bridge between foundational AI algorithm builders and applied AI. The HOLMES platform handles all your needs from building, publishing, metering, governance to monetization of heterogenous AI solutions. It can act as a standalone platform to provide solutions you need and act as a complementary platform with AI capabilities. This flexibility provides Wipro the ability to work with its customers and provide the same set of capabilities on the customers' infrastructure and platforms Figure 5: Wipro HOLMES framework Wipro has been recognized for its holistic AI-enabled transformation solutions: If you are interested in knowing how Wipro is helping our clients achieve their vision of a transformed AI-powered cybersecurity system, connect with us at cybersecurity.services@wipro.com. Saugat Sindhu Global Head - Strategy & Risk Practice - Cybersecurity & Risk Services, Wipro Saugat is currently leading a team of diverse professionals that provides clients business advisory, management consulting, technology enablement & intelligent automation-based transformation services. He leverages Wipro's HOLMES ecosystem along with alliance partnerships to bring forth cyber and risk process enhancement strategy and solutions that solve business problems of economics, efficiency, and experience. Supported by: Partho Pratim Das Group Head, HOLMES   Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

How Media & Entertainment Industry Can Protect Against Ransomware

----- Arcticle source ----- https://www.wipro.com/cybersecurity/how-media-entertainment-industry-can-protect-against-ransomware/ ----- About The

How Media and Entertainment Industry Can Protect Against Ransomware June | 2021 In recent times, the media & entertainment industry has become the prime target for ransomware. Large organizations such as Disney and Sony as well as A-list celebrities such as Elton John and Lady Gaga, have faced a cybersecurity attack. The complexity and number of these ransomware attacks are growing by the day. A survey by Sophos which found that the media & entertainment industry suffered the most with nearly 60% of organizations reporting ransomware attack. Most of the attacks are centered around social media, which leads to phishing campaigns and opens the door for malware to come inside the network. The cost of remediation of such attacks is exorbitant and often linked to the size of the organization. To address this challenge, Wipro has designed a holistic approach to prevent and remediate ransomware attacks by granular assessment of all the security controls. Multiple actors and security web in media & entertainment industry The most valuable asset for the media & entertainment industry is content. In a bid to match consumer habits and preferences, media & entertainment companies explore many channels. Among them, mobile and streaming devices are leading the steady growth of the digital content. Media & entertainment executives explore several avenues to keep with the explosion in digital content market. They collaborate with mid-sized and smaller network owners and studios, vendors, making the value chain longer. The other factor is increased usage of social media platforms for outreach and publicity. The always-on social media has posed trust issues and challenges for a long time now. Beyond connection and sharing, social media platforms have become gateways for consuming content in various formats. In a survey by Deloitte, 60% of respondents felt that social media companies are responsible for the content people post on their platforms. The security risk factors in the media & entertainment ecosystem have increased manifold with multiple actors at play. Organizations need to integrate all the links in their chain for an effective cybersecurity strategy. Cybercriminals have recognized the opportunities that online platforms and multiple actors in the ecosystem represent for the media & entertainment industry. The cost of remediation is effectively based on the market presence and revenue potential of the organization. Today commodity malware allows hackers to run successful campaigns as it is easier to implement, and may not require a Command & Control (C&C) server to execute. They are easier and cost efficient ways to extort money, by enabling threat actors in enterprise networks using lateral movement, escalation of privileges, exploitation of vulnerabilities, and data exfiltration. Types of ransomware and attack vectors A ransomware is malware that encrypts the victim's files and then demands a ransom be paid to decrypt the files. Leveraging social engineering techniques, by sending phishing emails with a malicious attachment in them, an attacker can gain access to the system after the user has opened the attachment. This process downloads the malware's executable file, installs it, and scans for files on the system to encrypt them. Using drive-by malware or users browsing infected content in a website downloads the malware, which looks attractive for the user. Attackers use Bitcoin to get ransom payment, which allows them to remain anonymous and the transaction to remain untraceable by the authorities. In a typical scenario, no additional action is required by the attacker using any communication channel to retrieve the victim's files.

Certain variants of ransomware do not even require communication to obtain the encryption key for file encryption as they come packaged with a pre-determined public key. Security control measures taken by enterprises today Enterprises today take several steps to mitigate cyber security threats. We underscore here the most prevalent actions taken by media and entertainment companies to thwart such risks. Wipro's framework for ransomware attack management Wipro's Cybersecurity and Risk Service can help you stay ahead of the threats. We take a holistic view of all the security controls that prioritize not only prevention but also minimize risk and control loss. Ecosystem of Security Controls & Ransomware Attack Figure 1 depicts the different phases and mechanisms of compromise. Every security control mentioned in the Figure has a significant role in prevention or propagation of ransomware in the infrastructure, which Wipro has derived based on the MITRE ATT@CK framework. Failure to meet the control efficiency can result in an attack. Media & entertainment enterprises should adopt a framework that maps their journey - before, during, and after production and release. Timely action can help prevent any ransomware from propagating the infrastructure and mandating costly remediation. Wipro provides detailed assessment of maturity for security controls to protect against ransomwares. The output shows heat map of control existence, maturity level & priority-based recommendation to fix the gaps. Reach us at cybersecurity.services@wipro.com for more information and quick discussion on this topic. Angshuman Chattopadhyay Infrastructure Security within Cybersecurity and Risk Services, Wipro Angshuman is the Consulting & Solutions Lead for Infrastructure Security within Cybersecurity and Risk Services at Wipro. He brings extensive experience with over 19 years in IT and cybersecurity across a wide range of global roles. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. =====================

Identity Management Simplified!

----- Arcticle source ----- https://www.wipro.com/cybersecurity/identity-management-simplified/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Identity Management Simplified! A Quick Walkthrough of an ID Conversion Project for a Bank July | 2021 In the twenty-first century, no matter what industry you are in, it is important to have a secure identity. In banking, specifically, there are genuine threats to an environment that can be easily exploited due to lack of unique or secure identities. Let's take a look at a case where a bank had seven Active Directory (AD) domains and one LDAP infrastructure. The LDAP was the centralized repository for all users. The scattered environment where employees and contractors worked on seven different domains (MAX / CORE / PROD/ MWS / MMR/ B2B/ B2C) added complexity to

the legacy infrastructure, as shown in Figure 1.   All these AD user / service accounts (seven AD domains) were synced with LDAP in different organizational unit under the single LDAP branch. Hence, all the critical applications, including SiteMinder, connected to LDAP for authentication and authorization. Since such infrastructure could not support future technologies and could face numerous challenges during migration, the bank decided to migrate all seven AD domains to one single AD domain to modernize and simplify the architecture. Precursor for migration Complex infrastructure, higher cost for maintenance, administrative overhead, and longer resolution time. Migration approach As a part of the cost reduction strategy, we consolidated all AD domains to one domain (CORE). Our approach was that of migrating complex environments to simple ones. We focused on migration in waves for seamless migrations which would allow users and resources time to adjust.   We formed a team (ID Conversion), to access, analyze, implement, evaluate the migration tasks, and collaborate with multiple dependent teams. This new unit worked together with LDAP, Desktop, Exchange, AD, RSA, Azure, Application teams, WebEx, and others as users were spread across multiple locations. Implementation During the pilot identity conversion wave, we identified a few gaps in the current system. We then designed an eight-month migration plan to address these issues and get on track. We were able to complete the project much faster than anticipated. Preparation for migration We segregated users into multiple waves and planned the migration schedule. We informed all the dependent teams including (AD/LDAP/RSA/Desktop/exchange/Application), to align with the schedule. During the migration We migrated the accounts from the source domain to the CORE domain, switched the account in LDAP, and the dependent application teams propagated the changes in their respective applications. Users validated their access and confirmed. The objective for migration The objective was to migrate from a complex environment to a simple environment for cost reduction, future-readiness, and cloud migration. Performance benefits Cost benefit Maintenance/ support benefits Aravind Ramani Aravind has 15+ years of extensive IT experience in Identity & Access management domain which includes six years in Wipro as Technical Lead. He has hands on experience in various IDAM products like Oracle Unified Directory, Oracle Directory Server Enterprise Edition, Sun One Directory Server, CA Site Minder, ForgeRock, FIM and Identity Synchronization for Windows. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.
=====================

Ten Considerations for Data Privacy Governance in the Digital World

Ten Considerations for Data Privacy Governance in the Digital World August | 2021 With data privacy and protection regulations gaining momentum across geographies, a robust and mature data privacy governance program has become an imperative for organizations. Data privacy governance is not just about compliance: it brings in the true benefits of an ongoing data privacy program. The demands of a burgeoning data economy in the backdrop of the pandemic have shifted the focus to an online world, whether its finance, healthcare or retail. Companies face extinction without an online presence to continue delivering services, products and value to end users and customers.   A significant change is the shift in user behavior patterns towards ecommerce, digital payment, online banking, eHealthcare, and many other online avatars. An immediate outcome is the tremendous growth in the volume of personal and sensitive data being stored, processed and transmitted across the data economy. Organizations are also adopting cloud in a significant way, to be nimble footed against competition. This has resulted in personal data moving into an environment managed by the cloud provider. Given this scenario, organizations have to be conscious of the impact on personal data and how strongly it needs to be safeguarded through their existing privacy programs. Post the implementation of the General Data Protection Regulation (GDPR), organizations have become increasingly aware of the various controls, and they have initiated privacy programs. However, while these programs exist, and as organizations mature in adopting best practices, technologies and processes for robust data privacy and protection measures, they must also implement sound privacy governance. The privacy programs driven in organizations already have an element of governance included. However, these are often diluted in every day transactions, movement and change of stakeholders, newer regulations and so on. Even as organizations implement various aspects of privacy, from cookie consent to data subject rights, it is critical to ensure that data privacy governance is aligned to the data privacy machinery. Here is a distilled list of ten considerations for data privacy governance in a digital world to help organizations stay on top of privacy programs: Sharpen data classification: Privacy programs already include data classification and mapping of data flows as the first step towards building privacy controls. This needs to be sharpened further to include newer personally identifiable information (PII) definitions, expand geographies, and increase in business application footprint. Ensure governance policies are well defined and available: The data privacy governance policy framework must be available across knowledge management sites. Assign data ownership across the stakeholder ecosystem: Identify stakeholders and owners to drive, monitor,

and govern the data privacy program with a defined privacy organization to meet the multi-skilled people across functions such as legal, information security, privacy, business, and IT. Assess privacy frequently: Conduct periodic privacy assessments to evaluate As-Is status and risk based analysis with measures to address gaps if any. Start at the beginning: Include privacy in the overall blueprint of the organization as a part of governance. Also, ensure that it is followed through with checks and balances for new and upcoming business requirements. Measure your progress: Dashboards and reports with an overarching view of various aspects of the privacy program with measurable progress supported by well-defined KPIs and metrics are critical. Meet the stakeholders: Ensure regular steering committee meetings with stakeholders and sponsors to track privacy vitals and sound off any alarm bells. Know the rules: A continuous process should be initiated to identify the new and upcoming data privacy regulations and compliance requirements.   Create awareness: Privacy awareness programs across the organization can bring everyone up to speed on privacy, its impact, protecting personal data, and so on. Programs can be woven into the academic curriculum for new members. Listen to the change: Do continuous impact analysis and monitoring of changing regulations, business footprint for new services and products, expansion into newer geographies, on the organizations' privacy posture. The endgame is not just about meeting compliance requirements driven by regulations but also ensuring that personal data is protected and privacy requirements are addressed through sound governance. If you are interested in learning how Wipro is helping our clients achieve their vision of a sound Data privacy governance program, connect with us. About the author Rupa Parekh Rupa Parekh is Practice Director with Wipro Limited, and has around 18 years of experience in various consulting, business and delivery roles in the information security domain. She is an accomplished risk and compliance leader with extensive experience in data privacy and protection. She is passionate about creating and delivering effective and efficient solutions to clients in their information security journey in the fast-paced digital world. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. ======================

Risk Management — It's a State of Mind

----- Arcticle source ----- https://www.wipro.com/cybersecurity/risk-management-its-a-state-of-mind/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Risk Management — It's a State of Mind August | 2021 I have been involved in risk management and company governance for more than 30 years, – and

one thing I have learnt is that risk management is never just a question of tooling or processes, or a matter of organization or people. It's a state of mind. Embracing risk at the enterprise level requires a cultural paradigm shift. It means adding the "Management by Risk" capability into the board and the executive committee. In the early 2000s, after the Committee of Sponsoring Organization (COSO) II was released post the Enron crisis, risk became a key focus of audit committees and directors did not know what to do with it. It took more than 15 years to transform how decisions are made at the top level in our companies. But, have we really transformed the culture of our companies? Many have started adopting governance risk and compliance (GRC) tools to better understand their risks, provide assurance on compliance with laws, regulations, and internal policies, and to manage their system of control. Nevertheless, we find that the initial objectives have not been fully achieved. The state of risk management Challenge 1 Most of the tools are still siloed in various part of the organization, not truly allowing for end-to-end, bottom up, top down, and horizontal understanding of risk across departments and geographies. You will have a system for IT, another one for finance, a third one for cyber risk, others for human relations (HR), environmental, social, and governance (ESG) management, etc. Often, you will see business lines, regions, or countries using different tools and of course, they will not talk to each other, they will not aggregate. You cannot manage risk if you cannot consolidate, understand, and respond to your risks in the same way all across your company, whatever the function, business line, country, etc. You need to be able to consolidate at the board level and drill down from there to the individual department or function's risk and response action plan. Challenge 2 Consolidation is not enough. Adopting risk state of mind means transforming your culture. There are CXOs who understand this. One of them once told me that during management meetings he asks his directors to talk about their top three risks. "If they are unable to, I tell them that I did not recruit them to manage business as usual — their teams can do that perfectly — but to manage the unexpected, the tough decisions and their risks, he said." This is a great example of how to transform a company's mentality towards risk. It illustrates the need for a cultural shift. Another example of effective cultural transformation is rewarding early risk reporting and challenging late discovery of major issues. When you audit company behavior, you often notice that the top management is eager to know about risk, and people in the field are eager to talk about it. It is often the middle management that has difficulty relaying the information. Which is why it is important to focus on changing middle management culture if you want to change the mindset towards risk. Where, on one hand, you do not shoot the messenger who talks about risk, but reward it. On the other hand, you challenge the one escalating major issues belatedly and too late, instead of flagging and responding to the risk earlier. Move from firefighting to forward (risk) planning. Rewarding people for highlighting risk is not common yet, but it will help to grow your understanding of your true risk exposure, and in making better business decisions. Challenge 3 To achieve risk state of mind, it is important to come back to the definition of risk per ISO 31000. If we agree that risk is a deviation from business objectives, then we need to change our culture and tools accordingly, not only recording and appraising threats, or negative risks, but also mitigating opportunities, or positive risks. Mostly, they are two sides of the same coin. For, often, a negative risk has

proven to have a positive side. This pandemic is obviously a dramatic event for most of us, with serious illness, unexpected death, and mental health issues upending life as we know it. But, at the same time, look at how some companies have succeeded in reinventing themselves, how remote working has thrived, and the positive impact this has had on the climate crisis. On the other hand, look at how positive risks, or opportunities, can also be risky. How — with large mergers and acquisitions (M&A) — poorly managed exponential growth could be devastating. How your largest contract, with uncapped liabilities, could ruin your company. Most companies still only consider, record, and manage negative risks. Embracing the positive and negative dimensions of risk management is a great way to transform the culture and to socialize robust risk management across the organization. Doing good business is taking informed risk.   Connect with us at cybersecurity.services@wipro.com to know more about robust risk management. Eric Le Martret Practice Head, ServiceNow-Risk and Security, Wipro Eric has over 38 years of experience in Risk, Compliance, Audit, Privacy and Security Management, mostly as a practitioner. Before joining Wipro as Global Head of ServiceNow Risk & Security Practice, he has created IRM Expert Ltd and Belasis Ltd, two Service Now Partners dedicated to IRM-GRC and SecOps services and solutions. He had worked in several executive roles, such as Chief Risk Officer or Deputy Head of Internal Audit, for global companies. He is also a former member of the Institute of Risk Management and certified to ISO 31000. Eric holds an MBA (International Business) from AUDENCIA (France). Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. =======================

US President's Executive Order on Improving National Cybersecurity

----- Arcticle source ----- https://www.wipro.com/cybersecurity/us-presidents-executive-order-on-improving-national-cybersecurity/ ----- Related Articles Contact Wipro Please fill the required details to access the content US President's Executive Order on Improving National Cybersecurity October | 2021 The Executive Order - Key Takeaways Public and private sector organizations in the US are under attack by nation states and cyber criminals using increasingly sophisticated and malicious activities. Cases such as the Solar Winds, Colonial Pipelines, and Microsoft Exchange point to a need to improve cyber defenses, protect public and private sector entities and the American people's security and privacy. On 12th May 2021, the US President signed an executive order that covered three key areas to improve national cybersecurity: Improve software supply chain security by establishing baseline security standards Modernize

and implement stronger cybersecurity standards Improve the Federal Government's investigative and remediation capabilities Key Considerations for a New Reality For effective implementation of policies, frameworks, standards and guidelines that will be formulated as part of the execution of the order, the top management should seek answers to key questions in each of the three areas in order to understand their current state and the gaps: Software Supply Chain Security Modernize Cybersecurity Improve Cyber Defense Strategies to Improve Cybersecurity Posture Consider developing a strategy that helps close the gaps identified in
your supply chain security, the current cybersecurity structure, and cyber defense mechanism. People, process, and technology, play a critical role in building cyber resilience and improving your cybersecurity
posture. Following are the points you could consider: Modernize and Implement stronger cybesecurity standards Strengthen cyber defence Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. =====================

Wipro's Open Source Security Program: A Key Initiative to Enhancing Cybersecurity with Open Source

----- Arccticle source ----- https://www.wipro.com/cybersecurity/o31e-wipros-open-source-security-program-a-key-initiative-to-enhancing-cybersecurity-with-open-source/ ----- Impact: Related Articles Contact Wipro Organizations can leverage the open-source security program to Be-Secure community Creating a partner network for open source security Please fill the required details to access the content Wipro's Open Source Security Program: A Key Initiative to Enhancing Cybersecurity with Open Source October | 2021 Open source empowers organizations to pursue their business transformations with greater agility and control while avoiding vendor lock-in. However, components with potential security vulnerabilities are not identified and remediated by organizations before consuming them. Security risks are further enhanced in the absence of formal security policies and controls. This risk elevation amplifies the need for security for open source projects. Wipro's Open Source Security Program Wipro has instituted an open source security program to secure open source projects and standardize open source security assessment. The program is designed to deliver enterprise grade trusted and verified open source software (TAVOSS) and customized open source security services to customers. The program comprises of open source security lab, open source security projects and

open source community necessary to enable platform scale open source security. Be-Secure is a platform and an umbrella project of open source security tools, sandbox (security assessment) environment, and utilities for the open source security community. The Be-Secure platform aggregates various open source security tools and services to offer security assessments efficiently. The open source security lab is offered as an enterprise service. There are several ways to deploy open source technologies and develop an open source solution. An organization needs to narrow down to a select list of trusted and secured open source components to build open source solutions. Due to the very nature of open source, keeping all open source components updated is a tedious and time-consuming process. An organization must keep track of all changes that happen across the open source software technology stack. Open source projects have been categorized into five open source security tech stacks or Be-Secure tech stack to help standardize security assessments of open source projects. Open Source Security Lab The open source security lab forms the base for offering various open source security services to our customers. We perform open source and security compliance checks, automated evaluation and hardening of open source tech stacks, and seed open source security community projects and tools at the lab. Figure 1: O31E Lab overview *O31E is an abbreviation of "Open Source Security Lab as a Service". The term "O31E" is derived from its spelling, indicating the number of characters between the letters O and E The community is key to any open source project. The Be-Secure community is responsible for supporting and maintaining Be-Secure project tools and sandbox environments used for regular assessment of open source security stacks. The open source security program also focuses on leveraging the open source community to develop and sustain the Be-Secure platform. The community will help identify new open source technology stacks, proactively flagging off a potential vulnerability in open source components and contributing to new security assessment environments. The community involvement leads to the assessment of the open source stack and triggers the generation of the patch to create trusted and verified open source software (TAVOSS). As part of the open source security program, we intend to develop a network of trusted security partners to collaborate on defining security assessment models for open source technology stacks and open source security best practices. We will aggregate the service offerings from our security partners to offer cutting edge open source security capabilities at a platform scale. The open source security program helps drive awareness of open source security among organizations and open source community members. It also allows organizations access to standardized security assessment services that align with the open source security stacks. Today, many open source projects/components are consumed in a predefined manner without exploring the possibility of interoperability across open source technology components. The program helps to address this shortcoming by offering customized environments, pre-bundled with various open source projects. The program enables the open source developers to access the best practices/tools/projects and sandbox environments to secure open source projects. Utilization of Be-Secure open source technologies stack will drive the efficiency of open source security assessments. Wipro's open source security program expects to drive greater adoption of open source technologies, enhance awareness of open source and open source security,

bring together cybersecurity expertise covering all domains of security, and enable continuous security assessment to address changing security needs of open source projects. About the Authors Vinod Panicker Global Head Open source & Blockchain Security, Cybersecurity & Risk Services, Wipro Vinod is a Distinguished Member of Technical Staff, Senior Member and Chief Architect. He has over 21 years of experience in software development and product architecture. Vinod currently leads the open source and blockchain security initiatives for the cybersecurity practice at Wipro. He is an expert in decentralized identity, blockchain security, building open source solutions, community-led tools development, open-source licensing, and re-engineering of products. Sumod Rajan George, PMP Sr. Project Manager, Cybersecurity and Risk services, Wipro Sumod has over two decades of experience in software development, managing various projects and programs for business domains, such as retail, finance, healthcare, and transportation. He is currently part of the open source and blockchain security practice team with CRS, which focuses on security for open source and blockchain technology-based solutions. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

Securing Patient Privacy in the Era of Digital Health

----- Arcticle source ----- https://www.wipro.com/cybersecurity/securing-patient-privacy-in-the-era-of-digital-health/ ----- Related Articles Contact Wipro Please fill the required details to access the content Securing Patient Privacy in the Era of Digital Health October | 2021 In this age of hyper-connectivity, the face of the global healthcare industry is changing rapidly with innovations in technology and the rise of interconnected medical devices. Should you be concerned about medical data privacy and security? Did you know that the healthcare industry worldwide has witnessed a 45% increase in cyber-attacks? Medical device manufacturers are vulnerable to cyber-attacks as their sensitive patient data traverses the vast network of managed and unmanaged medical devices. While security measures have been very successful in addressing the risk of data theft, a layer of trust established between patients and healthcare providers, is achievable when we adopt best practices for privacy. For example a Privacy Impact Assessment helps organization to identify the patient's personal information processed by the company and analyze and manage the risks of processing such data. Read the white paper on Safeguarding Privacy in the Complex Healthcare Ecosystem to get an in-depth information about why Privacy Impact Assessment is a cornerstone in building a healthcare system that evokes patient trust and confidence. Cyberattacks have moved on from

traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.
========================

A Closer Look at Managing Data Privacy in AI-Based Medical Devices

----- Arcticle source ----- https://www.wipro.com/cybersecurity/a-closer-look-at-managing-data-privacy-in-ai-based-medical-devices/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content A Closer Look at Managing Data Privacy in AI-Based Medical Devices To minimize biased outcomes, one must consider non-technical attributes of devices, in addition to technical specifications and controls. November | 2021 Market growth of AI The application of AI in the healthcare sector is growing. The key factors contributing to AI's growth in healthcare include: AI-based healthcare informatics due to large volume of patient data, a need to improve efficiency in hospital operations, and increase in the number of start-ups offering AI-based healthcare software. Another contributing factor is the government's support towards technology innovation in many countries such as India, Canada, US, Denmark, Hungary, China, Singapore, and many more. For example, India launched INDIAai platform in 2020, With an objective to improve collaboration among ecosystem players and spread awareness about AI across sectors. Large corporations such as Google, Microsoft, Apple and others are also developing AI based tools and software. Commercial usage of AI, however, raises concerns around ethics and data privacy. There are numerous debates around commercialization of AI based tool such as GPT-3, which has more than scale of operations. As an example, a leading medical device manufacturer leverages AI to 175 billion parameters to base its automated decision on, but still raises question about data privacy and ethics. Ethics and data privacy challenges become more pronounced in medical devices as it collects personal sensitive health information. Growth of the AI market is attributed to investments by governments, as well as innovations happening in the private sector. However, AI poses significant challenges around ethics and data privacy that need to be addressed in near term. Challenges in AI-based medical devices Hospitals are using AI based devices for screening decision without human intervention. The algorithm provides physicians with the recommendation on the next steps after analyzing the patients. However, the greatest challenge in this field remains lack of trust and existence of privacy issues. In AI-based devices/algorithm-based set-up, the patient's consent becomes one of the leading challenges. It is challenging to understand the data flow because of unexpected correlations. A simple

solution to this challenge is to work only on an anonymized dataset. Data privacy and cybersecurity challenges also impact the big data/AI based devices. Some of the risks arising may be the result of lack of cybersecurity controls (access controls, encryption, logs), and lack of privacy controls (data minimization isn't followed, lack of data segregation, unattended data such as individual's preference capture due to corporate policies etc.) While data privacy and cybersecurity challenges can be solved by implementing traditional controls, and following the regulatory guidelines, the challenges around reliable & trusted recommendation and algorithm biases are comparatively niche and hence difficult to solve. Automated decisions run "behind the scenes", thus making it difficult to scrutinize. Thus, to minimize the biased outcomes, one must consider non-technical attributes of devices, in addition to the technical specifications and controls. Missing on either of the aspects may not help device manufacturers to solve this challenge. Other key success factor will be cooperation within industry to push for larger adoption of the AI-algorithm assessment for bias. To overcome the data privacy and cybersecurity challenge, organizations in the healthcare sector must conduct a Data Privacy Impact Assessment (DPIA), along with assessment of the underlying algorithms for these medical devices, at the beginning of the project. Wipro's approach to address privacy challenges Wipro recommends a risk-based approach to address privacy challenges. Such an approach must begin by asking a key question – why is DPIA needed in the given context? AI-based medical devices (or in general medical devices) collect and use personal data that has an impact on the privacy of individual,if mismanaged. This becomes the key reason for carrying out a DPIA. Other reasons could be compliance requirements, building trust among stakeholders, and identifying and addressing the risks to the personal data of the patients An approach to solve these challenges takes 5 steps, with emphasis on how well the data is being stored and managed by medical devices. It should begin by understanding and documenting the inherent features and specifications of medical devices, controls that are in place, and potential vulnerabilities that can be exploited in the light of prevalent threats. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

Cross-border data transfers: Our point of view

----- Arcticle source ----- https://www.wipro.com/cybersecurity/cross-border-data-transfers-our-point-of-view/ ----- Related Articles Contact Wipro Please fill the required details to access the content Cross-border data transfers: Our point of view January | 2022 The safety of our clients' data is our utmost

priority. At Wipro, we have an established GDPR compliance program and, in the aftermath of Schrems II, we have reviewed our own contracts and transfers by looking at the legal framework that applies in the receiving country. We take into account relevant, objective, reliable, verifiable and publicly available or otherwise accessible information that reveals whether the transferred data will be appropriately safeguarded in practice. This experience helps us understand what our clients need and we can work with you to establish any additional measure required. Our customers can rely on unparalleled data security expertise. As a responsible global corporate enterprise, Wipro takes processing of personal data with the highest level of seriousness and ensures that processing follows globally accepted privacy principles. We promote a culture that values privacy through awareness and protects privacy of individuals through guidance, direction, and imposition. Wipro has a dedicated central Global Data Privacy Team as well as Data Privacy Champions across all internal functions (Governance structure attached for reference). Below diagram represents the Data Privacy governance at Wipro. Our cross-functional Data Transfers Team (encompassing the Global Data Privacy Team, Legal and Security) is in charge of rolling out the new SCCs and implementing them through the inclusion of additional measures when necessary. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. =======================

Cloud with no chance of identity risks

----- Arcticle source ----- https://www.wipro.com/cybersecurity/cloud-with-no-chance-of-identity-risks/ ----- Related Articles Contact Wipro Please fill the required details to access the content Cloud with no chance of identity risks Migrating your legacy IAM platform to the enterprise cloud March | 2022 The challenges of legacy identity platforms The post-COVID world constantly challenges businesses to ensure a secure work-from-home model while catering to the growing need for accessing cloud applications. The idea that identity governance should remain on-prem has been around for quite some time now, probably because physical hardware within the confines of premises can create a sense of regulation and security. Though potentially more customizable, this approach often leads to critical errors in management and maintenance of the IAM (Identity Access Management) infrastructure and even permeates into onboarding and off-boarding procedures. Why move your identity management to the cloud? The framework of legacy on-premises IAM solutions such as enterprise Single Sign On (SSO), Virtual Private Network (VPN), or web access management often has limited capabilities. It supports a relatively small number of

employees, restricting access to applications beyond the on-premises network perimeter. Further, in-house governance of identities is expensive, time-consuming, difficult to manage, and comes with its own set of risks involving people, processes, and products. From network overloads in directing cloud access traffic through an on-prem platform; to creating a possible single point of failure by relying on a VPN for cloud access; to the exponential costs incurred due to the maintenance of legacy solutions, the problems of maintaining an on-premises IAM for secure access of cloud applications are a-plenty. These cumulative issues, along with the incremental infrastructure costs and operational costs for management and support, have made the choice of migrating their on-premises legacy applications to the cloud a no-brainer for businesses. Moreover, the proliferation of cloud-based apps and distributed computing models have created a gap in the market where legacy IAM can no longer meet the needs of modern identity platforms. The cloud benefits Migrating your legacy IAM to the cloud can prove to be a more flexible, secure, and cost-effective solution that supports a wide array of systems, providers, and platforms through a centralized console and is future-forward. Let us take stock of the benefits that a real-world enterprise cloud platform like Savyint offers to get a clear understanding of the exponential rewards that you can reap. Establishing the point with a case study The need to transform A leading cloud-based provider of integrated digital human capital and business solutions had an outdated identity program that was almost 18 years old. The legacy platform had been through various acquisitions and divestitures and constantly added disjointed adhesive patches to keep it functional. The platform's different instances ran different versions that were out of support, and all these issues snowballed into huge infrastructure debt. The company realized that they were spending almost 40% of their IAM budget on fixing infrastructure problems unrelated to IAM, like server and OS upgrades. It was clear that the company needed a more efficient and streamlined platform and took this opportunity to leap to the cloud and be future-ready. The cloud journey Within four months of starting its transformation journey, the company could already connect its HR system. The following two months saw the company complete provisioning for their four directories plus Azure entitlements for licensing while onboarding applications. They completed the onboarding of around 300 applications in less than a year, with the high point being the onboarding of a whopping number of 150 applications in just one day! By harnessing the power of Saviynt's factory model, the company will continue the transition to a managed services model by operationalizing the platform and ensuring that they continue to expand their program's footprint to help out the customers who are the application owners in the environment. The business bottom line Shift from business operations protector to enabler The traditional perception of security has been about meeting a checklist of defending business operations. However, a more extensive security goal, especially in identity access management, is to enable business operations rather than just protecting them. Moving your legacy identity management platform to the cloud does not only provide efficiency, flexibility, enhanced security, and cost benefits. I starts your strategic journey towards being a business operations enabler rather than a mere defender by enabling your security posture with the power of cloud-based IAM. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in

stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.
=======================

Cloud Security to Propel Digital Health

----- Arcticle source ----- https://www.wipro.com/cybersecurity/cloud-security-to-propel-digital-health/ ----- Related Articles Contact Wipro Please fill the required details to access the content Cloud Security to Propel Digital Health March | 2022 Healthcare technology strategy and Internet of Medical Things (IoMT) have become more pertinent than ever. The World Health Organization (WHO) has estimated that there are 2 million different types of medical devices that are categorized into more than 7,000 different generic device groups. The inter-networked devices in IoMT include medical devices, diagnostic tools, hospital equipment and even wearable tech products. A huge volume of sensitive data is generated and transmitted continuously by the sensors. When vital signs like blood pressure, respiratory rate, pain, level of consciousness, pulse, oxygen saturation etc. are monitored remotely, knowing who has access to it and how it is managed is as important as the data itself. This sensitive data needs to be protected as it progresses through the DIKW (Data, Information, Knowledge, Wisdom) model and throughout the lifecycle from creation through archiving or destruction. One of the viable options to manage this enormous amount of data is to embrace the functionalities offered by secure public cloud platforms. Secure cloud adoption offers several benefits such as analytics capabilities, pre-built HIPAA compliant APIs in addition to meeting unlimited data storage and archival needs. The Internet of Medical Things (IoMT) is an offshoot of Internet of Things (IoT) and comprises connected healthcare equipment and applications used in medical information technology. The specialized hardware and software components of the integrated OT environments are now a ripe target for threat actors who seek to disrupt operations or steal confidential information. In Wipro's State of Cybersecurity Report, we analyzed the top 40 publicly reported data breaches and classified the breached data sets into seven broad categories: Figure 1: Analysis of compromised data Wipro's State of Cybersecurity Report 2020 noted that there has been a universal increase in the deployment of all core organizational control areas. The organizational control deployments for IoT are shown in the Figure 2. Figure 2: Controls planned to mitigate IoT risks Healthcare technologies must adopt the cloud to manage the massive scale of devices and healthcare technology improvements. It is imperative that providing a secure and compliant cloud environment forms the baseline for this adoption to be faster and successful. Leveraging cloud for healthcare requires adherence to Health IT Standards such as C-CDA, HL7, FHIR, DICOM in addition to the standard set of cloud

security controls and HIPAA compliance. Consolidated-Clinical Document Architecture (C-CDA) is a framework for creating clinical documents that contain both human-readable text and machine-readable XML. Fast Healthcare Interoperability Resource (FHIR) is a specification for exchanging clinical and administrative health care data. The standard is based on REST and OAuth. Health Level 7 (HL7) v2 messaging is a commonly used data interchange standard. This standard includes messaging specifications for patient administration, orders, results, scheduling, claims management, document management, and many others. DICOM® is the international standard to transmit, store, retrieve, print, process, and display medical imaging information Public cloud provides several capabilities to make compliance easier for customers. For example, collaboration tools such as Microsoft Teams, Google Workspace used for telehealth support HIPAA compliance. Customers who are subject to HIPAA must sign a Business Associate Agreement (BAA) with the cloud service provider. Amazon HealthLake, Amazon Comprehend Medical, Google Cloud Healthcare Data Engine, Healthcare API, and Azure Health Bot are a few examples of purpose-built solutions for the healthcare industry. Leveraging these solutions would significantly enhance the pace of the cloud journey. Readily available tools and templates can be used to build customized healthcare compliant solutions. The cloud environment undergoes multiple independent third-party audits that provide assurance that the implemented controls are validated. For example, adherence to disposal policy and use of techniques described in NIST SP 800-88 Revision 1 "Guidelines for Media Sanitization" is validated during the third-party audit and report on compliance is published. If tools developed in-house are to be hosted in the public cloud, customers should have the flexibility to access and review logs of action taken by the cloud service provider engineers / administrators. Also, de-identification of data must be done to protect patient privacy. Native security controls should be augmented with cloud security posture management, cloud native security analytics and container security solutions for enhanced protection. The greatest wealth is health. Health is personal and privacy is key. Privacy by design and privacy by default must be an integral part of every solution. Technologists who develop and implement secure, compliant digital health systems in partnership with health professionals will create enormous value and cybersecurists have a significant role to play. About the authors Bhaveshkumar Bhatt Cloud Security Practice Head at Wipro's Cybersecurity and Risk Services Bhavesh is the Cloud Security Practice Head at Wipro's Cybersecurity and Risk Services. He is a cybersecurity professional with 21 years of experience in security covering business strategy design, solutions and services development, and program and delivery management across industry verticals. Allen Stanley Jones Cloud Security Architect Allen Stanley Jones is an accomplished Cloud Security Architect with nearly 18 years' experience in multiple cloud and cybersecurity domains. He has participated in (ISC)² Security Congress and represented Cloud Security in Wipro booth at AWS re:Invent 2018. He is focused on working with clients to ensure that the right guardrails are in place for their fast-paced digital transformation journey. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted)

infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service. =====================

Why Leading CISOs are Adopting a Strategy-First Approach to Identity and Access Management (IAM)

----- Arcticle source ----- https://www.wipro.com/cybersecurity/why-leading-CISOs-are-adopting-a-strategy-first-approach-to-Identity-and-Access-Management-IAM/ ----- Contact Wipro Please fill the required details to access the content Why Leading CISOs are Adopting a Strategy-First Approach to Identity and Access Management (IAM) Optimize business outcomes with a strategy-first IAM approach Learn how your company should benefit from a multi-perspective IAM plan. With mounting cybersecurity threats, audit, and regulatory deadlines, CISOs are challenged with the lofty duty of prioritizing problems within an enterprise. As a result, IAM efforts are often managed from a technology-first standpoint. Download the white paper and discover how a strategy-first approach looks beyond technology to incorporate other important perspectives. You'll learn how to: An IAM strategy provides the secret weapon to create urgency, win over executive champions, and assuage change-wary users. Learn more about why leading CISOs are adopting a strategy-first approach to Identity & Access Management. About Wipro and Edgile Edgile, a Wipro company, is the trusted leader in cybersecurity transformation and risk services, partnering with the world's leading organizations, including 31% of the Fortune 100 and 20% of the Fortune 500. Our strategy-first model optimizes today's enterprise journey to the cloud and modernizes identity and security programs through a risk lens and expert compliance knowledge. We secure the modern enterprise by transforming risk into opportunity with solutions that increase business agility and create a competitive advantage for our clients. A Quick Start to Zero Trust for the Modern Enterprise

----- Arcticle source ----- https://www.wipro.com/cybersecurity/a-quick-start-to-zero-trust-for-the-modern-enterprise/ ----- Contact Wipro Please fill the required details to access the content A Quick Start to Zero Trust for the Modern Enterprise A joint solution from Microsoft and "Microsoft Partner of The Year" Edgile, a Wipro company As many industry leaders are beginning to understand, traditional models for security are not attuned to the realities of modern business. Today, you need a model that can adapt to new

complexities – the hybrid workplace, the distributed workforce, the increasing diversity of people, devices, and applications. The multitude of hacks and breaches due to challenging and changing geopolitical conditions must also be considered. Data needs to be protected, wherever it is and wherever it goes. While the old model assumes that everything behind the corporate firewall is safe, the new model – known as Zero Trust – dictates that we "never trust, but always verify." It's becoming a table stake for securing the modern enterprise. Just as important, it's become critical to ensuring that the enterprise can grow. The question is, how do you get started? What steps do you need to take to begin the Zero Trust journey today? Edgile and Wipro provide a glide path for getting the most from your investment in the full M365 E3 and E5 Security suite to take advantage of all the available tools and resources. Download the eBook Wipro + Edgile: Cybersecurity by CyberSecurists Wipro is the trusted leader in cybersecurity transformation and risk services partnering with the world's leading organizations, including 55 of the Fortune 100. Wipro acquired Edgile in 2021 and together developed an integrated suite of cybersecurity services and technology — CyberTransformSM — which enables business growth through a strategy-first, business-aligned approach that solves security, risk, cloud, identity and compliance challenges on a global scale. CyberShieldSM — our managed services offering—defends business operations through on-demand cyber resilience management. To learn more, visit wipro.com/cybersecurity.

The Growing Need to Proactively Track Technology and Security Regulations in the Middle East

----- Arcticle source ----- https://www.wipro.com/cybersecurity/the-growing-need-to-proactively-track-technology-and-security-regulations/ ----- About The Author Contact Wipro Please fill the required details to access the content The Growing Need to Proactively Track Technology and Security Regulations November | 2022 Over the last two years, many new regulations have been rolled out specifically relating to the banking, financial services and insurance (BFSI) sector. These regulations impact various technologies and processes such as cloud, consumer protection, privacy and data sovereignty.   Among the many reasons for this surge is the accelerated adoption of new technology during the coronavirus pandemic. While this trend helped organizations quickly adapt to business disruptions, many organizations were only able to move so quickly because they either fast-tracked risk evaluations for these new technologies or skipped risk evaluations entirely. Many technologies also required risk and cybersecurity teams to be upskilled to better identify risk exposure, but with limited time, training was sometimes put on hold.   Rushed adoption and overlooked security procedures increased organizations' exposure to breaches, some more than others. Research into the cost of data breaches globally shows the Middle East trending as the second most expensive region in terms of

average cost of breached data, up from 2021. The financial sector stands as the second most targeted sector globally.   Although these surges appear to be linked to the pandemic, they are not limited to the pandemic. As technology adoption continues, new security risks will emerge and new regulations will be introduced. Businesses need a way to outpace these changes, to move from a manual, reactive approach to regulatory tracking, to an automated, proactive one. A new pace for technology regulations The release of regulations is closely linked to the adoption of new technologies, specifically when those technologies can potentially impact organizations and the sector at large (e.g. UAE's Critical Information Infrastructure Protection Policy). Faster adoption of technologies during the pandemic has therefore led to faster roll out of regulations. The diagram below shows the timeline of technology adoption since to pandemic compared to the estimated timeline had the pandemic not occurred.   Regulators in the UAE have been releasing regulations addressing cybersecurity and technology risks for over 10 years, but the last two years has seen a sudden increase in the regulations with an added stringent adherence clause. The list below shows just some of the regulations and initiatives enacted in the UAE between 2020 and 2022 that have an impact on banks and BFSI sector. With critical entities and organizations throughout the Middle East's BFSI sector widely adopting newer technologies, regulators are pushing the release of more regulations, some of which may not be very clear or mature.   For example: In certain cases, Central Bank of UAE requires banks to seek CB UAE's approval for data stored outside the region. This may not be a sustainable model considering changes that banks in the regions are going through, such as some larger banks switching to cloud computing. It is likely that this approval process will be replaced with stronger and mature regulations in the future, but for now, this requirement from Central Bank has introduced delays and uncertainty in DevOps cycles and is impacting agile working methodologies. The manual-tracking issue With most countries in the Middle East embarking on digitalization initiatives and new business propositions gaining popularity, organizations can expect more regulations to be rolled out. This could pose a challenge because businesses are already struggling to keep up with all these new regulations due to outdated approaches, such as manually tracking regulatory requirements using a spreadsheet-based repository. Such manual approaches have several shortcomings: Siloed and difficult to maintain Spreadsheet-based repositories are generally built as a onetime effort by individual teams with limited access or communication with each other. These registers are often ignored because manually tracking new regulations and updating the registers requires extensive effort. Limited implementation   Repositories are generally built to mainly capture regulation requirements, with little to no analysis of the applicability of the clauses or mapped controls. Lack of visibility If the applicable regulation registers are not regularly updated or if access is limited, organizations and technology functions cannot know their true level of compliance with regulatory requirements, leaving them vulnerable to hackers and penalties from regulators.   Frequent noncompliance A common noncompliance reported by internal audits is lack of regulatory adherence or use of outdated regulations, and lack of awareness of new applicable regulations. How to address this challenge To keep up and remain compliant, organizations can no longer rely on manual regulatory monitoring; they

need the support of a strong regulatory compliance program that is specific to technology and cybersecurity. At a minimum, this program should: To establish and maintain a program like this, organizations first need to build a robust, well-maintained regulatory repository, then embed those regulatory requirements into normal operations by linking them to the organization's common control framework, as shown in the diagram below. As long as organizations consider identifying and implementing regulations as separate tasks, the chance of losing track of compliance is high. This is especially true for organizations operating across multiple geographies because regulations can differ so much from region to region. The first step in developing a strong regulatory compliance program is to develop a robust repository of regulations, one that is comprehensive and continuously updated. This will ensure that the organization is always up to date on the latest regulations and able to map them to common control. The diagram below shows several ways a well-maintained repository can benefit technology and cybersecurity operations. Organizations can further enhance their security programs by incorporating automation at every stage: With the regulatory landscape for technology and cybersecurity constantly changing, it can be hard enough to keep track of what's changed, especially for global businesses operating in different countries. To be prepared for these changes and actually be able to work with them, businesses need to be more proactive with their regulatory tracking, and automation can help. You can learn more about Wipro's cybersecurity and risk management solutions. Anoop Ravindra Partner & Head of Cybersecurity & Risk Consulting Services — Middle East, Wipro Anoop has more than 19 years of experience in cybersecurity, information and technology services, working across various sectors and specializing in BFSI. He has worked with several large global clients on technology, risk, and cybersecurity initiatives

Multi-Cloud Security and Compliance Services

----- Arcticle source ----- https://www.wipro.com/cybersecurity/multi-cloud-security-and-compliance-services/ ----- Contact Wipro Please fill the required details to access the content Multi-Cloud Security and Compliance Services Adopt the most comprehensive solutions and enable a secure digital transformation journey December | 2022 Realize business ambitions via public cloud without compromising security and compliance Public cloud has become the top enabler for an organization's digital transformation journey. However, a common flaw in the adoption process is to leave out security and compliance, focusing on them as an afterthought. This error in strategy has the potential to derail an organization's ability to realize its business ambitions. Wipro's Multi-Cloud Security and Compliance Services provide Fortune 1000 clients with comprehensive, outcome-based cloud security, risk management, and governance solutions designed to protect multi-cloud business applications and assets. The service includes threat and security posture views powered by the Wipro IP CARG (Cloud Application Risk Governance) platform, as well as advisory, implementation, and

managed security services, aimed at assisting clients in adopting the right response model for potential risk incidents. Our services are powered and co-innovated with Palo Alto Networks and other top cloud service providers and offer the most comprehensive multi-cloud security and compliance management. ======================

Securing Digital Identities in the Cloud Era

----- Arcticle source ----- https://www.wipro.com/cybersecurity/securing-digital-identities-in-the-cloud-era/ ----- Contact Wipro Please fill the required details to access the content Securing Digital Identities in the Cloud Era February | 2023 Statistics show that 94% of businesses have suffered a data breach, with over 79% happening in the past two years (Source: Expert Insights). Identity security is critical for cloud enterprise success in the digital age. As more and more companies continue to transition their operations to the cloud, it is important to ensure that the security of their digital identities is top-notch. The current business and technology environment is evolving, with cyber threats becoming increasingly sophisticated, making it imperative for companies to take proactive measures in defending themselves against these threats. Ensuring the safety of sensitive information, including financial data, intellectual property, and personal details of employees and customers is now more important than ever before. Accelerating Cloud Investments A projected growth of 20.7% in cloud spending is estimated for the year 2023 (Source: Gartner). This highlights the fact that organizations are going to ramp up their investments in cloud technology in the future, recognizing its many advantages such as increased agility, scalability, and cost-effectiveness. The cloud enables organizations to reduce their IT infrastructure costs, streamline their operations, and enhance their ability to scale. Additionally, the cloud provides organizations with access to powerful and sophisticated tools and technologies that can help them to drive innovation and growth. As a result, many organizations are transitioning from traditional IT models to cloud-based solutions, with spending on cloud technology expected to continue growing in the coming years. This shift is driven by the growing recognition of cloud benefits and the increasing demand for cloud solutions across multiple industries and business functions. Importance of Identity Security in the Digital Era While the cloud provides organizations with convenient storage and access options, it has also opened new avenues for cyberattacks. Cybercriminals constantly lookout for vulnerabilities in an organization's security system, and digital identities are a prime target. Data as Currency in a Continuously Evolving Threat Landscape Data breaches can cause significant harm to a company, affecting both its finances and its reputation. Among various types of cyber threats, stolen or compromised credentials can take the longest time to detect. In some cases, it can take over a year and cost thousands of dollars to identify the source of the attack. Despite this, compromised credentials remain the most vital aspect of data that an organization must protect. It is therefore important for companies to invest in strong cybersecurity measures and regularly

assess and update their data protection policies to minimize the risk of a data breach and protect their assets and reputation. At Wipro, we understand the unique security needs of different enterprises. Edgile, a Wipro company, has been propelling innovative solutions to help enterprises bridge the gaps in their identity security management systems. Edgile's solution expertise was recently demonstrated on a global stage with our designation as the Global Delivery Admiral for both SaaS and Software at the SailPoint Sales Kickoff 2022 event.   The recognition highlights our proficiencies in SailPoint's IdentityNow (SaaS) and IdentityIQ (Software) platforms. It is a testament to our success inintegrating SailPoint solutions to enhance customer experiences, creating positive outcomes, and demonstrating our resource and technical expertise. About SailPoint SailPoint offers identity management and governance for managing access to unstructured data. The organization empowers enterprises across industries with an open identity platform to expand into new markets, enhance workforce capabilities, adopt cutting-edge technologies, drive innovation, and compete on a global scale. "What SailPoint has recognized is what our customers have known for years—we go above and beyond with every deployment, working to make sure that we continuously exceed our client's expectations and successfully deliver on our projects with highly skilled resources". - Gretchen Wichmann, Partner & Identity Service Line Leader – Edgile. It is imperative for enterprises to be proactive in implementing best practices, monitoring their security systems, and educating employees to protect their digital identities and to ensure the security of their critical assets. The combined expertise of Wipro and Edgile in SailPoint solutions creates a winning combination for enterprises to secure their endpoints and safeguard their organizations.

Secure Cloud Foundation: Accelerate your AWS cloud journey

----- Arcticle source ----- https://www.wipro.com/cybersecurity/secure-cloud-foundation-accelerate-your-aws-cloud-journey/ ----- Contact Wipro Please fill the required details to access the content Secure Cloud Foundation: Accelerate your AWS cloud journey April | 2023   Protect your sensitive data and intellectual property in AWS As enterprises adopt cloud computing, they face new security challenges. Unlike the traditional data center model, critical data and intellectual property now reside on servers outside of the enterprise's direct control. Business leaders seeking to secure their AWS environment and migrate existing workloads to a hybrid environment should ask the following questions: Wipro's Secure Cloud Foundation (SCF) for AWS solution addresses these concerns by building a secure environment. The SCF covers the major areas of security, including compliance, identity and access management, data protection, application security, network security, and infrastructure protection capabilities, which accelerates AWS cloud adoption. By automating security processes, Wipro's SCF eliminates

or reduces the need for a pool of skilled resources for ongoing deployment and maintenance. Download the solution overview

Managed Zero Trust Network Access
powered by Netskope

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipro-managed-zero-trust-network-access-ztna/ ----- Contact Wipro Please fill the required details to access the content Wipro's Managed Zero Trust Network Access (ZTNA) Secure your applications and data with unprecedented control and visibility As cloud and hybrid work environments become more prevalent, traditional network infrastructures with perimeter controls cannot protect against emerging threats. VPN devices become a single point of failure and traffic chokepoints negatively impact performance and the end user experience. Multiple solutions can make network management more complex, reduce visibility and control, and increase the risk of data loss. Enterprises cannot afford to compromise control over their applications and data, regardless of where the resources are located. A solution that provides secure and efficient access while maintaining control is essential. Wipro's Managed Zero Trust Network Access (ZTNA) solution, powered by Netskope, offers a comprehensive approach to network security that elevates customer experience and enables secure connectivity to resources hosted in the cloud or on-premises—without compromising control. Connect securely from anywhere using any device Wipro's ZTNA allows users to connect securely from anywhere using any device, eliminating lateral movement in the network and reducing the risk of exploitations by threats. Enterprises can retire legacy connections, resulting in cost reductions and operational efficiencies, while providing seamless access to applications and data. Whether your resources are located in the cloud or on-premises, Wipro's ZTNA solution provides the ideal solution to secure and streamline access while maintaining control. =======================

Wipro's Managed Secure Access Service Edge (SASE)
powered by Netskope

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipro-managed-secure-access-service-edge-sase-powered-by-netskope/ ----- Contact Wipro Please fill the required details to access the content Fast and reliable cloud-based enterprise security Cloud transformation is imperative to enable today's workforce. As users become remote and applications and services move to cloud, the native security controls become dated leaving users, applications, data, and cloud workloads exposed to threats. With Wipro's

Managed Secure Access Service Edge (SASE) powered by Netskope, enterprises can implement a cloud-based security posture that safeguards data, applications, and users—both on-premises and in the cloud—without impacting business productivity. The Managed SASE solution leverages Wipro's strategy-first design and implementation and Netskope's NewEdge Network, the world's largest, highest-performing security private cloud. The combination delivers unparalleled service coverage, performance, and resilience. Wipro SASE solution features and benefits

Transforming Third-Party Risk Management: Leveraging AI for Faster, Accurate Assessments

----- Arcticle source ----- https://www.wipro.com/cybersecurity/transforming-third-party-risk-management-leveraging-ai-for-faster-accurate-assessments/ ----- About the Authors Related Articles Contact Wipro Please fill the required details to access the content Transforming Third-Party Risk Management: Leveraging AI for Faster, Accurate Assessments May | 2023 Implementing third-party risk management (TPRM) is crucial for organizations that rely heavily on external partners or vendors to run its essential services and operations. The traditional approach of conducting manual, slow, static, and tedious assessments may help achieve compliance, but does not prioritize prevention in modern times. In a recent study, it was discovered that 59% of data breaches involve external vendors . Hence, it is crucial to incorporate continuous monitoring of vendors as a key element of TPRM to gain a better understanding of the associated risk. The importance of TPRM TPRM aims to detect, evaluate, and manage risks associated with using services or goods from third parties. It is essential to choose vendors and partners who will adequately mitigate the risks and protect your organization's interests. TPRM has developed into a critical component of an organization's risk management strategy due to the growing number of vendors/suppliers and the complexity of their services. Leveraging AI for continuous monitoring Implementing ongoing continuous monitoring in TPRM, with the help of external datasets, can be highly beneficial. When supported by Natural Language Processing (NLP) and Optical Character Recognition (OCR) capabilities powered by Artificial Intelligence (AI) and Machine Learning (ML), it can strengthen and fast-track the TPRM assessment process. This allows vendors to respond quickly, and organizations can detect risks as soon as they occur and take appropriate action. Furthermore, it facilitates efficient engagement with vendors to partner in addressing identified risks and achieve favorable risk remediation outcomes. The growth of AI and ML in TPRM AI and ML technologies are increasingly being adopted in every field, and cybersecurity is no exception. The application of AI and ML technologies to third-party risk management is growing. According to a Gartner report, "By 2025, AI and ML will be used to reduce the likelihood of significant third-party incidents by 60% and reduce time to detection and response by 50%." As AI and ML technologies

continue to evolve and improve, they can be leveraged to enhance the TPRM process, allowing organizations to quickly identify and mitigate risks associated with third-party relationships. This will lead to more efficient risk management and better protection of sensitive data and intellectual property. Streamlining assessments with AI and ML Assessing third-party risk can be a complex and time-consuming process, requiring a thorough understanding of the vendor's business practices, financial stability, legal compliance, and more. However, by leveraging AI and ML-driven NLP OCR capabilities, organizations can simplify the assessment process and make more informed decisions. Using automation and advanced technologies such as Wipro's TPRM, organizations can drive faster auto response to assessments and make more accurate decisions that align with the speed of business. The future of TPRM To keep up with the evolving threat landscape, organizations must take a proactive approach to third-party risk management. This means leveraging advanced technologies such as AI and automation to quickly identify and respond to potential risks. Wipro's third-party risk management (TPRM) has evolved and matured over time by leveraging Natural Language Processing (NLP) and Optical Character Recognition (OCR), AI and ML technologies. By extracting valuable information from structured and unstructured data sources, such as compliance audit reports, assessment reports, and vendor contracts, organizations can automate assessing vendor risk and identify potential risks more quickly. These technologies can also provide insights into vendor performance and help organizations make better-informed decisions. This highly engaging and automated process highlights the areas that require attention, making it faster and more efficient. Conclusion The time has come to transform third-party risk management by leveraging the power of AI and ML for automated and efficient assessment cycles. TPRM is a critical aspect of an organization's risk management strategy, and continuous monitoring and external datasets are essential for detecting and responding to real-time risks. With AI and ML-driven NLP OCR capabilities, organizations can simplify and automate some extractable questions in the assessment process and gain valuable insights into vendor risk. By leveraging these technologies, organizations can make more informed decisions and reduce the time it takes to identify and respond to risks and threats. Shamir Lalani – Author Shamir is a seasoned CyberSecurist with Wipro's Cybersecurity & Risk Services (CRS). He is an experienced Cybersecurity Product leader with over 2 decades of experience in Global Risk, Compliance, Audit, and Assurance. He specializes in Third Party Risk Management (TPRM), Data Privacy, Environmental, Social and Governance (ESG), Cyber Risk Management, Cyber Defense, and Cyber Resilience. Shamir plays a crucial role in developing CyberSecurity IP and Platforms in CRS and possesses strong domain expertise in various areas, including Product development, Program Delivery, Business Stakeholder Management, Risk Management, and Change Management. Ramkumar Narayanan - Co-Author Ramkumar Narayanan is the Global Practice Lead for Wipro CRS's Strategy and Risk business. He is responsible for leading a team of diverse professionals providing advisory, technology enablement, and managed services focused on Governance Risk & Compliance (GRC), Third Party Risk Management (TPRM), Data Privacy, Environmental, Social and Governance (ESG) and Enterprise Security Architecture services. He has got extensive experience in providing cyber security & privacy consulting to Fortune Global 100

corporations in various industries like Banking, Finance, Retail, Telecom, Securities and Insurance. Cyberattacks have moved on from traditional techniques and have become more targeted and sector-specific. Attackers are operating in stealth mode, making attribution of attacks more difficult. Today's Cyber defenses are focused on defending unchanging (sprawling, distributed, & untrusted) infrastructure by monitoring, detecting, preventing and remediating threats. The healthcare industry is shifting focus to personalized preventive care and an increasing number of patients are expecting healthcare to be delivered as a service.

The report tells a story of how enterprises like yours are facing new risk and security challenges thanks to a series of technological (think generative AI), geopolitical (think nation-state-led cyber warfare) and economic disruptions (think budget restrictions forcing you to do more with less). Here's a sampling of relevant trends from Europe region: For more regional insights, download the regional SOCR executive summary for Europe below ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/state-of-cybersecurity-report-2023/technology/ ----- Contact Wipro Please fill the required details to access the content Technology July | 2023 =====================

We're Spending Too Much on Cybersecurity

----- Arcticle source ----- https://www.wipro.com/cybersecurity/we-are-spending-too-much-on-cybersecurity/ ----- About the Author Contact Wipro

Please fill the required details to access the content We're Spending Too Much on Cybersecurity For at least the past year, inflation and the threat of recession have hung in the air. Growth for businesses has been a delicate act, and that's doubly true for getting a cybersecurity strategy right. Cybercrime is on the rise. According to the UK Government's Cyber Security Breaches Survey 2023, more than one-quarter of businesses admitted to experiencing cyber-attacks in the past 12 months, with the number much higher for medium businesses (59%) and large companies (69%). The combined effect of this increased threat and economic uncertainty is causing tangible differences in the cybersecurity market, and therefore how businesses tackle cybercrime. That is why more and more organizations are opting for macro platforms to protect themselves from cyber criminals, instead of looking for the expected best-in-class solutions out there. Let's have a more detailed look at why these platforms have become popular amongst businesses. Cost optimization means the pendulum is swinging towards security platforms To generalize, a macro trend we have seen in the cybersecurity market has been for businesses to oscillate between two different cybersecurity strategies. On the one hand, best-of-class platforms tackle specific areas of cybersecurity. While they can be effective, they can also have a complicating effect because organizations need to procure, integrate and measure multiple solutions to build a robust defense against cyber criminals. This, in turn, proves to be a time-consuming and costly exercise. Instead, in the face of increased demand for cost optimization, CISOs have been under pressure to do more with less. Platforms, therefore, offer a suite of solutions from a single company that handle different operations in cyber defense. Choosing a suite of tools can offer efficient, comprehensive protection against cyber threats and deliver on budget constraints through multi-year cost optimization; reducing costs significantly in the long run. This can be later supplemented with additional best-in-class solutions to cover any further requirements. There's another important reason why simpler, easy-to-integrate and cost-effective solutions might work best for CISOs and cybersecurity professionals. There is tangible exhaustion amongst leaders and board members when it comes to cybersecurity – above all, they want to break the endless cycle of purchasing a new solution, integrating it, and then having to replace or upgrade it only a few years later. What is driving this? Interview-based risk assessment is no longer working. What is next? The standard "interview-based risk assessment" often used to assess a business's cybersecurity readiness, is no longer fit for purpose. The holy grail of cybersecurity is to establish real-time and automated systems-led maturity assessments that end the exhausting cycle of investing and renewing. But so far, measuring precisely which tools have been leveraged, how effective these have been and whether their efficiency justifies their cost is extremely difficult. Consequently, businesses are finding hyper vendors and macro platforms offer the clearest path to achieve this goal in the short term. Here's where the conundrum lies: how can businesses ensure they employ the right tools and measurements to elevate their security posture in a way that resonates with the board? Achieving this kind of reporting visibility is not a one-size-fits all proposition, and ultimately CISOs should look to partner with experts able to draw on wider industry context and tailor to their needs and history. Automation has a key role to play The first step to presenting plans to the board and picking a platform is establishing visibility, reporting and systems-

led assessments. The skills gap may be a much-discussed concern but it's automation that can help to mitigate the issue, especially during periods of budget cuts, when layoffs are common. Secondly, automation can free cybersecurity teams from mandatory time-consuming repetitive tasks while scaling a business's security efforts. In tandem with AI and Machine Learning (ML) it can also play an important role in the design of cyber resilience plans. As a result, automation can further strengthen a company's cybersecurity strategy making it much more agile and flexible. Once visibility is established, the right expertise can make connections between data points to link cybersecurity to business outcomes and KPIs which boards can digest. An effective cybersecurity strategy starts with you It's clear that the recent economic uncertainty has caused consolidation in the market. CISOs under financial pressure are having to do more with less, and a move to macro platforms offers vital budget savings through multi-year cost optimization, all while delivering on high standards of protection. The first step to picking a macro platform that delivers on both cyber and cost saving needs is establishing visibility. Only by establishing the right measurements and KPIs can CISOs successfully present cyber investment in terms that the board can understand, such as its links to revenue and corporate reputation. Automation has a central role to play. Not only can it help teams to do more with less, but it can also improve a team's ability to measure positive outcomes and the sophistication of responses to threats. Taken alongside deeper collaboration with experts across the cybersecurity ecosystem who can help navigate change, provide context, and identify new vendors to integrate into their cybersecurity infrastructure. It's the first step towards a more holistic and stronger view of cybersecurity, that will help CISOs deliver cost savings as well as their organization's security needs. This article originally appeared on TechRadar Pro. Tony Buffomante Senior Vice President & Global Head – Cybersecurity & Risk Services, Wipro Limited Over the past 27 years, Tony has managed and executed cybersecurity risk assessments, strategies and implementations for the largest and most complex global organizations. He helps clients identify cyber risks and develop secure strategies that enable business value throughout the digital transformation journey.

Cloud & AI Creating Cybersecurity Gaps

----- Arcticle source ----- https://www.wipro.com/cybersecurity/cloud-and-ai-creating-cybersecurity-gaps/ ----- Contact Wipro Please fill the required details to access the content Cloud & AI Creating Cybersecurity Gaps Wipro cybersecurity report highlights emerging challenges for CISOs and how disruptive technologies like AI and the cloud present business challenges. [This article, written by Amber Jackson, was originally published by Technology Magazine.] Technologies like generative AI and the cloud have created gaps in cybersecurity, posing significant challenges for CISOs at global companies, according to research published by leading technology services company Wipro. According to the 2023 edition of its State of

Cybersecurity Report, providing an in-depth look at cybersecurity trends across seven industry sectors, CISOs are facing unprecedented security challenges, with increasing global geo-political tensions and constantly increasing quantities of cyber attacks. The digital evolution: businesses must continue developments The report included responses from the security leadership of 345 organisations across US, Europe and Asia Pacific Middle East and Africa regions, who each responded to 30 questions around trends, governance, security practices, collaboration and best practices. In the report, Wipro found that 32% of surveyed organisations are spending more than 10% of their IT budget for security, recognising that perhaps businesses are becoming more aware of the dangers of poor cybersecurity measures. In addition, 61% of organisations are focusing on regional compliance and suggest that compliance in particular is currently a priority for businesses. The top threats also remain the same, according to Wipro, with 81% of attacks being as a result of phishing having increased, alongside 79% being due to ransomware attacks. Breach notification laws are also being strengthened globally, with 70% of the 23 countries analysed having strengthened breach notification laws. With this information, Wipro will hopefully be able to confirm if they need to take any actions to better achieve cyber resilience moving forward. The report comes in the wake of The National Cyber Workforce and Education Strategy (NCWES) in the US stating that it is working to meet the evolving needs of the cyber workforce. Recently announced by the Biden-Harris Administration, the proposed outline is designed to build upon the existing US cyber workforce and education system and work to address critical cyber workforce shortages. It calls for greater knowledge and educational resources to be shared within the workplace to better combat cyber threats. Unprecedented changes occurring across cyber industry According to Wipro, CISOs are facing unprecedented changes across the cybersecurity landscape that are proving to be very disruptive. The report has been released in line with industry professionals citing that the cyber industry is on the edge of an industry crisis as a result of an ever-increasing workforce skills gap. Security needs have changed and, as demand for skilled cyber experts has risen, the number of specialists in the market has not grown to match this. In the midst of cloud adoption starting to increase in use across organisations, the new frontier of generative AI has resulted in greater amounts of data. "Political and economic uncertainties, coupled with the rise of sophisticated new technologies, including generative AI and machine learning, is creating a widening cyber resiliency gap within many enterprises," said Josey George, Editor of the report and General Manager for Strategy and M&A at Wipro CRS. "The insights and recommendations in the State of Cybersecurity Report will help organisations identify security, risk and compliance concerns and provide a path to achieving more resilient operations that can support strategic, business-aligned objectives."
======================

Unmasking the Illusion: Are Your Threat Feeds Truly Intelligent?

Unmasking the Illusion: Are Your Threat Feeds Truly Intelligent? In today's digitally connected world, the term "threat intelligence" is thrown around quite a bit. Many organizations — especially those in the realm of cybersecurity — invest heavily in both paid and open-source threat feeds. But are these feeds actually providing threat intelligence? The truth is - most of what you receive from these feeds is not intelligence at all. Often, it's simply raw data, or, at best, information. But you need to go beyond mere information to enhance your cyber resilience. The data, information, and intelligence spectrum Let's clarify what we mean when we talk about data, information, and intelligence in the context of cybersecurity. Data are simply raw numbers, facts, or observations. For instance, a list of IP addresses or domains associated with malicious activity. Information is contextualized and processed data that provides a better understanding of its significance. For example, knowing that a particular IP address is associated with the Dridex malware and has been involved in command and control (C2) communication on port 8043 between 7/23/2022 and 8/22/2023. Intelligence is information that has been analyzed, assessed, and applied with intention. Intelligence goes beyond knowing what happened to understanding why it happened, who might be behind it and how to respond effectively. How to turn data into intelligence One common issue with threat feeds is a lack of context. Simply providing a list of malicious IPs or domains is like trying to solve a jigsaw puzzle without the picture on the box. You have the pieces, but you don't know what the completed puzzle is supposed to look like. To understand the broader threat landscape and make informed decisions, context is crucial. Context may include details about the threat actor, the techniques they employ and their observed behavior. Without context, it's challenging to use the data effectively. The journey from data to actionable intelligence is a multi-step process. Here's how it can be achieved: The power of internal threat intelligence While threat feeds are a valuable source of information, they are only a part of the puzzle. Intelligence sharing programs, whether through closed communities or threat intelligence platforms (TIPs) can also provide insights. However, it's essential to remember that what constitutes intelligence for one organization may be mere information for another. Tailoring information to the specific needs and intentions of your enterprise is key. Effective threat intelligence requires a dedicated team with the skills and expertise to analyze, contextualize and apply the information. These teams play a critical role in turning data into actionable intelligence. They are the ones who add value to threat feeds. The most potent and high-fidelity threat intelligence often comes from teams within your organization. It's not about reading blogs or repackaging information, but about having a keen eye on what your security operations center (SOC) and incident response (IR) teams are observing in the real world. They are the ones who can provide insights into what is directly impacting your organization, and by applying discerning intention, they can help you convert information into

actionable intelligence tailored to your organization's unique requirements. Use intelligence to improve your cyber resilience In the world of cybersecurity, the term "threat intelligence" is often applied to threat feeds. But this can be an illusion. The raw data from threat feeds must be turned into actionable intelligence by applying context and discerning intention that aligns with an organization's needs. In this process, internal insights often provide the highest fidelity. The next time you pay for threat intel, ask, "is my organization getting what we need?". True threat intelligence goes beyond the feeds. It's about understanding, intention, and the ability to proactively defend your organization against evolving threats. About the authors Brian Bell Brian is Wipro's the Global Head of Next-Gen Threat Intelligence. He has over 15 years of industry, consulting and training experience with deep expertise in many cybersecurity practice areas, including threat intelligence, security operations, incident response and data analytics for the military and defense industry as well as security startups. Brian's team is currently designing new approaches to contextualize and operationalize cyber threat intelligence. David Charbel David is Wipro's Global Head of Next-Gen Threat Hunting. With over 10 years of industry and consulting experience, David has deep expertise in a number of cyber disciplines, including threat hunting, red teaming, penetration testing, vulnerability management automation and IT audits. He has implemented purple teaming strategies for a world class healthcare enterprise and designed red team engagements in support of the 2020 presidential debates. Currently, David's team is creating innovative ways to visualize threat Intelligence. =====================

True Zero Trust Should Mean VPN Retirement

----- Arcticle source ----- https://www.wipro.com/cybersecurity/true-zero-trust-should-mean-vpn-retirement/ ----- Contact Wipro Please fill the required details to access the content True Zero Trust Should Mean VPN Retirement As enterprises transition to the cloud and hybrid work environments, network infrastructure no longer has one clearly defined perimeter. Legacy approaches to remote access, including virtual private networks (VPNs), lead to slow and unreliable performance that can reduce productivity. Multiple vendor solutions increase deployment complexity and reduce visibility and control, heightening the risk of data loss. Even more concerning, legacy solutions provide a convenient way for malware to effortlessly cross into an enterprise's most sensitive areas. This is because a VPN is nothing more than an encrypted tunnel. It has no security-scanning functions (no anti-virus capabilities, for example) which means malware can get into the tunnel without being challenged. As the limitations of VPNs and other legacy approaches become more apparent, Zero Trust Network Access (ZTNA) is emerging as a better alternative, moving defenses from static, network-based perimeters to users, assets and resources. However, many enterprises will be forced to maintain VPNs for years until they can upgrade their infrastructure to leverage ZTNA. Wipro and Netskope offer a strategic approach that facilitate the transition to Zero Trust by assessing your

current cybersecurity maturity and designing application migration to ZTNA. Download the Whitepaper ======================

Wipro + Google SOC-as-a-Service

Wipro + Google SOC-as-a-Service Empower your Security Operations Center (SOC) with Wipro and Google In today's digital landscape, safeguarding your enterprise from cyber threats is critical. The Security Operations Center (SOC) plays a crucial role in monitoring and analyzing defensive controls to protect against cyber intrusions. Because it is impossible to build foolproof defenses, suitable monitoring must be in place to respond to attacks that break through. A SOC requires the right blend of security operations, full stack engineering, contextual threat intelligence, noiseless detection, threat hunting and incident response. That's where Wipro and Google come in. Together, we have developed SOC-as-a-Service, a comprehensive solution that addresses the challenges faced by modern SOC environments. Powered by Wipro's Cloud Security Operations (CloudSecOps), this offering equips organizations with the necessary resources to meet the demands of a modern SOC. Key features of our SOC-as-a-Service include: Unified security operations: Align your security operations with enterprise-wide intelligence, ensuring a holistic approach to threat detection and response. Context-aware threat detection: Leverage artificial intelligence and user behavior analytics to identify and mitigate threats with precision and speed. Proactive threat hunting: Harness the power of Google's speed and expertise to swiftly investigate potential threats and stay one step ahead of attackers. By choosing Wipro's CloudSecOps, your enterprise will experience accelerated and efficient transformations. Our automation jumpstart kit and other accelerators enable seamless integration and optimization of your security operations. Additionally, our dedicated team of Cybersecurists and our Center of Excellence (CoE) for managed security services provide a flexible operating model and enhanced governance on a global scale. Take the first step towards an empowered SOC. Download our brochure to learn more about how Wipro + Google SOC-as-a-Service can revolutionize your security operations. Download Brochure ======================

State of Cybersecurity Report 2023

Spotlight on AI

State of Cybersecurity Report 2023 Spotlight on AI State of Cybersecurity Report 2023 Spotlight on AI

Managing the risk, security and compliance of generative AI (GenAI) is a formidable challenge for CISOs. However, the rapid evolution of GenAI and large language model tools, with their seemingly unlimited capabilities, often leads to risk management being overlooked. Key challenges surrounding the increased use of AI include: AI, along with its machine learning (ML) and generative AI components, has the potential to significantly transform the cybersecurity landscape. It can continuously grow and learn, enabling defense reactions that outpace the tactics of the bad actors, even when they employ previously unseen attack patterns. But like all tools, AI is only as good as the people using it. To ensure a robust AI cybersecurity framework, a collaborative approach is essential. This involves having the right individuals to write the code, test it, and most importantly, oversee the AI programs on an ongoing basis. To discover valuable insights on deploying cost-effective AI governance, including strategies to prevent security vulnerabilities and backdoors that may lead to data breaches by cyber thieves or business competitors, download our Spotlight on AI.

Complying with the EU Artificial Intelligence Act

----- Arcticle source ----- https://www.wipro.com/cybersecurity/complying-with-the-eu-artificial-intelligence-act-an-overview-of-the-eus-regulatory-framework-for-ai/ ----- Contact Wipro Please fill the required details to access the content Complying with the EU Artificial Intelligence Act An overview of the EU's regulatory framework for AI An overview of the EU's regulatory framework for AI Artificial Intelligence (AI) is an unstoppable force that has the world at the precipice of a new era. The European Union is taking groundbreaking steps towards implementing a comprehensive regulatory framework for AI called the Artificial Intelligence Act (AIA). Wipro has produced a guide that offers an overview of the AIA provisions and principles. Download your copy . It is crucial for enterprise security operations to devise strategies that will ensure the security and effectiveness of AI systems. The AIA introduces key provisions that help define the boundaries of AI deployment based on four categories of risk systems: Two examples of unacceptable risk systems are real-time biometric identification in public spaces and emotion recognition in law enforcement. High-risk AI systems encompass biometric and biometrics-based systems, essential public and private services, research and analysis systems for justice administration and democratic processes, and recommendation systems in social media platforms. These systems are considered high risk because they may pose a significant threat to the fundamental rights, health and safety of individuals. To ensure transparency and accountability, the AIA mandates that AI systems inform users — both natural persons and deployers — about their operation, capabilities, and the rights affected by their use. It emphasizes the need for thorough assessments of AI systems to identify their long-term impacts on humans,

society and democracy. Download our AIA guide to get early insights into the future of AI regulation. Stay ahead of the curve and be prepared for the transformative changes that lie ahead. Download Your Copy ======================

Securing Data with Private GenAI Models

----- Arcticle source ----- https://www.wipro.com/cybersecurity/securing-data-with-private-gen-ai-models/ ----- Contact Wipro Please fill the required details to access the content Securing Data with Private GenAI Models Generative AI (GenAI) is a dominant topic of conversation and strategy in every enterprise conference room. It can deliver extraordinary efficiency in countless tasks and perform fast analysis without human intervention. However, as enterprise use of GenAI proliferated, CIOs and CISOs immediately identified a security downside in the commonly used public models: Public GenAI models can leak sensitive data to competitors and undermine compliance posture by divulging personally identifiable customer information. Security-conscious enterprises have responded by insisting on private models for most GenAI use cases to control privacy and data handling. In a private model, users can customize the model for specific business uses and control data handling when training the model. However, adopting a private model does not guarantee a bulletproof security posture. To use GenAI effectively and securely, CIOs and CISOs need to consider several other data security factors specific to GenAI. Internal Security Risks: Prevent Data Leaks to Employees From a data security perspective, enterprises should carefully plan applications, interfaces and workflows to avoid intentional and unintentional misuse of the datasets used by the GenAI models. The problem can be complex. For example, sensitive data from one business unit may not be shareable with other business units, even in the same division. Some of the data to be analyzed may not be public information and only available to a handful of need-to-know employees. The goal should be to expose teams only to the data required for their roles/ tasks. CISOs should include all relevant stakeholders – legal, security, HR, and other essential business units – in GenAI strategy deliberations to identify the sensitive data and access rights relative to individual business units.   Third-Party Cybersecurity Risks: Contractors and Partners Using Open AI with Your Data A corporate partner can undercut an enterprise's security efforts by bringing sloppy GenAI practices into collaborative projects. Can CIOs and CISOs reap the benefits of collaborative GenAI projects and simultaneously sidestep the damages? The answer is yes, but GenAI must be implemented strategically and carefully. Corporate leaders should evaluate any project-related use of GenAI by partners and contractors. This will mean extending the enterprise's acceptable GenAI practices into contractor and partner contracts to ensure conformity with corporate privacy policies, including assurances that data will not leak to public GenAI models.   Model Training Risks : Data Leakage to the Model and Beyond One of the balancing acts of GenAI is model training. All GenAI models train on and get better with more data. However, more data could

lead to inaccurate outputs, false narratives, and potential exposure of sensitive data. Organizations using a private model will add their data for specific use cases, insights, and recommendations. Companies need to prevent the model from leaking that data externally by walling off company data and defining uses like "analysis only" to secure data and trade secrets. In addition, they can take steps to prevent platform vendors from ingesting company data to train and improve their platform, thereby inadvertently benefiting competitors. Professionals involved in the GenAI implementation strategy must fully understand the model training functions and how to protect the company's intellectual property and data when used for model training. Boundaries must be strict and well-understood. Wipro's State of Cybersecurity Report 2023 explains how organizations can establish an AI risk management framework with rules and controls to leverage GenAI safely. Where to Go from Here? GenAI holds the promise of significant efficiency gains and enriched experiences. However, it can harm a business if an adequate data security plan is not in place. This technology will continue to evolve. Strategies to properly govern the data fed into GenAI models will change correspondingly. Governments globally have already started to regulate AI (NIST AI-100-1, the EU AI Act, the U.S. White House's Blueprint for an AI Bill of Rights, etc.). However, AI regulation is challenging because few businesses, let alone governments, completely understand AI or the best regulation strategy. Inevitably, CISOs must monitor the evolving AI regulatory landscape to keep data secure while staying compliant. There is no doubt that CISOs have their plates full. However, this is not the first time a new technology has challenged how companies work. GenAI has the potential to make employees more productive and offer customers enriched experiences. Companies should launch their GenAI strategies by focusing on security issues, and keep those issues front and center throughout their use case design to safeguard business interests when implementing AI solutions. About the Author Saugat Sindhu Global Head Strategy and Risk Practice, Wipro Cybersecurity and Risk Services Saugat's team provides business advisory, technology enablement, intelligent automation-based transformation, co-sourcing and managed services. His areas of focus include cybersecurity, risk strategy governance and compliance (GRC), third-party risk management (TPRM), data privacy, enterprise security architecture, enterprise resource planning (ERP) platform security and AI governance. =======================

Wipro's Secure Cloud Foundation for AWS

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipros-secure-cloud-foundation-for-aws/ ----- Contact Wipro Please fill the required details to access the content Wipro's Secure Cloud Foundation for AWS As enterprises expand their cloud landscape, an increasing percentage of data are moving across traditional data center boundaries. This requires a consistent security mechanism that covers all cloud and on-premises environments. Wipro's Secure Cloud Foundation for AWS (SCF) addresses enterprise cybersecurity challenges by building a more secure environment

for AWS cloud deployment. SCF encompasses various aspects of cloud security, including data protection, application security, network security, infrastructure protection, compliance and identity and access management. Wipro's SCF also contains many functions to complement AWS security capability, such as customized guardrails for specific security needs, compliance packs for quick adherence to specific regulatory compliance standards and custom permission sets for integration with third-party identification stores. Major SCF benefits include: To learn more, please download the Secure Cloud Foundation for AWS whitepaper. Download Whitepaper =====================

Securing the Future of Manufacturing: Cybersecurity Challenges in the Industry 4.0 Era

----- Arcticle source ----- https://www.wipro.com/cybersecurity/securing-the-future-of-manufacturing-cybersecurity-challenges-in-the-industry-4-0-era/ ----- Contact Wipro Please fill the required details to access the content Securing the Future of Manufacturing: Cybersecurity Challenges in the Industry 4.0 Era Industry 4.0 refers to the fourth industrial revolution, a technological and organizational metamorphosis that promises to fundamentally alter the way we manufacture, operate and interact with the world. This includes the convergence of automation, data exchange and digital technologies which is enhancing efficiencies across manufacturing industries. Central to this transformative shift is the industrial internet of things (IIoT), a fusion of cyber and physical systems that create a smart manufacturing ecosystem. The promises include improved efficiency, cost reduction, agile manufacturing capabilities and reduced inventory. However, as we journey into this brave new world, cybersecurity becomes a daunting challenge. Understanding the Unique Threat Landscape Industry 4.0 creates new threats that were previously inconceivable in the traditional manufacturing landscape. As technology evolves, so do the tactics of cyber attackers. These threats can target critical infrastructure, operational technology, and even the safety of workers. It's not merely about protecting data. It's also about safeguarding the core of manufacturing operations. Interconnected systems can dramatically amplify the impact of cyberattacks when a breach in one area cascades through the entire manufacturing process leading to widespread disruption. The consequences can range from production delays to compromised product quality. Challenges in Embracing Cybersecurity in the Industry 4.0 Landscape A number of formidable cybersecurity challenges stand in the path of Industry 4.0's full realization: These challenges underscore the critical need for a holistic approach to cybersecurity in the Industry 4.0 era. Overcoming these hurdles requires careful planning, proactive measures, and a commitment to making cybersecurity an integral part of the transformation process. The Need for a Multidimensional Approach to Cybersecurity Addressing cyber risks in Industry 4.0 demands a comprehensive strategy. A one-size-fits-all approach is insufficient. Instead, organizations must adopt a multidimensional

approach that covers the following six aspects of cybersecurity: To navigate this new industrial revolution successfully, businesses must prioritize cybersecurity from the outset. Wipro's VISTRA framework — Visibility, Intelligence, Security, Trust, Resilience, and Awareness — stands as a beacon of hope in the cybersecurity landscape. It's a multidimensional approach that can help organizations conquer the digital divide and reap the rewards of Industry 4.0 while mitigating its risks. As we move forward, we must remember that Industry 4.0 is not just about embracing innovation. It's about securing it. Let us embark on this journey with vigilance, resilience and a commitment to safeguarding the future of manufacturing. *Source: Wipro State of Cybersecurity Report 2023

Securing the 5G Landscape: Unveiling Risks and Monitoring Threats

----- Arcticle source ----- https://www.wipro.com/cybersecurity/securing-the-5g-landscape-unveiling-risks-and-monitoring-threats/ ----- Contact Wipro Please fill the required details to access the content Securing the 5G Landscape: Unveiling Risks and Monitoring Threats The emergence of 5G will revolutionize how we connect and interact with the world. However, with the widespread adoption of 5G, concerns surrounding network security have escalated. The future of 5G network security lies in embracing novel security frameworks and adopting proactive measures to counter emerging threats. In this article, we will delve into the intricacies of 5G network architecture, its key components, its impact on security and strategies to monitor and mitigate associated risks. 5G Network Architecture: An Overview Compared to its predecessors, 5G technology offers superior bandwidth and lower latency, paving the way for transformative possibilities. The 5G network architecture is comprised of three primary components: the radio access network (RAN), the core network, and the transport network. The RAN connects end-user devices to the core network, which in turn delivers voice, video, and data services, while the transport network connects the core network to the internet. One notable innovation within 5G is virtualization technology, enabling network slicing services. Network slicing allows the division of a physical network into virtual networks with distinct bandwidth, latency, and security parameters. While this enhances network performance, it also introduces new security vulnerabilities. Figure 1: 5G Network Architecture Open Radio Access Network (ORAN) and its Impact on 5G Network Security The concept of the open radio access network (ORAN/OpenRAN) seeks to create a more adaptable and open RAN environment by separating RAN hardware from software. While this approach can reduce capital and operational expenses, it introduces fresh security concerns such as supply chain threats, software vulnerabilities, configuration errors, and access control issues. ORAN's flexibility increases the attack surface, which in turn creates the need for vulnerability assessments and penetration testing. To mitigate security hazards, secure

connection methods like security gateway and IPsec should be employed. Figure 2: 5G Network Architecture with ORAN Network Slicing Services and Their Impact on 5G Network Security Network slicing empowers the creation of multiple virtual networks within a physical infrastructure, each tailored with unique characteristics. However, this technology introduces security risks as each virtual network has its own security requirements and vulnerabilities. Implementing a comprehensive security framework involving a security gateway (SecGW), IPsec, DDoS solutions and firewalls is essential to mitigate these risks. Regular security audits are crucial for identifying and addressing potential vulnerabilities. 5G Network Signaling, Legacy Technology, and Their Impact on 5G Network Security As 5G coverage expands worldwide, it relies on legacy technology networks and IP networks to manage existing services. This convergence of technologies compounds security challenges, including common threats such as man-in-the-middle (MITM) attacks, distributed denial-of-service (DDoS) attacks, UDP flooding, TCP SYN attacks, TCP session flooding, and DNS poisoning. Legacy networks like 2G, 3G, and 4G are also susceptible to SS7/diameter protocol threats, SMS-phishing, unauthorized A2P message terminations, network access authentication flaws, and unwarranted static/dynamic subscriber data queries. Employing a comprehensive security framework comprised of signaling security systems, SMS firewalls, and network firewalls is vital to mitigate these risks. Regular security audits and monitoring of network users and signaling traffic can further enhance threat detection and mitigation. 5G Network Security: C-Plane, U-Plane, and M-Plane The 5G network is divided into three principal planes (layers): Each layer has unique security requirements and vulnerabilities, necessitating the implementation of a comprehensive security framework. This framework should encompass firewalls, IPsec, vulnerability assessments, penetration testing, and overall monitoring capabilities. Figure 3: 5G Network Layers 5G Network Security Monitoring Using SIEM, SOAR, and Evolving Existing Security Operations Security orchestration, automation and response (SOAR), and security information and event management (SIEM) are essential components of any comprehensive security framework. SOAR enables the automation of security operations, while SIEM facilitates the collection, analysis, and monitoring of security events. Ensuring high visibility in network-related security events is vital for incident management so a robust security framework should integrate SIEM and SOAR to effectively monitor and mitigate security risks within the 5G network. Regular security audits and vulnerability assessments aid in identifying and mitigating potential security threats. 5G Network Security Services: What to Look For Selecting a 5G network security solution and service provider requires careful consideration. Look for providers offering a comprehensive security framework that includes vulnerability assessment, penetration testing, security system services, IPsec, and signaling firewalls. Additionally, the provider should conduct regular security audits and network traffic surveillance to detect and mitigate potential security hazards. A vendor-agnostic approach can help you select the most effective security products and procedures. As 5G network technology and deployment advances, new security threats are introduced, underscoring the importance of maintaining visibility and preparedness in the face of evolving challenges. Embracing new security frameworks and practices to mitigate emerging threats is the

future of 5G network security. For more information, contact our experts in our Emerging Technologies practice. =====================

Shortage of Qualified Critical Incident Response Professionals Continues to Plague Organizations

----- Arcticle source ----- https://www.wipro.com/cybersecurity/shortage-of-qualified-critical-incident-response-professionals-continues-to-plague-organizations/ ----- Contact Wipro Please fill the required details to access the content Shortage of Qualified Critical Incident Response Professionals Continues to Plague Organizations In Wipro's 2023 State of Cybersecurity Report (SOCR), 79% of organizations surveyed responded that ransomware is a top threat to their operations. Data leaks can disrupt systems and business operations for days, sometimes weeks. In addition to locking down systems through encryption, hackers are now using malicious extortion tactics against senior executives, threatening to release stolen data on the dark web. All this can negatively impact brand reputation and erode trust among customers and clients. To adequately address these threats, enterprises need skilled cybersecurity professionals securing the digital frontier. But data suggests that in-house cybersecurity teams are not enough on their own. Teams may not be large enough for round-the-clock monitoring, and new cyber threats require increasingly specialized skillsets to mitigate. A critical incident response team (CIRT) is a dedicated group of cybersecurity professionals who work around the clock to respond to threats, protect data and strengthen an organization's cyber resilience. Filling this critical incident response skills shortage is reportedly one of the highest priorities for CISOs across industries, especially in those that cannot afford downtime such as healthcare, government agencies, manufacturing and financial institutions. This infographic from 451 Research breaks down the cyber workforce capacity issue and offers insights for how to secure your digital frontier. Download Infographic =====================

Cybersecurity Strategies to Secure IoMT Healthcare Networks

----- Arcticle source ----- https://www.wipro.com/cybersecurity/cybersecurity-strategies-to-secure-iomt-healthcare-networks/ ----- About the Author Contact Wipro Please fill the required details to access the content Cybersecurity Strategies to Secure IoMT Healthcare Networks Discover proven mitigation strategies to secure vulnerable IoMT healthcare networks. The healthcare industry is experiencing a transformative shift towards "Healthcare 4.0," driven by technologies like cloud, 5G, AI/ML, blockchain, IoMT, and more. This transformation will benefit patients with convenient and fast remote diagnosis and disease-prevention advice both in the hospital

and remotely in their homes. The IoMT and other emerging technologies will play a transformational role in modernizing healthcare networks and care delivery. These technologies power smart medical devices connected through communications mediums (Wi-Fi, Bluetooth, internet-to-cloud server, and mobile applications) that exchange sensitive patient medical data and personal details with a central location. The IoMT combines the digital and physical worlds to improve the speed and accuracy of diagnosis, treatments, and real-time monitoring. Amid numerous benefits, IoMT-driven modernization also brings new challenges to hospital Chief Information Security Officers (CISOs). Hospitals are full of networked medical devices that are now a target of various security threats. Health systems need to prioritize addressing the evolving threats that these connected devices pose. Understanding the Unique Threat Landscape A typical healthcare organization or hospital may have 20,000 or more connected devices, including IT, IoMT, IoT, and OT devices. In hospitals, Wi-Fi access is free for guest users. The guest might connect to the same hospital network to which critical medical devices are connected (in case of a flat network), potentially opening access to cyber criminals. The most common threats that IoMT devices introduce include ransomware, intentional data theft (including protected health information), attacks against the network, and tampering with devices to alter medical data that might impact patient health. Cybercriminal groups can also turn weak hospital networks into money-making machines (for example, through crypto mining). Attackers are becoming increasingly clever at scanning the internet to find vulnerable systems (including hospital networks and medical devices) that are ripe for exploitation.   Why Cybersecurity is Lacking in the IoMT Landscape With so many different networked-enabled devices in a hospital, it has been challenging to address cybersecurity. These heterogeneous IoMT devices are sometimes managed and sometimes unmanaged, often running an outdated OS, using old browsers, and connecting over wired or wireless networks. Some devices have insecure protocols and default credentials. Medical devices that use default credentials are weak links in the network. These devices exchange data over both propriety and insecure protocols, and both within and outside the network. Many healthcare facilities have weak patch management deployments. IoT medical devices often have static credentials (difficult to change), no encrypted communications, open ports, unknown services, and proprietary firmware. More issues arise due to a lack of identification and management of vulnerabilities. Installing security-enhancing agents on unmanaged devices is difficult due to device constraints like low memory, proprietary operating systems, and protocols. Existing IT-based vulnerability scanning tools that perform active scanning are often not supported by these devices. Some devices also use non-standard protocols, making it challenging to identify vulnerabilities within the devices. Proven Mitigation Strategies for Healthcare CISOs Wipro has worked with many hospitals to develop cybersecurity strategies that secure IoMT healthcare networks and ensure HIPAA compliance. Key IoMT security strategies for hospitals include: Key Takeaways Hospital systems have a daunting task ahead. Emerging technologies are progressing with speed and scale in functionality, benefits, and risks. Connected devices are more common than ever both in healthcare facilities and in patient homes. Any of these devices can pose a potential threat to the hospital and its patients. A comprehensive cybersecurity plan that extends from the device to the

network with a secure data pipeline is essential. Shyamkant Dhamke Shyamkant Dhamke is a cybersecurity professional with over 23 years of experience in IoT/IoMT, OT/ICS security services, cyber-physical security, and application and data security across various industries, including Healthcare, Manufacturing, ENU, Banking, Telecom, and ENU. He leads a global IoT and OT/ICS security practice at Wipro and has been honored with Distinguished Member of Technical Staff (DMTS) at Wipro.

Migrating to a modern IGA platform involves several essential steps. Do you know where to start?

----- Arcticle source ----- https://www.wipro.com/cybersecurity/migrating-to-a-modern-iga-platform-involves-several-essential-steps-do-you-know-where-to-start/ ----- Contact Wipro Please fill the required details to access the content Migrating to a modern IGA platform involves several essential steps. Do you know where to start? In today's dynamic business environment, legacy identity governance and administration (IGA) platforms struggle to meet the evolving needs of organizations. As businesses embrace hybrid work setups, distributed teams, and diverse digital ecosystems, the limitations of legacy systems become apparent. Enter modern identity governance – a paradigm shift towards adaptable and robust identity management solutions. Our eBook, "Modernizing your identity platform," serves as a compass for organizations seeking to modernize their IGA strategies. Explore the challenges posed by legacy platforms and discover the transformative potential of upgrading your identity infrastructure. Wipro offers a strategy-first approach to IGA modernization, leveraging a comprehensive roadmap to enhance security, streamline operations, and ensure compliance. Start your journey towards a more resilient and efficient identity ecosystem today. Download our eBook and pave the way for a secure and agile future for your organization. What you will learn: Modern identity governance and administration (IGA) capabilities are necessary for each human and digital identity in a company. However, the growing complexity is pushing legacy IGA platforms to their limits. This eBook discusses the benefits of modernizing your identity platform, explores one organization's migration journey, and walks through a smart approach for modernizing your IGA platform. Download the eBook Key benefits of a modern IGA platform: Enhanced Security Advanced authentication methods strengthen security and reduce identity-related breaches. Streamlined Compliance Built-in compliance frameworks automate workflows and streamline compliance. Simplified User Experience Self-service functionality reduces dependency on IT staff and enhances user experiences. 61% of data breaches are caused by compromised credentials *"Cybercrime thrives during the pandemic: Verizon 2021 Data Breach Investigations Report." Verizon, May 2021 Why modernize your IGA system? Organizations need effective management of identities, access requests, and entitlements to maintain a strong security posture while adapting to the evolving needs of the business. The legacy IGA

transformation: A case study Organizations need effective management of identities, access requests, and entitlements to maintain a strong security posture while adapting to the evolving needs of the business.

Beyond the Breach: How to Safeguard Your Organization from Third-Party Risks

----- Arcticle source ----- https://www.wipro.com/cybersecurity/beyond-the-breach-how-to-safeguard-your-organization-from-third-party-risks/ ----- Contact Wipro Please fill the required details to access the content Beyond the Breach: How to Safeguard Your Organization from Third-Party Risks Recent data breaches have highlighted a common vulnerability — third-party cloud platforms, where hackers have accessed millions of sensitive customer records. Even though the breaches were carried out by different adversaries, they shared a common thread — the involvement of third-party cloud services. Robust risk management can protect your organization As businesses increasingly rely on third-party providers for essential services, it's crucial to assess and manage the associated risks. A robust Third-Party Risk Management (TPRM) program is vital for mitigating the risk of third-

party breaches. The program should verify that vendors both adhere to the organization's security standards and comply with regulatory requirements. TPRM must encompass the entire lifecycle of a third-party engagement, including onboarding, mitigation of risks, and continuous monitoring. Wipro has compiled the following best practices that can help safeguard your organization: 1. Minimize third-party access to sensitive data: Implement Privileged Access Management (PAM) to restrict third-party access to only what is necessary for contractual obligations. Establish clear policies for data storage and transfer. 2. Create an incident response plan: Your plan should outline security incident protocols and include provisions for third parties to promptly notify your organization if a breach occurs. 3. Incorporate risk management into contracts: Use detailed contractual agreements that specify security requirements, responsibilities and expectations to ensure vendor accountability. 4. Use data intelligence tools: Utilize tools to assess the cybersecurity posture of your vendors. Continuous monitoring of information security, vulnerabilities, and threats supports informed risk management decisions and minimizes attack impacts. 5. Offer training and awareness programs for employees and third parties: Ongoing education helps everyone understand their roles in protecting data and identifying potential risks. 6. Ensure compliance and regulatory adherence: Your third-party vendors should comply with relevant industry standards like GDPR and HIPAA. For critical vendors with access to highly sensitive data, request that they maintain security certifications or submit to annual assessments such as ISO27001, CSA STAR, PCI DSS, NIST, SOC 2 Type 2, and ISO 23001. Strengthen Your Defenses with Wipro's Cybersecurity Expertise In today's digital landscape, data breaches are a significant risk that can compromise customer trust and organizational integrity. Wipro Cybersecurists are specialists in cybersecurity, data privacy and operational resilience and are ready to support the ability of organizations to prevent, prepare for, and respond to third-party risk challenges. Our strategic approach ensures that your business is not only protected but also resilient in the face of cyber threats by offering: Today's enterprises are deeply reliant on third-party providers. The efficiencies and capabilities that third-party providers deliver generally outweigh the risks, and as we enter the age of AI, it will be essential for businesses to build new data-driven relationships with third-party providers. As these third-party relationships proliferate, organizations can future-proof their data strategy by investing in robust TPRM program. Leverage Wipro's expertise to fortify your third-party cybersecurity defenses and safeguard your organization against evolving digital threats. About the Author Stephanie Kasten Managing Director, Risk and Compliance Transformation Stephanie serves as a leader in the Risk and Compliance transformation team, extending from delivery and execution to risk management consulting across multiple industries. Stephanie is passionate about reducing risk, simplifying complex issues, and building cohesion across organizations. She comes to Wipro with 15 years industry experience building and leading risk programs in heavily regulated operations. =====================

Identity Management Center

What We Think Contact Wipro Please fill the required details to access the content Identity Management Center Simple, Secure, Automate & Accelerate A single holistic service management platform providing a single pane of glass view into your Identity & Access Management (IAM) ecosystem, including accelerators and automation tools that help you at every step of the IAM journey — implementation, transformation, and operations. An IAM program manager has to deal with several manual, effort-intensive, repetitive, and redundant activities. This takes away crucial time from IAM development and operations teams which is better spent resolving problems, performing root cause analysis, and implementing optimizations in the existing process. Wipro's IMC automates & accelerates activities at every stage of the IAM journey to help IAM teams focus on fixing problems rather than finding them. Problem triage is either automated or left-shifted to L1 and L1.5 teams, leaving the IAM niche teams to focus on the high-value activities. Customers can expect a 30–70% reduction in effort across application onboarding, manual user access management activities, regression testing, data clean-up, and application information collection during onboarding. It can also help left-shift repetitive activities like IAM-specific monitoring and regression testing to L1-teams. Overall, the IMC is a highly customizable tool designed to fit an organization's individual IAM needs and ensure high visibility into the IAM ecosystem. In this ever-changing enterprise landscape, several identity and access management (IAM) solutions are deployed to enforce security controls on the different types of identities – enterprise users, privileged users, contractors, and even consumers. =====================

Microsoft Security

Our Expertise What We Think What We Think What We Do Contact Wipro Please fill the required details to access the content Microsoft Security Enable customers to seamlessly adopt, architect, implement and provide managed services globally. In the current digital era, enterprises are dealing with multitude of identities through various personas and connected things. Enterprise data, applications and servers residency have been expanding from on-premise governed zones to multi Cloud environments. The explosion of Cloud and mobile applications along with rapid adoption of Cloud workloads have opened huge security risks posture and widened the gaps with on-premise security solutions that work in silos. To combat and stop advanced threats, enterprises are in need of easily deployable, multi-layered and integrated security solutions with cognitive intelligence. Microsoft provides a set of comprehensive Cloud and analytics powered security solutions to protect enterprise users, data and infrastructure. Enterprises can reduce costs and complexity by leveraging integrated Cloud and hybrid security offerings. Comprehensive security and compliance

solution from Wipro to provide a layered and zero trust security for Azure workloads Wipro and Microsoft jointly hosted a CISO panel discussion on "Overcoming Security and Compliance Challenges in a Hybrid/Multi-Cloud Environment". Integrated and intelligent security and compliance solution for SAP workloads on Azure. Wipro and Microsoft recently hosted a joint CISO panel event on the topic of Zero Trust user access for a secure remote working environment. Wipro's Modern SOC MDR service is Azure Sentinel powered fully managed Wipro's SAP on Azure offering provides a comprehensive security Identify and assess the risks posture of the IoT/OT environment by performing risk assessment leveraging Azure Defender for IoT service. Wipro achieves AWS Level 1 Managed Security Service Provider (MSSP) and AWS Security Competencies

----- Arcticle source ----- https://www.wipro.com/cybersecurity/aws-managed-security-services/ ----- AWS Infrastructure Vulnerability Scanning AWS Asset Inventory Visibility AWS Security Best Practices Monitoring AWS Compliance Monitoring Monitor, Triage Security Events 247 Incident Alerting and Response Distributed Denial of Service (DDoS) Mitigation Managed Intrusion Prevention System (IPS) Managed Detection and Response for AWS Endpoints Managed Web Application Firewall (WAF) What We Think What We Think Contact Wipro Please fill the required details to access the content AWS Managed Security Services Wipro is proud to be recognized as AWS Level 1 Managed Security Service Provider (MSSP) Competency Partner. The Level 1 Managed Security Services is a new baseline standard of quality created by Amazon Web Services (AWS), for organizations to refer to when choosing an AWS Partner to team up with when operationalizing their AWS security responsibilities in the cloud. The Competency Partners have had their technical and operational capabilities successfully validated against the Level 1 Managed Security Services baseline. The recognition is an endorsement for Wipro's Cybersecurity and Risk Services Practice, which helps enterprises stay ahead of the threats in the cloud. Wipro helps accelerating resilience during the cloud journey and

helps mitigate threats in an efficient manner. AWS Managed Security Services provides security protection and monitoring of essential AWS environment assets delivered as a 24/7 fully managed service through Wipro's AWS security experts. It comes with the additional flexibility of either supplementing the internal security team or end-to-end managed service. The managed security services help reduce business risk, increase cloud security posture, fill cyber skills gaps, and span across the six security domains: vulnerability management, cloud security best practices and compliance, threat detection and response, network security, host and endpoint security, and application security. As an AWS Managed Security Service Provider (MSSP), Wipro has closely worked with AWS security experts to develop the 10 managed security service (MSS) specializations to protect and monitor your AWS environment. Regular and automated scanning of your AWS infrastructure assets for software vulnerabilities to provide a single comprehensive view of the security status of all applications within an organization. Helps prioritize vulnerabilities and enable higher-level risk decisions across the AWS estate to quickly remediate these findings, ensuring that the infrastructure is in line with security best practices. Complete visibility across all customer accounts and regions is provided in a consolidated view along with the information of AWS assets being added, changed, or removed across your organization to help reduce business risk from unapproved activities. Provides visibility into cloud misconfigurations and their potential impact on application risk to avoid or reduce potential security breaches. Detects AWS accounts for the configurations of deployed resources not aligned with security best practices. Provides AWS application risk visibility based on risky changes in the environment and considers associated environmental health parameters providing improved visibility into cloud application risk and helps in risk reduction. Provides visibility into cloud misconfigurations and their potential impact on application risk to avoid or reduce potential security breaches. Detects AWS accounts for the configurations of deployed resources not aligned with security best practices. Provides AWS application risk visibility based on risky changes in the environment and considers associated environmental health parameters providing improved visibility into cloud application risk and helps in risk reduction. Enables organizations to prepare for cyber incidents through effective threat management and defend against and reduce the impact of cyber-attacks for their AWS environment. Complete visibility into security alerts related to your AWS environment, with a consolidated list of security events and recommended remediation guidance. Security intelligence services with a combination of automated tools and security experts monitoring AWS asset logs 24/7/365 to analyze and triage security events, providing remediation steps and guidance. Industry best practices for tuning and optimizing AWS log sources. Wipro provides protection by implementing cybersecurity best practices. Wipro offers DDoS protection solutions designed to protect everything on cloud and on-premise networks. DDoS protection from Wipro allows an organization to stay focused on running online business without disruption. Wipro has highly trained security experts offering threat analysis, strategy, which provides 24/7 globally distributed monitoring and security operations centers. Wipro`s IDS/IPS solution is designed to identify and block malicious traffic, prevent lateral movement of malware, ensure network availability and resiliency, and enhance network performance.

Wipro provides an additional layer of security by scanning and analyzing suspicious content for potential threats. There are various solutions available per customer requirement like Trend Micro and Alert Logic that integrate with AWS CloudTrail. It helps to collect API activity data within an AWS account and include it with log data from other applications and systems. Wipro's Cloud Endpoint Security solution is proficient to safeguard the data and instances on cloud. Wipro offers Real Time discovery of Public Cloud Workloads and Protection against malware and other threats. Wipro offers the most authentic WAF solution for AWS users. Wipro delivers enterprise-grade WAF solutions using AWS WAF and 3rd-Party WAF vendor solutions to safeguard your site from the latest threats; an intelligent array of performance monitoring and analytic services to provide insights about a website's security and performance. Wipro harnesses unmatched visibility into attacks to deliver curated and highly accurate WAF protections that keep up with the latest threats. Digital and cloud transformation initiatives are enabling organizations to adapt to changing business.....

Third Party Risk Management

----- Arcticle source ----- https://www.wipro.com/cybersecurity/third-party-risk-management/ ----- What We Think Form Title Form Title Form Title Form Title Contact Wipro Please fill the required details to access the content Third Party Risk Management Continuous risk monitoring solution on an integrated risk management platform Wipro's Third-Party Risk Management (TPRM) is a fast and efficient automated process of collecting, validating, and continuous monitoring of data with real-time visibility of threat and risk across all your third parties. Wipro's TPRM champions holistic visibility across vendors and suppliers. Its agile framework solution addresses automation of the end-to-end lifecycle of TPRM processes - onboarding, detailed assessments, remediation planning and tracking, ongoing risk monitoring, and continuous monitoring with real-time visibility. TPRM involves a comprehensive plan for the identification and mitigation of potential business uncertainties. The flexibility of this solution allows it to adapt and blend with current practices in the organization. TPRM focuses on assessing vendors across multiple ERM domains and makes an assessment based on a questionnaire, feeds, and intelligent data from independent external sources. TPRM combines all assessment inputs and external feeds to understand the vendor's risk posture and then comes up with a rating. Overall, the TPRM framework solution empowers organizations to onboard and assesses vendors securely while continuously assessing risk via automation across multiple ERM domains. This gives your organization confidence and peace of mind of knowing that your vendors' security is continuously under watchful, expert eyes. Implementing third-part risk management (TPRM) is crucial for organizations that rely heavily on external partners or vendors to run its essential services and operations. In the movie 'After Earth', Will Smith asks his son Kitai to "take a knee" whenever he is out of ideas during a crisis. Why traditional risk management practices fall short The COVID-19 pandemic will have a lasting effect on our business and industry in general. It is no surprise that most corporate

security profiles are being changed and updated on a regular basis.

Many global organizations are now focused on cloud-first strategies as they advance the use of cloud services across the business. In North America alone, 40% of organizations plan to spend the majority of new or additional funding on cloud, according to a recent Gartner survey. GlobeNewswire predicts the global cloud computing market will grow at a compound annual growth rate (CAGR) of 18% from 2019 to 2027. Even the recent pandemic has motivated businesses to pursue cloud transformations. Cloud adoption is on the rise — but what about cloud security? In our experience working with Google Cloud, we've noticed that enforcing security controls, privacy, and data protection for data processed and stored on the cloud is a common challenge for businesses. Google and Wipro offer leading security solutions and services within cybersecurity operations and risk advisory. At Wipro, we help enterprises assess and transform their cybersecurity maturity levels on the Google Cloud. We also modernize enterprise cybersecurity by integrating native technology solutions that protect the business and its data while reducing the total cost of ownership. Our zero-trust approach blends the native security controls with best practices and technologies from our partner ecosystem, for superior protection for our clients' businesses and their customers'. Use strict parameters and rigorous security standards, not trust, to verify devices and protect sensitive environments Transitions to native solutions that strengthen cloud security while optimizing the TCO Reduce risk exposure for your applications before and after workload migrations on Google cloud Ensure compliance with data protection regulations and security standards with robust data security controls Optimize your security analytics to detect anomalies and potential data breaches with the Security Operations Center of the future Secure your business applications before, during and after migration to Google Cloud. A pre-configured solution for metering, billing, back office, asset management, and self-service functions of water utilities. The solution optimizes meter-to-cash processes, seamlessly integrates customer data, increases customer satisfaction and call center efficiency, and simplifies financials, billing and invoicing. A pre-configured solution that helps the mining industry manage commodity risks, improve asset utilization and effectively oversee operational safety, risk and compliance. An end-to-end SAP pre-configured solution for retail grocers to enable efficient omnichannel supply operations and customer service. It helps gaining flexibility of Assemble-to-Order components that are tightly integrated to core retail solution. A preconfigured industry solution for businesses in the Manufacturing

industry to accelerate SAP S/4HANA deployments. It helps expand intelligent automation capabilities across supply chain and finance operations with lower efforts and minimal risks A pre-configured solution to manage the end-to-end supply chain processes of refineries, terminals, jobbers and depots for oil and gas companies. The solution accelerates time-to-market, reduces capex, provides accurate inventory visibility, quicker invoicing, and dynamic scheduling. A rapid deployment solution to manage operations related to production and maintenance, ensure compliance and record and report production costs. It ensures reduction in percentage of lost orders, material costs and order to cash cycle time, and improvement in customer service levels and product availability. A pre-configured, ready-to-run SAP best practices driven template for rapid SAP S/4HANA implementation of core line of business (LOBs). A pre-configured solution to enable organizations to manage their real estate portfolios more proactively and efficiently. Designed for automobile original equipment manufacturers (OEMs) and tier-1 suppliers, this SAP pre-configured industry solution improves return of investment and performance of the entire value chain right from product design and innovation to aftermarket services, lowering R&D expenses and ensuring faster time-to-market. This SAP pre-configured solution enables rapid SAP S/4HANA deployment by adopting fit-to-standard industry best practices with scalability. It provides accurate traceability & tracking of consumer goods & perishable food products with batch managed inventory, efficient control & monitoring of material flow with pallet managed inventory options and embedded real-time analytics tailored to business needs. =====================

Wipro's Security Management Center

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipros-security-management-center/ ----- What We Think Form Title Contact Wipro Please fill the required details to access the content Wipro's Security Management Center Single pane of glass for entire cybersecurity estate Wipro's Security Management Center identifies operational security risks. It enables a better realization of security investments using a customized dashboard to consolidate overall risk, reliability, compliance, and operations effectiveness. "What you see and detect is what you can protect." Proactively protect enterprises from enormous threats and rampant cyber-attacks caused due to lack of "Security Hygiene" of the infrastructure, limited visibility of security controls and, associated ineffectiveness of services. Wipro's Security Management Centre 3.0 (SMC 3.0) enables CISOs to visualize compliance with trends & analytics across technologies. With this functional insight enterprises, attain operational maturity and reduced time-to-market to a great extent. Visibility is crucial to effective defense against modern and sophisticated threats by proactively identifying risks and prioritizing them for remediation. Greater visibility will allow smooth security operation by integrating different technologies and enable the use of extreme automation. Wipro offers its customers a state-of-the-art Security Management Center (SMC), built on the "beat before beaten" principle. It

takes an integrated approach combining predictive, preventive, and proactive activities based on automation and analytics to ensure a 360-degree business-oriented view of security operations. Wipro provides a consolidated view that comprises risk, reliability, and efficiency of infrastructure through SMC, with the richness of correlated data, aggregated information, and transparency of services offered. The best features of SMC to call out would be: Get a consolidated view comprising of risk, reliability and efficiency of the infrastructure to understand your security posture Driving improved effciency in security operations, from insight to action, leveraging extreme automation

AWS Security

----- Arcticle source ----- https://www.wipro.com/cybersecurity/aws-security/ ----- Wipro's Security Service Offerings on AWS Our Success Stories Form Title Form Title What We Think Our AWS Security Solutions Infrastructure and Workload Security Data Protection Secure Identity and Access Management Application Security Threat Monitoring and Detection Governance and Compliance Managed Security Services Contact Wipro Please fill the required details to access the content AWS Security Securing the AWS landscape throughout the digital journey Securing cloud journeys is one of the most important aspects being considered by enterprises worldwide. Even though enterprises embrace AWS to realize the full potential of the cloud, they are still concerned about securing their business applications, information, workloads, and identities. Wipro's Cybersecurity & Risk Services (CRS) helps enterprises in their digital journey through innovation, transformation, and optimization while enabling businesses to be more secure and compliant to various stringent regulatory requirements. CRS helps customers gain the control and confidence needed to secure their business against evolving and sophisticated cyber threats. Using its expertise, solutions, and innovative platforms, Wipro enables enterprises to protect their assets on AWS. This solution considers both the native controls of AWS and third-party controls and tools. We differentiate ourselves by providing a holistic risk view of the entire AWS Security Posture and proactively mitigating the risks. Wipro delivered best in class AWS cloud based security solution comprising of native and third party security controls to meet customer's business needs.. Wipro enabled the road and public infrastructure safety agency... Plan, design, build, transform, and manage AWS native and third-party security controls with enterprise cloud security strategies and best practices. AWS solutions provide isolation and segmentation, secure landing zones, secure dedicated connectivity, DDOS protection, network and traffic load balancing, and building and maintenance of secure workload images. This service helps an enterprise protect its data and workloads from unauthorized access. Wipro's AWS data protection service continuously monitors and protects data and workloads through data discovery, classification, key storage management, certificate management, secrets management, and database security. Securely manage identities, resources, and permissions at scale. Manage access to workloads and applications through identity management, secure AWS resource

sharing, encryption key management, single sign-on, multi-factor authentication, and directory service. IAM continuously detects and helps remediate over-permissioned identities. Stay on top of breaches and discover and control active threats present in your AWS environment. Application security protects against web attacks via rule-based traffic filtering and secures application development by employing best security practices in DevOps, along with robust vulnerability management. Identify threats by continuously monitoring network activity and account behavior within your AWS environment and quickly assess your high-priority security alerts and security posture across AWS accounts in one comprehensive view. TMD services offer predefined and custom use cases and playbooks for AWS environments. A single pane of glass view across multiple AWS accounts covering various AWS services that provides enterprise the deeper visibility of their asset inventory, comprehensive view of compliance status, and continuous controls monitoring of your AWS environment using automated compliance checks based on AWS best practices and industry standards. It provides a consolidated compliance posture of business applications and their associated AWS services and helps fast track application migration to the web services your organization follows. AWS Managed Security Services provides 24/7 continuous security protection and essential AWS environment monitoring delivered as a fully managed service through Wipro's AWS security experts. MSS comes with the additional flexibility of either supplementing the enterprise's internal security team or performing an end-to-end managed service. =====================

Managed Deception Services

----- Arcticle source ----- https://www.wipro.com/cybersecurity/managed-deception-services/ ----- Contact Wipro Please fill the required details to access the content Managed Deception Services Detect and deflect cyber attackers proactively A comprehensive defense strategy that leverages deception to swiftly thwart sophisticated zero day attacks. Cyber deception has emerged as an effective and offensive threat hunting technology to offer protection for core information networks and infrastructure. It involves luring attackers to decoy systems, which unmasks their activities and provides key indicators of compromise. This enables defenders to act swiftly and thwart sophisticated zero day attacks. The technology also gives attackers a false sense of achievement by allowing them to believe that they have penetrated the network. Deception technology can be placed across enterprise networks by placing decoys, breadcrumbs and lures. It empowers organizations with a proactive defense strategy by providing comprehensive coverage on zero-day exploits. It also reduces the dwell time of the intruder from over 180 days to a few hours, providing maximum accuracy (high fidelity detection) with minimal human intervention. Wipro's AI-based deception technology can be integrated with SIEM, EDR and firewalls to provide a more holistic picture of the attack surface. Once there is positive affirmation of a compromise (on a decoy), a "Detect and Deflect" approach will elect to block the threat actor. Advanced IR (incidence response) and threat hunting capabilities provide us the opportunity to engage with the attacker and learn more about the threat actor's TTP (tools, techniques and

procedures). Wipro facilitates seamless integration with other detective and protective security controls to enhance layered defenses. We partner with Acalvio to offer Managed Deception Services to our customers. ======================

ServiceNow Cyber and Risk Services

----- Arcticle source ----- https://www.wipro.com/cybersecurity/servicenow-cyber-and-risk-services/ ----- What We Do What We Think Form Title Form Title Form Title Contact Wipro Please fill the required details to access the content ServiceNow Cyber and Risk Services Seamlessly adopt, architect, implement, and provide managed services globally. End-to-end security and risk solutions delivered through ServiceNow's Integrated Risk Management-Governance, Risk and Compliance (IRM-GRC), and Security Operations solutions. In the recent years, Wipro has seen a clear move from dedicated vertical solutions towards enterprise platforms that enable our customers to share a common data model, deploy a world-class enterprise-wide workflow engine, and enhance productivity. This is supported by our partner ServiceNow, a leading Cloud computing company. In the cyber and risk services world, ServiceNow has transformed the way our customers think and deliver security and risk management. We support our customers in their transformation journey by helping them design and implement ServiceNow IRM-GRC and Security Operation modules leveraging best practices. We also manage these solutions in the long term, and support customers in transforming their risk and security processes. With over 800 consultants, Wipro has dedicated a ServiceNow practice for risk and cybersecurity services. Automating your security operations while aligning security to information technology and the business Integrated risk management across lines of defense, from cyber risks to corporate compliance or, from operational risks to IT system of control. Experts in design and architecture of ServiceNow IRM-GRC and SecOps projects Cybersecurity Best Practices – Preparedness for a secure remote workforce, compliance, and building a cyber-resilient environment Disruptive situations force businesses to change the way they function. Amid the coronavirus pandemic, organizations have deviated from their standard operations to maintain some sense of business as usual – working from home, for example, rather than on site. ======================

ServiceNow Security Services

----- Arcticle source ----- https://www.wipro.com/cybersecurity/servicenow-security-services/ ----- What We Think Contact Wipro Please fill the required details to access the content ServiceNow Security Services Automating your security operations while aligning security to information technology and the business ServiceNow SecOps uses the Now Platform to connect security incidents and vulnerabilities directly to the CMDB IT assets and leverage its enterprise workflow engine. ServiceNow SecOps covers Security Incident Response (SIR), Vulnerability Response (VR), Threat Intelligence (TI), and Configuration Compliance (CC). It proposes over 60 standard REST API integrations with leading security information and event management (SIEM) solutions, vulnerability scanners and security detection solutions. It supports the three leading cloud solutions as well (AWS, Azure, and Google Cloud). With over 800 consultants, Wipro has dedicated a ServiceNow practice for risk and cybersecurity services. Wipro leverages its deep and wide security and ServiceNow expertise to support customers in implementing and running ServiceNow SecOps. Our expert architects design solutions that maximize the value for business stakeholders. Please click here to go back to the ServiceNow Cybersecurity & Risk Services main

page Security teams today are inundated with alerts and information from a growing number of siloed point solutions. ServiceNow Vulnerability Response helps organizations understand the most common and severe threats from external sources and from their own application developments. Managing your ServiceNow SecOps solution by yourself is obviously an option. =====================

ServiceNow IRM-GRC Services

----- Arcticle source ----- https://www.wipro.com/cybersecurity/servicenow-irm-grc-services/ ----- What We Think Form Title Contact Wipro Please fill the required details to access the content ServiceNow IRM-GRC Services Integrated risk management across lines of defense, from cyber risks to corporate compliance or, from operational risks to IT system of control. ServiceNow IRM-GRC is a new generation integrated risk management solution, natively built on the cloud, under the SaaS model and leveraging an enterprise platform. Wipro's ServiceNow IRM-GRC is a unique solution that helps both legacy Governance, Risk, and Compliance (GRC) customers looking to migrate to a new generation solution, as well as new adopters of GRC looking to take leading IRM solutions to market. ServiceNow IRM-GRC supports companies embracing enterprise risk management and operational resilience. These aspirations require a single IRM solution processing all use cases and all Lines of Defense under a single solution supported by a single platform such as ServiceNow. Wipro's Cyber Security and Risk Services (CRS) is best placed in the market to support customers with this transition. With over 800 consultants, Wipro has dedicated a ServiceNow practice for risk and cybersecurity services. Wipro leverages its deep and wide security and ServiceNow expertise to support customers in implementing and running ServiceNow IRM-GRC. Our expert architects design solutions that maximize the value for business stakeholders. Please click here to go back to the ServiceNow Cybersecurity & Risk Services main page Legacy GRC solutions have been built on technologies and architectures that are now obsolete, with inflexible architecture. Managing risk and compliance with a manual, siloed and reactive work model is no longer effective as the global regulatory environment continuously evolves. Scarcity of resources and lack of appropriate skills are key challenges in managing your ServiceNow Integrated Risk Management (IRM)/ Governance, Risk and Compliance (GRC) solution. Continuous risk monitoring solution on an integrated risk management platform =====================

ServiceNow Security and Risk Advisory Services

Protecting critical infrastructure in today's hyperconnected age

----- Arcticle source ----- https://www.wipro.com/cybersecurity/protecting-critical-infrastructure-in-todays-hyperconnected-age/ ----- Contact Wipro Please fill the required details to access the content Protecting critical infrastructure in today's hyperconnected age The integration of Information Technology (IT) and Operational Technology (OT) in the Industry 4.0 transformation is revolutionizing the modern business landscape. By harnessing the power of OT for efficient and effective operations and incorporating cutting-edge technologies, businesses are experiencing growth, enhanced productivity, and improved customer experiences. However, these advancements also pose security challenges that organizations must address. Challenges in securing OT/IoT environments The current state of the operational technology landscape is being affected by legacy devices and networks. Many of the legacy Industrial Control System (ICS) devices in use today were designed before the current understanding of cybersecurity and may lack sufficient security measures. Legacy ICS devices may have vulnerabilities due to outdated software and hardware, increasing the risk to cyber-attacks. Furthermore, as these devices may no longer receive security updates, they remain exposed to known security threats. 20% of organizations have detected an IoT-based attack in the past three years. Source: Gartner Also, As the number of IoT devices continues to increase in the business landscape, enterprises must acknowledge the need to   modernize their security strategies to eliminate new threats and cyberattacks. IT teams must embrace novel technologies and methodologies to safeguard all critical data, regardless of its location. Bridging OT/IoT security gaps At Wipro, we understand the unique challenges and risks that come with OT and IoT systems. Our extensive portfolio of security solutions is engineered to help enterprises secure their OT/IoT environments. ======================

Wipro's Managed Security Data Lake Services

What We Think Our AWS Security Solutions Infrastructure and Workload Security Data Protection Secure Identity and Access Management Application Security Threat Monitoring and Detection Governance and Compliance Managed Security Services Contact Wipro Please fill the required details to access the content Wipro's Managed Security Data Lake Services Wipro is an official general availability (GA) launch partner for Amazon Security Lake, a service that centralizes security data from cloud, on-premises, and custom sources to improve security visibility and minimize threat landscape. With Security Lake, customers can get a more complete understanding of their data security across the entire organization. The collaboration with AWS will aggregate data from Wipro's Cloud Application Risk Governance (CARG) platform to provide a "single pane of glass," unified real-time view of cloud applications and compliance postures across the enterprise. Consulting, implementation and managed data lake services Wipro delivers security analytics for enterprises with hybrid and multi-cloud networks by leveraging the Amazon Security Lake solution. The security data lake acts as single source of truth for security and compliance data collected from multiple sources deployed on the network perimeter, end-user machines, and on SaaS/business applications. Wipro's holistic approach to MDR and security data lake management includes two offerings: 1. Security data lake consulting and implementation services 2. Fully managed security data lake services Amazon Security Lake benefits Plan, design, build, transform, and manage AWS native and third-party security controls with enterprise cloud security strategies and best practices. AWS solutions provide isolation and segmentation, secure landing zones, secure dedicated connectivity, DDOS protection, network and traffic load balancing, and building and maintenance of secure workload images. This service helps an enterprise protect its data and workloads from unauthorized access. Wipro's AWS data protection service continuously monitors and protects data and workloads through data discovery, classification, key storage management, certificate management, secrets management, and database security. Securely manage identities, resources, and permissions at scale. Manage access to workloads and applications through identity management, secure AWS resource sharing, encryption key management, single sign-on, multi-factor authentication, and directory service. IAM continuously detects and helps remediate over-permissioned identities. Stay on top of breaches and discover and control active threats present in your AWS environment. Application security protects against web attacks via rule-based traffic filtering and secures application development by employing best security practices in DevOps, along with robust vulnerability management. Identify threats by continuously monitoring network activity and account behavior within your AWS environment and quickly assess your high-priority security alerts and security posture across AWS accounts in one comprehensive view. TMD services offer predefined and custom use cases and playbooks for AWS environments. A single pane of glass view across multiple AWS accounts

covering various AWS services that provides enterprise the deeper visibility of their asset inventory, comprehensive view of compliance status, and continuous controls monitoring of your AWS environment using automated compliance checks based on AWS best practices and industry standards. It provides a consolidated compliance posture of business applications and their associated AWS services and helps fast track application migration to the web services your organization follows. Wipro's Managed Secure Access Service Edge (SASE) Powered by Zscaler

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipro-managed-sase-powered-by-zscaler/ ----- Contact Wipro Please fill the required details to access the content Wipro's Managed SASE Powered by Zscaler Securing users, workloads and device communication The combination of mobility and cloud technology is revolutionizing the way businesses operate. In today's hybrid environment, it is impractical to rely on conventional approaches to defend on-premises resources. To stay competitive, enterprises must enhance operational efficiency and build future-proof cyber resiliency. Enterprise challenges Wipro's SASE in partnership with Zscaler In collaboration with Zscaler, Wipro has developed a cutting-edge SASE (Secure Access Service Edge) framework that integrates networking and security capabilities into a single, globally distributed, cloud-native service. By emphasizing identity rather than traffic flow, SASE offers comprehensive security coverage for users, applications, and resources – regardless of their location or the transportation technology being used. With this innovative bundle of technologies, security is embedded directly into the global network fabric, always making it easily accessible. As a result, enterprises can ensure that operations are secure, efficient, and future-ready. The solution differentiators =====================

Wipro's Managed Zero Trust Security Powered by Zscaler

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipro-managed-zero-trust-security/ ----- Contact Wipro Please fill the required details to access the content Wipro's Managed Zero Trust Security

Accelerating secure digital transformation The migration of infrastructure to the cloud and Software-as-a-Service (SaaS), along with the rapid increase in users and connected devices, has greatly widened the attack surface, resulting in more sophisticated cyber assaults. In this scenario, the lack of visibility into user activity, data interactions, and resource utilization in a flat network poses challenges in detecting malicious actors. A lack of maturity in adhering to data privacy and protection requirements adds to complexities in safeguarding sensitive information. The Zero Trust framework operates on the principle that no communication is inherently trusted, especially when it comes to safeguarding businesses in the cloud and hybrid environment. Zero Trust enables fast and secure communication while allowing access to network resources for users, devices, and workloads in both IT and OT domains. Access is granted through a sophisticated combination of advanced identity, posture, and risk-based authentication mechanisms, ensuring a robust and comprehensive approach to network security. Controlled, secure access anytime, anywhere Wipro's Zero Trust framework, powered by Zscaler, utilizes cutting-edge security toolkits to establish a seamless and safe environment. By removing traditional point products from both inbound and outbound security stacks, the framework offers a practical and cost-effective approach. Users and workloads can connect seamlessly, benefiting from consistent, frictionless security across the board, and effectively mitigating threats. The Zero Trust Exchange architecture, enhanced by Zscaler's AI-powered innovations, prevents lateral movement within the organizational infrastructure, reducing risks and strengthening overall security.

Wipro's Cloud Native Application Protection Platform (CNAPP) Powered by Zscaler

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipro-cloud-native-application-protection-platform-cnapp/ ----- Contact Wipro Please fill the required details to access the content Wipro's Cloud Native Application Protection Platform (CNAPP) Consolidate multiple security toolsets and prioritize risks for end-to-end cloud-native security A majority of new digital workloads are being deployed on cloud-native platforms. While this will let enterprises leverage instant scalability and limitless on-demand computing capability, it also presents new security challenges that traditional tools cannot manage. To overcome these challenges, security teams often deploy a mix of different security tools and technologies. These multiple platforms can present inconsistent capabilities, policies, and reporting, which may produce operational inefficiencies. Secure and protect cloud-native environments with confidence Wipro's Cloud Native Application Protection Platform (CNAPP), powered by Zscaler, is a simple, agentless approach to cloud security. The platform correlates multiple security engines across the entire cloud stack to prioritize risks caused by misconfigurations, threats, and vulnerabilities. Wipro's CNAPP provides end-to-end cloud native

security with Wipro-defined customized playbooks for cloud workload, containerized environment, secure cloud identity management, and more. Key elements of Wipro's CNAPP powered by Zscaler Discover how Wipro's CNAPP solution, powered by Zscaler, can secure your enterprise's cloud native journey.   =======================

Wipro's Cloud Security Posture Assessment (CSPA)

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipro-cloud-security-posture-assessment-cspa-powered-by-palo-alto-networks-prisma-cloud/ ----- Contact Wipro Please fill the required details to access the content Wipro's Cloud Security Posture Assessment (CSPA) Powered by Palo Alto Networks' Prisma Cloud Powered by Palo Alto Networks' Prisma Cloud Digital enterprises are facing an ever-expanding threat landscape, including: Safeguarding your networks, data and workflows requires a strategy-first approach to risk mitigation. And cloud security must be a fundamental part of the business strategy. Before you can address these challenges, you need to know where your cloud security stands today. Wipro, in partnership with Palo Alto Networks, offers a Cloud Security Posture Assessment (CSPA) tailored to your specific needs. The solution leverages the expertise of Wipro Cybersecurists and the technical power of the Palo Alto Networks' Prisma Cloud platform. Our agentless assessment process is designed for speed and efficiency. It takes just a few minutes for onboarding, providing you with a swift and comprehensive overview of your multi/hybrid cloud configurations. Comprehensive coverage of multi/hybrid cloud environments Actionable recommendations to strengthen your cloud strategy Ongoing support for remediation, control deployment and managed security services Select the service level you need Basic Assessment (up to 2 weeks): This package is focused on the major cloud service providers like AWS, Azure, and Google Cloud and covers the following areas: Take the assessment to proactively address cloud security challenges, mitigate risks and build a resilient cloud environment. Wipro's CloudSecOps on Google Cloud

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipro-cloudsecops-on-google-cloud/ ----- Contact Wipro Please fill the required details to access the content Wipro's CloudSecOps on Google Cloud Transform your SOC journey with autonomous security operations As organizations embrace digital transformation, security leaders are challenged by traditional SOC environments that employ costly and complex manual investigations to manage high log volumes from a variety of sources, such as hybrid environments, IoT devices and microservices, spread across different cloud environments. This can lead to alert fatigue, investigative delays and a build up of false positive alerts. Enterprises need advanced

analytics and machine learning-based solutions to more effectively identify and prioritize security incidents and maintain compliance with evolving regulatory requirements. Wipro's CloudSecOps on Google Cloud – A shield for cyber threats Wipro's CloudSecOps on Google Cloud is a cloud-native SOC-as-a-Service solution that leverages the power of the Google Chronicle SIEM/SOAR platform. Wipro and Google offer a proactive operations suite to automate the SecOps. We construct a robust mechanism for threat management and handle routine security events and operations. Robust monitoring Compliance adherence Improved ROI and TCO Key features Wipro's CloudSecOps is built on the Google Cloud platform with 180+ custom YARA-L rules and 40+ custom playbook libraries. It is designed to be fully cloud-native, ensuring seamless integration, growth, speed and optimal performance. The solution features include: To learn more about how you can enhance your cloud security with Wipro's CloudSecOps, contact us. Contact Us =====================

Wipro's Cloud Security Posture Treatment - CSPT

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipro-cloud-security-posture-treatment-cspt/ ----- Contact Wipro Please fill the required details to access the content Wipro's Cloud Security Posture Treatment — CSPT Prioritized remediation and risk treatment plans Cloud adoption and digital service enhancements are empowering business transformation and global agility. But it's also opening doors to vulnerabilities and security gaps that can endanger enterprise cyber resilience. As organizations undergo assessments or audits, security gaps are revealed. The key imperative here is to promptly address these gaps, giving priority to and automating remediation for maximum risk mitigation. Strengthen your cloud security posture Wipro's Cloud Security Posture Treatment (CSPT) solution is designed to reduce risks and strengthen your cloud security posture. CSPT caters to primary enterprise needs by quickly addressing cloud security gaps, minimizing audit risks and bolstering cloud security compliance and threat resilience. Improved cloud security posture and compliance Reduced risk of audit violations   Adherence to industry and CSP security best practices   Automated remediation across multi-cloud environments Wipro's CSPT solution, delivered by our cloud Cybersecurists, offers a comprehensive approach to infrastructure security across multi-cloud environments. The platform includes: To learn how to take your cloud security to the next level, contact our Cybersecurists. Contact Us =====================

Wipro's Cloud Native Application Protection Platform (CNAPP) Solution

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipro-cloud-native-application-protection-platform/ ----- Contact Wipro Please fill the

required details to access the content Wipro's Cloud Native Application Protection Platform — CNAPP A unified cloud security solution In today's rapidly evolving digital landscape, traditional security tools designed for on-premises environments simply can't keep up with the agility and speed of innovation on the cloud. These legacy solutions lack visibility and can introduce new vulnerabilities, increase overhead and create security loopholes. To navigate the complex challenges of cloud security, many businesses are deploying a mix of cloud-native applications and security tools which creates a pressing need for a comprehensive and integrated cloud security solution. Streamline the deployment of secure cloud-native apps Wipro's Cloud Native Application Protection Platform (CNAPP) solution addresses this challenge by providing comprehensive security capabilities that enable security and DevOps teams to speed up the development and deployment of secure cloud-native applications from code to the cloud. CNAPP replaces multiple point solutions in cloud security with a unified, real-time visibility into your multi-cloud security posture and compliance to reduce risk and improve operational efficiency. Comprehensive cloud security Enhancing security of applications and workloads Compliance adherence Ensuring compliance with CSP-and industry-based regulatory requirements One-click visibility Providing real-time security

posture visibility Wipro maintains a cloud Center of Excellence (CoE) that drives a digital-first strategy. We leverage advanced labs for innovative pilot projects and build custom use cases and policies tailored to your specific security requirements. By combining user behavior data from the cloud and workloads, CNAPP provides leading-edge insights that can improve detection rates, reduce false positives and help your teams focus on what matters now. To gain insights into your current cloud security gaps and learn how CNAPP can enhance your security posture, please contact our Cybersecurists. Contact Us =====================

Cyber Resilience for Medical IoT Devices

----- Arcticle source ----- https://www.wipro.com/cybersecurity/cyber-resilience-for-medical-iot-devices/ ----- Contact Wipro Please fill the required details to access the content Cyber Resilience for Medical IoT Devices Wipro's IoMT security risk assessment program leverages AI and deep domain expertise to rapidly assess and improve the security of medical device networks. How secure is your medical device network? The connected Internet of Medical Things (IoMT) is providing precise, consistent, and barrier-free healthcare services to patients. A typical hospital IoT network includes surgical robots, remote ventilators, smart blood glucose monitors, infusion pumps, MRI and CT scanners, and much more. Because these medical devices hold sensitive
personal health information (PHI) that is transmitted over the internet, all IoMT networks also present serious cybersecurity challenges. High-profile cyberattacks routinely aim to compromise PHI. Without proper governance, malicious actions like ransomware, email phishing, and data exfiltration can cripple critical operations for two weeks or more and compromise sensitive patient information, leading to HIPAA violations and deep reputation damage. According to Gartner® "Many healthcare delivery organization (HDO) CIOs and chief information security officers (CISOs) do not have an

up-to-date, complete, and accurate inventory of the medical devices within their enterprises, undermining efforts to thwart continuous security threats."* Wipro's AI-powered risk assessment program Most IoMT data breaches can be traced back to four factors: Wipro's AI-powered 5-day IoMT security risk assessment program provides a rapid understanding of your IoMT landscape and the associated cyber-risks, then creates a proven remediation roadmap to secure your medical devices. During this program, our cybersecurity experts–Cybersecurists–will assess your IoMT environment with an AI-powered risk assessment tool to discover managed and unmanaged IoMT devices and identify default credentials and risk profiles. Based on the assessment report, we design a customized remediation roadmap to harden your IoMT security posture. We will also activate detection and response mechanisms to ensure that your medical device network is remains cyber resilient in the future. AI-powered risk assessment Quick understanding of asset landscape Secure PHI data boundaries Assessment program benefits Contact Us

AI-Powered Security Management Center: Wipro SMC-AI

----- Arcticle source ----- https://www.wipro.com/cybersecurity/wipro-launches-ai-powered-smc-solution-smc-ai/ ----- Contact Wipro Enterprise Cybersecurity Solutions for Zero Trust Maturity Wipro SMC-AI Demo How to find and rationalize hidden tools that are costing you money The strategic paths to take on the complex Zero Trust journey Please fill the required details to access the content Wipro Launches AI-Powered SMC Solution — Wipro SMC-AI Intelligent Security Operations Solution Ever increasing security tools are adding to complexity and impacting cyber security operations Organizations continue to invest in security technologies to protect assets and data and to enhance their ability to respond to threats in a timely manner. The propensity to adopt new security technologies over time leads to the accumulation of tool sets. This creates complexities in the environment due to a lack of interoperability, lack of a coherent security posture view and inconsistent tools management, increasing operations overhead. The main reason for this is the missing "security hygiene" of the infrastructure and limited visibility of the environment and associated service effectiveness. Issues in delivering effective security operations Security operations teams are overwhelmed with managing complex environments and dynamic policies of security tools deployed in organizations. Even with adequate security controls in place to protect the enterprise assets, and efforts to manage infrastructure, the following gaps can occur: There is a definite need for a framework and tool that can ensure service effectiveness and fill the potential gaps in traditional security operations by leveraging the modern concept of intelligent operations powered by AI. A modern approach to simplify security operations Simplifying security operations and providing smart governance is a feature of the effective automation associated with AI. In addition, visibility is a key factor as described by the cliché "what you see and detect is what you can

protect." It is important to define the view which will meet the expectations of all stakeholders who are responsible for the organization's IT security. Wipro offers its customers an AI-powered Intelligent Security Operations solution–Wipro SMC-AI–built on the principle of "Beat Before Beaten." Wipro SMC-AI is an integrated approach to intelligent security operations based on automation and analytics. It ensures a 360-degree business-oriented view of security operations and objectives. The consolidated view is comprised of risk, reliability and efficiency posture of the infrastructure. Wipro helps organizations look at their security infrastructure through Wipro SMC-AI with the richness of correlated data, aggregated information and transparency of the services being offered. Wipro SMC-AI for intelligent security operations It is critical for enterprises to practice effective cyber hygiene and ensure that the core security technologies are working in the right manner. This can be achieved if the security and related tools are deployed appropriately and configured so they adhere to baselines and best practices. Effective security operations processes need to be sustained over time to protect enterprises from attacks and prevent exploitation of vulnerabilities. This requires visibility and insights into the environment, while continuously monitoring for any deviation or non-compliance so that issues can be identified on a regular basis. Enterprises going through their Zero Trust security journey need to rely on solutions and tools that enable visibility of their security posture and mitigate identified risks. Zero Trust security is also about integrated architecture, with security tools working in a cohesive manner to exchange information and respond to threats. Wipro SMC-AI provides insights into the enterprise environment and reports operational risks to orchestrate and remediate operational issues. It helps in intelligent security operations to sustain Zero Trust and move toward cybersecurity maturity. Benefits of Wipro SMC-AI Wipro SMC-AI helps improve operational efficiency by up to 40% while proactively identifying issues, analysing trends to identify patterns and performing root cause analysis. It protects enterprises from threats caused by a lack of infrastructure "security hygiene," limited security controls visibility and response ineffectiveness. Wipro SMC-AI encourages active involvement of stakeholders across the organizational hierarchy by providing a business view of the technologies and tools and simplifying cyber security wellness reporting. Wipro SMC-AI provides insights, reports risks, and helps remediate issues, supporting intelligent security operations and advancing cybersecurity maturity. One of the more harmful threats to enterprise cybersecurity (and cyber budgets) is the accumulation of excess security tools. The days of trusted hosts are long gone. The Zero Trust model is becoming an absolute necessity. When anything hits your environment — a user, a network, an app or a spider — the default assumption is that the interaction is hostile and the entity is an attacker. Contact Us ===================== ----- Arcticle source ----- https:// www.wipro.com/cybersecurity/digital-trust/ ----- Digital Trust   Digital Trust What We Do Emerging Technologies Identity and Access Management & Governance OT / IoT Security Zero Trust Data Security & Protection What We Think What We Think Contact Wipro Please fill the required details to access the content Next-gen Identity & Access Services to secure your digital transformation journey.   Digital Trust is the foundation for digital transactions and has become the new security perimeter. Digital Identity is a vital component for achieving Digital Trust. Wipro Cybersecurists accelerate

your Digital Trust journey by leveraging next-gen IAM solutions, and implementing zero trust architecture, smart data and OT/IoT security solutions. We provide a personalized and seamless user experience while ensuring compliance to evolving regulatory landscape. Cybersecurity offerings in advanced technologies and emerging areas like Open Source security, Blockchain and 5G Security. Digital Identity platforms and solutions that enable a well-defined, comprehensive, seamless and secure access. Developing, designing, and implementing security frameworks to safeguard your operational environment from cyber-attacks. Establish a zero-trust framework by leveraging security and automation tools to provide limited access to critical data, and the ability to visualize threats and respond in time. Apply latest data security controls to protect and safeguard your critical data. Risk based approach to data privacy can help businesses manage global data privacy risks, apply, calibrate and enforce controls based on the risk exposure, in a manner that is flexible and more agile. To achieve Zero Trust maturity, an organization will have to build the context, and develop continuous and adaptive authentication, authorization, device security state, resource criticality, application type and network information as part of the key decision-making process Why Wipro's Zero Trust Security Framework is Your Best Defense Strategy Traditionally, most manufacturing industries, whether process manufacturing or discrete manufacturing The ability to exchange cyber threat intelligence (CTI) in privacy preserving and in a secure manner is vital for enterprises to manage their security risks effectively. The safety of our clients' data is our utmost priority. At Wipro, we have an established GDPR compliance program and, in the aftermath of Schrems II, we have reviewed our own contracts and transfers by looking at the legal framework that applies in the receiving country. Open source is empowering organizations to pursue their business transformations with greater agility and control while avoiding vendor lock-in. Wipro and Microsoft recently hosted a joint CISO panel event on the topic of Zero Trust user access for a secure remote working environment. Disruptive situations force businesses to change the way they function. Stringent data security used to be an afterthought for some businesses, until privacy issues gave rise to GDPR regulations. 60% of organizations believe that a bad cyber security event will lead to significant fines or sanctions due to non-compliance A Quick Walkthrough of an ID Conversion Project for a Bank The biggest data privacy challenge in a cloud based analytics solution is "robust and scalable privacy, preserving data mining and analytics, that provides the required outcome to organizations, while adhering to all data privacy regulations. Meeting compliance requirements is not enough. It is critical that personal data is protected and privacy needs are addressed through sound governance. Security monitoring has always been critical to protecting IT ecosystems but with the rise in IoT-enabled devices and connected systems, the fear of cyberattacks has grown exponentially. There is an increasing pace in adoption of Internet of Things (IoT) by businesses globally as it has proven to open new revenue streams through new smart offerings. ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/security-and-risk-advisory/ ----- Security and Risk Advisory   Security and Risk Advisory   What We Do Cyber Risk and Privacy Strategy Industry Security & Risk Advisory Security Architecture & Engineering Security Governance, Risk & Compliance Business Continuity & Cyber Resilience Third Party Risk Management Cyber and Risk Platform

Automation Services ESG Performance Management & Reporting What We Think Form Title What We Think Contact Wipro Please fill the required details to access the content Helping C-suite assess and enhance the enterprise cybersecurity risk posture, adhere to regulatory compliances, and provide risk advisory. The transition to digitization of our lives and businesses accelerated at a baffling speed post pandemic. Today, CISOs are tasked with ensuring effective security controls and privileges to prevent cyber-attacks. Organizations are looking for end-to-end cybersecurity implementation practices to ensure a truly resilient enterprise posture when collaborating with both internal stakeholders and third parties. Wipro's team of Cybersecurists help protect your brand, business processes and data by neutralizing threats, and helping comply with tightening regulations — all the while being conscious of security investments. Help CISOs and CROs develop the strategies, operating models, metrics, governance and policies needed to manage cyber and privacy risk while empowering business growth. We provide advisory services to safeguard organization's critical assets ensuring real time threat detection and mitigation. Enterprise Security Architecture and Design Services aligned with organizational objectives, business imperatives, and technology blueprints for cloud and on-premises environments. Transformation Services to automate and orchestrate GRC processes to enable effective protection, detection and response. Help CXOs build and manage resilient cyber and IT programs supported by necessary tools and technologies to withstand and recover from natural disasters and adverse events caused by human actions. Wipro's Third-Party Risk Management (TPRM) is a fast and efficient automated process of collecting, validating, and continuously monitoring data with real-time visibility of threat and risk across your third parties aided by intelligent workflows. End-to-end security, risk and privacy digital transformation delivered through leading platforms ServiceNow, OneTrust, RSA Archer, MetricStream, etc. using unique Wipro accelerators and intelligent automation powered by Wipro HOLMES Augmented Intelligence Increasingly, a company's sustainability performance and ESG (Environmental, Social & Governance) profile has a direct bearing on its cost of capital, its cost of doing business, and ultimately--as proposed regulations come into force--its right to operate. Implementing third-part risk management (TPRM) is crucial for organizations that rely heavily on external partners or vendors to run its essential services and operations. In the post COVID-19 world, businesses are looking for ways to be more... Amid the coronavirus pandemic, organizations have deviated from their standard operations to maintain some sense of business as usual – working from home, for example, rather than on site. Why traditional risk management practices fall short In this age of hyper-connectivity, the face of the global healthcare industry To minimize biased outcomes, one must consider non-technical attributes of devices, in addition to technical specifications and controls. In the movie 'After Earth', Will Smith asks his son Kitai to "take a knee" whenever he is out of ideas during a crisis. CISOs face the tricky challenge of minimizing costs while also investing for growth The secure by design approach for business process controls helps the organization with cost savings and business benefits. An effective Risk Intelligence Solution framework helps businesses identify risks near real-time, enabling stakeholders to take actions & decisions based on priority. Risk based approach to data privacy can help businesses manage global

data privacy risks, apply, calibrate and enforce controls based on the risk exposure Public and private sector organizations in the US are under attack by nation states... Meeting compliance requirements is not enough. It is critical that personal data is protected and privacy needs are addressed through sound governance. =====================

Make your journey secure-by-design to deliver better business outcome by using defence-in-depth and zero-trust architectures. Wipro FullStride Cloud Services industry leading cloud solutions and our Cybersecurists will help you address challenges related to compliance, data exposure, threat detection and incident response. We fuel business growth by providing secure, rapid, and frictionless Cloud and Infrastructure Security Services. Today's business leaders want to achieve success through digital transformation. Leverage cloud, hybrid security solutions with Wipro and Microsoft cybersecurity partnership and reduce security threats through enterprise/consumer IoT security etc Securing Businesses and Digital Transformations on Google Cloud Securing the AWS landscape throughout the digital journey Adopt the most comprehensive solutions and enable a secure digital transformation journey A secure VDI environment demands periodic risk assessment, maintaining the controls, and a strong action plan to mitigate the impact of identified risks.

Healthcare technology strategy and Internet of Medical Things (IoMT) have become more pertinent than ever. Wipro and Microsoft jointly hosted a CISO panel discussion on "Overcoming Security and Compliance Challenges in a Hybrid/Multi-Cloud Environment". Wipro and AWS had a great interaction over a two-day round table.... DevSecOps as a practice is getting increasing popular as organizations look to tackle ever-evolving challenges in security. The recent increase in the frequency and impact of cyber-attacks have kept Critical Infrastructure companies on their toes. With increasing technology digitization, innovation and agility have become essential ingredients for competitive advantage; regardless of industry. Technology has become the pulse of every single interaction In recent times, the media & entertainment industry has become the prime target for ransomware. As digital journeys become the cornerstone of IT ecosystems, agile has become a preferred SDLC model, inviting an abundance of open source, third party solutions to the market, and making these journeys faster and smoother. With multiple tooling options, choosing the apt application security toolset can be a challenge. There are ways you can get the permutation and combination right. To effectively manage business continuity, enterprises are rapidly working to support a remote workforce, which has become a "New Normal" way of working remotely. Do these Security Orchestration / Incident Response Platforms address the challenge of shortage of resources and having to deal with an incident in the near future? Reports suggest that, over the last two years, more than 33 billion documents faced security breaches due to misconfigurations of cloud-native services, costing businesses worldwide nearly $5 trillion. Organizations around the world have been forced to rely on remote working due to the COVID-19 pandemic. The retail sector is currently witnessing an intense technological disruption. ===================== ----- Arcticle source ----- https://www.wipro.com/cybersecurity/application-security/ ----- Application Security Application Security   What We Do Mobile and API Security Platform Security (ERP, Salesforce, Workday etc.) Threat & Vulnerability Management What We Think Form Title What We Think Contact Wipro Please fill the required details to access the content Embed security into the SaaS platforms, enterprise and custom applications that support the business. As cloud becomes the ubiquitous and predominant technology platform for transforming business, it drastically increases the enterprise attack surface making applications vulnerable to cyber-attacks. Vulnerable applications serve as a backdoor entry for threat actors to access critical organizational data. Application security process imbibes developing and testing security features to protect organization's critical assets from threats. Wipro FullStride Cloud Services and our Cybersecurists follow a secure-by-design approach that involves embedding security into DevOps. We ensure optimum security by addressing security challenges that arise with the growing ecosystem of users and services. Using advanced cyber defense, applied cyber solutions, and managed security services, Wipro provides the end-to-end protection for mobile devices. Protect organization's mission-critical platform systems to ensure real time and inline identification and mitigation of risks specific to the platforms. We help the CISOs with 24x7 real time threat monitoring to evaluate, test, analyze and remediate gaps in the security and risk posture. Get a consolidated view comprising of risk, reliability and efficiency of the infrastructure to understand your security posture As the cyber-crime ecosystem evolves, cyberattacks are becoming

more complex, creative, and tailored to the industries and organizations they target. To do this, attackers must research, prepare and seek out information on their targets prior to an attack. While each attack may differ, the general types of information an attacker is required to have to succeed remain similar. A Holistic Approach to Application Security and Risk Management With ransomware attacks continuing to dominate media headlines, it's clear that a security approach centered on prevention no longer suffices. The dark web poses a risk to all organizations, but it also presents an opportunity. Start using dark web activity to inform a proactive security strategy, and gain an advantage over your adversaries. The endpoint is the best pivot point to start the journey towards adopting machine learning capabilities for threat detection.

Managed Security Services   Managed Security Services   What We Do Next Gen Cyber Command Center – AI MDR Managed Security Risk & Compliance Managed Application Security Managed Digital Trust Managed Cloud & Infra Security What We Think What We Think Contact Wipro Please fill the required details to access the content Seamless and cost-effective management of security operations provided in an as-a-service model. Wipro's managed security services include advanced cyber defense centres, cybersecurity platforms and managed security infrastructure and operations. Wipro's Managed Security Services (MSS) differentiates through a global scale augmented by localization and regional presence, where our highly experienced cybersecurity talent pool is backed by strong partnerships and venture investments. Wipro's Cyber Defense Centers, spread across 16 locations, is powered by cutting edge technology to provide scale and cost competitiveness. We make IT and operational choices that reduce costs and improve efficiency while enhancing security capabilities. Our MSS offers operations and management of IT security infrastructures for one or several customers through a security operations center (SOC). Typical services include security monitoring, behavior analysis, unauthorized access detection, advisory on prevention measures, penetration testing, firewall operations, anti-virus operations, IAM operation services, DLP operations, and all other operating services to provide ongoing, real-time protection without compromising business performance. Wipro's 24x7 SOC and Managed Detection and Response (MDR) Service provides cyber resilience using 360' degree threat detection and response coverage. End-to-end Managed Services to transform, automate and orchestrate Risk and Compliance processes enabling effective protection, detection and response. Create highly secure applications in compliant environments backed by deep industry expertise, best-in-class platforms and scalable processes. Managed Digital Trust services and platforms to improve time to market while uncovering cyber threats and reducing enterprise costs. Build Zero Trust and Digital Identity resiliency to establish trust at scale, while detecting and preventing unusual access to data, services, software, processes and intellectual property. Comprehensive Managed Cloud and Infra Security, Risk Management and Governance using Wipro's 24x7 Cyber Defense Center and 360-degree threat detection and response coverage. Often, enterprises fail in getting a holistic view of potential security risks in the AWS environment due to the complexity of the integrated security solutions. Key Takeaways from CISO Panel Discussion

Disruptive situations force businesses to change the way they function. Stringent data security used to be an afterthought for some businesses, until privacy issues gave rise to GDPR regulations. With increasing willingness to use wearables and share personal information over the web, patients want healthcare to be delivered as a service. Healthcare providers are catering to these expectations by building their digital ecosystem, with around 60% of them having made this a top priority. Become the New Face of Global Cybersecurity

Contact Wipro Please fill the required details to access the content Join Wipro Women in Cyber (WWIC) Join Wipro Women in Cyber (WWIC) Be the change The world of cybersecurity — as with other parts of the Wipro global portfolio — is rapidly evolving and diversifying. Wipro Cybersecurity & Risk Services (CRS) is boldly leading the way. You can also be a part of the effort and reinforce a culture of diversity and inclusivity that enables innovation. We are inviting you to join Wipro Women in Cyber (WWIC), where top leaders from various functions across CRS have come together with a mission—to build a workplace where women can lead, inspire, and become cybersecurists of the future. We work with diverse, young, and motivated individuals to drive change and make this mission-critical journey successful.   What is our mission? WWIC was founded in 2022 to focus on developing an inclusive and open culture that guarantees opportunities for women in CRS. We do this through engagement, training, and enablement efforts. Our work with women helps them identify the key areas of growth and opportunity in the cybersecurity space and enhances their leadership qualities by leveraging the skills of professionals. The process ensures that women represent cybersecurity, our clients, Wipro, and themselves successfully. The WWIC strongly emphasizes four essential areas that promote awareness, encourage advocacy, and increase brand value. The four key pillars include: These components are crucial to the purpose of the WWIC. The WWIC has different programs that focus on the following: Our vision is to sustain talented women in cybersecurity The WWIC is driven by the vision of utilizing leadership and technology to shape the future of women in cybersecurity by acquiring, nurturing, and sustaining talented women within the cybersecurity workforce. In turn, we know this will support Wipro's leadership and long-term success. Our purpose Joining the WWIC is easy Email us at WomenInCyberCallToAction@wipro365.onmicrosoft.com, and we'll send you the information to join WWIC. A Logistics Firm Improves IT Reliability with Full-Stack Observability

----- Arcticle source ----- https://www.wipro.com/cloud/a-logistics-firm-improves-it-reliability-with-full-stack-observability/ ----- Contact Wipro Please fill the required details to access the content A Logistics Firm Improves IT Reliability with Full-Stack Observability Ambitions Traditional IT monitoring techniques are not enough for today's complex cloud environments. As cloud-based IT systems become more powerful and complex, companies need precise round-the-cloud monitoring and observability services to identify and resolve problems. An industry-leading logistics company recognized how valuable cloud computing could be for its parcels division, providing the flexibility and accessibility necessary to provide end-to-end support for a growing customer base. But as the client began migrating operations to the cloud, it also recognized that its business ambitions were outpacing the capabilities of its IT monitoring system. Lack of real-time visibility into IT issues was making proactive incident response difficult. IT alerts were basic and reactive, lacking the in-depth analysis that IT teams needed to fully understand and resolve IT issues. These challenges contributed to long resolution times that ultimately jeopardized the experiences of both consumer and employees in the parcels division. The client wanted to increase the strength and reliability of its IT system without sacrificing the momentum of its cloud migration. The company partnered with Wipro to incorporate observability services that would provide greater insight into the performance of applications throughout the system, including applications that managed crucial tasks like package tracking and sorting scans for trucks. The client also wanted a better connection between the IT and business teams. Action Wipro identified gaps in monitoring program and recommended a transition from traditional application-level monitoring to full-stack, business-level observability. Moving to a full-stack, business-level observability would provide a more unified view of performance across applications and business processes, allowing teams to identify incidents more easily, root causes and potential solutions. Wipro also suggested migrating from Broadcom (Introscope) to AppDynamics and implemented a single dashboard to provide real-time analytics and unified monitoring for servers, applications, infrastructure and networks, including data centers and the cloud. The new dashboard is compatible with the full technology stack and capable of integrating advanced automation tools for

critical tasks like ticket creation in Pulse/Jira. Every time the system detects parameters or KPIs that are trending towards a possible down time or anomaly, AppDynamics automatically logs a ticket for the incident, notifying the team. The client worked with Wipro to establish an Observability Command Centre (OCC), a managed service provided by Wipro to help assess, establish and manage the observability program. Together they developed a roadmap that aligned the client's IT and business team priorities, ensuring seamless end-user experience. They configured over 150 applications, created more than 800 health rules (flagging parameters) to enable alerts, installed over 300 agents and continue to monitor more than 50 critical business processes. Wipro continues to manage the OCC, providing constant observability to eliminate IT blind spots and support in-depth data analysis across each layer of IT architecture. Ambitions Realized Wipro's approach provided effective KPI metrics, eliminated rudimentary alerts, and provided data analysis for better insight for all stakeholders. This enabled real-time tracking of critical business events, improving coordination between IT and business stakeholders. Proactive monitoring helped reduce ticket volumes by 26% with zero downtime for business-critical applications. By ensuring IT reliability, the client improved customer retention, leading to increased brand reputation and business revenue. Real-time tracking improved end-to-end visibility across each event transaction, creating better coordination between IT and business stakeholders and increasing workforce optimization by 17%. Total number of orders increased by 10% and weekly revenue increased by 5% on average. Performance of other key applications like package tracking and vehicle scans also increased. Truck drivers reported better user experience for PDT devices (99.05%, up from 95%), which helped reduce shipment delays by 15%. False positives on the package tracking app reduced by 50% and overall failures decreased by 10%. Through proactive incident response, the client's IT teams were able to reduce hardware overload on servers by 20%. By establishing an observability command center, Wipro was able to help the client become more efficient and enhance its response – providing customers with a more well-rounded and positive experience.
=======================

SaaS Delivery –

A Growing Opportunity

----- Arcticle source ----- https://www.wipro.com/cloud/saas-delivery-_-a-growing-opportunity/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content SaaS Delivery – A Growing Opportunity SaaS Claims the Future, Changing the Playing Field Introduction With cloud and mobile technologies taking root, Software as a Service (SaaS) is mushrooming. Wipro's research indicates that more than half of the business software acquisitions by 2014 will be cloud or SaaS basedi. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership (TCO). SaaS implies zero upfront investment in IT infrastructure, making it attractive.

Applications such as CRM, financial accounting and management, marketing and demand generation, lead and order management, web analytics, digital content creation and ERP are among the early movers to the SaaS model. Estimates suggest that the global SaaS market was $16.7 billion in 2013 growing to $21.3 billion by 2015ii. The latest industry projections indicate that the global spending on SaaS applications will increase significantly over the next two years. In this article, we will discuss the key challenges facing Independent Software Vendors (ISVs) in their SaaS journey. The ISV Imperative: Adapt to SaaS or Die Independent Software Vendors (ISVs) must move fast to get in front of this trend if they are to retain their clients and protect revenues. The challenge for them is evident. For decades, ISVs have focused on creating and selling software. Now, given the SaaS model, they must run it too. This implies being on top of the customer's business and creating an ecosystem around products. It is interesting to note that the traditional leaders in global software markets have quickly jockeyed into position with financial engineering providing an op-ex model to clients. They have hastily invested in smaller companies offering SaaS products so that their clients can leverage SaaS models. However, these large ISVs are now in the unenviable position of selling disparate solutions to retain clients. The end result is growing complexity. It makes it very difficult for their clients to on-board and get off just as easily – which is quite the opposite of what SaaS is meant to enable.   There are five key SaaS delivery related challenges before ISVs today: 1. Product Evolution The SaaS model is as promising as it is challenging for ISVs. The primary challenge is product evolution. ISVs are not very keen to re-engineer their products because they still contribute to the bottom line. Their clients need to use their core solutions which have been built over years if not decades. To align themselves with evolving customer needs is an uphill task for most ISVs. They have either multiple products acquired inorganically or products that have been developed by diverse teams. The skills required to re-engineer these products may no longer exist within the company, thus hampering the ISVs' ability to remain competitive. Typically, an ISV may take anywhere between 18 and 36 months to re-engineer a package. This is an unacceptable time frame in an era where cloud and mobile technologies are changing businesses overnight. What about the fact that ISVs have bought smaller companies to meet the SaaS demand? Doesn't this solve the problem? To an extent it does; but each of their products is a different business line. The challenge before them is to integrate these heterogeneous products in an easy-to-consume op-ex model. 2. Customer Retention Customer retention in a SaaS delivery model is possibly the biggest nightmare before an ISV. Customers don't want to get locked in by an ISV. They want solutions that make it easy for them to switch products as well as migrate from a provider when necessary. This means an ISV must adhere to standards that enable a quick switch or migration. In such an environment, how can an ISV retain customers? The only way is to demonstrate continuous improvement in the service and to guarantee product and service innovation. For ISVs, long used to selling entire technology stacks with all components and licenses, this is a dramatic change. On one hand they need to ensure that if a customer wants to switch, the cost is extremely low, and on the other, they must continuously add value to the product and force customers to continue with their service. 3. Building Customer Insight ISVs develop solutions through a wide understanding of industry needs. They don't have access to individual

customer usage patterns and therefore they are unable to build customer insights. This has left them feature-focused rather than business-focused. In a SaaS universe this handicap doesn't exist: ISVs can track customer usage patterns and make rapid adjustments to their product and service to match customer needs. This means building real-time analytics capabilities. However, analytics may not be their core competency. In such cases, the ISV needs assistance from an SI – in fact, SIs build their business through an understanding of clients' needs.   4. Business Agility SaaS is not about selling a product; it is about service delivery. Traditionally, ISVs have been used to selling features and product upgrades. In a SaaS model, they must contend with stringent SLAs to be successful. How do they respond to customers quickly? What kind of tools do they need to support customers instead of assigning people to each customer? What kind of automation do they need to effectively service clients? In other words, how do ISVs become more agile in a SaaS model for their products? For pure play SaaS providers this is a volume game. They sell faster to customers, on-board faster and boost margins by keeping costs in control. Larger players are unable to match these characteristics. 5. Customer Experience ISVs have, for long, depended on product features to entice clients. They have to work continuously to improve client experience. The ISV must maintain a high level of transparency so that the client knows what was used, how much of it was used and at what cost. In addition, the ISV must provide the necessary services (support, maintenance and upgrades) and ensure that clients want to come back for more. In the SaaS model, an ISV sells subscriptions and pay-as-you-go solutions. Therefore, revenues are tied to returning clients. A customer's experience can spell the difference between success and failure. The Inevitable Transformation for ISVs The solution for an ISV is to bundle products effectively for different markets. SIs have been traditionally bundling products to create holistic solutions. They know how to package technologies so that features tie in to customer-specific values. How these bundles are delivered to the client is a business and not a technological problem. It is obvious that SIs can play a decisive role here. A good SI partner can be the stepping stone to a great customer experience. However, there are three distinct reasons why an ISV should partner with a competent SI to create effective SaaS models: 1. Service delivery: With data management and analytical capabilities, an SI is able to map customer needs and create a service that fits in well with business needs. The SI can then ensure smooth on boarding of customers; deliver easy-to-use self-service models through appropriate tools, mechanisms and automation; and create the appropriate subscription models. 2. Customer experience: The key to customer retention in a SaaS model is customer experience. Underlying great customer experience is the ability to build insights into how a customer uses an application, innovate around those insights and deliver value through domain-specific expertise for the 'wow' factor. An SI is well-positioned to deliver the kind of experience that is central to retaining valuable customers. 3. Maximize profit: An ISV doesn't need to build the complete SaaS infrastructure. Instead, ISVs should leverage the expertise and infrastructure of an SI to keep service delivery costs low and maximize profit. Conclusion ISVs are beginning to realize that selling a service is vastly different from selling a product. The entire ecosystem around a service comprises client needs, building business intelligence, bundling products, managing SLAs and improving customer experience. For SaaS

success, an ISV must innovate around this ecosystem. One of the ways to address the challenge is to partner with an SI who specializes in automation and has the tools and point solutions to deliver a service. The lines between product, licences, implementation, integration, upgrades, suppor t and other ser vices are being blurred by SaaS. ISVs that recognize this change and work with SIs at being service oriented will find that they are able to tap into the growing SaaS opportunity. References i. ISV-to-SaaS Business and Technology Success: Partnering for Speed and Innovation, research report by Saugatuck Technology/ publishing sponsor Wipro ii. http://www.centerbeam.com/news/Cloud-Computing/U.S.-leads-in-SaaS-adoption-CBOID122491912-GRPOID50590013/View.aspx DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. Continuous Delivery Platform for DevOps

----- Arcticle source ----- https://www.wipro.com/cloud/continuous-delivery-platform-for-devops0/ ----- Related Articles Contact Wipro Please fill the required details to access the content Continuous Delivery Platform for DevOps Accelerate Application Release Cycle through Cloud To survive and succeed in an uncertain economic environment, business models and processes must be agile and flexible. The IT organization must align itself to business priorities and adopt some bold changes to deliver business value. Today, the application development life cycle is often bottle-necked by environment availability issues: Wipro's Continuous Delivery Platform for DevOps Limited availability of environments and dependence on legacy systems drastically reduces the number of projects that can run simultaneously in your enterprise. DevOps on Cloud infuses agility and speed into IT, enabling you to react faster to your business needs, accelerate your project timelines and quickly respond to change and continuous development. Wipro's Continuous Delivery Platform orchestrates the on-demand provisioning of environments on different types of infrastructures like public cloud, private cloud or hybrid infrastructure for DevOps. DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. The on-demand provisioning of environments within this infrastructure, with all the software and application deployed and configured on it, is the key enabler for DevOps. Key features With Wipro's Continuous Delivery Platform, you can achieve Success Story Wipro saved 65% costs for a leading UK-based publishing & information provider with the Continuous Delivery Platform for DevOps. A leading UK-based publishing and information provider operating in the science, medical, legal, risk & business sector, selected Wipro for

their application transformation on public cloud (AWS). Wipro's Continuous Delivery Platform for DevOps enabled the client deploy environments across the application life cycle, in an on-demand basis, reducing both project costs and time savings up to 65%. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. What is Virtual Desktop Infrastructure (VDI)? A technology that enables your global workforce to securely access company data on their personal devices without sacrificing security.

The OSS Cloud Opportunity

----- Arcticle source ----- https://www.wipro.com/cloud/the-oss-cloud-opportunity/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content The OSS Cloud Opportunity Exploring the challenges and benefits of cloud-based operational support systems 1. Introduction OSS plays a critical role in shaping the service portfolios of CSPs. OSS not only impacts a CSP's agility to rollout new services; it also impacts their ability to measure the quality of services (QoS). However, due to exponential growth in data consumption in recent years, CSPs have prioritized investments in network upgrades over OSS/BSS transformations. Legacy OSS systems pose many challenges to CSPs, including: In addition, large carriers and wireless operators have a vast array of products in their OSS landscape consisting primarily of silos of OSS stacks to manage different network technology domains. This approach is inefficient and costly from an OPEX perspective. Although CSP revenues are growing, growth in margins is not keeping pace. In fact, for some CSPs, OPEX constitute ~60% of revenues (see figure 1), pushing margins to unsustainable levels. Network & OSS Managed Services Providers (MSPs) have gained significant popularity in recent years as CSPs outsource their network operations for cost savings. However, MSPs are also facing similar OSS challenges and are under cost pressure due to the network and OSS diversity of their clients. These OSS challenges are equally relevant for Tier 2 and mid-market operators and OSS on the cloud presents an interesting value proposition potentially addressing these challenges. Figure 1: CSP's expenditure by geography, Source: Wipro estimates based on Infonetics Research, 2011 2. The OSS Cloud Opportunity OSS solutions deployed over cloud platforms can address many of the business and technical challenges faced by the communications industry today. In this section, we explore the business potential for OSS on the cloud and consider how industry participants can deploy this opportunity. 2. 1. OSS Cloud for Tier 1 CSPs Tier 1 CSPs have multiple OSS applications. This is because of their heterogeneous technology and vendor landscape. One of the key challenges CSPs face is the management of software patches and upgrades. Due to the abundance of legacy systems, scaling up operations on an on-demand basis is another big issue. Cloud-based infrastructure offers an efficient and easy way to enable resource sharing, automation and monitoring. We propose a cloud hosted OSS solution for Tier 1 CSPs. In this model, CSPs host the OSS

solutions within their private cloud (see figure 2). It provides the flexibility to scale operations on-demand and simplifies software upgrade procedures, reducing costs considerably. Figure 2: Reference Architecture: OSS Cloud for Ti Business Benefits for CSPs Although, the OSS on the cloud model presents some challenges, it can provide significant business benefits to Tier 1 CSPs, including: 1. Reduced Costs 2. Improved Operational Agility 3. Analytics Capabilities 2. 2. OSS Cloud for Managed Services Providers Today, CSPs rely upon MSPs to improve their operations and reduce costs. One of the key challenges for MSPs is that CSPs have an array of OSS products from multiple vendors. These systems use different hardware and middleware and also have different upgrade cycles and change management processes. The overheads of managing the OSS applications prevent service providers from achieving economies of scale, significantly limiting their value proposition. We propose a cloud hosted OSS model specifically tailored for MSPs. Moving to a cloud model (see figure 3) reduces both the CAPEX and OPEX for MSPs and provides much needed business and operational agility. Figure 3: Reference Architecture: OSS cloud for a MSP, Source: Wipro Technologies   The model presented in Figure 3 includes some adoption challenges that are described below with possible solutions. Business Benefits for MSPs The key benefits of an OSS cloud model for MSPs are described below. 1.Reduced Costs 2. Operational Agility 3. Simplified Vendor Management 2. 3. OSS as a Service OSS services delivered over the cloud in a SaaS model (see figure 4) offers small-to-medium sized CSPs a unique combination of technology and business flexibility – at a fraction of the cost of traditional licensed software. This model is more relevant for Tier 2 or 3 operators in emerging markets with limited budgets. On-demand cloud services can provide the same level of business maturity to Tier 2 and 3 operators that large CSPs enjoy while also reducing OPEX.   The model presented in Figure 4 includes some adoption challenges which are discussed below, along with a recommended remediation strategy: Business Benefits of OSS as a Service OSS cloud in a SaaS model provides numerous business benefits to CSPs, discussed in more detail below. 1. Best of Breed Solutions 2. Reduced CAPEX and OPEX 3. Flexibility 3. Recommendations There are different options for delivering OSS through the cloud. Identification of systems that can be migrated to the cloud requires an examination of architectural readiness, maturity and priority of the OSS product, in conjunction with an evaluation of the OSS landscape of the CSP. The deployment approach will also depend upon the scale of operations of the CSP. We propose a step-by-step approach for migrating to OSS on the cloud for the following three stakeholders: 3.1. Tier 1 Communication Service Providers: Tier 1 CSPs typically have a large legacy system footprint and large network and IT operations. They must consider a phased approach towards cloud. IT Roadmap and Strategy IT-OSS Planning Procurement Strategy 3.2. Tier 2, 3 Communication Service Providers: Tier 2 and Tier 3 CSPs have more limited network and IT operations budgets than Tier 1's. Greenfield operators can also be considered part of this category. IT Roadmap and Strategy IT-OSS Planning Procurement Strategy 3.3. OSS Software Vendors Recommendations for OSS vendors are discussed below. Product Roadmap and Strategy Product Architecture 4. Conclusion With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. To keep pace with market demand,

CSPs will have to continue to make significant network investments. But the network is only as powerful as the operational systems that support it – OSS helps CSPs better leverage their networks and enables them to develop a portfolio of automated, high quality, secure services and applications. CSPs should carefully consider the benefits of OSS on the cloud which offers much needed scalability and flexibility that will help them keep pace with rapidly evolving market requirements. The benefits for OSS vendors and MSPs are equally important as a SaaSbased model can provide recurring cash-flows and improved operational efficiency. This decouples OSS software sales with network upgrades or rollouts. It will enable OSS vendors to quickly rollout new features in OSS solutions to a larger segment of customers. Raghavendra Tadepalli works as a Senior Consultant for Wipro's telecom equipment vendor business unit. He has more than 10 years of experience in OSS/BSS solutions and works with the Telecom Research & Development Consulting practice that offers product strategy, architecture and technology consulting to major telecom software vendors. Jayanta Dey is Vice President and Head- Consulting, Solutions and Practice for Wipro's telecom equipment vendor business unit. Jayanta is Vice President and Head- Consulting, Solutions and Practice for Wipro's telecom equipment vendor business unit. Jayanta has over 23 years experience in the telecommunications industry managing complex transformational deals and advising clients on various strategic issues. His areas of specialty include fault tolerant operating systems, network and service management and wireless technologies. Jayanta has held various leadership roles at Wipro and in the past he was also the Business Head for Wipro's Wireless Network services The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. What is Virtual Desktop Infrastructure (VDI)? A technology that enables your global workforce to securely access company data on their personal devices without sacrificing security. ====================== ----- Arcticle source ----- https://www.wipro.com/cloud/accelerate-your-transition-from-office-to-remote-work/ ----- Contact Wipro Please fill the required details to access the content With so many employees working from home for the first time, enterprises are scrambling to provide anywhere, anytime access to increasingly diverse workforces. While remote work has been a hot topic and has been gaining traction across industries for several years, it's become a necessity now, earlier than expected for many of us. So how do enterprises who might lack a standard remote work strategy or have only limited work-from-home capabilities suddenly onboard their entire workforce to a digital workspace? With the help of Virtual Desktop Infrastructure (VDI). What is Virtual Desktop Infrastructure (VDI)? VDI is a technology that enables a virtual desktop environment. In traditional server setups, an operating system is installed right on top of the hardware of a physical server. With virtualization, an additional layer is created between the hardware and an operating system, enabling the operating system to run inside each virtual machine. How does VDI work? A virtualization layer is an abstraction layer between network and storage hardware that creates a virtual version of a desktop, operating system, network, or server. A connection broker enables users to connect to a remote virtual desktop without sacrificing security across the devices allowed within your enterprise technology and mobile

policy. With VDI, users can securely access company data on personal desktops, laptops, tablets, and smartphones, and changes on a parent desktop can be easily mirrored to virtual desktops in a desktop pool. Why VDI? VDI integrates with your existing corporate IT infrastructure for effective business continuity and to support workflows and processes already in place. It can help you reduce costs by eliminating travel and storage costs in today's high-risk infection environment. VDI also increases the agility and responsiveness of your IT through cloud infrastructure and next-generation hardware, positioning you for future growth as things normalize around the world. Most importantly, in today's resource-strapped enterprises, it enables cost-effective self service, real-time desktop management. The benefits of VDI for enterprise: VDI can pave the way to a connected global workforce that's well-informed, productive, and empowered to act with confidence in uncertain times. VDI is a fast, flexible, cost-effective solution to getting your enterprise up and running even if your physical offices remain shuttered for an extended period of time. Most importantly, this technology lays the foundation for future work-from-home policies as we flatten the COVID-19 curve and resume operations in a post-pandemic world. From ensuring business continuity to managing crises: When does VDI make sense? Most enterprises have continuity plans, but even the best prepared could not have anticipated the weeks (potentially months) of disruption from coronavirus. Many businesses are still in crisis-management mode and are struggling to maintain operations, sustain employees, and continuously pivot to meet the requirements of a rapidly changing situation. Wipro's VirtuaDesk™ enables existing desktop application suites to be deployed in a cloud-based computing model without the common compatibility or performance problems encountered when deploying a vast number of applications. Wipro offers unrivaled deployment flexibility. We have deployed over 1.4 million virtual desktops for global customers and are experienced in delivering VDIs with Citrix and VMware as well as hosted VDIs to our customers. Additionally, we offer comprehensive monitoring tools to track infrastructure health and user experience. Wipro's "Cloud Ecosystem" enables businesses to offer up to an additional 10,000 desktops globally within a short timeframe. Business as usual is possible in the new normal. Enterprises can lay the foundation necessary in our COVID-19 reality with minimal disruption and upscale when needed as things begin to normalize. To learn more about how to onboard your remote workforce to a fast, flexible, and cost-effective digital workspace, get in touch with a VDI specialist.

Cloud Risk Confusion: Are you evaluating cloud migration risks effectively?

----- Arcticle source ----- https://www.wipro.com/cloud/cloud-risk-confusion-are-you-evaluating-cloud-migration-risks-effectively/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the

content Cloud Risk Confusion: Are you evaluating cloud migration risks effectively? December | 2020 This blog post is part 1 of a 3-part blog series on taking the journey to the cloud and understanding how to approach the risks involved.   When it comes to the Cloud, security remains the biggest concern for IT leaders[i]. While the cost and flexibility offered by the Cloud are appealing, the risk of data breaches and downtimes have CIOs thinking twice about moving to the Cloud. But risk is an unavoidable aspect of business. Any project you undertake has a risk element – will it be delivered on time, aligned to your strategy, and within scope and budget? Well, Cloud adoption is no different. However, in the case of Cloud, what most CIOs end up doing is focusing too much on certain aspects of the technology risk and externalized security controls. They fail to pay enough attention to all the other risks in the aggregate ecosystem they are carrying today that may indeed be even larger.   Behind the scenes: A comprehensive look at Cloud risks As they say in compliance, you can be secure without being compliant, and you can be compliant without being secure. Similarly, you can be secure in your Cloud technology without eliminating risks related to cost, schedule, attrition, service, data loss etc. When looking at risk elements for Cloud adoption, other than the usual suspects of technology, data, and security risks, CIOs need to also consider the risks associated with the Cloud strategy, operating model, economic model, service resiliency, etc. (See Fig. 1) and the various obstructions that could hinder their ability to move forward in various ways. Fig 1: Cloud Risk Elements   For instance, overspending is a risk when it comes to the Cloud economic model. You could achieve the most elegant IT implementation, but what it would cost could break your business. Spending more than planned is a frequent occurrence with as many as 69% of companies reportedly overspending on their cloud budget by 25% or more[i]. Wasted cloud spend runs into billions of dollars every year! Managing this risk is not just a financial but also a career-level discussion for many leaders. When it comes to data, there are security risks that raise questions like - Who holds the encryption keys? Where is the data? Where is the data being replicated to? Are the services externally contactable? Are we using Zero Trust? The truth is that while there are many things that are perceived to be risks on data in Cloud, a well-architected Cloud Data Platform is no more risky than any global enterprise data platform today. Creating an app migration strategy also comes with its share of risks that are a part of any transformation and not specific to Cloud. For instance, migration of applications from legacy code to new code may not duplicate functionality and result in risky/unpredictable behavior. Then there are operating risks during implementation. If you aren't geared to do it right and move too many things at the same time or too quickly, you could tip the balance. An organizational ability and maturity to manage a process, which is poorly planned and ends up partially on Cloud and partially on-prem, may end up increasing the number of Cloud to non-Cloud handoffs. This could put too much strain on existing IT resources and processes. And a botched implementation could mean unhappy employees and attrition that could further damage operational stability. These risks have nothing to do with Cloud as a platform! In essence, risks to Cloud Adoption are absolutely complex and multi-dimensional and managing them, like managing Cloud adoption, requires an integrated strategy.   An integrated approach for cloud risk management For successful Cloud adoption, the planned initiatives must have a balance of risk vs. reward in a specific timeframe. For example,

you may want to consider: A good approach would be to map out what is the risk to business, what are the potential benefits, and what will be the cost to achieve these (See Fig 2). For example, let's say you've planned 7 initiatives A, B, C, D, E, F, and G over three quarters. In Q1 when you go ahead with A, B, and C the aggregate risk and cost is acceptable, but benefit is insufficient. Similarly, in Q2 when initiatives D and E roll out, the benefit is high, and the cost is ok, but the risk is too high. This mapping can be done for all initiatives planned for the entire journey and optimized accordingly. For example, in Wipro Cloud Studio, we have a methodology to classify projects and programs in a standardized way, which helps consistent treatment of these within an enterprise's overall risk posture and level of comfort. Is the Cloud really worth it? All of these elements of risk are not unique to the Cloud and externalization of services is certainly nothing new to organizations. And indeed, material outsourcing (as defined by the regulators) is also nothing new to organizations. So, where does the Cloud come in? Talking about mitigating and managing all these risks that could come in the way of successful Cloud adoption could sound like a lot of work. And honestly, is that effort worth it? Well, the short answer is YES. We believe that the benefits of Cloud far outweigh these risks, and that with a strategic approach and partnerships like Wipro's Cloud Studio, it's quite possible to manage them. In fact, we will go so far as to say that the reverse is true and that adopting Cloud has the potential to not only improve your overall security but also reduce your level of risk across all the axes mentioned. In the next article, we'll continue this discussion and talk about how Cloud actually cuts down cost and risk significantly.   Please click here to read part 2 (Balancing the Cloud risk equation) of the blog series. Refrences   Gavin Williams Senior Partner, Cloud Consulting, UK and Europe Gavin has 25 years of experience with enterprise customers, helping them drive business success through innovative technology solutions. He works with different customers throughout the UK and Europe to understand their business needs and help them set technology strategy and direction. He also has in-depth and extensive knowledge of customer business challenges with board-level messaging. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Balancing the Cloud risk equation

----- Arcticle source ----- https://www.wipro.com/cloud/balancing-the-cloud-risk-equation/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Balancing the Cloud risk equation The fallacy that change is always more risk, and why Cloud makes a better business case January | 2021 This blog post is part 2 of a 3-part blog series on taking the journey to the cloud and understanding how to approach the risks involved.   I mentioned in my last post the need to assess many types of risk. Security is often highlighted as one of the primary ones.

Let's start with a well-acknowledged fact: Cloud Service Providers (CSPs) are the most cyber-attacked entities on the planet. Therefore, they have the greatest single conglomeration of security experts, who know the ins and outs of security, which you'll find anywhere (with the possible exception of government agencies). For example, even back in 2016, Microsoft invested $1Bn on security alone – a spend non-CSP companies cannot match or justify. And since then, all CSPs have continued to invest and grow their security capabilities in a similar fashion and will continue to do so in 2020 and beyond.   While arguably, Cloud may introduce some new risk to you, the total value from working with these hyper-scalers in Cloud is unparalleled. They are solving problems that non-CSP companies haven't even begun to conceive. Going Cloud native with a CSP has a much lower level of overall risk because you are leveraging the experience and expertise that comes from building Cloud infrastructure, fabrics, and security on a global scale. Since their solutions affect millions of customers with a presence across multiple countries all around the globe, and in different jurisdictions, hyperscaler CSPs put in an enormous amount of engineering effort that is just not possible in one-off builds. Therefore, when you use just for example in Data services such as AWS Aurora, or Google BigQuery, or Azure Synapse, you know that it works – and that it works much better than anything you could build in-house. You can rest easy knowing that they have been designed based around the accumulated challenges and lessons of those millions of customers around the world, in aggregate. This focus and investment makes Cloud safer and more reliable than on-premise models with the added benefits of cost effectiveness, manageability, stability, predictability, reliability, and transparency. Why is Cloud risk such a big decision factor then? Well, mostly because companies are looking at risk through the wrong lens. Risk needs a multidimensional lens As we mentioned in the previous post, most companies make the mistake of looking at Cloud risk like they look at Cloud cost. Cost is two-dimensional – you have the number of applications, you have the average cost per application, you multiply that, and you get the total cost of applications. Similarly, if you reduce the number of applications or reduce the cost per application, your total cost goes down proportionately. I will talk more about cost implications of Cloud in my next article. Risk on the other hand is three-dimensional and even a small reduction in risk in one area can have a significantly higher impact on the overall risk exposure (See Fig. 1). Total organizational risk is often based around complexity. When you move applications to the Cloud using Cloud services built on a global level, the complexity and the risk of your environment goes down. In a multi-dimensional model, tackling one area and reducing it by half through cloud, can reduce total risk/complexity exposure by 4x-8x. A 25% reduction in application risk factors can lead to a 75% reduction in operational risk. In addition, the operational risk you reduce by moving to Cloud outweighs the risk of lock-in and portability. As mentioned above, one of the biggest challenges in assessing risk is using the right lens to look at it. Based on my personal experience in dialogue with CSPs, clients and other parties, when 10 risks are called out, then usually, out of every 10 risks for Cloud: So only one or two risks remain. And even in that, the biggest risk we see is not the Cloud itself but the successful transition of the organization into a Cloud-powered organization. Think of it this way – you are driving on a highway and want to change lanes. Both the lanes are safe by themselves, but the

change may come at some risk. Now imagine if you make this change while changing your steering console AND changing the driver! That is the risk that organizations should really focus on – the risk that comes with a combination of technology improvement, process improvement, operational improvement, and upskilling and cross-skilling of existing resources for a migration. It is all simply about change and there is nothing inherently risky or different on cloud versus legacy - the risk is the organizational journey. Please note: We are not saying that the cloud is riskless or that any journey is riskless, but rather that the unreliable/unknown dependencies and failure items have had much more engineering into their reduction/elimination. Are you making the right decisions? A click down on risks A typical application landscape in an organization is often a big ball of mud of organically grown legacy. This is not a criticism but a reflection of the well-known truism that technical debt increases over time. Let us not forget, for example, that COBOL turns 60 today, and some applications in your enterprise may not be much younger. The total number of things that interact with each other inside a major enterprise application platform can be almost mindboggling. Everything is touching everything and connected in a complex way in all directions. What you have here, is change risk. If you change anything, you have no idea what it might impact. It could affect code stability and create security, latency, or people risks. Terrified of what might happen if they meddle with the system, organizations resist change, and that costs them in terms of strategic growth – which is a higher cost to pay. This was happening to one major financial client of ours. They had a host of legacy applications and the bank's change budget for them was surprisingly low and didn't present a lot of saving opportunity. But when we dug deeper, we realized that the change budget was low because they didn't want to open that can of worms. Every time that they had tried to make changes in the past, it had cost them millions of dollars while messing up other parts of this complex ecosystem. So, all this while they chose to not change, accepted that limitation, and instead ended up risking business growth. Another aspect organizations often consider is business knowledge. They believe they know more about their systems, processes, and their complexities than an external provider ever will. This leads them to believe that moving to Cloud will mean a loss of this knowledge. This was a concern that yet another major bank voiced when discussing Cloud transition. They had people with over 30 years of experience on their systems, who knew their application processes inside out. And they were reluctant to let go of this control. But what they failed to consider was that they were dealing with a much greater risk, this is particularly (and tragically) relevant in today's COVID-19 world. If you have a high people dependency, you have higher risk. What if the key people you depend on retire, resign, or meet with an unfortunate accident? What is your fallback option? It's much less risk to move key applications away from terribly complicated environments to the Cloud. It doesn't help that people are also resistant to change. Change is inconvenient. It means they have to learn to do things a new way. If they have been working on something a certain way, they don't want to change it no matter how great the new option is. On the other hand, the transformation to Cloud involves one of the most exciting opportunities for enterprise application owners and developers to not only improve the stability of their applications but also to stand on the shoulders of giants in terms of automation and service innovation. This also allows them to spend

their time on business improvements and on learning new (and highly market valued) skills instead of mitigation activities that have already been solved by CSPs. Break the mould to unlock business gains Traditional decision models are not suitable when it comes to evaluating a move to the Cloud. CIOs need to adopt multi-dimensional thinking and look at the impact of each scenario on the business KPIs. Isn't it worth investigating whether you can trade 10 old risks for three new ones? Either way, you are dropping seven of them! In the next article, we'll talk a little more about these models and how a right approach can fast-track your business toward achieving ambitious goals.   Please click here to read part 3 (The key to achieving ambitious Cloud goals, bringing Costs and Risks together) of the blog series.   References: Gavin Williams Senior Partner Cloud Consulting Gavin has 25 years of experience with enterprise customers, helping them drive business success through innovative technology solutions. He works with different customers throughout the UK and Europe to understand their business needs and help them set technology strategy and direction. He also has in-depth and extensive knowledge of customer business challenges with board-level messaging. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. ======================

The key to achieving ambitious Cloud goals, bringing Costs and Risks together

----- Arcticle source ----- https://www.wipro.com/cloud/the-key-to-achieving-ambitious-cloud-goals-bringing-costs-and-risks-together/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content The key to achieving ambitious Cloud goals, bringing Costs and Risks together January | 2021 This blog post is part 3 of a 3-part blog series on taking the journey to the cloud and understanding how to approach the risks involved.   In my previous articles, I focussed on the risk areas of a cloud ambition, but what happens when you tie this into the economic cost model as well? In the post-COVID era, businesses are very cost conscious. But innovation and growth cannot be side-tracked for cost constraints. In times like these, a strong Cloud migration strategy can not only fund itself but also open floodgates of opportunities for companies trying to make sense of the new normal. Cost and value are not always aligned In any organization, there are usually thousands of business applications running and their cost vs. value equation looks something like the one shown in Fig 1. A few applications will have very, very high cost, but likewise also have very, very high strategic needs. On the other hand, there will be apps that are adding to the cost but have no discernible business value. For example, one of the major clients we were working with had a

portfolio of 3,000 business applications. Of these, the top 25 applications controlled 25% of the total cost, top 150 applications controlled 33% of the total cost, and the top 500 applications controlled 50% of the cost. Often, for decision making, particularly in a "material outsourcing" discussion such as cloud, businesses tend to look at the total cost of applications or the average cost of applications. That could be misleading because the true business value and cost are not really aligned. Tackling the cost challenge There are two ways to reduce the total application costs of a business (See Fig 2): These two activities together result in fewer, more strategic applications that are more modern and can be run at a lower cost per application. Here's how it happens. Cloud allows you to select the price you want to pay by opting for services you would like to avail. This is a typical Starbucks model - if the only thing you want is a Straight Black Americano that's going to cost you £2. If on the other hand you want a Venti Soy Chai Latte with Almond milk then you pay £5.80 – a premium for all the add-on services. The same model works for Cloud. To arrive at a Cloud price, you look at what your core application complexity is and what your non-functional requirements are, what SLAs you need, and then what is the Cloud model you are looking at. In an on-prem model, you buy for the peaks and worry about returns, whereas Cloud gives you the flexibility to buy for the valley (the lowest requirement) and scale to the peaks as needed. This way, you can adjust for changes in core complexity, non-functional requirements, and SLAs for each application. For instance, one of my clients was a leading credit-rating company and had a data centre in the UK. It was an exceptionally robust, secure, and resilient data centre and cost a lot to maintain. And so, any application that was hosted there, no matter how trivial, had super resilience and cost a fortune. The question is, do you want all your applications at this level of resilience, or could you move the non-strategic ones – like facilities management, conveyance etc. – to the Cloud? Usually, in an Enterprise environment, there isn't in-depth granularity on how apps are managed. Mostly with a "pack the rucksack" model of bundling as many applications and workloads together as possible, which is heavily influenced by traditional capital asset- utilisation considerations, low-value applications get clubbed together with high-value applications. And as a result, they get the same level of service as a strategic app. This additional service is expensive and not required for a low-value app. Breaking this model and getting to a hyperscaler Cloud can ensure application services much better tuned to the value and needs of each application without the added consideration of infrastructure or middleware expenses. The ambitious vision: a low cost, low risk, future-ready application landscape Which CIO wouldn't want an over 30% reduction in application costs while retaining the app performance and reducing risk? The two-pronged approach outlined above, along with the risk discussions in the previous articles makes this ambitious vision possible. At Wipro Cloud Studio, we have developed expert capabilities to help our clients achieve this ambitious vision, and we do these transformations routinely. One of our clients had an application landscape with 810 apps that cost $62 million to manage – this meant their average cost per application was $76,000. We helped them analyze all their applications and identify low value, duplicate, and zombie apps. By eliminating these apps and deploying microservices, they were able to cut the long tail by 15%, bringing down the total number of apps to be addressed to 688. This reduced the total potential cost of applications by

20%. In addition, by moving to the Cloud and using the model discussed above, we showed them how they could reduce their cost further, bringing the total cost to $42.2 million and the average cost per application down to $61,000 – that's a 32% reduction in cost. Creating a continuous working capital fund for Cloud initiatives We've seen how it's possible to significantly reduce application costs. These savings can be reinvested to fund new initiatives. However, like any other initiative, Cloud migration also requires initial investment before it can pay for itself. If you don't make the initial investment, you don't realize any savings that could fund further changes. To ensure this initial investment, CIOs need to build the business case and work together with business leaders, technology partners like Wipro, and CSPs to establish a starter fund. Once the savings are realized, a portion of the savings goes back to the business and the remaining portion continues to get reinvested for more improvements (See Fig) Supporting all of this is the crucial consideration discussed in the previous POVs- POV1 and POV2, which is that by moving onto a Cloud fabric which has been built on a planetary scale with SKUs, continually tested on their service reliability and resilience, where every piece of code has been tested by millions of services on millions of clients, you significantly reduce your risks. In this instance, the client's operational risk reduced by a high double digit %. Don't be misled by the myth of Cloud being risky. It is the only way to build an agile, future- ready IT platform. And the time to make this shift is now. If you want to know how Cloud can benefit your business, write to me at gavin.williams@wipro.com . Please click here to read part 1 and part 2 of the blog series.. Gavin Williams Senior Partner Cloud Consulting Gavin has 25 years of experience with enterprise customers, helping them drive business success through innovative technology solutions. He also has in- depth and extensive knowledge of customer business challenges with board-level messaging. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Extending cloud journeys by migrating VMware workloads to the cloud

----- Arcticle source ----- https://www.wipro.com/cloud/extending-cloud-journeys-by-migrating-vmware-workloads-to-the-cloud/ ----- About the Author(s) Related Articles Contact Wipro Please fill the required details to access the content Extending cloud journeys by migrating VMware workloads to the cloud January | 2022 Background and motivation: Over the last few years, enterprises across the globe are embracing digital. The

COVID-19 pandemic has accelerated this trend to enhance customer experience, explore innovative cash flow models, mitigate supply chain disruptions, and explore M&A opportunities. Cloud technologies enabled these business goals by paving the path for innovation, automation, and cost optimization. Classical cloud adoption for many companies has been a green-field approach. Enterprises created many new cloud-native applications as a part of digital-readiness initiatives. These applications are often add-ons to the existing core business solutions, focusing on customer-facing areas where innovation was most urgently required. As a result, many enterprises still run their core business solutions on virtualized infrastructure1. Virtualization has helped reduce operating and capital costs and increase information technology (IT) productivity and agility. However, these infrastructures often lack multi-site failover capabilities and do not meet the business's elasticity. They run in a single data center and might have a failover site where they plan to resume business in case of failures, but this is very constrained in most circumstances. Additionally, despite an apparent demand for 24×7 business and zero downtime, it is expensive to make workloads available in multiple global regions close to the customers. Furthermore, the existing central data centers introduce latency issues. Infrastructure designs that solve these problems require a significant budget, time, and effort from IT and business departments. Hence enterprises are looking at options to continue to run their core business solutions with minimal investments while remediating the technical debt and optimizing the costs. Wipro FullStride Cloud Services2 partners with enterprises to migrate applications to the cloud to help customers achieve the scale, intelligence, and agility required to stay competitive and generate value. Wipro is a cloud innovator and expert in cloud strategies that balance the efforts, investment, and risks of migrating workloads to the cloud. In the past, Wipro has partnered with virtualization technology companies, like VMware and other cloud providers, to provide thought leadership on the migration approach. First, this article discusses business and IT considerations for migrating existing core business solutions lying on virtualized infrastructure, specifically VMware, to the cloud. Later, it reinforces the importance of adopting the correct planning and execution method for such migrations.   Extending VMware workloads to the cloud: Considering the significant budget and IT efforts required to migrate core business solutions to the cloud, enterprises are now adopting the strategy of expanding on-premises VMware infrastructure to manage VMware in the cloud. All major cloud providers offer fully or partially managed VMware services with the required components like vSphere, vCenter, vSAN, NSX-T, and HCX that companies can govern within a cloud provider management console. Compared to classical cloud migrations, one of the significant reasons for moving on-prem VMware workload to the cloud is the ability to execute zero downtime 'vMotion' based migrations while preserving IPs and hostnames of the migrated VMs. This advantage allows for totally new cloud migration concepts compared to classical approaches, as migrated VMs can continue to provide their services on their own IPs and network names even during and after the migration. In such a migration, enterprises gain the most relevant benefits: elasticity, scalability, and move to a pay-as-you-go model that converts CAPEX to OPEX for business. Companies can now execute a scale-out of adding new nodes to a cluster in 20 minutes and eliminate managing underlying hardware infrastructure

components by consuming a managed service. VMware resources can spin up in any geography following business requirements without the need to book into a data center in that geography. In addition, enterprises can continue to use the existing management stack and team skillset on the ground without the need to up-skill everyone within the organization during a cloud migration. Planning and execution: Even though consuming managed VMware services in the cloud eases the migration journey by setting up and running the infrastructure, migration of VMware workloads to the cloud comes with its challenges. A case in point is a Layer 2 stretched network that extends on-prem networks to the cloud, introducing network latencies that must be analyzed and considered before migration. Also, preserving and enhancing the current level of security is crucial when cutting over the network gateways to the cloud. This transition is an important step that requires existing on-prem packet filtering firewall capabilities and IDS/IPS systems built in the cloud. "Despite a zero-downtime lift-and-shift migration by nature, successful migration of VMware workloads to the cloud requires technical expertise and collaboration from multiple disciplines, e.g., networking across the entire VMware stack, backup services, security, and program management.", says Tim Lapawa, Technical Lead for VMware Compute Enterprise at Wipro. Enterprises often miscalculate ROIs because the economics of cloud migration involves several costs over and above cloud consumption and server depreciation. "Such a migration involves specialized tools for discovery, assessment and migration, backup and disaster recovery tools, several other systems and subsystems to inter-operate, and several execution teams to collaborate," says Pramod Nair, Head of Architecture at Wipro. Wipro works with clients in designing a proper migration strategy and planning, orchestration, integration, and simplification across the cloud partner ecosystem towards a successful migration of VMware workloads to the cloud. Wipro proposes a 7-S framework while planning a migration of VMware workloads to the cloud: Wipro helps enterprises discuss the right questions and evaluate the technical aspects of a successful VMware workloads cloud migration. We also work with clients to provide thought leadership and technical solutions to add modernizations like software-defined networking, distributed firewalls, modern IDS/IPS concepts. Wipro advises conducting MVPs and POCs to have an incremental approach to perform partial workload migrations and testing for complex architectures with no prior migration history. As the cloud migration and post-migration phase requires a proper balance of team comprising of infrastructure, application, and cloud experts, the 'structure' component of 7S becomes crucial. Hence, skilling them and defining their roles is essential. Wipro works closely with clients to provide end-to-end support in their cloud migration journey, including designing cloud excellence centers, governance models, and operating team structures. Wipro's capabilities: As companies typically execute VMWare migration within the context of a general cloud adoption strategy, it is essential to be supported by a partner that can cater to all technical, security, operational, and financial challenges aspects of cloud migration. Wipro delivers transformative cloud migration journeys to clients across geographies and industries with highly skilled teams to strategize and implement cloud migration. Wipro FullStride Cloud Services leverages proprietary tools and frameworks from our Cloud Studios and our partner ecosystem to deliver cloud migration engagements. In the case of VMware

workload migration to the cloud, Wipro FullStride Cloud Services brings together its partnerships with VMware, the partnerships with the hyperscalers, and the associations with the core business systems vendors. We work closely with the customer stakeholders such as the application teams, infrastructure teams, security, and operations teams for a successful migration. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Redefining Application Modernization:

An iterative approach leveraging Strangler Pattern on AWS Cloud

----- Arcticle source ----- https://www.wipro.com/cloud/re-defining-application-modernization-an-iterative-approach-leveraging-strangler-pattern-on-aws-cloud/ ----- About the Author(s) Related Articles Contact Wipro Please fill the required details to access the content Redefining Application Modernization: An iterative approach leveraging Strangler Pattern on AWS Cloud March | 2022 Business imperative As organizations continue to look for ways to increase business agility, reduce costs, and improve business resilience, accelerating the move to the cloud and modernizing their legacy apps are high on CIO agendas to help their business achieve those objectives. Cost and risk are chief among the modernization challenges faced by organizations. Cost: Complete refactoring of applications using microservices architectures can be a costly exercise, as companies have to pay a premium to hire staff with experience in modern software

development tools, re-skill their workforce and possibly outsource to speed up development effort. Risk: Organizations already saddled with technology debt are often fearful of venturing into full-scale modernization projects due to potential cost and schedule over runs, that could impact benefit realization and return on investment (RoI). Current strategies Organizations embarking on cloud migrations have a number of choices – including rehosting and/or refactoring their on-premises monolith applications. Rehosting is often the easiest, as they can quickly lift and shift their monoliths to AWS with minimal effort, resulting in quick time to value. With rehosting onto AWS, Wipro FullStride Cloud Services has seen clients immediately start taking advantage of the benefits of the cloud – such as getting access to elastic, on-demand scalable infrastructure; high availability of applications; and migrating managed database services. The other choice they have is to refactor their applications into modern, microservices-based, cloud native architectures and then bring them across to AWS. While this approach will drive higher agility for the organization, it will require significantly more effort resulting in longer time to value realization. Wipro FullStride Cloud Services Framework for Application Modernization and Monolith Refactoring leveraging Strangler Pattern on AWS cloud Wipro FullStride Cloud Services has a robust framework for Application Modernization that covers various modernization levers and initiatives. Typically, application modernization has multiple dimensions and a few of them are depicted in the figure below. A more specific guided approach for application modernization on AWS is elaborated further below. Modernizing Applications on AWS An alternative approach to modernizing applications— called the strangler (or fig) pattern—is increasingly being adopted by organizations. The strangler pattern offers a cost-effective, middle-of-the-road option to incrementally modernize your monoliths once they have been rehosted on the AWS Cloud, delivering incremental value along the modernization journey. Strangler pattern strategy Let's see how the strangler pattern can be put into practice to modernize a monolith. Step 1: Rehost-application The first step is to rehost your application using Amazon EC2 Auto Scaling Groups and Elastic Load Balancers in a multi-AZ design with a managed database service such as Amazon Relational Database Service (RDS). Step 2: Façade with Amazon API Gateway API Gateway can act as a proxy to your application, creating the façade and allowing you to safely rearchitect your application. Step 3: Detect and measure hot spots Using observability services like AWS X-Ray or Amazon CloudWatch, you can identify hotspots to help you locate potential seams or domains to decompose the monolith. Step 4: Create AWS Lambda for top hot spot The parallel system functionality can be built using AWS Lambda for compute and Amazon Dynamo DB for transactional databases. To migrate data from the Amazon RDS to the new DynamoDB tables, Amazon Database Migration Service can be utilized. Step 5: Canary release You can use API Gateway Canary release to redirect a portion of traffic to the new service to test the functionality, before cutting over fully. Step 6: Iteratively strangulate Repeating steps 3-5 you can identify and decompose areas of the monolith, using the appropriate services. Step 7: "Not with a bang but with a whimper" When you have completely decomposed and modernized the application you can remove the monolith resources, not with a "big bang" cut-over, but quietly and without any disruption to your end-users. Wipro FullStride Cloud Services and AWS Cases for Application Modernization

Wipro FullStride Cloud Services and AWS have assisted several customers for application modernization that has resulted in incremental business value, cost reduction and increased feature agility. Some of examples are as below: Summary/Conclusions For organization wanting to modernize their legacy apps but have little or no appetite for big-bang refactoring due to cost and risk considerations, iterative app modernization using the strangler pattern offers a compelling value proposition. Once functional decomposition of the monolith has been performed, use observability data to find components which have scalability requirements and offer high modernization value to the business. Apply the strangler pattern to modify these components first to showcase time savings/realized business value of iterative app modernization to stakeholders. AWS services like API Gateway and AWS Lambda are accelerators and they don't require you to "spend to save" – no extra infrastructure is required. Gautam Nadkarni Chief Architect, Wipro FullStride Cloud Services, leads the Enterprise Architecture and Application Cloud Services for the APMEA region. He assists the Wipro customers in technology transformations and architecting technology solutions for business problems. Ian Hughes Ian Hughes is a Sr. Partner Solutions Architect at AWS based in Perth, Australia. His area of depth is in Serverless Architecture, and he works with partners in Australia to help them modernize workloads in the AWS cloud. Senaka Ariyasinghe Senaka Ariyasinghe is a Partner Solutions Architect at AWS based in Sydney, Australia. In his role, Senaka supports Wipro's cloud migration and app modernization teams in the APJ region.   The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. ===================== ----- Arcticle source ----- https://www.wipro.com/cloud/industry-cloud-innovation/ ----- Contact Wipro Please fill the required details to access the content Industry Cloud October | 2022 The evolution of cloud: The growing use of industry-specific clouds The value that cloud technologies deliver has grown exponentially over the last few years, providing greater business agility and new ways of working that have been greatly accelerated in response to the pandemic. Remote or hybrid workforces have become common, with people gaining access to real-time information from anywhere, anytime, on any device. Business teams are also gaining vital market insights and processing huge amounts of data, thanks to cloud-based applications, AI/ML platforms, and automation tools. In this hyperconnected ecosystem, the increasing benefits of cloud as the transformational platform to build businesses are undeniably clear, and with cloud capabilities evolving, the business opportunities are expanding. For many enterprises, continuing this trajectory of growth requires finding innovative ways to stand out from their competitors and ensure they're getting the most from their cloud investments. Due to increasing data loads, access to information, and the rapid pace of change in today's volatile landscape, brands will have to adjust their cloud strategies and not remain locked into a static approach that will fail to deliver business value. Industry cloud: The next wave of cloud innovations Cloud advancements and a cloud development mindset have ushered in a new era, and among the new fields and advancements is the

creation of industry-specific clouds. These custom-built cloud solutions are specifically designed to address unique industry challenges and nuances to provide greater advantages than standard cloud platforms, which are limited in their ability to provide industry-focused advantages. The speed of competition and growing customer demand require that brands have a fast, scalable cloud platform that can handle the latest market trends and meet changing customer expectations. In response to these challenges, industry clouds provide opportunities to enhance workflows bespoke to the specific industry requirements, resulting in optimized processes, operations, and cost reductions. By adopting a full-stack, cloud-native platform custom-built according to industry needs, a brand can quickly build new data architectures and cloud-native applications, and for enterprises planning an end-to-end cloud transformation, industry-specific platforms provide an effective path forward. Whether an organization is looking to make its supply chains more resilient, its healthcare portals more customer-focused, or its retail operations more agile, industry cloud solutions can put these opportunities in reach. Industry transformation: Driving new advantages As organizations refocus their cloud operations with industry-specific strategies, they create a foundation for receiving new benefits from them. Becoming an intelligent enterprise is a primary goal for most businesses, and they can make progress toward achieving this with the range of advantages industry clouds put in reach: Developing a strategy for cloud innovations Putting these benefits in reach requires a business-led and technology-enabled strategy for adopting industry-specific solutions, and major industries have developed bespoke cloud strategies for realizing these advantages. Among them is the automotive industry, which is transforming its engineering processes to offer software-defined vehicles (SDVs) with embedded features built on AI, ML, and IoT capabilities. It's expected that within the next decade fully connected SDVs will be what the majority of people are driving, and cloud technologies are powering these engineering breakthroughs. Cloud-enabled SDV algorithms can deliver valuable information to drivers and provide seamless software upgrades, allowing a next-generation driving experience while empowering an automotive cloud ecosystem. By adopting industry cloud solutions, auto brands can completely reimagine the possibilities of vehicle software and create opportunities for business growth. The cloud is the center of any digital transformation, and now industry transformation is the next big driver for cloud as the essential component for business growth. While cloud has enabled companies to reinvent their operations and customer engagements, now industry cloud can go one step further to fuel new business value unique to the special needs of the most demanding industries. In today's Industry 4.0 era, being able to thrive hinges on defining a cloud strategy and platform tailored to an organization's needs and goals. Industry cloud expertise and solutions can evolve what is no longer the purview of IT executives alone, but a critical responsibility for most of the C-Suite, allowing enterprises to leave their legacy systems behind to develop a comprehensive strategy for driving innovation and positioning them to face the challenges of tomorrow.
=====================

Retail Industry Cloud: Innovate retail operations and customer experiences with industry cloud

Retail Industry Cloud: Innovate retail operations and customer experiences with industry cloud The changing retail landscape Being customer focused is a constant priority for any retail brand, and now that omnichannel engagements have completely changed the shopping experience, it's vital that retailers have a modernized infrastructure in place. Supply chains continue to pose challenges for retailers as disruptions continue, and hybrid shopping experiences that blend digital and in-store interactions are now here to stay. The digital transformations that enabled retailers to remain competitive in the past mustn't remain static. Being able to continue serving customers effectively requires a continued focus on enhancing engagements across each touchpoint and utilizing data effectively to prevent gaps in inventory and stay in step with market trends. To become more customer focused and meet omnichannel expectations, retail brands are developing transformation roadmaps around a series of crucial goals: Achieving these business goals allows a business to prepare for future challenges, create innovative business models, and remain competitive, yet the key is having the right tech solutions in place. Through cloud-based tools, retailers can strengthen inventory tasks, create new business models, and reduce their environmental impact.   Delivering retail transformations with Wipro's Retail Experience solutions   Designed to help retailers evolve their businesses, Wipro's Retail Innovation Experience offers a portfolio of industry-specific solutions built on Microsoft Cloud covering the range of retail challenges. These solutions further expand the retail-focused offerings that Wipro provides to optimize and modernize retail operations and customer engagements.   iShelf Insights Our AI-driven solution, iShelf Insights, enables brands to deliver reliable customer experiences. It provides an effective way to monitor store shelves in real-time and detect incorrectly placed or missing items. Teams can reimagine their planogram management, ensuring that products are properly showcased, in stock, and priced according to specifications. Keeping all those factors in alignment can drive positive customer experiences and drive sales opportunities.   Unified Customer Intelligence Knowing how to best engage with customers depends on having a unified, data-driven view of them. Unified Customer Intelligence allows retailers to create a single source of truth for their engagement efforts, allowing them to better understand a customer's shopping journey and develop targeted engagements. It unifies data from various touchpoints (including points of sale, customer relationship management systems, and MarTech platforms) to gather intelligence on customers' preferences and perceptions on various topics based on reviews and feedback. Using the solution's capabilities, brands can better predict

customer churn and create omnichannel experiences with personalized recommendations that drive strong conversion rates.   Smart-Track   For supply chains to work as expected, products need to be kept from damage due to temperature changes, improper handling, or tampering. Wipro's Smart-Track enables high visibility across the transportation process to strengthen security and reduce cold chain waste. Using the solution's IoT-enabled tools, retail brands can track and monitor transit operations in real time, and consumers can be assured they'll purchase quality products.   Endless Aisle   As a "buy anywhere, fulfil anywhere" solution, Endless Aisle enables customers to find products from a global inventory via in-store kiosks, providing access to inventory across stores, data centers, inventory-in-transit, and suppliers. Through these kiosks, retailers can offer merchandise that isn't physically present at the stores, take orders, and fulfill them from anywhere in the supply chain. As a result, brands can avoid lost sales from out-of-stock scenarios, expand business opportunities, and reduce inventory carrying costs.   Realizing greater business value with industry cloud solutions By adopting these cloud solutions in conjunction with Wipro's other retail-specific solutions and expertise, retail brands can work toward meeting their business goals, overcome industry challenges, and gain a range of benefits: The retail industry has seen unprecedented change over the last few years, and as cloud technologies have become a key asset in maintaining customer engagements, further advancements are necessary to staying in step with consumer demands. Creating a multidimensional store requires cloud-driven solutions that can handle the industry challenges and enable brands to fully modernize operations. With Wipro's Retail Innovation Experience and our other industry-specific solutions, retail brands can strengthen their ability to know their customers and expand their tech maturity to become more resilient and future ready.

Energy Industry Cloud: Cloud modernizations are driving energy industry innovations

----- Arcticle source ----- https://www.wipro.com/cloud/cloud-modernizations-are-driving-energy-industry-innovations/ ----- Contact Wipro Please fill the required details to access the content Energy Industry Cloud: Cloud modernizations are driving energy industry innovations The need for continuous innovation has become a business imperative in the energy sector due to a range of challenges. The fundamental issue impacting both energy suppliers and consumers is the development of innovative pathways toward the energy transition and meeting net-zero targets. Other factors increasing the urgency of transition are various geopolitical events and economic uncertainties. Energy demands are increasing exponentially each year, and energy suppliers are researching how to mass-produce sustainable energy products. As product research picks up, new entrants in the energy products market are sensing the larger growth opportunities. Faster innovation requires on-demand infrastructure provisioning, industry

common data models (CDM), and APIs to build working prototypes of new ideas and then market those prototypes for faster customer/end-user feedback. To meet these innovation needs, industry cloud, which is a layer of CDM and a collection of industry-specific APIs on basic cloud services, is getting more and more popular.   The energy transition, as a major industry goal, involves various initiatives. These include cloud-native development of digital value chains, leveraging industry cloud and exploiting heritage IT to increase reuse and drive efficiencies in the existing infrastructure. Enhancing operational capabilities with an industry-specific solution can enable organizations to gain a range of advantages that result in improved customer experiences and new levels of growth.   The cloud-driven opportunities in reach   At one point in time, cloud platforms were seen solely an IT asset, but today cloud technologies provide a foundation for data-driven market insights, greater business agility, and improved resiliency. As a result, organizations are recognizing that data-driven cloud platforms are vital to achieving business goals. By modernizing cloud infrastructures, energy enterprises can reimagine their service delivery and business models through a series of cloud-based advantages.   Creating digital value chains with data aggregation   Energy transition pathways need new digital value chains, both natively built on cloud and existing value chains transformed to exist on cloud. As an example, let us look at hydrogen as a low carbon fuel. With time, hydrogen is becoming more and more viable, transforming the heavy surface transport sector. The adoption of hydrogen requires new digital value chains in production and retailing, while transportation capabilities will be developed largely by reusing the existing liquified natural gas (LNG) infrastructure, a classic example of repurpose and modernization. Developing new value chains and modernizing the existing ones will require the efficient use of digital technologies, enabled by relevant insights coming from the vast amount of data being generated at every point of the value chains. Cloud solutions, both basic cloud services and industry cloud solutions, can help bring data sitting in silos to a common repository and run analytics on it to extract relevant insights.   Energy teams can then evolve their data operations through greater data access and visibility, allowing them to literally visualize how operations are performing and whether business value is being achieved. Adopting advanced analytics platforms featuring AI/ML capabilities can help optimize service processes, improve productivity, identify new revenue streams, and lower the total cost of ownership (TCO) of a cloud infrastructure. The overall result is a digitized value chain that enhances collaboration among teams, accelerates decision-making, and improves resiliency.   Becoming more customer-focused   Based on the advantages a digital cloud-driven value chain can deliver, energy providers can work toward a constant goal: becoming more customer-centric. Using data effectively is the foundation for achieving it, and once valuable insights have been gathered, organizations can commit to ensuring that the energy products and services they provide are meeting customer needs. This requires a shift from a product-focused mindset to understanding people's expectations around reliability, costs, and sustainability.   Since the arrival of the pandemic, the importance of personalized engagements has greatly increased, and maintaining customer loyalty is now tied to treating customers as individuals, rather than in monolithic ways. To drive hyper-personalisation, AI/ML-based solutions are available natively on cloud

platforms, which can be used to keep customer-centric communications relevant and focused on their needs. As an example, customers can be made aware of their ongoing energy usage and its commercial impact, based on their historical usage and demand curve, so that consumption and costs can be controlled in a more informed manner. Offering these customer-focused services can open new business opportunities and build brand loyalty. Innovating operations, products, and services Any kind of stagnation in terms of business strategy or offerings will inevitably lead to falling behind the competition and losing customers. Staying relevant depends on continually innovating energy services and products that provide seamless customers experiences and streamline internal operations. Cloud-enabled research and development efforts are fueling industry transformations, and with the greater customer focus mentioned above, energy providers can devise a game plan for revitalizing services to fit customer expectations. Cloud technologies are also allowing energy enterprises to improve their compliance initiatives and ensure they're meeting industry regulations. Monitoring operations, gathering data, and producing compliance reports can be simplified to reduce the time and effort of meeting industry mandates.   Devising an effective cloud transformation strategy   The first step in gaining these cloud-driven advantages requires developing a customized roadmap. A large-scale enhancement should be based on a company-wide commitment with buy-in from all stakeholders and an organizational change management (OCM) plan to help realize business value quickly. To avoid any pitfalls, an organization should have a clearly defined vision for their business transformation and business outcomes, one that can be delivered through a comprehensive cloud transformation project leveraging a data-driven intelligent infrastructure. Creating a series of short- and long-term goals will keep the efforts on track, and a company will need to verify it has the ability to stand up programs to be executed on time in alignment with budgets and business objectives.   An effective way to execute a customized cloud modernization strategy is through a phased approach aligned with a company's business goals. Partnering with a cloud expert can ensure a transformation initiative achieves the intended results and drives business growth, and selecting a cloud partner should be based on certain fundamental criteria: Preparing for future opportunities Companies across the energy sector are facing a defining moment as crucial changes are taking place that require new approaches to staying competitive. With more startups entering the market, disruptions are frequent, forcing established brands to reassess their established approach to product development, innovation, and the monetization of legacy systems, as well as standing up new capabilities using cloud and industry cloud solutions. All the major cloud service providers (CSPs) provide a set of industry cloud solutions based on industry needs, starting with the most important use cases: sustainability and carbon reduction.   The evolution of the energy industry, as it develops new low-carbon energy products, has an impact on all other industries. Given their strategic importance to the overall industrial economy and the need to innovate and build scalable energy products, industry cloud solutions are a game changer for the energy industry. Launching a cloud-driven business modernization can help energy providers prepare for unpredictable economic trends and develop greater agility and an improved ability to innovate. Whether energy firms are just beginning their cloud initiatives or are already seeing a strong ROI, an

industry cloud solution will be essential to building native digital value chains, using data more effectively, and driving future growth.

Financial Services Industry Cloud: Prevent financial sector crime with a full-stack industry cloud

----- Arcticle source ----- https://www.wipro.com/cloud/prevent-financial-sector-crime-with-a-full-stack-industry-cloud/ ----- Contact Wipro Please fill the required details to access the content Financial Services Industry Cloud: Prevent financial sector crime with a full-stack industry cloud The sophistication of fraud attempts in the banking, financial services and insurance (BFSI) industry is becoming more advanced, resulting in the need for updated security strategies to prevent the latest threats. Likewise, money laundering and other crimes become greater concerns, enterprises also face the necessity of complying with expanding industry regulations. To reduce vulnerabilities and improve compliance approaches, enterprises require a unified, comprehensive strategy for modernizing legacy platforms, eliminating data silos, and enabling greater access to data. The prevalence of criminal activity is one major area within the financial services industry that is driving the demand for more efficient system alerts that better pinpoint suspicious activities and decrease redundant efforts. Financial institutions are also seeking effective ways to reduce their dependence on manual processes while standardizing resolution times and accelerating security investigations. Wipro FullStride Cloud Services' full-stack industry cloud approach offers an effective answer to these challenges, allowing BFSI enterprises to evolve their operations with a cloud-native, customized infrastructure built to comply with the heavy regulatory and compliance requirements of the industry. Designed to specifically address the unique BFSI challenges and requirements, Wipro helps organizations maximize cloud architectures that are scalable and agile enough to handle the latest market trends and meet changing customer expectations. Wipro FullStride Cloud Services' industry cloud expertise Wipro delivers a comprehensive approach to building and maximizing cloud infrastructures and enhancing fraud prevention strategies. Our cloud and industry experts work closely with financial institutions to redefine their business models and create cloud-native, digital value chains that enable them to lay the groundwork for a range of achievements, such as: Our BFSI team also provides two specific fincrime cloud-based solutions for mitigating risks: Wipro FullStride Cloud Services success stories Enterprises that adopt industry clouds in partnership with Wipro are optimizing their security operations for improved performance, as evidenced by these real-world examples: Protecting against criminal activity and complying with industry regulations are ongoing tasks that require continual reevaluation, adjustments, and up-to-date approaches. Wipro FullStride Cloud Services' Industry-specific cloud transformations enable financial firms to modernize their security and

compliance initiatives while developing business innovations that drive future-ready resiliency.   =====================

FinOps and the New Path to Cloud Success

FinOps and the New Path to Cloud Success Organizations often begin migrating applications to the cloud believing that doing so will save money on IT expenditures such as data centers. While cloud migrations can help reduce costs and deliver value, they require careful management of cloud expenses focusing on what will work for the business now and down the line. By incorporating FinOps into a cloud economics strategy, companies can increase transparency to improve the management of cloud costs and expenses. FinOps also provides a strategic framework that supports stronger cloud financial management, helping businesses go from moving to the cloud to running in the cloud. What Is FinOps? FinOps, a portmanteau of "finance" and "DevOps," is an approach to cloud financial management that aims to maximize the business value of cloud programs through close collaboration of finance, IT and business teams. The decentralized nature of consumption-based cloud programs can make them difficult to manage across an organization. Spending can vary by business function. So can reporting. FinOps aims to address these challenges by bringing cloud finance management under the control of a centralized FinOps team of leaders from IT, finance, business, and even executive functions. This cross-functional team helps increase visibility into cloud spending throughout the organization, align the various functional areas around shared cloud finance goals, and empower teams to take the necessary actions to achieve those goals. How Does FinOps Do This? After the FinOps team aligns on the cloud finance goals of the business, they set about building the capabilities necessary to achieve those goals, using three guiding principles: 1. Identify Relay all necessary information to the stakeholders so they can make informed decisions about cloud usage. 2. Optimize Look for opportunities to reduce spending and increase savings. 3. Operate Continuously monitor performance, evaluate the progress of business objectives, and look for new ways to improve. Capabilities include cost allocation, budget management, data analysis and show back, and managing anomalies or unexpected costs. The FinOps team works together, or with a strategic partner, to identify what capabilities will deliver the most value. Whether that's advancing their goals, reducing spending, or reinvesting in other areas, information is gathered and analyzed to determine the changes with the greatest potential value (what's necessary, the potential impact, etc.) and then enact those changes and monitor the progress. These stages are not linear, meaning an organization can be in multiple stages at once. The intent of the FinOps process is repetition. The more businesses implement changes, evaluate those changes, and refine their operations, the stronger and more mature their cloud program will be. How to Build a Mature FinOps Practice FinOps follows the crawl, walk, run

approach, designed to encourage small, focused efforts that gradually expand in scope and complexity as the program matures. This strategy helps FinOps teams trace the true impact of their efforts and assess what additional actions might be necessary. Figure 1: Path to Unlock the Power of FinOps. The goal is not to get to the Run stage as fast as possible in all areas of the cloud program. FinOps encourages teams to consider what actions will deliver the most value for the business. For example, a FinOps team may focus on maturing chargeback and finance integration capabilities. They move from Crawl to Walk, creating a tagging strategy for greater visibility of expense allocation and implementing that strategy, but stop short of automating that strategy (Run phase) to focus on other critical capabilities like budget management and forecasting. The automation would be helpful, but the FinOps team realizes that establishing a firm foundation of capabilities first is more important for the business. Automation is critical to FinOps' success. Repeating the three phases — Identify, Optimize, and Operate — refines operations, trimming unnecessary cloud costs while maximizing value. The key is knowing when and how to implement it. Achieving Success in the Cloud Through FinOps A team armed with timely, accurate, focused information is best suited to optimize decisions. Collaboration is crucial — among internal teams and with external technology partners. Experienced technology partners bring experience with the tools associated with FinOps, such as automation and data analysis, along with the strategic knowledge to know how those tools can best serve the business goals. Reporting, for example, can be a complicated challenge to overcome in FinOps. Bills for cloud usage are massive files. Breaking these down across business functions is time-consuming, with many businesses doing so manually. On top of this, each business function might format its reporting a different way, slowing down the process even further. A technology partner can help identify the most efficient way to standardize reporting across the organization and the right automation to streamline the process. Technology partners can even support FinOps teams from the beginning of their FinOps journey, working with teams to develop tools supporting their ambitions. When one of Wipro's clients set out to create a FinOps strategy, it tapped Wipro for support. The two companies conducted a current-state assessment which was used to inform the clients' FinOps strategy. Based on their goals, Wipro suggested opportunities for optimization, conducted feasibility studies on those opportunities, and created custom reports to help with the show back. Those savings were reinvested into the FinOps program, funding more proactive approaches, further refining cloud spending and maximizing business value. Success and thriving in the cloud require each enterprise to define its own FinOps strategy based on its unique needs. An experienced technology partner can help advance these efforts. But that partner should be flexible enough to support the needs of the business rather than force them to fit a standard approach. About the Author Santanu Kumar Patro General Manager & Practice Head – Cloud Economics, Wipro FullStride Cloud Advisory and Consulting Santanu Patro has about 20 years of experience in IT and close to 15 years' experience in Advisory & Consulting. Being a techno-evangelist, he has been developing future ready solutions/services to meet the ever-changing requirements of an enterprise and leading a team of IT therapists to solve enterprise challenges. =====================

Monetizing Your Data Center Exit Strategy

Monetizing Your Data Center Exit Strategy By 2025, Gartner estimates that 80% of businesses will have decommissioned some or all of their on-premises data centers and moved operations to the cloud. This is a significant shift considering how much businesses have invested in data centers over the years. But when you consider the growing costs of data centers – on the business, its customers, the environment – it might seem surprising that more haven't left them already. In fact, most businesses have already adopted some form of cloud computing, recognizing the tremendous value it can bring. Moving applications to the cloud can help reduce a company's carbon footprint while increasing flexibility, allowing the business to easily scale up and down as needed. It can increase accessibility for developers, fostering collaboration and innovation, and cut costs, switching spends from CapEx to OpEx. What many companies may not know is that by monetizing their data center exits they can also make money by switching to the cloud, offsetting the upfront costs that may be standing in the way. The Costs of Exiting a Data Center There are a lot of logistical and financial hurdles to exiting a data center. Companies may be contractually bound to their facilities and face high penalties for early termination. Hardware must be decommissioned in accordance with regulations to avoid fines. And what are companies to do with this equipment afterward? Is it possible to recoup their expenses? Addressing all these concerns can take time, but the longer businesses wait to exit their data centers, the more pressure they may feel to make the switch to get ahead of the curve, resulting in rushed timelines, missed opportunities, and more avoidable expenses. Meanwhile, the business must also transition its applications from the data center to the cloud – a tremendous task that is often more complex and time-consuming than companies anticipate. The dreaded double bubble scenario, in which businesses find themselves stuck, mid exit, between the data center and the cloud, is an unfortunately common occurrence. Businesses underestimate the complexity of exiting a data center and assume their internal IT teams are the best ones to manage the shift. As the project progresses, applications become more complex, the data sources get harder to trace, and the project stalls out, increasing costs, decreasing efficiency, and exposing the company to security risks. A hasty data center exit can be more trouble than its worth. It also paints a misleading picture of legacy modernization, suggesting that moving from data centers to the cloud is an expensive, time-consuming project likely to severely disrupt business operations before showing returns on the investment. But with proper planning and a monetized exit strategy, businesses can essentially get paid to make the best decisions for the organization. Monetizing Your Data Center Exit A monetized data center exit strategy is one that pays companies for things like hardware and facilities. These programs free companies to start exiting their data centers and provide an immediate influx of funds so they can do so more confidently. For example, the company

avoids the double bubble by working with an exit partner that specializes in data center exits to strategize the shift, liquidate any legacy assets, and seamlessly transition the desired applications to the cloud. Monetizing the data exit also frees companies to set their own timelines, helping them avoid hasty decisions that might set them back. Being bought out of their leases frees companies from the pressure of falling behind their competitors while waiting for the terms to end, and the additional funds up front can help satisfy the demand for quick return on investment. Some exit partners will even be able to work with companies to design interim capabilities that ease the transition from data centers to cloud. These interfaces are not officially the cloud, but they're more cloud-like than data centers, and they allow the modernizing company to begin reaping the benefits of a hybrid cloud program while they strategize the best path forward. Monetize and modernize programs, for example, buy businesses out of their existing contracts and legacy assets, and immediately set them up with a cloud-like infrastructure, making the company asset-light and cloud-like from Day One. Such programs are a collaboration between the strategic partner and the client, along with leading cloud service providers (CSPs), original equipment manufacturers (OEM) and hosting partners. These organizations work together to help the client safely decommission and sell its legacy assets, then combine those funds with additional investments from the partners to finance a stronger cloud modernization program and eventually reach a hybrid cloud state. Through such programs, businesses are also able to set their own pace for modernization, which is tremendously beneficial. Rather than rush into a one-size-fits-all approach that may not actually fit the business, the client works with the strategic partner to devise a strong exit strategy in line with its immediate needs and long-term goals, then phase out implementation appropriately. This extra time to strategize helps ensure a more successful, efficient data center exit. At the same time, the business is already experiencing some of the benefits of IT modernization – such as an automation layer and enhanced user services to improve efficiency – by being cloud-like from the start. Programs like these empower businesses to start making the changes they need to grow stronger, smarter, and more sustainable. Faced with rapid innovation and near-constant industry disruptions, businesses need to be able to adapt. Exiting their data centers for the cloud is an important first step, and with the right guidance it can be a successful, seamless transition. This article was originally published on Forbes.com Jo Debecker - Managing Partner and Global Head of Wipro FullStride Cloud. =====================

The Secret to Cloud Success: A CXO's Guide to Business-Driven Cloud Strategies

----- Arcticle source ----- https://www.wipro.com/cloud/the-secret-to-cloud-success-a-cxos-guide-to-business-driven-cloud-strategies/ ----- Developing A Proactive, Business-Driven Cloud Strategy About The Author Contact Wipro Please fill the required details to access the content The Secret to Cloud

Success: A CXO's Guide to Business-Driven Cloud Strategies In 2020, a certain life insurance company began its cloud transformation, quickly migrating applications and building new ones on the cloud. The company launched a cloud-native platform in 2021, which went on to win an award. Later that same year, it put its cloud migration on hold, citing issues with its lift-and-shift that kept sending the program over budget. This is a familiar story. Many cloud transformations fail to deliver the intended results on the first attempt. Executives recognize that the cloud holds tremendous potential for their businesses, and over the past several years they've made significant investments in enterprise cloud transformations. But what hinders so many of these efforts is a lack of alignment between business strategy and cloud strategy. While many businesses look to migrate to the cloud as a way to cut costs, that ambition is not enough to carry them through the challenges of a large-scale cloud transformation. Businesses need to go deeper. What are the changes that will help the organization cut costs or increase efficiency, and is the cloud the best technology to support those changes? What changes need to be made to support a cloud migration? What kind of impact will a move like that have on the organization? To be truly successful in their cloud migrations, businesses need to take a more proactive, business-driven approach to technology. This begins with identifying the business challenges they want to address and developing a technology strategy that will do just that. Cloud Transformation As Business Transformation Cloud strategy and business strategy are becoming synonymous. Today's business challenges are going to be solved by a technology underpinning. AI and machine learning can help process huge volumes of customer data and generate insights that can be used to improve operations or customer experience. The cloud can increase the scalability of data stores and make them more accessible. Technology holds the key to many business challenges. But like any good business solution, technology—especially the cloud—needs to be implemented strategically to avoid unexpected risks down the line. It's common for businesses to embark on their cloud migrations only to find out too late that certain applications are impossible or too complicated to move, leading to delays, costs, inefficiencies and even risks. These could all be avoided with greater upfront planning and a more business-driven technology strategy. Similarly, if a business only approaches cloud migration from a technology perspective—if the CIO is involved but not the CFO or business managers—the migration is likely to hit a wall. Because moving to the cloud is a journey, not a destination, it must always include organizational change management to align business goals, priorities and calendars with technology capabilities and implications. What does the business need? What do the business managers want, and what kind of support will they need throughout the transition? If business owners do not feel supported in the transition, and if the move to the cloud is more trouble for them than it's worth, they may stay where they are and progress will stall. So how do business leaders anticipate and address these challenges? To start, they need to align on the strategic priorities for the business—increased resiliency and agility, for example, or more data-driven operations. The cloud can bring tremendous value to a business, and it can do so in many different ways. The key is to identify the specific value and the specific applications that will be most helpful to the business in achieving its goals. Consider a business that is interested in becoming future-ready—more

adaptable, resilient, agile and efficient. The cloud can help achieve these ambitions by offering as-a-service models that lower capex and refocus opex. Data center management can be outsourced to cloud service providers (CSPs), increasing security monitoring and infrastructure management while bringing IT teams closer to the business for increased attention to and efficiency of internal business operations. Meanwhile, the business is only spending money on the services it uses and is suddenly able to scale up and down as needed without investing in physical data centers, reducing technical debt and carbon footprint. This scenario may seem similar to investing in the cloud as a way to cut costs, but the difference is critical: The scenario above offers guidance for how to best implement the cloud throughout the organization, while a strictly cost-focused scenario does not. By focusing on future-proofing operations, the business has a road map for its business and technology program. Teams can start assessing what operations are most critical to moving to the cloud and what it will take to do so, then develop a phased approach, making incremental changes to reduce disruptions to the business while increasing ROI. This return on investment might be cost reductions, or it might be increased efficiency or user experience. Business leaders can define what value means in that moment and at various stages throughout the cloud migration to be sure they stay on track while adapting to new challenges as the migration progresses. Infrastructure changes cannot happen in a vacuum. To be successful, organizations need to consider the bigger picture—the long-term goals, the potential challenges and what it will take to address them. After pausing its cloud transformation, the insurance company spent another year revising its cloud migration strategy to one that is now almost indistinguishable from its business strategy. The company is using business outcomes to guide its modernization, ensuring that the cloud migration adheres to the company's business principles and that the workforce is supported throughout the transformation with necessary training. This kind of holistic approach will require more time and commitment to implement, but the payoff will likely be more significant and sustainable. By approaching cloud adoption from a business perspective and by taking a proactive approach that is guided by business ambitions and organizational change management, organizations can lead more successful cloud transformations that go well beyond expectations. This article was originally published on Forbes.com. Jo Debecker - Managing Partner and Global Head of Wipro FullStride Cloud. =====================

The True Value of Gen AI for Quality Engineering

----- Arcticle source ----- https://www.wipro.com/cloud/the-true-value-of-gen-ai-for-quality-engineering/ ----- Contact Wipro Please fill the required details to access the content The True Value of Gen AI for Quality Engineering Quality engineering and testing offers practical applications to expand existing AI capabilities QET teams tend to be at the forefront of technology adoption, so it should come as no surprise that they are leading the way with generative AI. What stands out is the opportunities it's unlocking. Quality

engineering and testing (QET) are critical to an enterprise digital strategy. They can also be some of the most overlooked and underdeveloped elements. In the early stages of digital transformation programs, enterprises focus a lot of their attention on big-ticket items like modernizing key assets or moving core systems and processes to the cloud. Upgrades to the testing process tend to come much later, sometimes too late, putting the company at risk of service disruptions, regulatory violations, fines or worse. Modernizing QET is essential, and it may be easier than enterprises perceive it to be. QET teams have been using advanced technologies like AI for some time now to assist with tasks like data generation, validation, risk-based and model-based testing. Advancements in generative AI promise even greater support for QET and can be tremendously valuable for the entire organization, even helping to accelerate the overall digital transformation initiative by enhancing critical capabilities like synthetic data generation, unstructured data processing and automating the test lifecycle. As organizations across industries scramble to find the best use cases for Gen AI that will help them stand out from their competitors, QET offers plenty of practical applications that will expand existing AI capabilities and lay a solid foundation for successful, low-risk digital transformation throughout the organization. Autonomous Testing Generative AI is well suited to assist with key elements of the testing process such as creating test scenarios from user stories, creating scripts, optimizing regression test suites, scaling test executions, conducting result analysis and detecting anomalies. Bringing Gen AI in the loop for the software testing lifecycle can help automate processes and reduce manual intervention to accelerate time to market. While traditional approaches might take weeks or months, Gen AI can enable autonomous script migration from older to newer tech in a fraction of the time. Beyond core test activities, Gen AI can play a critical role in integrating tools (especially with the CI/CD or DevSecOps pipelines), optimizing test dependencies, enabling faster test execution cycles, reducing redundancies and roadblocks that can hinder productivity. Gen AI can also help clients modernize their tech landscapes and test architecture faster. While traditional approaches might take weeks or months, Gen AI can enable autonomous script migration from older to newer tech in a fraction of the time. And because these capabilities are easier to use through generative AI than through traditional AI models, teams may not need to invest as much time and money in building technical skills to adopt and implement an AI program. Synthetic Data Generation Synthetic data generation is one of the most effective and low-hanging use cases for generative AI. To ensure adequate test coverage, QET teams need adequate data. In many programs, this can be difficult to obtain with production data alone due to challenges with regulatory compliance or insufficient data masking. QET teams turn to synthetic data generation to supplement production data and acquire test data for scenarios the business has not yet encountered but is likely to encounter in the future. For example, in the insurance industry, policy and claims systems require information on customer demographics such as age, gender, location, prior health issues, to recommend the right insurance policies. Because the data combinations needed for testing such scenarios is exhaustive and extremely complicated, production data alone may be insufficient, leading to gaps, oversights or skewed testing results. Generative AI can help produce the necessary test data to supplement production data. It's important to note that while

generating synthetic data using large language models with generative AI may make sense for early-phase testing, this approach will need tweaks to make it cost-effective for large-scale projects due to the tokenization Gen AI uses to monitor and monetize data. Companies may consider hosting their own Gen AI model or infrastructure or incorporating alternative approaches such as generative adversarial networks (GANs). Modernization and New Technology Adoption To keep pace with technology advancements and beat off competition, many banks have been acquiring fintech companies for specific processes, such as retail loan processing, and migrating only those specific processes. Decoupling features like this allows banks to adopt new technologies and modernize faster because they don't have to overhaul the entire core system. Still, these changes require major reworking from a testing perspective. The bank would need to modify the loan-oriented test cases, assess the impact of changes, create new test cases for modifications in the workflow, grade new tests for the new product and match release cycles. QET teams can use generative AI to expedite these tasks by prompting Gen AI to generate test cases, scan code for anomalies and predict potential issues. Advanced natural language processing of generative AI can help streamline technology migrations by assisting with translation. If a bank is migrating from a mainframe to a newer Java-based system, for example, the process typically involves migrating technology as well as testing assets. Testing teams can feed the old scripts or assets into a generative AI platform, which will then translate those scripts, speeding up the process significantly. Test teams can also use Gen AI to automate these tasks for greater efficiency and ongoing refinement. Improved User Experience Generative AI's sentiment analysis is better equipped than traditional AI to analyze text such as customer reviews and emails and pick up on the nuances of language. Traditional models struggle to identify sarcasm, for example, and might mislabel a negative review as a positive one. Gen AI, on the other hand, can make those distinctions. When combined with other AI capabilities, models can even trace those comments to potential root causes in an application and suggest corrective action. Generative AI also helps increase observability in the production environment. Securities and capital market (SCM) organizations, for example, are always on the lookout for quality interventions which can improve test coverage holistically for their trading platforms. Gen AI can help autonomously reverse engineer customer journeys into UI test cases and automation scripts. It can also analyze API logs and autonomously generate test cases and scripts relating the front-end user journey to the relevant navigations through the back end. These capabilities ensure that critical financial transactions are not impacted, which could lead to heavy regulatory fines. The Importance of Validating Generative AI Models Due to information security restrictions, many organizations are planning for either open-source models or building their own large language models. But before any organization can incorporate generative AI into their testing programs, they need to be sure the model is secure, reliable and compliant with regulations. This requires a thorough validation process that considers the various challenges and characteristics of the model such as biases and errors, complexity, and scale. The validation process should clarify the intended use of the model and what is needed to support those functions, help develop tests to evaluate the model's performance, compliance, and suggest corrective action. Validating an AI model and supervising the

outcomes given by the model is an ongoing process that requires a robust quality engineering strategy to ensure constant monitoring and updating based on changes in performance, business goals, industry demands, regulations. Engaging stakeholders throughout the organization to work with the quality engineering team can help develop a stronger program that meets the shared goals of the firm. For larger, more ambitious projects, a technology partner can help by working with the various stakeholders to align on a vision for generative AI in the business and develop a realistic implementation strategy. The true value of generative AI is likely to vary from business to business depending on the specific needs of the organization, its employees, and its customers, but the potential of this new technology cannot be understated. Ongoing investments are leading to rapid development, and savvy enterprises are finding new opportunities to combine Gen AI with other advancements in automation, data analytics, IoT and cloud. This is a boom time for innovation, and QET teams can make the most of it by exploring Gen AI strategically, with business value top of mind. About the Authors Rituparna (Ritu) Ghosh Ritu has more than 20 years of experience and leads Wipro's Quality Engineering and Testing practice. Throughout her career, Ritu has nurtured and developed high-performing teams, fostering a culture of collaboration, creativity, and continuous learning. Ritu is a strong believer in building diversity and inclusiveness at the workplace. She is also a mentor to several budding young leaders across Wipro and believes strongly in sharing her learnings with others. Ritu has an MBA in marketing and strategy, and a certified Black Belt in DMAIC, trained in Lean, CMM®, CMMI®, ITIL® and Agile and DevOps. Dr. Abhijit Ranjekar Dr. Abhijit is an experienced practitioner and researcher with over 20 years of work in the fields of software architecture, engineering and quality engineering. He currently heads the Gen AI COE for Wipro's Quality Engineering and Testing practice, globally, and heads consulting for Wipro clients' transformation journeys across next-gen themes such as digital and cloud. Dr. Abhijit is passionate about industry academia and is a frequent speaker at leading industry forums. ======================

How Observability Improves Customer Engagement

----- Arcticle source ----- https://www.wipro.com/cloud/how-observability-improves-customer-engagement/ ----- Contact Wipro Please fill the required details to access the content How Observability Improves Customer Engagement Pave the way for greater returns on investment with complete controllability across cloud ecosystems. To keep customers coming back, businesses need to prioritize the customer experience – not just in physical stores but virtually and throughout the entire value chain. If a website fails to load, customers can easily take their business to another platform. A negative review about user experience can impact the reputation of the business, creating a ripple effect if not addressed quickly and adequately. Cloud assurance teams have the herculean task of preventing these scenarios from playing out because they have the in-depth knowledge of the application stack and how it works with various businesses processes. And

while monitoring technology has made their jobs easier, other advancements — including increased cloud adoption and the rise of hybrid cloud environments — have created new and more complex challenges. Today's customers have come to expect seamless user experiences. An IT pitfall such as an application or website being down for too long could severely impact sales and customer spend. Yet the various microservices of hybrid cloud environments can make identifying the root cause of an issue extremely challenging. It's no longer enough for teams to know an issue has occurred. To deliver quality service and remain competitive, companies need to quickly identify the cause and implement the right solution, whether the issue resides in their on-premises or cloud environments. Central to this shift from being reactive to proactive is a focus on observability in production environments. Observability Is Key Traditional monitoring focuses on a single element in the vast system of an organization. One program might monitor servers or virtual machines, while another monitors applications, and still another monitors business transactions. This siloed approach presents an incomplete picture of incidents that can delay resolutions. Does an application crash affect only the end user? Or, does the issue also involve back-end operations and a third party? The effects might span multiple areas of the business, but teams need to quickly identify the root cause. Observability, on the other hand, approaches incidents from a customer-journey perspective, focusing on the business processes and the various IT components they cut across. By shifting the focus to business processes rather than single elements, observability connects the dots between various applications and microservices. A single business process might cut across 20 applications, 50 services and hundreds of servers. Observability provides a unified view of these various elements, making it easier for teams to see what's happening, where it's happening, and how to solve it. In other words: with observability comes controllability. Valuable Insights, Powerful Actions Consider a typical eCommerce transaction. A customer places an order, which triggers actions from item allocation, the fulfillment center and dispatch, which involves associates scanning items and coordinating with trucks for shipment. If a business were monitoring all these operations in siloes, tracking incidents and coordinating responses would take too much time and shipments would be delayed left and right. Observability services monitor all these operations and their corresponding endpoints simultaneously, collecting data and processing it to provide a holistic view of business operations. Traditional monitoring services might only show that response time for a website is taking longer than usual, or that virtual machines hosting order services are maxing out. Observability services can go a step further, connecting those incidents to an increase in check-out pages and delays in third-party tokenization. With these insights, solutions become clearer: If the team can filter only the customers at the check-out stage and direct them to the edge, they can divert all other traffic to the static shopping pages, relieving the bottleneck without disrupting the shopping experience. Observability services take stock of the entire value chain, from servers and virtual machines to the scanners used by warehouse associates and the trucks used for distribution. They collect data throughout these elements, process it and present a single coherent picture of what's happening throughout the business, enabling teams to make more informed and timely decisions based on those insights. Advanced data processing also allows cloud assurance and quality engineering (QE) teams to be more

proactive. By integrating other technologies like AI and machine learning, teams can automate data analysis and pattern detection to anticipate incidents and prompt responses before they interrupt service. Don't Underestimate Brand Affinity To make the most of these capabilities, businesses must develop the infrastructure to collect and process data and convert it into actions. Organizations often overlook this point, especially in the early stages of their cloud migrations and digital transformations. But doing so can cost the organization down the line — not just in missed opportunities, but also poor customer experience. Observability and controllability help cloud assurance teams ensure business operations not only run smoothly but remain relevant by offering improved services and continuous tech iterations, improving the customer experience. Services can be automated to ensure regular updates and testing for an error-free product. Keeping Customers Technologies like cloud and automation can increase adaptability and enable new and improved ways of connecting with customers. But many digital transformations have been followed by a spike in cybercrime and service disruptions due to businesses moving too quickly and overlooking critical testing and quality engineering services, impacting the customer experience. Working with cloud assurance teams to make observability and controllability services an integral part of the transformation strategy can help ensure a more successful integration, strengthen operations, increase quality service, bolster the customer experience, and pave the way for greater returns on investment. About the Authors Saket Bihari Saket leads Wipro's Observability practice as part of the Quality Engineering and Testing unit. He has more than 18 years of experience in non-functional quality-specifically performance engineering, chaos engineering and observability. He focuses on innovating and rolling out solutions for clients looking to improve business resiliency in their cloud journey. Rachna Trivedi Rachna is a results-oriented, highly accomplished site reliability engineer (SRE) leader with over 18 years of experience in IT. She has consulted and implemented full stack observability, chaos engineering and site reliability engineering initiatives for clients across multiple domains including retail, banking, manufacturing and insurance. ========================

How software defined test environments are revolutionizing testing

----- Arcticle source ----- https://www.wipro.com/cloud/how-software-defined-test-environments-are-evolutionizing-testing/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content How software defined test environments are revolutionizing testing October | 2023 Are you juggling between multiple test environments to ensure right configurations at the right time? Are you spending days of effort in setting up a new test environment? Are you underutilizing your test environments

and resources? Are you compromising on your test coverage due to unavailability of test environments? Experience from traditional test environment service shows that at least 30% of testing time is compromised due to test environment issues. There are numerous gaps preventing higher availability of test environments. Few of these gaps are To cater to these perennial problems, industry is moving towards 'Next Gen Test Environments', wherein 90% of test environment lifecycle is automated by software defined services of compute, storage and network. Software defined test environment model As the name explains, software defined test environments (SDTE) is the concept of managing your test environments the same way that we manage applications or any such software code. SDTE is the major evolution of next generation test environments. It provides a complete set of software defined services for compute, storage, security and network to provision the test environments in public or private Cloud infrastructure. The basic principle of SDTE is that the test environment engineers can write and execute code to provision the test infrastructure, deploy the application and configure with right parameters. This means a test environment engineer can bring up 100s of servers with a single click and with a couple of clicks, the engineer can install all the applications properly with the right configuration. In this journey, all the benefits of Cloud architecture (i.e. elasticity, flexibility, security etc.) can be fully leveraged from software-defined services of the Cloud service provider. As depicted in figure 1, SDTE model is broadly categorized into two parts - Software controlled environment provisioning and environment services (or operations) Figure1 : Software defined test environment service Container based rapid provisioning On demand environments on Cloud, with end-to-end test environment support helps to simplify the process of creating and managing complex test environments. In this simplification journey, container-based provisioning is emerging as a revolutionary technology and industry is responding very positively. Figure 2: Traditional Vs Auto provisioning As depicted in figure 2, test environment setup is optimized further by leveraging containerization, which is an alternative to machine virtualization. Container technology is simpler and faster as it abstracts the application and platform in easy-to-use, re-usable and manageable containers. However, before taking the advantage of container-based test environments, a significant amount of refactoring is required for the applications in test environment. Container orchestration tools such as Kubernetes are emerging rapidly to manage the clusters efficiently. These Kubernetes clusters eliminate lengthy deployment processes and improves the environment readiness by on-demand provisioning, scaling, and patching with CLI interface. More and more network, storage and security features are evolving to ensure higher efficiency and security. Fully automated environment management In the current DevOps world, test environments are built, and live fast, most of the times, die fast as well. Continuous deployments and continuous monitoring helps the testing team to achieve higher availability of the environments, thereby ensuring higher test coverage. With minimal manual intervention, these test environments can be made auto-scalable and ready to meet the ad-hoc demands. All the assets information and the relationship is available at a single place so that the environment team can control the assets and environments efficiently. Using this information, environment maps can be easily defined and reused to move assets from one virtual environment to other. Once the environment

usage is over, a complete backup will be provided to the testing team for future re-use purpose. Environments will be de-commissioned at the same speed as provisioning and all assets will be released along with billing and usage details. The next gen test environment SDTE is a unique work model designed for DevOps world where all the low-level environments are defined and controlled by the software. This model consists of specifically selected tools and pre-packaged infrastructure components with the flexibility of service utilization on Cloud. It will enable enterprises to get easy access on Cloud based test environments supported by monitoring and ITSM tools. This work model is designed to help the test environment team to create and access all low-level environments with few clicks and shorter turnaround time. Other key advantages of this model are: Peri Narasimha Practice Head for Test Environment & Infrastructure Testing at Wipro Ltd. A postgraduate in Computer Science with over 18+ years of IT experience, Peri has designed and patented Unified Test Environment Model. Currently, Peri is working on Next Gen Test Environments for DevOps world by leveraging Cloud and Containerization technologies. Peri has led and executed many integrated and standalone testing projects for various clients in the retail, telecom, and insurance domains. Peri has developed a tool called the TE – Manager that automates the operations layer of environment activities. He has also defined best practices and standardized test environment activities at an enterprise level and has helped organizations achieve highest maturity level in managing test environments. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Adopting the Hybrid Habit for Agile Quality Assurance

----- Arcticle source ----- https://www.wipro.com/cloud/adopting-the-hybrid-habit-for-agile-quality-assurance-qa/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Adopting the Hybrid Habit for Agile Quality Assurance October | 2023 Today's enterprises are constantly looking to maximize benefits reaped from their Quality Assurance (QA) function, both on speed and costs. This is easier said than done. Today's QA industry is volatile and success in such a landscape is defined by how quickly an organization is able to seamlessly adapt. Organizations need to ensure that their multiyear QA strategies withstand upcoming disruptive technology and consumer trends. Let's rewind to a few years back... Traditionally, QA teams were aligned to lines of businesses or Business Verticals - a decentralized operating mode. However, as IT priorities shifted to having the customer 'at the core of everything', the role of QA took on a strategic nature and the concept of a Testing Center of Excellence (TCoE) was born. TCoEs offered a string of benefits including

process standardization, reusable domain centric templates and accelerators and incubation and development of specialized QA competencies. The disruptive onset of digital however, has exposed the TCoE model. The flexibility and complete independence from lines of businesses / business verticals clashes with the scrum team powered Agile development way. Organizations are looking again at the decentralized QA model, however the older drawbacks of the model have not disappeared. Understanding the drawbacks: To better understand how to address this challenge, let's compare the pros and cons of the Centralized and Decentralized models. These have been broadly classified into 5 major themes - Governance, Center of Excellence (CoE), Delivery, and centralized repository and cost. The Solution: Hybrid Operating Model The solution to this dilemma is to have a model that integrates the best of both the centralized TCoE and the decentralized agile model: a hybrid operating model. This model would comprise the beneficial horizontal governance components of the TCoE approach and the vertical governance processes from the decentralized approach. The hybrid operating model would be in the form of an Inverted T having two major components: Rupali Agarwal - Consultant, Test Advisory Services (TAS), Wipro Ltd. Rupali Agarwal is a Consultant with Test Advisory Services (TAS) in Wipro. She is currently instrumental in conducting QA assessments for test consulting engagements and also contributes to thought leadership. She has an overall experience of 4+ years and has worked extensively across different phases of software development lifecycle. After completing Engineering in IT from BIT Mesra, Rupali worked with TCS for two years and then went on to pursue an MBA from Symbiosis. Rupali enjoys playing sports like basketball, badminton, likes reading and listening to music in her leisure time. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

How has DevOps Impacted Quality? How is Customer Pressure Shaping Testing?

----- Arcticle source ----- https://www.wipro.com/cloud/how-has-devops-impacted-quality-how-is-customer-pressure-shaping-testing/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content How has DevOps impacted quality? How is customer pressure shaping testing? October | 2023 We have a unique report on the state of quality and software testing that will answer those questions - and several others - waiting for you. The report has two distinguishing features: one, it is based on over 1,500 quality engagements; and two, it has been

created by quality practitioners. But more than anything else, the report serves as a handbook, providing you the opportunity to benchmark practices within your organization with what is happening outside, across peers and competitors. The genesis of this report is interesting. After successfully completing over 1,500 quality engagements with more than 400 global organizations in the last few months, we could not resist asking ourselves the question - what is the real value delivered by quality today? Are organizations spending too much on quality or too little? What is the right amount to spend? How has the practice of testing changed in the light of DevOps, Agile and Continuous Delivery? How has it evolved under the pressure of impatient customers? What has been the impact of technologies like mobile and cloud? These questions consumed us - just as we are sure they consume you. So we began looking for real answers - from customers. We sat down with our analytics team and began making our way through data from more than 1,000 quality related RFPs and RFIs and over 50 advisory and consulting engagements (there is a lot more, but we'll leave you to go through our freshly-released quality report and see the astonishing depth of detail we had access to). We fed the data into our proprietary intelligent quality platform, IntelliAssure, and waited for the results. So what did we see? We'll give you the good news first. We saw that quality had gone from reactive testing to a proactive discipline of Quality Engineering and Assurance. Testing had evolved from a humble caterpillar to a beautiful butterfly. Everything about the practice, from the speed, structure and skills (what we call S3) had changed. There really is no bad news that the report holds. What it tells us are the imperatives of digital transformation that are sweeping across industries. It tells us why strategically interleaving test solutions at the right moments in the lifecycle of a product enhance speed of delivery. It looks why the luxury of a separate test window and a central test organization are evaporating and what your most reasonable alternatives are. It delves into when you should use central testing capabilities and when you should use decentralized capabilities. It examines the skills required for testing that have undergone a massive transformation. Today, testers need to be skilled programmers and programmers need to be skilled at testing. This is giving rise to new roles like Quality Engineers, substantially changing the game of quality testing. The report has insights into several other aspects of quality. Importantly, it reveals the developing trends in Automation, Performance Engineering, End Customer Experience, Test Data and Environment Management, and the Emergence of Quality Engineering. Test professionals will appreciate the depth and breadth of insights. Actually, the report may hold some bad news after all. If your organization is still stuck with traditional testing methodologies, your peers may be getting ahead. It is time for you to catch up. Arun Melkote - General Manager And Global Head, Testing Services, Wipro, Ltd. Arun is the Global Head of Testing Services at Wipro where he is responsible for business growth, delivery, operations and Client relationship management. He is an acknowledged leader in the Quality Engineering and Assurance Space with 20+ years of industry experience. As a core member of the team that set up Testing Services Practice at Wipro, Arun has seen Testing Services evolve in his career. He has led Quality Assurance and Engineering practices at multiple Business units and has forged strong customer relationships, deep technical expertise and tremendous employee orientation as a leader. The speedy SaaS momentum can not only be attributed to a tight economy but

also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified.
========================

Mobile Testing

----- Arcticle source ----- https://www.wipro.com/cloud/mobile-testing/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Mobile Testing Preparing for a fast-changing mobile world October | 2023 Introduction Mobile phones are becoming the equivalent of the Swiss Army knife. They are being designed for the needs of urban warriors who want to do everything with a single device. The 'always-on' mobile ecosystem has gone beyond the boundaries of telephony. It records activities, provides event alerts, keeps users in touch with their personal lives and assists in business processes like closing transactions and completing payments. These sophisticated smartphone capabilities are giving rise to novel ways in which to address the needs of customers, employers and partners. As a result, mobile adoption is on a steep adoption curve. A Cisco study suggests that by the end of 2013, the number of mobile-connected devices will exceed the number of people on earth. By 2017 there will be almost 1.4 mobile devices per person. The most obvious inference that can be made from the growth of mobility is that access to alerts, data, intelligence and applications on the move will filter down to the lowest levels in industry and enterprise. The corollary to this is obvious: businesses will begin to mobile-enable their web presence. Mobile applications are already becoming a natural extension of web applications. While this sounds simple, it presents a major engineering challenge to mobile developers. This is because what is not immediately obvious is the fact that the mobile landscape is vastly different from that of the desktop / laptop landscape. Mobile devices are built on a variety of fragmented platforms that include multiple versions of iOS, Android, Windows, BlackBerry, Symbian, Bada, Brew and dozens of others (as of today, there are 17 versions of Android alone published since its beta release at the end of 2007). Mobile devices themselves come in a vast variety of form factors, resolutions, processing capabilities and with a diverse range of sensors and interface options. Within this environment, bristling with differing hardware, software and connectivity capabilities are applications in three distinct flavours: Mobile Web Apps: These are server side apps that bring together the vast capabilities of the web and the functionality of touch-enabled smartphones. These apps are quick to deploy since they don't need to go through approvals as they don't depend on a mobile app store or marketplace for distribution. Native Mobile Apps: These are platform-specific applications designed for a device's OS and firmware. They leverage the device's sensors and capabilities. Typically, a native app developed for one mobile device will have to be re-worked and adapted for another device. Native apps may enjoy a higher level of security than web apps. Hybrid Mobile Apps: These apps are designed using web technologies (HTML5 being amongst the most

popular) but run inside the device's native container. A hybrid app is powerful because it exposes the device's capabilities (say a camera or an accelerometer using an abstraction layer) to what is essentially a web app. This is not good news from a business point of view as usability, capability and security of hybrid mobile apps can be different across devices. For businesses this means an exceptionally large burden on testing mobile applications across devices and device versions. Let's consider some of the key questions (see figure above 1.0) thrown up when testing mobile applications to understand the complexity of mobile testing: Mobile Application Testing It shouldn't come as a surprise to discover that for adequate coverage with respect to mass markets, an application might have to get tested on 15 to 20 device combinations [Platform-Version-Device Type]. It is evident that testing applications for mobile environments calls for a completely different approach, infrastructure and expertise. The Complexities of Testing There are several areas that need attention when creating a strategy for mobile application testing. Functionality Testing: Functionality testing is essential across all valid use cases and boundary / special conditions because it ensures a good user experience. Some of the critical factors to evaluate include ease of navigation and screen transitions, response speed of the device and application, ability to customise and personalise the application and the intuitiveness of the touch interface. Such testing must be done among various user groups against benchmarks to ensure adaption and quality feedback about the application's functionality. Performance and Usability Testing: While application stability and performance are of prime importance, they are dependent on a variety of other factors ranging from the mobile device to load and application response, server utilisation and network conditions. A number of test tools such as Shunra, Keynote, Neotys, Gomez, SDK Tools and LoadRunner are available for performance testing. Selecting the right tool based on the scope of the test and costs is critical. Automation: Test solutions should be platform agnostic. In order to ensure that testing time is reduced, the solutions should be reusable and scalable. Automation leads to shorter test cycles and productivity improvements of around 25 to 30 per cent. Security Testing: The mobile and personal nature of smartphones makes it a very vulnerable device to security threats. Security testing for mobile applications comes in three tiers – physical end-point device security, enterprise level security for devices (Mobile Device Management - MDM) and application security. Security check lists include password locked keypads, policy enforcements via MDM solution, remote data wipe in the event of non-compliance / theft / accidental loss of the device, application security checks via tools and vulnerability exploitation exercises. Security testing requirements of the mobile application includes evaluating OS specific vulnerabilities, application specific vulnerabilities, network vulnerabilities, storage vulnerabilities, data vulnerability and physical security of devices. Device Proliferation: With such severe fragmentation in the device space, application testing has to be done across a variety of devices. This means having a very large inventory of handsets available for tests. Upgrades: Rapid platform upgrades means keeping pace with them and validating the impact of the upgrades on the applications as soon as possible. Though platform owners don't wish to impact any public application interfaces leveraged by 3rd party developers, at times there could be impact on the application due to an upgrade. It is a good practice

to check the release notes of the platform upgrade to look for any potential impact / enhancement opportunity for the application. For businesses this means identifying the core regression suite to validate the impact of the change. This must be executed every time there is a platform / application upgrade. Tests should be based on upgrade release notes that identify the impact areas. Finally, this calls for automation of core regression suite for quick execution with increasing coverage to include more features. Infrastructure and Connectivity: Mobile testing requires dedicated infrastructure. To function, most mobile applications require connecting to the application servers. This creates the need for having Wi-Fi connectivity to the enterprise backbone (limited to application servers). There are several other ways to gain connectivity to application servers and it is important from a scaling perspective to ensure that test environments can be leveraged by geographically distributed testing team. This, in turn, may impact compliance to IT security policies and require intervention from the IT department. Addressing the Complexities of Testing Mobile application testing requires several sophisticated tools to ensure comprehensive and reliable test management. The most common tools required are for test automation, performance testing and security testing. Test automation is a must for mobility testing. This is evident from the fact that the same use case has to be run and validated on a growing number of devices and platforms. A reusable and scalable automation solution can help optimise the test effort. This significantly reduces the time required for testing and also the cost of testing. Automation solutions can be broadly classified in two categories – cloud based and desktop based. Tools must be selected for reusability across platforms and devices while keeping in mind the entire application portfolio. For a majority of the enterprises selecting and maintaining test automation tools can be a confusing task prone to expensive errors. This is one reason why it is best to partner with a technology provider who has a deep understanding of mobile test automation and who also has an understanding of your specific test needs and priorities. Another way to manage mobile application testing is to set up an in-house mobile test automation lab. This means equipping the lab with devices (various platforms and form factors), mobile infrastructure (secure Wi-Fi, internet, backend, automation stations, PI servers), tools (test, performance, security) and data (test data, benchmarks etc.). This is an expensive exercise. Most enterprises also find it difficult to retain the skills and expertise required to manage and maintain such facilities that are not core to their respective business. The Solution and the Benefits In today's highly fragmented, fast growing and dynamic mobile market it is tough for enterprises to own and operate mobile application testing infrastructure with high utilisation levels to justify the investment. It is best for businesses to work with a partner who can deliver testing as a service. Such a partner would ideally have the required skills and experience and also the infrastructure to deliver a reliable testing service. As an example a partner must offer the following to its customers: The benefits of such a partnership mean that an enterprise can remain platform agnostic and focus on the application rather than on the device. Rapid automated testing of applications across platforms and versions will ensure faster time to market, with a high degree of functional and security assurance in addition to deep test coverage - all this without the headache of managing the test infrastructure or making CAPEX investments with uncertain ROI. Summary

It is inevitable that your business will adopt mobile technologies to improve efficiency and become an 'always available' business. However, in a fast-changing mobile environment, application testing must be done in days instead of weeks, to ensure that your business remains agile, productivity is not lost and customer satisfaction is not impacted. How your business overcomes these challenges will determine how mobile it is and how competitive it remains. One of the best approaches to mobile testing, therefore, is to engage with a technology partner that offers mobile testing as a service. Sudheer M, Practice Head – Mobility Testing and Automation Sudheer has 12 years of experience in Wireless Technologies & Mobility and is currently working as the Practice Head for Wipro Mobility Testing. He handles Enterprise Mobility Testing and is also responsible for Mobility Test solutions. He has developed automation solutions for Smart Devices, Android Platform and Chipset Validation The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Automation Checkerboard - What moves my Benefits?

----- Arcticle source ----- https://www.wipro.com/cloud/automation-checkerboard-what-moves-my-benefits/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Automation Checkerboard - What Moves my Benefits? October | 2023 Across industry verticals, enterprises are moving towards test automation. It has been observed that there are a lot of investments into test automation but not every initiative has been able to provide the desired benefits. How many times have we heard the project sponsor say – "I have invested into automation, but I don't see the benefits and automation has not been able to add significant value." What moved the benefits away? The answer lies on the Automation Checkerboard. Test automation has characteristics similar to the news we read in a newspaper or watch on television. It keeps changing every day, and it needs to be refreshed regularly, lest it loses its intrinsic value. Usually, test automation is an afterthought largely driven due to schedule slippages in upstream development. The typical approach to automation is an ROI computation that compares the investments against the effort savings brought in by automation. Developing an automated test upstream is cheaper than developing the same script much later in the development lifecycle. Due to this dynamism, the traditional ROI model will not predict the benefits correctly. Every enterprise believes that it can derive significant benefits from automation. However, there is no structured model or approach, which defines where to start and when to end the investments into automation. The complexity of the problem is aggravated due to the fact that test automation activity is highly dynamic in nature. Any

task that gets automated will always be affected due to a business change, process change or technology change. Hence a simple ROI model will always fail, and will be inadequate to drive the strategy for automation. Understanding the problems with test automation Let us look deeper into the problems of test automation at an enterprise level. Here is the story of a test team – Team GodSea which is performing the testing of a suite of applications in a leading investment bank. The classical problems with test automation are brought out. GodSea - the test team has been writing regression tests and executing them manually across many releases. The regression pack has grown, and the test assets have changed many hands. It has reached a stage where the regression pack is large, and cannot be executed entirely for the next release as manual manpower is not sufficient. The team selects a subset of tests for regression based on the risk and priorities. The regression pack is not fully executed, and the test coverage is limited. The natural fallout is that some bugs slip into production. GodSea test team figures that the best way to solve the problem is to automate the regression test pack. Performing an automation assessment yields the following results A new test automation team MountainGod is setup to address the issues in testing. Their objective is to bring in cost benefits along with increased quality. Once the automation team starts, it faces the following challenges:- A periodic review of the MountainGod team reveals that the automation is far behind expectations and the confidence of the application teams on the overall testing is low. Additional efforts have gone in to make the automation work, making the automation more expensive and the ROI weaker. The automation scripts that have been built so far are being A new test automation team MountainGod is setup to address the issues in testing. Their objective is to bring in cost benefits along with increased quality. Once the automation team starts, it faces the following challenges:- subject to continuous maintenance. The GodSea team is scampering as testing schedules are crunched and they have to finish up in the reduced timeframe. The benefits from automation are being questioned. This is the classical story with every enterprise on an automation journey. The Solution- Automation Checkerboard The benefits derived from automation for an enterprise needs to be looked at in two dimensions. The first dimension is the 'Quantum of Automation' and this drives the classical ROI model. The quantum of automation achieved resulting in effort savings compared against the absolute manual effort determines the cost benefit achieved through automation. The second dimension often neglected is the 'Effectiveness of Automation'. In the purest sense, effectiveness of automation is a misnomer, as it tends to define the effectiveness of the tests itself than the automation per se. However, automation without this relationship to the defined tests is quite meaningless and hence it is imperative to keep this dimension into consideration. Automation has evolved from being an efficiency lever into a two dimensional plane where the effectiveness of automation also needs to be measured. This can be best visualized as a simple two dimensional checkerboard. The starting point on the grid is the current state of automation in the project. If a project has moved from 20 to 80% automation achievement (X axis), it is highly possible that due to maintenance considerations, the effectiveness can be near zero (Y axis). Using the two dimensional automation checkerboard Automation Checkerboard gives a clear answer to the question – Where and how the benefits move. The Automation Checkerboard is a useful tool to define the

automation strategy and roadmap for an enterprise – the plane on the x axis defines the quantum and the y axis defines the effectiveness. The right moves by an enterprise will deliver on both planes – efficiency and effectiveness, and hence deliver maximum value from automation. To be able to effectively use the Automation Checkerboard, it is important to understand the positioning and the moves towards realizing the benefits. The aim would be to move from the current position to the top right corner to derive the maximum benefits. Starting on the grid The first step for any project is to position itself on the checkerboard. This is based on the current state of the project. If the project is just about starting and in its infancy, then the left most corner is the starting position. However, if the project is already in progress, and some percentage of automation has already been developed, then the squares on the right would be the starting position. Knight's move At the start of the automation initiative, it is very intuitive to start building on the quantum of automation for early benefits. At this level, we need to address the aspects of technology stack based on the needs of the test suite. The right choice of the automation toolset as well as the framework is required to implement automation. A good automation framework provides an abstraction layer that removes the technical nuances of the automation tool and provides with higher productivity of automation. This move will attempt to move the effectiveness north by one position while the quantum of automation produced will move it east by multiple positions. A classical Knight's move delivers the horsepower to gain on the pace of automation development and deliver effectiveness even with smaller percentage of automation development. Rook's move The design of the components and their reusability is the key to success. Each test scenario needs to be analyzed and the business process components need to be defined. Doing this early in the testing lifecycle enables proactive and progressive automation. The right design and underlying framework enables development of automation scripts even while the application development is in progress. This is most beneficial in Agile projects and is probably a true implementation of 'Shift left'. By designing the business process components well, each component can be automated once, and reused across multiple test scenarios as well as across multiple phases of the testing lifecycle, increasing the overall effectiveness with the same quantum of automation development. A classical Rook's move looks at moving north by improving the maturity of automation and delivering higher benefits. Bishop's move The Bishop's move is to move diagonally and bring in continuous improvements. This move is required to improve the performance and speed of execution. Improving the speed of execution and enabling unattended execution helps in continuous refresh of the regression pack. This requires integration with the test management tool, typically HP's ALM. The other aspect that needs to be taken care of is the preconditions for each test execution to be automated and creation/organization of test data required for execution. In this way, the tests can be scheduled to run automatically at a predetermined time, and the results of the execution are auto-populated back into ALM. Continuous integration into the development environment helps improve the effectiveness, right from code build to smoke and regression tests done in an automated and unattended way. Queen's move The Queen's move is the most critical action towards the success of automation. It is used to address regular maintenance. The automated test suite should be run regularly (nightly, unattended) and analyzed for failures.

By running the automated pack regularly, the maintenance needs are caught much early and provide sufficient time for the team to make updates to the automated regression pack. This is most beneficial in an agile environment when things can change on a daily basis and the automated executions can catch issues very early in the lifecycle. Having a continuous running regression engine will enable tests to be pushed in and out, and the results continuously monitored. The outdated tests can be purged out on a regular basis and newer tests should be defined, automated and added to the existing pack. This will ensure that the automated regression pack is at all times up-to-date and most-effective. Conclusion Automation is dynamic by nature. It can get outdated in no time. For it to deliver benefits, it needs to be constantly monitored and refreshed. Design of components ensures reusability. Choice of tools and frameworks enables speed and agility. Continuous integration helps increase the benefits and at the same time keeps the automation relevant. Ensuring early maintenance gives the desired long-term benefits. The automation checkerboard provides a structured mechanism and gives a two dimensional view towards deriving the maximum benefits from the investments into automation. The checkerboard and starting point is representative of the current state of the project and at what time the investments into automation have begun. The different moves on the checkerboard are metaphors for levers that need to be engaged to derive maximum benefits. There are multiple openings for a game. It's the right set of moves that make you win. Girish Kulkarni is the Global Practice Head for Test Automation, Testing Services. With two decades of experience in Software development and testing, he has played various leadership roles at Wipro. A business leader with successful results in delivering projects for global Financial Services customers, he has rich and diverse experience – from driving transformation programs through automation to Program management, Product development, Business enablement and Global Account management. Being an avid reader, creative thinker, painter, sculptor, cook and a gardener, he likes to indulge in various hobbies and activities. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Digital Assurance: Reaching a Seamless Customer Experience

----- Arcticle source ----- https://www.wipro.com/cloud/digital-assurance-reaching-a-seamless-customer-experience/ ----- Contact Wipro Please fill the required details to access the content Digital Assurance: Reaching a Seamless Customer Experience October | 2023 As digital technologies envelop all spheres of business operations, the need for assurance of near-flawless performance in user experience and security has taken center

stage. The practice of digital assurance aims to meet that demand, and has elevated the testing function to being a critical piece in the design and development process for digital services. Wipro's head of testing services, Kumudha Sridharan, and Wharton professor Shawndra Hill discuss the latest challenges in this Future of Industry series white paper, produced by Knowledge@Wharton and sponsored by Wipro Technologies. On October 6, 2014, technology badly let down Bangalore-based Flipkart, India's largest e-commerce retailer and Amazon's biggest rival in the country. Flipkart's expectations for its big sale event that day came crashing down when its website couldn't handle the unprecedented volume of customers looking for deep discounts. Also, its promotional pricing programs went haywire, leading to massive order cancellations, angry suppliers and of course, upset customers. Flipkart apologized, and promised to make its systems fail safe. In the U.S., data security has been the victim of technology imperfections. Retail chain Home Depot in September said thata breach into its in-store payments system may have compromised up to 60 million credit cards; making it the worst such case so far (no debit cards were affected). It eclipses a similar breach at the Target retail chain, which has so far affected 40 million credit cards. Even the U.S. government healthcare website, which was built on a whooping budget of $500 million, faced technical glitches, during its launch in October 2013. Most of the people were unable to sign up and enroll to the website to purchase health insurance for themselves and their families. These are a few instances of the technology snafus that highlight the growing impact of digital assurance, a function that basically tries to ensure that technology works as it is supposed to. The practice has outgrown its earlier testing role to become a front-end function influencing product design and development now that digital technology has reached every aspect of business. "More and more software is coming online and people are sometimes using the software in ways that they weren't intended. The risks are greater as numerous mobile and web apps are written by freelance developers who lack the foresight — or the budget resources — to test and control how their creations are used." - Shawndra Hill Digital assurance services focus on the interplay of devices and apps on the web or mobile platforms. Ideally it provides superior navigability and content on those channels, and ensures a seamless customer engagement before, during and after a purchase, and across multiple touch points that could start with an online visit and end at a physical store. Through that process, digital assurance is designed to provide a smooth and relevant experience while protecting their financial and other data from hackers, according to Kumudha Sridharan, vice president and global head of testing services at Wipro Technologies. Shawndra Hill, Wharton professor of operations and information management, says retailers' online crashes under volume loads or security breaches underline digital assurance's increasingly critical role. "More and more software is coming online and people are sometimes using the software in ways that they weren't intended. The risks are greater as numerous mobile and web apps are written by freelance developers who lack the foresight — or the budget resources — to test and control how their creations are used." Thus, digital commerce with smooth user experiences is a high priority for many businesses, along with data security. Digital assurance will become more and more important for businesses because "fundamentally, companies want to ensure that their end-customer experience is good and that their digital channels enable them to achieve a

higher reach," says Sridharan. She offers the example of a large North American retail chain that effectively used digital assurance. The retailer wanted to increase the number of prospective customers browsing its offerings on web and mobile channels who ended up making purchases. It hired a digital assurance provider to develop new apps and improve the user experience on mobile, tablet and online channels. That helped the retailer increase the so-called "conversions" of prospective customers to actual purchasers from 8% to 11%, she says. Sridharan cites the experience of online shopping network Shopzilla as another example of how digital assurance can enhance the customer experience. When Shopzilla invested in improving the performance of its website and related applications, it gained a five-second speed increase (from seven seconds to two seconds) as its pages loaded. That increased page views by 25% and revenues by 7%- 12%, while costs were slashed by 50% and performance improved overall. Digital assurance services to improve user experience also brought gains to some firms polled in a recent survey by research firm Econsultancy and digital technology services provider RedEye, both of London. And the gains are not always strictly IT related. Veeam Software, a Swiss IT services firm, found that changing a single word can bring seemingly magical results. It replaced the words "Request a quote" on its website's sales inquiry form to "Request pricing" and found the click-through rate soared 161%, according to the survey report. Companies that do not invest in digital assurance do so at their peril, says Sridharan. For example, retailers must test their systems for potential crashes ahead of festive seasons such as Black Friday (the Friday following Thanksgiving Day) when sales volumes soar, Sridharan added. "If they crash, the retailers could lose heavily." Sridharan pointed also to Amazon, which found that even a one-second slowdown in webpage load time could cost it $1.6 billion in lost annual sales, according to a report in Fast Company magazine. Investments in digital assurance could also pay back through reduced risk premiums on insurance coverage against business disruptions caused by technology glitches. "Companies want to ensure that their end-customer experience is good and that their digital channels enable them to achieve a higher reach." — Kumudha Sridharan Digital Assurance for New Age Digital Marketing Digital marketing is another area which has undergone a massive change towards end-to-end assurance. The marketing effort has moved beyond simply placing ads or campaigns on various digital channels to recasting the digital production ecosystem, which executes campaigns across geographies more cost effectively. Now many multinational companies are implementing "digital decoupling," using one advertising agency to create their core brand message, which is then customized to suit different markets or business units. Sridharan says this approach ensures higher brand consistency and lower costs as creative work is separated from cheaper, repetitive and non-creative work. One example of this approach is Nokia. In 2008, the company was looking reduce global digital production costs (60% of Nokia's total digital budget) while improving consistency in marketing campaigns. While Nokia had one central creative AOR (agency on record) responsible for creating its global brand message, it also had sixty-four local agencies implementing that message, each operating in significantly different ways. As a result, the global message was often changed or lost in its local implementation. Nokia consolidated its local digital production to a single organization, providing more global control. It also consolidated global

digital production to five time-zone hubs, each serving five to 15 local markets, and all operating on a single platform. The result: Nokia cut production costs to their target — 20% of the digital marketing budget. In addition, the new model dramatically corrected inconsistency issues and improved campaign performance across all markets. Nokia benefitted from faster campaign time to market as well as real-time visibility of local market activities. Digital assurance no longer works best as an in-house service at companies, and they typically outsource it to third party providers. Using multiple products and software in an ever-changing mix of permutations and combinations brings complexity that extends beyond the testing of any one supplier, says Hill. She also notes that there have been several startups popping up recently to create test software for the user experience, such as one working on mobile apps to track user's pain points. Unlike in the past, companies today want to build agile, fully automated systems where these kinds of more thorough testing are part of the initial blueprint, says Sridharan. Consequently, companies can no longer afford to be reactive. They have to do what is called "progressive, in-sprint automation." Digital assurance is still "an evolving space, and no perfect formula has arisen" as yet for how to go about it, says Sridharan. End-consumers drive much of the changes in digital technology, making it dynamic and therefore difficult for companies to keep pace. "Companies today want to build agile, fully automated systems where these kinds of thorough testing are part of the initial blueprint." — Kumudha Sridharan The field faces several hurdles. First, even as devices or apps are tested for performance under various conditions, there is no guarantee that all possible scenarios will get covered. Second, when companies source apps from different vendors, they might fall short in their ability to maintain or enhance them. Hill notes that digital assurance cannot work in a silo and must have a collaborative setting – and a keen eye on human error. "Digital assurance is also about educating companies and consumers on how they can keep their data secure." She points to human intervention as a risk factor for digital assurance, such as in breaches caused by weak passwords or by disgruntled employees. That last aspect highlights the role for human resources, she adds. "If your database administrator is somebody whom you haven't fully vetted, there could be leaks of sensitive data." Businesses are willing to make the necessary investments in digital assurance, but the challenge is in meeting their expectations of performance guarantees, says Sridharan. "It's an iterative journey, towards meeting consumer expectations especially when so much in the digital world is user driven and dynamic." But she adds that despite the challenges, digital assurance can go a long way towards helping organizations reach the goal of providing a fully integrated and seamless customer experience. "Digital assurance is also about educating companies and consumers on how they can keep their data secure." — Shawndra Hill

The Burgeoning need

for Big Data Assurance

The Burgeoning Need for Big Data Assurance October | 2023 Executive Summary Over two-third of enterprises, across industry verticals, who are currently planning or implementing Big Data analytics projects stated that their projects have not progressed past the pilot stage. One of the primary reasons identified for this lack of success appears to be the lack of a holistic Big Data Assurance Strategy to address issues related to data quality and rein in the cost of quality and delivery on projects. Big Data has been a key focus area for enterprises in the information technology landscape for many years now. Industry analysts across the globe agree that Big Data is a multi-billion dollar industry. However, despite the buzz and spending on implementing Big Data technologies, only a few understand what the term really means. Moreover, there is a lot of uncertainty around implementing Big Data projects globally across industries due to the lack of credible market intelligence in the subject. To find out more, Wipro conducted a market research study to gain insights into the state of current enterprise Big Data projects. Our survey of senior executives and leading analysts based in organizations in the US, Canada, Europe, and Asia – captures a vivid snapshot of the various drivers and flavors of the current enterprise Big Data project implementations across a few industries. Our research findings also provide a strategic outlook into some of the critical elements in the market such as the most favored Big Data tools and technologies, investment interests of enterprises, hurdles in current project implementations, as well as the gaps that exist in today's Big Data ecosystem. A quick synopsis of the survey results show that: Introduction Fueled by plummeting data storage costs, Big Data technologies have grown exponentially over the past decade. Big Data platforms, which started out as batch-processing platforms, are now evolving to handle near real-time processing. These platforms allow continuous access and processing of data at a large scale to aid datafication – the ability to discover previously unknown/unseen trends and relationships using data. This trend has further accelerated with the explosion in the number of connected devices collecting data. As data collection increases in scale and scope, there will be a larger need to assess data processing agility and data quality. New processes and policies to measure the speed and efficiency of capturing, managing, and analyzing data will come into effect, which in turn will help consolidate standards and policies for data management and analysis. In order to support this trend, there will be a rise in the number of self-servicing Big Data applications and platforms based on PaaS (Platform as a Service) and SaaS (Software as a Service) models. As a result of, the exponential generation of data, managing the volume, velocity and variety is posing a herculean challenge to businesses worldwide – which has resulted in issues related to data quality. Gartner estimates that

poor quality of data costs an average organization $13.5 million per year, and yet data governance problems — which all organizations suffer from — are worsening.1 Wipro believes that the key reasons for poor data quality include: Can Big Data Assurance help minimize losses associated with bad data quality? To answer that question, let's look at some of the current Big Data needs of organizations. The State of Big Data Implementations Today We found that most customers today appear to be taking their first steps towards creating a data processing engine for their various data processing needs. This is evidenced by the fact that 80% of our respondents stated that their biggest spend on Big Data technologies were on the three leading Hadoop platforms (Cloudera - 32%, Hortonworks – 17%, MapR – 17%, and the base version – Apache Hadoop – 10%). After setting up their platforms to store and archive data – typically called Data Lakes – organizations seek to create data models that allow them to derive value from their data. This process of value creation from data requires the creation of data models. Data models typically govern the following processes for organizations across industries: Figure 1 – How Big Data will be used in enterprises by industry ? Once organizations create a data model, they are able to proceed into the next phase of their Big Data projects – Data Processing to provide value. Our survey finds out that enterprises are primarily adopting Big Data technologies and solutions to pursue projects that will provide business intelligence (92%), predictive/prescriptive analytics (88%), fraud detection (79%), and customer behavior and customer sentiment analysis (77%). To address their technological needs, most organizations appear to be using standard solutions (81%) rather than working on creating custom solutions/ services in-house. A large part of this may have to do with the fact that organizations are currently focused on enhancing their talent pools (79%), and still defining processes and solutions by working with third parties (75%). The survey results also indicate that only a smaller percentage of organizations have reached a point where they have proceeded past the data integration phase into the data processing phase as there are no data processing tools other than Splunk (20%) that figured in the top Big Data spends for enterprises. Figure II- What are the primary tools used in Big Data implementation? What is Big Data Assurance? Big Data Assurance is about providing a strategy, deriving a process, and aligning the right tools and resources required to address the problem areas outlined above. However, in order to create a Big Data Assurance strategy, it is not only important to understand the pain points observed in current implementations, it is also critical to understand the nature of Big Data implementations seen across enterprises. We have observed that there are currently two primary flavors of enterprise implementations that handle Big Data: Each flavor of implementation requires a different Assurance strategy to address the issues that will be faced. For Big Data platforms used as data repositories (such as Data Lakes), the primary area of concern relates to the correctness, completeness, and timeliness of the data stored from various sources. To ensure this, two primary tasks need to be performed – first, ensure that each data source provides data that is correct and complete (compared to the source),What is Big Data Assurance? and second, ensure that the quality of data on the system meets the standards that meets governance and timeliness policies required. Assuring quality on high performance Hadoop platforms require a slightly different approach in addition to the tasks associated with the first type of implementation. In

order to assure quality on this type of implementation, it is not only critical to ensure the quality and correctness of data that is stored on the data system, it is imperative to test (functional and non-functional such as performance) the various algorithms that are written to cleanse, process, and transform the data that will ultimately provide the metrics, dashboards, reports, and, other consumables required. Moreover, given that Assurance tasks in Big Data implementations involve working with large and varied amounts of data, it is imperative to have an automation strategy to ensure that resources don't spend too much time and effort performing mundane, yet, critical tasks. Despite this, most implementations today primarily perform all testing tasks in the Big Data world manually. Current State of Assurance in Big Data Implementations The level of maturity in current Big Data implementations show that there is a huge scope for Data Wellness/ Data Assurance in current Big Data implementations. This is further proven by the fact that over 52% of respondents cited that the market currently lacks good Assurance tools and services. Only the lack of data analysis tools and services (62%) was featured as a bigger service/tool-related gap for enterprises. The demand for professionals with Big Data Assurance experience coupled with the lack of tools and services has resulted in over 77% of the respondents to the survey struggling to find individuals who have the required skills to perform Assurance using Big Data technologies. Across verticals, Utilities (40%) have taken the lead in hiring third parties for Big Data Assurance, whereas Hi-Tech (67%), Banking and Insurance (50%) companies display a high preference in keeping Assurance activities in-house. Results also indicate that enterprises are on the lookout for testers who have expertise in data analysis (88%), Hadoop development (58%), and tool-specific work experience (52%). The profile of individuals who will perform the role of testers is skewed towards those who can develop as well as test. Although only 29% of our respondents stated that all Big Data Assurance will be tightly coupled with development, 49% believed that there will be a role for testers who have development and scripting skills as well. Only 22% of our respondents believe that there will be standalone Assurance opportunities on Big Data projects. Enterprises today appear to be in splits about how to fulfill the assurance resource requirements on projects. Only 29% of our respondents are either currently working with third-party service providers or considering an engagement with third-party providers whereas, 32% of our respondents expect to hire professionals outright from the market. Almost 39% of our respondents are unsure about what strategy they need to adopt at the moment. Although organizations are not planning to look for people resources for their Big Data projects, it appears that enterprises will look at engaging third-party tools and consulting services. This can be inferred by the fact that 80% of our respondents will engage with third parties for their Big Data Assurance requirements over the next three to five years. Overall, companies with budgets between $50M and $100M are most likely to outsource Big Data Assurance to third-party vendors. This shows that there is a lot of scope for Big Data Assurance tools and services (especially Big Data Assurance as a service) in the near term for third-party vendors. Benefits from Implementing a Holistic Big Data Assurance Strategy From the results mentioned above, it is clear that organizations are unable to implement a holistic Big Data strategy. This situation could have arisen due to a lack of understanding on how to integrate an Assurance strategy into current

implementations, along with a paucity of skilled resources, services, and tools available to address the specific challenges posed on current Big Data implementations. The best method to integrate a Big Data Assurance strategy – into existing implementations – would be to understand the essentials of what it involves, and how it will help organizations overcome current challenges. A Big Data Assurance strategy helps enterprises derive maximum value from their Big Data implementations. A holistic strategy should primarily deal with: Conclusion Despite the abundance of technologies and processes in the market today, there is a need for consolidation and industrialization throughout the entire Big Data lifecycle. Currently, there are no solutions available that provide a holistic approach to handle the various challenges faced by enterprises implementing Big Data. Moreover, there is clear need to identify a technology stack that will allow enterprises to aggregate, ingest, analyze and process, and consume data effectively. But not all is hazy. There are solutions available that help organizations create value in their Big Data implementations. These solutions establish a measurable and repeatable methodology for various technical and process-related challenges and help identify the key activities that require maximum attention. Validation and verification of these activities will ensure that enterprises can extract value from their Big Data implementations that are also imperative for any solution. Enterprises need to identify the right solution that fits their Big Data implementation strategy. This will ensure that they find light in the chaos. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Digital Assurance

----- Arcticle source ----- https://www.wipro.com/cloud/digital-assurance-difference-business-performance/ ----- Related Articles Contact Wipro Please fill the required details to access the content Digital Assurance By Kumudha Sridharan, Vice President & Global Head of Testing Services, Wipro Ltd October | 2023 In an Everything-Digital environment, businesses must stress on operations that provide accurate, rich and engaging digital content, and distribute it satisfactorily across channels to improve accessibility coupled with a high-end user experience. This translates into an inordinate focus on infrastructure and application performance, process optimization and stability, usability, design, functionality and security. Together, these deliver what every organization wants: digital assurance. Digital assurance is vital. It makes a morethan-significant difference to business performance. For example Shopzilla, one of the largest online retailers, unlocked a 7-12% increase in revenue through a 5 second speed up in page loads. The speed up resulted in a 25% increase in page views, leading to improved revenues and a 50% reduction in hardware deployments. Staples redesigned its website to make it easier for customers to place orders, thereby increasing the likelihood of repeat purchasers. Staples reported that repeat customers

had increased from 180,000 to 300,000 over a single quarter after the new design had been tested. In addition, speed is of the essence. In 2013, during a 34-minute blackout at the Super Bowl, Oreo sent out a Tweet that said, "You can still dunk in the dark." Some believe that the Tweet resulted in better customer response than the actual Oreo Super Bowl ad that had a multimillion dollar budget2 For Digital Marketing to be agile, systems need to be continuously tested and kept on the ready for a response on scale, else opportunities can be lost. What this tells us is elementary but often overlooked: digital businesses can achieve considerably more with greater ease than traditional businesses -- but they are also vulnerable to multiple points of failure. Today industries across the globe are leveraging innovations in digital technology to reinvent and transform their businesses. They bank on an omni-channel strategy for deeper market penetration. And they use digital content to effectively market their services and products and provide great customer engagement through digital user experience. The challenge is to do this seamlessly and consistently across platforms, operating systems and device form factors – all of which continue to evolve. In addition, content itself is growing in velocity and formats. Today, rich streaming content is the norm, digital decoupling is being employed for effectively managing digital marketing operations, and devices and consumer actions are unleashing a flood of data that must be assimilated, validated, crunched and put into the feedback loop of businesses. There is no room for error. Testing infrastructure, applications, process, usability and design, functionality and system security using standardized tools is an effective and essential method to create digital assurance. This insulates systems from unexpected failure. The strategy of rigorous testing is relevant to internal, employee-facing applications as much as it is to external customer-facing applications. Businesses must therefore ensure they have a 360 degree test strategy that prevents failure at both levels. References The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified.

How to Provision the Right test data for Business Events

How to Provision the Right Test Data for Business Events October | 2023 For any given organization to succeed, irrespective of its size, area of expertise and customer base, an awareness of the end user needs, and adapting to meet those is of utmost importance. In addition adapting to the changes promptly is equally important to achieve competitive advantage. Test Data Management plays a key role in ensuring quality roll out of applications at the right time. As a service/practice, it has matured in most organizations. The predominant activities include sub-setting, masking, data refresh and synthetic creation standardized through Test Data Management (TDM), Extract Transform Load (ETL) or Database (DB) tools. However, domain and platform specific test data provisioning still remains a challenge as this needs deep knowledge of the entire business processes. Data preparation for business events across domains is still in its infancy with organizations devising their own methods to address these challenges. This paper summarizes the various approaches available for effectively preparing Test data sets for business events. Introduction In any organization, approximately 40% of a tester's time is spent on waiting for the right kind of test data. To add to it, 20% to 25% of defects found in UAT and production phase are directly or indirectly attributable to the quality of test data used. Organizations have realized the impact of test data on the three pillars of Cost, Quality and Schedule. Hence, investments are being made in Centralizing Test Data as-a-Service (TDaaS) and automating test data provisioning through implementation of sophisticated Test Data Management (TDM) tools. These tools play a key role in: And all this needs to be achieved while retaining data integrity at an application level across applications. Data integrity across applications is a critical requirement for testing end-to-end business scenarios. The TDM tools also have capabilities for generating synthetic data for new functionalities where data does not exist in production databases. Preparing test data for business events like End of Day (EoD) process in the banking sector or holiday season in the retail domain are complex scenarios where out-of-the-box solutions don't exist. Various dimensions like volume of data, dependencies across applications and time sensitivity adds to the complexity of preparing data for business event testing. The Challenge Consider a scenario where

the taxation rules for interest earned from bank deposits in US changes from 1-Jan-2015 and we are currently on 1-Jul-2014. In this case, the software changes may be developed in Sep-2014 and the modified programs may be implemented in production by 31-Oct-2014. However, the new tax calculation program will not be actually executed till say, the night of 31-Jan-2015. In order to test this scenario, we will have to simulate the data for 1-Jan-2015 to 31-Jan-2015 in the test environment. A typical bank will have in excess of 20000 batch jobs for the month-end processing. Now, if a data model change impacting these batch jobs has to be implemented, it is imperative to test the entire month-end process. A copy of data from production cannot be used directly for testing as there will be at least two shortcomings: Similarly, in the retail industry, let us take the example of a situation where a new piece of code needs to be implemented for calculating and applying discounts to purchases made between the discount period of 25-Nov-2014 and 5-Jan-2015. This cannot be addressed completely by just advancing the date on the database and application servers. There will be many scenarios that will actually need data that spans before, during and after the discount period like: Hence, organizations have to carefully strategize their approach towards test data management, to ensure the quality of application and deliver excellent end user experience to safeguard their brand image. Solution Approaches Let us now focus on the approaches available for provisioning data for Business events like the ones mentioned above. Selective Updates Scenario 1: Suppose a telecom service provider gets a new customer request and the Customer status is initially "New" and the status changes to "Active" only after 48 hrs. This is a typical scenario where a small volume of data is required for testing the scenarios. For this we can use employee selective updates where the table columns that are impacted are first identified and then updated with values for the records that will be used in that particular test cycle. So, in this case we can create a new customer from the application frontend with "New" status and then wait for 48 hours for it to change it to "Active" status. Only after that can they further test cases associated with this customer. Alternatively we can also update the "Customer creation Timestamp" column for the new customer to 48 hrs in the past and then run the "Customer Status Update" program. This will set the customer status to "Active". The latter approach is most commonly used by organization as it is quick and least disruptive. But the following factors need to be considered while employing this approach. Mass Update Scenario 2: An organization wants to simulate entire data in their Test environment from 31-Jan-2015 while current date is 1-Jul-2014. For this, data backup from production is loaded into the test environment and all date columns are advanced by a preset number of days. The process that would be needed to be followed will include: This approach should be treated like a software development project. The complete process has to be designed developed and tested. It has to be maintained on an ongoing basis to take care of: Mass Update with Look up One of the drawbacks of the Mass Update approach is that when the data is updated by a fixed number of days, the date in production may map to a wrong day in the Test environment. Scenario 3: 1-Jul-2014 is a Friday. If it is advanced by 7 months to 1-Jan-015 it will be a Thursday. However, 1-Jan-2015 is a holiday where 1-Jul-2014 is a working day. If it is desired that data of a weekday is mapped to a week day, that of a weekend is mapped to a weekend and data of a Holiday is mapped to a Holiday, a lookup table will have to be used. The lookup table

will contain three columns at a minimum. The table below shows sample data for a look up table: The steps involved in this process are very similar to the Mass update approach. Only the Update step will be different, wherein the lookup table will be used instead of a formula. This approach gives the flexibility of generating data for specific dates based on the project needs. If we have to simulate a scenario where sales on an e-Commerce application shoots up by 400%. All we have to do is map 4 days in the Source to 1 day in the Target. Also, by using a single look up table across application, we can easily ensure data integrity is maintained. Holiday Calendar Many organizations maintain a Holiday calendar which can be accessed by one or more applications. This Holiday calendar is used by the scheduler to determine if a particular job needs to be run on that date or not. If this feature is available in an environment, the Holiday calendar can be used for ageing data sets. Scenario 4: Suppose a new business rule comes into effect from 1-Jan-2015 and we need to test this business rule on 21-Dec-2014. This approach has a dependency on Holiday Calendar being a part of the application design. This is generally applicable in the Banking domain. This is effective if data has to be aged by a few days and might not work if data has to be aged by a month or more. Incremental Data Sets The Mass update and Mass Update with look up approaches require that a separate data set is created and maintained for each business cycle (daily, weekly, monthly and so on). Maintaining multiple data sets could be painstaking if there are too many cycles. And, if the data is not masked, there could be potential data security risks with multiple data sets. In the Incremental data sets approach, data is extracted at a lower granularity level from production and updated separately for each incremental set. Example 1: In an e-Commerce environment, data can be extracted for every hour. Each hourly data set is updated (using the steps mentioned in the mass update approach) and data can be provisioned in the Test environment using combinations of hourly data sets. Example 2: Suppose we need to prepare data for a month-end job in Jan-2015. We extract data from production on a daily basis from 1-Jul-2014 to 31-Jul-2014. Each day's data is updated as per our need (following steps mentioned in the Mass Update approach). All the 31 data sets will be loaded sequentially into the Test environment. Suppose we need to provision data for an end of week job, we can identify 7 days' worth of data from our data repository and load them. Conclusion To sum up, while Test Data Management tools and processes have matured in the last few years, there are still many areas across domains where processes are still not standardized. Hence, Businesses are not deriving the maximum benefits that a robust TDM function can deliver. Multiple approaches are available to overcome this and the right one for a given scenario depends on the quality, quantity and quickness with which data is required. In some complex situations, a combination of these approaches can also be adopted to solve the Test data challenge. Implementing a standardized Test Data solution for business events can significantly reduce risk, improve quality and reduce cost for Businesses. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Critical Success Factors

for a Successful

Test Environment Management

Critical Success Factors for a Successful Test Environment Management October | 2023 Test Environment Management is about controlling, steering and managing the enterprise level test environments. It consists of multiple components like hardware, software, databases, middleware, applications and test data managed by tools, procedures and resources effectively. However with the number of tools increasing by the day, managing test environments is becoming more of a challenge than ever before. It has now dawned upon businesses that managing multiple slow, inconsistent and unreliable test environments will result in higher operational costs and lower test coverage. Some of the key test environment challenges are as follows: Doing business in the midst of these unreliable test environments have made organizations wary of their higher operations cost and lower test coverage. Most organizations today have recognized these challenges and are initiating best practices to transform the current operating model to best in class test environment model This whitepaper highlights key recommendations for best - in - class enterprise test environment management and also gives an insight on the pre requisites for successful testing. Key factors for a successful test environment management: Test Environment is a necessary pre-requisite for successful testing and many organizations are setting up a dedicated service to manage the test environments effectively. The key factors for a successful test environment management are summarized below: 1. Efficient Resource Management 2. Strategic Planning and Robust Program Governance 3. Process Optimization and Operations excellence 4. Automation 1) Efficient Resource Management a) Complete Ownership – Establishing a dedicated Enterprise Test Environment Management team To transform to a best – in – class test environment model the first step is to establish a dedicated test environment team at the enterprise level. This team will serve as the single point of contact for all test environment related activities and will be held accountable for enterprise Test Environment Management as a fully functional and mature enterprise service. Challenges faced in distributed Test Environment Management model can be overcome by adopting the Test Environment Management Enterprise model with a few initial difficulties. Once these difficulties have been attended to with a perfect transformation plan, then the rest of the operational level challenges can be addressed quickly. b) Speaking the Same Language - Maintaining common terminology at enterprise level. Another essential aspect of best in class Test Environment Management is maintaining the same terminology at the

enterprise level. Most of the times people create and use their own words which would lead to misapprehension on test environment issues. Eventually this leads to a delay in resolution and impacts the overall quality of test environment. The Program Governance team will have to define the terminology and ensures that the team adheres to it. Standardization leads to better understanding and efficiency in collection and dissemination of information. c) Sharing the Wisdom - Knowledge Management Knowledge management implementation at the enterprise level will be a challenge when there is no centralized test environment team. The program governance team will have to plan and implement a well-structured knowledge base for Test Environment Management and must ensure that all information is available to end users and stakeholders. The test environment team will have to develop and maintain a library for all Test Environment Management activities, including test environment solution documents, schedules, test environment plans, status reports, recovery procedures, incident management and others as defined by the governance and audit requirements 2) Strategic Planning and Robust Program Governance a) Improving viability - Defining the Test environment strategy Given the test environment challenges most organizations face today, it has become essential for an organization to define the test environment strategy at enterprise level. The strategy document serves as a master reference manuscript for the organization to implement Test Environment Management as a fully functional service and to evolve release (or project) level test environment strategy. While defining the test environment strategy, it is important to be aligned with enterprise test strategy, IT infrastructure strategy and release pattern. The strategy should be directed and governed by the 'Program Governance Office' by working closely with all relevant stakeholders. For better rationale, alignment and control, another key aspect that organizations would have to keep in mind whilst defining their test environment strategy would be to build and manage their End - to - End test environment rather than testing applications in fragmented environments. b) Creating a Perimeter – Defining the Test Environment lifecycle and its scope At its highest level, Test Environment Management contains four activities Design, Build, Manage, and Refresh & Reuse. Organizations have realized that each and every activity plays a critical role and ensures the availability of the right test environment at the right time. The Enterprise Architect team designs the test environment based on the production environment blueprint and future test requirements. Designing and building a new test environment exactly like production would not be feasible for the Enterprise Architect team given the amount of burden it would have on the overall infrastructure and operations costs. All the stakeholders would have to discuss and take a judicious call on this activity. The support team performs day to day operational activities and aims at maximizing the overall value of the quality by ensuring maximum availability of test environments to the testing team. Test environment support team should always follow the process standards and look for continuous improvements. c) The Good, The Better and The Best – Program Governance & Continuous Improvement The success of an enterprise level test environment is based on how robust the program governance model is. The Governance team will have to understand the business requirement at the early stage of the release and plan accordingly. An effective program governance team will understand the business requirement better and align

the test phases with test environment proactively. The key activities for program governance team are to - 3) Process Optimization and Operations Excellence a) Consolidation, Simplification and Reuse – Test Environment Assets Utilization The traditional approach of adding more and more hardware and software without exploiting the existing capacity and requirement burdens an organization with both cost and operational issues. Consolidating environment estate is an exercise which consists of working information of all assets, owners, contact details, vendor details, physical location details, etc This is a tedious exercise and till date one of the biggest challenges at the enterprise level. However this is a 'one-off' activity, after which test environment team would have to perform the review periodically. After consolidating the assets, the organization will have to focus on creating application constellation based on patterns and should know how to simplify the test environment landscape. Sharing test environments and ensuring that resources, skills knowledge and assets are reused will minimize the operations cost. b) Improving efficiency – Process optimization and standardization In most cases, the reason for a poor quality product is because the Test Environment Management wasn't given the highest priority. Another important reason for poor output is due to the undefined process that the Test Environment Management goes through. This is unlike the Production Environment where processes are defined and thus implemented efficiently. To efficiently manage the test environments, it has become necessary to define, implement and adhere to the best practices. Few organizations have reached the highest level of maturity by replicating best practices adopted from production environments and measuring the performance of the Test Environment Management service by using metrics and enforcing SLAs for continuous improvements and better accountability. c) Thinking Ahead – Demand Forecasting and Capacity Planning Demand forecasting and capacity planning are big challenges for most organizations since there is no visibility on the test environment estate and the availability of environment usage trends. In most cases, environment unavailability is due to poor or no assessment on demand forecasting and capacity planning. The central program governance team will have to take ownership and assist the other stakeholders by providing the right information like - d) Working together – Orchestration through Collaboration In many organizations, cross team collaboration is the biggest challenge that affects the on time environment provisioning, incident resolution and results in multiple environmental conflicts and delays. The test environment team will have to maintain skilled resources to orchestrate test environment activities by collaborating with other teams and business units. The support team has to - e) An Early Bird Catches the Worm – Involve the Test Environment Team early on The test environment team has to be involved at the earliest stage of the project and would have to collect the detailed requirements. Otherwise lack of time, incomplete requirements and deficiency of owners would lead to the collapse of the team and thereby creating a chaotic situation. f) The Right Test Data at The Right time – Managing Test Data Test data management is an essential activity and occupies a vital role in managing test environments successfully. At an enterprise level, test data requests are not always limited to component or platform level. In most cases, the test data is a necessary requirement for E – 2 – E test case planning and generation. In such situations, fragmented test data cannot fulfill the test data requests. The centralized test data management team

should have specialists who are proficient in security compliance, business domain, database and overall knowledge on test scenarios. These specialists should also have the expertise in generating test data as per test requirements. The key functionalities of a successful test data management are to - 4) Automation a) Minimizing Dependencies – Automating Test Environment Activities. Most of the activities across test environment lifecycle can be automated by using a single tool or through multiple tools. Well proven tools are available for auto provisioning, auto deployments and test data management. To improve the turnaround time for test environment provisioning, few organizations have put their money on automation strategies like Cloud technology and Service Virtualization. By automating the provisioning process on cloud, the organization can fulfill ad-hoc environment requests and ensure 'on – time' test environment availability with lesser cost and effort. A new organizations have succeeded in automating day to day Test Environment Management activities like test environment booking, incident management, asset management, knowledgebase management and service request fulfillment. Automation of design, build, manage and refresh test environments is a key enabler for the organization to manage the test environments effectively. Conclusion Having understood the challenges of test environment, it becomes essential for an organization to establish a best in class practice at the enterprise level; thus marking the onset of the transformation. The recommendations mentioned earlier will ensure that the organization achieves an elegant Test Environment Management model and in the long run, will enhance quality. It guarantees effective utilization of assets and resources with the availability of the right test environment at the right time. This will not only help in reducing the cost to operations but also improve quality. As organizations embark on a journey of establishing a dedicated test environment management service; they will have to perform due-diligence and follow the above recommendation in a phased manner. To ensure success, organizations will have to invest more on test environments so as to implement the best practices and automate activities. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Dynamic Risk Based Testing

----- Arcticle source ----- https://www.wipro.com/cloud/dynamic-risk-based-testing/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Dynamic Risk Based Testing October | 2023 Risk-Based Testing (RBT) is a universal approach used to determine the right and optimal set of test cases that should be executed while assuring maximum coverage. It is observed that the existing approaches towards RBT define the risks in a static manner, i.e. the current approach does not take into consideration the factor of re-assessment of risk on a periodic basis, influenced by real-time test results. There has been

widespread acknowledgement, within the testing landscape, towards the necessity for re-assessment of the risk factor. This is based on recent observations that highlight the point that the quality of different modules of an application under development, tend to change frequently due to several variables. Hence during the course of testing, the risk needs to be reassessed on a frequent basis, based on the actual results of the test cases being executed. The current approaches lack efficient techniques to calculate risk dynamically, reassign the risk level, and execute the optimal set of test cases for best results. This white paper focuses on an alternative approach to Risk-Based Testing, based on dynamic reassessment of risk and its benefits. Industry Trend There is a paradigm shift in terms of expectation on the value of Testing and it is a common trend that Testing/Quality Assurance is now shifting towards Business Assurance. Testing is seen to have a direct impact on the brand value, market share and topline of organizations. Operationally this leads to completion of projects within a much shorter time and also at an optimal cost. From a service provider's perspective, the questions customers ask are: All these queries point towards performing the right amount of testing, at an optimal cost and high levels of quality, and enable a shift towards a business assurance dimension. This trend has necessitated the need to re-engineer the focus towards optimization, which should aim at: enhancing traditional approaches like Risk-Based Testing to address varying application quality and stability and a statistical approach aligned such as to achieve cycle-time reduction. The end outcome is to assure service/business resilience. Recommended Approach The concept considers two key parameters for assessing the risk. The first factor is the business impact, which is based on criticality of a component or module in the application, and identified based on application-specific knowledge. The second factor is the probability of failure that is continuously reassessed based on the actual test results. There are three identified levels for each of these factors; high, medium and low, thereby resulting in nine different riskprofiles. A test case can be associated with any of these risk profiles based on the weightage for each of these factors. The risk appetite would vary across different applications and modules, depending upon the project phase or type of release. Definition of this varying risk appetite is handled via a rule-based approach. This approach advocates specification of the optimization levels associated to each of the nine risk profiles. This definition is considered during the selection of a test suite for the execution phase. In addition to this, depending on the pass rate of high risk profile test cases during execution, the decision on when to conclude the test execution phase can be taken, again through a configurable rule-based approach depending on the risk appetite. Methodology 1. Assess the Business Impact: Assessment of business impact of a test case on the application under scrutiny can be done based on defined guidelines and the knowledge of the application landscape. This factor once defined for a particular test case is usually static. 2. Compute the Failure Probability: Assessment of probability of failure is done by analyzing the history of test execution results. Based on the extent of actual failures observed, the failure probability can be assessed. This probability is re-assessed periodically so that the influence of actual quality, revealed via the failures, gets reflected in concurrency of the risk of a particular test case. 3. Identify the Risk Profile of the test case: Based on the level of the above two factors, a test case can be associated with nine different risk

profiles as depicted in the table below: Fig: Test cases can be categorized under a risk pr Of these profiles, profile 6 carries the highest risk and profile 4 carries the least risk. 4. Select optimal set of test cases: An application release is usually associated with changes to existing test requirements. The choice of test cases for the test suite should be based on three key parameters: The above three parameters can be associated with different levels as shown in the table below: The extent of testing / the set of test cases, that are to be chosen for a particular requirement is dependent on a combination of levels of the above three parameters. Based on the risk appetite and the combination of the levels of the above three parameters, a set of rules shall be defined, which would be referred to for selecting the optimal set of test cases. A sample risk table is shown below: Depending on the risk appetite, the rules table can be included to Select or Eliminate more of lower risk profile test cases, thereby optimizing the set of test cases that would be selected for execution. 5. Dynamically Decide Test Completion: After choosing an optimal test suite for execution, a second level of optimization can be decided at run time based on the actual quality of the build being tested. This can be defined through a set of rules that would enable dynamic decision-making on test completion. A sample set of rules is shown in the table below: Fig: A system for dynamic risk-based testing The system would include: Conclusion This approach provides a realistic method for dynamic risk assessment. Instead of an approach of risk identification using the two components of risk i.e. business impact and probability of failure as intuitive, applying a deterministic approach to probability of failure makes the risk level concurrent and well-aligned to the quality of the application being tested at any point of time. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Reimagining Quality Assurance for the Digital Enterprise

----- Arcticle source ----- https://www.wipro.com/cloud/reimagining-quality-assurance-for-the-digital-enterprise/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Re-imagining Quality Assurance for the Digital Enterprise October | 2023 Consumerization and digital adoption are leading to polarization of Enterprise IT strategy. Today systems of engagement are transforming faster than ever with speed and experience as the driving factors. However, the slow evolution of systems of record are weighing down this transformation Ramesh Pai, Director and Head of Wipro's Digital Assurance practice, talks about how Quality is helping bridge this gap. Traditionally considered as the weakest (read slowest) link in a software development process, QA today is leading from the front to enable Digital Transformation.

Q: Is Testing really dead as some say it is? A: Testing in the conventional sense is dead, but addressing quality in a Software Development Life Cycle (SDLC) today (for digital enterprises) requires an engineering approach rather than a Testing approach. Addressing quality today is about enabling quality development rather than validating a work product post-facto. It starts with automating Tests and is in parallel to development. It is also about validating Application Program Interfaces (APIs) for function and User Interfaces (UIs) for form factors as well as time to market, as much as about quality itself. As a corollary – Testers in their traditional form with traditional skills are dead too. An engineering approach in digital IT requires Testing aptitude to be married with development skills. Hence, the need for Software Development Engineer in Test (SDET) rather than a Tester. Q: What is changing in this new approach to quality? A: The asks from QA are changing. In traditional QA, time (whatever time remains after development is done), cost (as low as possible) and quality (got to be perfect out of the door) were the key asks. Whereas today, digital channels are enabling enterprises to reach end consumers faster than ever with innovative products and services with experience at the core. Hence in Digital QA, Speed (Test as you build or even before), Experience (for personalized and omni-channel experience) and iterative development (building a Minimum Viable Product) is what both IT and business leaders are striving for. Test Automation is moving beyond regression to enable parallel development via progressiveTest automation approaches. Behavioral Development Driven (BDD) methodology is one such approach where user expectation of behavior in natural language constructs is the premise for automated Testing. Enterprises are embracing more and more Open Source tools, not-yet-established frameworks and are open to experimentation more than ever and the skill requirements are changing too. Q: By virtue of its very nature or where it falls in the lifecycle, isn't it counter intuitive to think of QA as a function that enables speed or influences experience or effectively delivers Minimum Viable Products (MVP)? A: It was, but not in today's digital world. Digital products and services are evolving at a rapid pace which has led to consumers demanding these services with least possible delay. Shorter releases have meant that the priority of quality assurance has moved towards Test-as-you-build, with customer experience as the key. In Continuous Testing approaches, Tests are automated before products are developed and then integrated with Continuous Integration pipelines. New age tools and accelerators like EggPlant, JBehave, Appium, SeeTest etc., enable Tests right at the development stage and crowd platforms (internal & external) enable early user experience feedback. All these are enabling QA to lead the Digital Transformation from the front rather than being the slowest link in the SDLC chain as in the past. Q: The above mentioned trends are certainly true about greenfield digital development projects, but how do you support a large part of Enterprise IT that is still migrating from legacy architectures and infrastructure? A: Digital Transformation today is not just about overhauling the UI, but about transforming the entire ecosystem, including infra (cloud) and software stacks (as a service). Quality Assurance, thus, is about supporting such transitions and is achieved through techniques like virtualization and, in many cases, SDETs, building custom tools for validation. Remember, engineering is an approach to QA for today's digital enterprises. Q: What benefits do large enterprises draw from QA initiatives in the digital age? A: With competition at an all-time high,

digital age enterprises strive for faster time-to-market with enhanced user experience. The end result: higher conversion rates and customer loyalty highlighted by a positive Net Promoter Score (NPS). These benefits are derived today by reducing cycle time through QA approach like Continuous Testing. This approach also provides much-needed flexibility and enhanced user experience by incorporating user feedback early in the iterative development. This eventually results in cost savings through early bug fixes. It is estimated that by 2020, customer experience will overtake price and product as the key brand differentiator. The ideal way forward is a user-centric and Continuous Testing approach for QA in digital. To know more about Quality Assurance, write to digital.contact@wipro.com The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified.
=======================

Cut the Clutter, Join the Big Data Wellness Club

----- Arcticle source ----- https://www.wipro.com/cloud/cut-the-clutter-join-the-big-data-wellness-club/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Cut the Clutter, Join the Big Data Wellness Club FIs, Retailers aiming to derive business value from Big Data need to ensure data correctness, Srinivasagopalan Venkataraman timeliness and completenes October | 2023 John Doe*, Vice President of Fraud Operations of a leading financial services institution, was disappointed with the latest Fraud Resolution report. The effort metrics for detection of fraudulent claims did not show any improvement from the previous report despite assurances from the Analytics team that introduction of Big Data technologies would help reduce these metrics by at least 50%. For an organization that had invested heavily in Big Data technologies, the impact on ROI seemed minimal. To find fixes, John called in a meeting with Rani*, Program Manager of the Analytics program. During the tempestuous meeting that followed, John learned that the Analytics team had not been able to proceed past the pilot stage of the project due to a number of data-related issues. Rani spoke about a whole list of challenges that were preventing her team from achieving their goals. The challenges primarily stemmed from lack of data quality from the source systems, causing issues with data processing. This included non-compliant, inconsistent, inaccurate and untimely data from an unmanageable plethora of sources that ranged from databases to large flat files. Rani's team tried to find a strategy to overcome these difficulties since the issues were getting detected late in the data lifecycle.   The one thing that was now clear was that the team needed a data assurance strategy to ensure the quality of data that was being pulled into the system was as close to the source as possible.

The assurance strategy needed to be comprehensive as well as easy to implement, especially given the volume and variety of data that needed to be tested. Data wellness is critical throughout the Data Analytics lifecycle. However, to ensure this wellness, issues with data such as completeness, correctness, timeliness, etc. need to be captured as close to the source of the data as possible. Ensuring data wellness requires an assurance process based on a Test strategy that expedites the detection and weeding out of bad data in the lifecycle. The Test strategy should also enable the enterprise to dissociate itself from the technology aspect and focus solely on creating value. This would require a methodology that accurately identifies, verifies and validates all the key activities in the data lifecycle. For maximum effectiveness, the methodology would need to be measurable, repeatable and should address various technical and process-related challenges. Retailers, too, are working on ways to wiggle out of data messiness as they cut through the clutter of business complexities. The Chief Data Officer of a leading multi-national retailer, Lucie Hall*, was at a loss to explain to the CEO as to why her team was again not going to deliver the bi-weekly Consumer Behavior Report required by Strategy, and Sales and Marketing teams worldwide. Despite a fruitful recruiting drive where the company had hired the best data scientists and done a successful data integration with various social media platforms, her team could not release the report on time. Lucie was constantly reminded that the company management had spared no expense in setting up a world class infrastructure and the team, and thus expected to see some quick results. As Lucie took stock of the situation, she realized the first key challenge was the exceedingly long time and effort required to ensure data quality and value throughout the data processing lifecycle. Although the team had integrated every data source correctly, the validation of the data at each stage was still performed manually due to the large number of tools used for a particular task The other challenge was the time the team spent in creating, executing and maintaining a suite of scripts and algorithms that did not integrate well with the tools used at various stages of the lifecycle. Furthermore, there was a lack of uniformity in the design and creation of the various scripts and algorithms used to run the entire system, which became a nightmare for the team to manage. Lucie realized that a lack of a holistic assurance approach to data lifecycle management was at the root of all problems. The assurance process required elucidation of an effective Testing strategy to Test both the data and the technology on which work was performed. This required the inception of a robust automation strategy that stitched together the various tools and workflows that were performed by the team. This would not only eliminate inefficiencies within the team, but also would expedite the execution of the report building process. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Digitized Platform for

One View of Quality

Digitized Platform for One View of Quality October | 2023 When it comes to things you can do online, the world is your oyster. Over the past decade, we have witnessed the dramatic emergence of the online channel. Amongst industries, retailers have capitalized on this the most - one can purchase almost any everyday item such as clothes, electronics, software products, or even food at the click of a button. But what about IT services like Quality Assurance (QA)? Can these be productized and sold online as well? Careful analysis of the market reveals that that there is indeed a business need today that supports this case. However, one would think that to deliver QA-as-a-service, the existing e-tailing/ecommerce models would need to be customized or tweaked to a high degree. However, not really. Let's take a look at what the basic requirements of the innovative new channel would be: For QA, a platform with the above features would be extremely powerful and address a number of unfulfilled needs, in addition to the above. By serving as a gateway for a unified view of quality across the engagement, it would address the most important need of large QA engagements today - transparency. In addition, it would define and digitize the entire QA process/ workflow right from onboarding of new services to execution and defined closure. Let's look at some of the major components or modules that would form the key pillars of the proposed system. To summarize, a digitized platform serving as a unified governance platform providing a 360-degree view of the entire QA engagement will immensely benefit customers by enabling better decision making. Aditya Tanwar - Consultant, Testing Advisory Services (TAS), Wipro, Ltd. Aditya Tanwar is a Consultant with Test Advisory Services (TAS) group in Wipro. He has an experience of nearly 4 years in different areas from testing advisory and test solutions consulting to development and support. After completing his Engineering in IT, Aditya worked with Accenture for some time and then went on to do his MBA in Marketing and Operations. Aditya is an avid Movie buff with his favorite genre being SciFi and Thriller. Aditya also likes to read and listen to music in his free time. Chink in the armor While smartphones with sensors have made biometric technology more accessible and mainstream, giving passwords a run for their money, the transition does come with its share of challenges. One such challenge is the security risk associated with data leakages. The uniqueness and the immutable nature of biometric data, which is its USP, can also turn out to be its biggest Achilles' heel. A stolen password can always be changed by the user whereas a user's biometric data is permanently compromised. There have been many instances where the fingerprint (widely accepted biometric option) data has been either replicated or stolen by hackers. "The 'non-perishable' nature of certain biometrics is driving serious concern in security circles," says CEB

Executive Advisor, Jason Malo, "While biometrics are easier to use than passwords, when they are compromised they cannot satisfy the security role for which they were implemented." The Iris recognition technology is, thus, becoming more widely accepted and may soon replace fingerprints since it is not only cheaper to implement but also difficult to replicate, and, thereby, more secure. The other challenge relates to the overall customer experience and makes it as seamless as possible across all mobile devices. For instance, not too many smartphones offer fingerprint sensors. If banks can offer both fingerprint and the facial recognition options, customers can use a wider range of devices. In fact, smartphones with as little as a 1 mega-pixel front-facing camera can offer the facial recognition option and this covers probably the entire smartphone market. Yet another challenge is the need for standardization of biometric data when multiple vendors are involved in the process. Often, banks need to decide whether to offer uni-factor biometric options or go for multi-factor authentication (refer figure 2). The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified.

Assuring Quality for

Internet of Things

----- Arcticle source ----- https://www.wipro.com/cloud/assuring-quality-for-internet-of-things/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Assuring Quality for Internet of Things October | 2023 Internet of things (IoT) has become one of the most frequently used terms in the IT industry today; but what does IoT really mean? The answer to this question is not set in stone and everybody has a different view. Personally, I define the term IoT as smart objects that can interact and communicate with each other via the internet. The object here can range from the thermostat in our houses to a bedroom lamp, from a car to a mobile phone and even the egg tray in our refrigerators. Any physical object that you come across in your day to day life can be injected with intelligence and be made part of a smart, self-aware eco system by connecting it to the internet. So what is IoT capable of? We can be extremely imaginative since the possibilities are limitless. On the flipside, implementation does come at a high cost and a ROI is never promised. Why Quality Assurance (QA) is critical for IoT based systems? In an IoT based system, any small malfunction can have unfavorable or even disastrous outcomes such as security lapses, physical accidents, unexpected outcomes and non-optimal use of resources. And therefore, it is very critical to test for service availability under various conditions as well for optimal performance. And to do, enterprises should focus on the essential components of a QA strategy for an IoT based system. The simplest

architecture for any IoT based system will have the following functionalities: A Quality Engineering (QE) team will be required to certify the system against requirements which includes both flavors, that is, functional as well as non-functional specifications. Along with these aspects, IoT Assurance requires certain other factors to be considered that are usually absent from the conventional Application Testing agenda: What are the best practices for executing this strategy effectively? Sudheer Mohan - Director And Head, Mobility & Cloud Quality Engineering, Testing Services, Wipro, Ltd. Sudheer has 14 years of experience in Wireless Technologies & Mobility and is currently the Practice Head & Director for Wipro's Mobility & Cloud Quality Engineering Practice. He is responsible for Business growth, Delivery, Operations and Customer Relationship management. He has setup a Mobility Test Centre of Excellence which has developed a gamut of "state of the art" automation solutions specific to Smart Phone applications, Video Quality, Android Platform and Chipset Validation. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Demystifying Testing in the Agile and DevOps World - Part 1

----- Arcticle source ----- https://www.wipro.com/cloud/demystifying-testing-in-the-agile-and-devops-world-part-1/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content Demystifying Testing in the Agile and DevOps World - Part 1 October | 2023 The world of Information Technology (IT) today is flooded with acronyms and terminologies which add to the enigma around our already mysterious sphere of work - 'Software'. If you have tried explaining 'Software' to a farmer as I attempted once, you might empathize with this sentiment. Quality Assurance (QA) and its subset - Testing - encounters similar buzz words doing the rounds in every industry domain. If you ask me, 'Agile' and 'DevOps' are two such confounding words in QA currently. In this post, I will attempt to address some key questions related to these two topics with respect to QA and highlight the value-add they deliver to the software life-cycle. 'Faster, cheaper and better' - factors referred to as Time to Market, Cost and Quality in the industry - enjoy no letup in today's competitive business landscape. In the software leg of this race between organizations, the benefits gained via collaboration, continuity and agility in QA are emerging as clear factors for differentiation. Most enterprises today, aim to push their products out quicker than their competition, and more consistently into the market; being unable to do so could easily harm, or even kill a company and its products. The Agile methodology aims to address this concern. DevOps - a concept which originated in an Agile environment - with its two key components - 'Continuous Integration and

Continuous Delivery/Deployment (CICD)', attempts to take agile processes and best practices to the next level by minimizing time to market and optimizing cost and quality. Here is a brief context of the history and market for Agile & DevOps before looking at their impact on QA: Here are some key aspects: Agile and DevOps have impacted all teams in the software lifecycle, including QA. Testing is viewed as one of the main levers for reducing time to market within the Agile and DevOps world. The ask for QA in this new approach is greater agility (reflected in the agile term 'test velocity'), continuity (reflected in the DevOps terms 'Continuous Testing' and 'Continuous Monitoring') and collaboration with developers, operations staff, release engineers, system admins etc. In addition all stakeholders need to put on their testing hat more frequently and continuously to ensure success in this approach. The key challenges for QA in this world are how to deliver value while testing in these shorter timeframes how to manage environment challenges and to how to shift left (predictive testing with developers) and shift right (testing with Ops and real time monitoring). The traditional QA TCoE is evolving into a distributed (as against co-located), co-managed (as against pure managed services by vendor), collaborative (with all teams in SDLC interacting) and hybrid (agile along with traditional waterfall) model. Is a separate role for performing testing justified? Very much so, when we look at the role of person who is primarily a tester, though his/her basic responsibilities remain the same, the requirements in terms of skillsets have increased. Testers need to better understand development, business operations and customer expectations. Following an Agile and DevOps approach does not mean that a tester is no longer required. As specified above, every team in the lifecycle is required to perform testing due to the continuous nature of integration and delivery. In addition to this, the QA cycle which features 'System Testing' (among other forms of dedicated testing), is still very much required. Once the build is certified in the QA environment, it can be deployed into production (Additional delivery to Acceptance and Staging environments for tests by users and Ops teams respectively are advisable however). Testers in this world need to be able to understand the application, prioritize their testing using predictive analytics where necessary, understand tools including virtualization tools better, use automation effectively and enable continuous delivery and strive to assure quality beyond testing. This explains the emergence of the 'Software development engineer tester' (SDET) or Developer-tester role in some organizations. In this world the roles for testing include core testers, developer testers (with skills like 'test- driven development' (TDD), and 'behavior-driven development' (BDD)), automation testers, specialized (performance, security, data and infra) testers, operations testers and business user testers assuring Quality throughout the Agile and DevOps lifecycle. Will Manual Testing die as fallout? Due to the nature of integration, continuity and agility involved in the Agile and DevOps life-cycle, repeatability of tests is an expected fallout, and that coupled with shorter timeframes render testing more towards automation. Right from unit tests to integrated build, smoke, acceptance, system and regression tests etc., automating the tests helps teams in each stage to ensure benefits in terms of Cost, time and quality, helps detect defects earlier in the cycle and gives greater control over testing. Shift left techniques for automation testing such as TDD, BDD, API testing are emerging as key levers for agile delivery. This however does not mean manual testing has no role in this

model. Exploratory manual testing is still required at every stage of the Agile and DevOps lifecycle and by every team to uncover potential issues. In the System Test phase, traditional manual tests as earlier, are the basis on which functional and non - functional automated tests are decided and executed. Similarly, acceptance tests run by users are still primarily performed in a manual manner, as earlier. The answers to these questions are not set in stone and are evolving, across organizations, even as you read this blog. In my next post I will touch upon the various approaches to testing in Agile and DevOps adopted by organizations around the world today. Srinivas Abhinav Raj- Consultant, Testing Advisory Services (TAS), Wipro Limited Srinivas Abhinav Raj is a Consultant from the Test Advisory Services (TAS) group in Wipro. He has an experience of nearly thirteen years in different areas from testing to business analysis and development. After completing his B.E. in Computer Science from the National Institute of Engineering in Mysore, he began his career with a campus placement in Infosys Technologies Ltd., where he worked for the Independent Validation Services group for more than three years, and then moved on to pursue his Masters in Information Systems Management from Carnegie Mellon University, U.S.A. Post this, he took up another campus placement in New York with an AXA group company Alliance Bernstein L.P., Where he worked till last year in various roles including Business Analyst, Developer and Senior Test Lead. Abhinav began his journey in Wipro with the TAS group in December 2014. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Assuring a Mobile Future – Part II

----- Arcticle source ----- https://www.wipro.com/cloud/assuring-a-mobile-future-part-ii/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Assuring a mobile future – Part II October | 2023 In my previous post, I discussed the industry trends impacting an organization's mobile strategy and the need for Quality Assurance (QA). In this post, I will cover what would be the ideal steps required to be taken to ensure a holistic mobility assurance strategy. As in the case with web applications, mobile application testing also started out in a manual manner. But gradually, as their complexity increased, so has the associated QA strategy. Following are the key points to be kept in mind to ensure success: Large Automation Footprint Test automation should be an integral part of a mobility QA certification strategy and is no longer a novelty but a must have. It should be initiated in the life-cycle early and encompass as much functional testing as possible. With advanced technological capabilities, even non-functional QA tasks could be automated to an optimum extent. The time saved through automation also allows test engineers to carry out additional value added tasks such as exploratory and ad-hoc testing, in-depth analysis on social media feedback from reviews, app

store comments, etc. This helps to better understand the customer's ailments and to accurately map those to the associated defects. So how does one start their automation journey? While some enterprises start with identifying the appropriate automation tool, the right way is to first build the automated testing vision and then selecting tools that best fit into the strategy. Ideally, the tool should have the following features: Continuous Integration & Continuous Deployment (CI/CD) As a testing programmer matures, best practices should be implemented to maximize return on investment and to increase productivity. In the case of mobile programmes, "do it right first time" is vital for success. This can best be achieved via Continuous Integration & Continuous Delivery (CI/CD) in a DevOps environment. Most enterprises in partnership with leading, technically sound, independent QA organizations orchestrate mobile projects via DevOps from day one. This enables the project to leverage powerful toolchain options the service provider has to offer. In summary, the development environment should integrate with CI/CD, automation tools, test environment, device clusters and test management systems to mature at a rapid rate and reap maximum benefits. Non-Functional Testing This is one of the most significant aspects of Mobility Testing. Enterprises that are worried about poor app store ratings (also read as poor sales/revenue from mobile channel) should restructure their non-functional testing strategy to address this concern. From our experience, we observed the following results from an in depth analysis of app store review comments: A holistic non-functional testing strategy for mobile should ensure that the following aspects are taken into account: Device Conditions Successful execution of the strategy would require a good mix of experienced engineers, well defined test cases and an appropriate tool set. A thorough understanding of the telecom landscape also helps testers develop the most appropriate test cases which form the building block of any engagement. Developer Skills for Test Engineers A majority of testing activities today are being automated; either in part or total. This requires a mobile application tester to evolve into a mobile quality engineer who has: Organizations with a strong talent pool of mobile quality engineers have the ability to develop custom mobile specific frameworks and are able to tap into the complete potential that off the shelf/open source tools have to offer. Sudheer Mohan - Director And Head, Mobility & Cloud Quality Engineering, Testing Services, Wipro, Ltd. Sudheer has 14 years of experience in Wireless Technologies & Mobility and is currently the Practice Head & Director for Wipro's Mobility & Cloud Quality Engineering Practice. He is responsible for Business growth, Delivery, Operations and Customer Relationship management. He has setup a Mobility Test Centre of Excellence which has developed a gamut of "state of the art" automation solutions specific to Smart Phone applications, Video Quality, Android Platform and Chipset Validation. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

Bots Offer 'Self-Healing' Touch to Correct Quality Errors

About the Author Related Articles Contact Wipro Please fill the required details to access the content Bots Offer 'Self-Healing' Touch to Correct Quality Errors October | 2023 Aditya, a Test engineer who is working on a customer experience-focused mobile app, finds that the automation scripts written to Test the new login screens and the Test automation framework have failed overnight. Aditya, who works for a leading retailer in the US, takes the help of a Test automation bot. The bot – an autonomous program – that underlies the automation framework put together by developers and Testers has already taken screenshots of the failed logins. It has also recorded key environment and application parameters at the time of the failure and mailed the location of these files to Aditya for review. Upon further examination, Aditya finds there is a bug in the application. He makes the required entries into the organization's defect management tool in natural language. A defect management bot analyses Aditya's findings and intervenes to inform him that another such problem may have already been detected earlier. Based on past actions, the bot also provides Aditya a list of potential resolutions that mirror this error and also offers "self-healing" options to resolve the issue. Some of the options provided to Aditya are: unauthorized user names and passwords used by the scripts, critical Test Data services not running at the time of the Test execution, the Web server going down due to excessive traffic. After evaluating the options, Aditya realizes the problem at hand was similar to an earlier one where two important Test data services required for execution of his scripts were not running. He clicks on the "fix" button next to the solution provided and waits for the Defect Management bot to communicate with the required Infrastructure Resolution bot to bring back the stalled services. Once the services are brought back, the Infrastructure Resolution bot passes along the success message to the Defect Management bot, which then informs him about the resolution of the issue. The bot then prompts the user to check whether the self-healing helped resolve the problem along with questions around what exactly he was doing. The Test Engineer re-runs the scripts and finds they are working. He then confirms the same to the Defect Management bot and provides information to the bot on what scripts he was running along with what actions led to the detection of the error. The Defect Management bot cross references the new information along with the "self-healing" solution to "learn" about the current problem and indexes it for future use. Any future entries that would be similar to this issue would be presented with this set of information and resolution. Delivering quality @ speed The scenario above is a great example of the marriage between man and machine through Cognitive Process Automation (CPA), Analytics, Artificial Intelligence (AI) and Machine Learning (ML) in the field of Quality Assurance (QA). We can see that the human was required only to make key decisions and fill in the gaps/intelligence required to resolve a real world

problem. Organizations across the board – be it retailers, banks, insurance providers, utilities or energy companies – are pulling out all stops to embark on the Digital journey and embrace software development. However, many of these organizations seem to lack the infrastructure (people, process and technology) needed to ensure that the outcome of Digital Transformation programs, such as omni channel initiatives (Web/mobile/connected device apps), are successful. Often organizations find that they are saddled with sluggish software development programs that are plagued with cost and time overruns and low quality products. These products have far-reaching consequences for organizations that require substantial outflows to rectify. For example, a large retailer recently spent a great deal of time and effort to correct quality issues of their mobile app which was making them lose out in the mobile shopping race. New beginnings for QA Typically, organizations have attempted to fix these issues by throwing more money and bodies at the problem. This results in the various project bulges in terms of cost and efforts. However, the remedy for this issue is to be smart about how the entire process is engineered. Although, many organizations today have embraced Agile and the use of practices such as DevOps, QA is an area that is often neglected. Although, software Testing,as it was done over the past two decades is possibly on its last legs, the practice of continuous validation in the software development process needs to be done more often. The scenario described above is one example of what can be done to provide the velocity and structure required to ensure quality throughout the software development process. It sure is time to brace for new beginnings in Quality Assurance. The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified.
========================

Digital Assurance for the real World

----- Arcticle source ----- https://www.wipro.com/cloud/digital-assurance-for-the-real-world/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Digital Assurance for the Real World October | 2023 1.0 Abstract Digital is the new Black. It seems to have taken over our lives, both personal and professional - smartphones, tablets, eBooks, digital newspapers, digital storefronts, doctors tweeting from operation theatres, digital ecosystems in our living rooms, digital notes, mobile commerce, digital media libraries, digital payments and even digital supply chains! This transformation has been set in motion by a greater adoption of the internet by the general public on a global scale, which has forced organizations to develop e-commerce strategies and incorporate the multi-channel approach into their business models. The number of internet users has increased dramatically over the past two decades. From 16 million

internet users which accounted for 0.4% of world population in 1993, the figure has increased to over 2.7 billion people in 2013 which corresponds to 39% of the world's population. Mobile-broadband subscriptions have climbed from 268 million in 2007 to 2.1 billion in 2013. This reflects an average annual growth rate of 40%, making mobile broadband the most dynamic ICT (Information and communication technology) market1 Organizations are fast aligning themselves to keep pace with this transformation. From Digital Lines of Businesses to optimize product service/development & mobile first product strategies, to Digital marketing, every function in the organization is getting a makeover in an attempt to reach out to today's connected consumer. Assurance though is still being looked at in silos with emphasis on "testing" an application or a channel. Testing for new world realities continues to be "best-effort" and at the mercy of ever shrinking IT budgets, resulting in inconsistent customer experience across channels, loss of market, and negative brand perception. What organizations need to realize is that a holistic assurance strategy not only ensures successful digital transformation but can also help in optimizing IT budgets. This whitepaper will walk you through the key considerations for such a strategy and will help you answer the following questions - What are the various points of assurance to be considered in a digital strategy? What are the enablers you can use for leveraging process efficiencies? Which tools and strategies should be employed to validate the technology used? 2.0 Points of Assurance - Challenges of a Digital Organization vs Needs of a Connected Consumer Digital has evolved from being just another channel to becoming "the preferred" channel for both consumers and organizations. The intersection of the needs of today's Digital Consumer and challenges for a Digital organization throws up common Points of Assurance (PoA) to be considered Figure 1 Digital Points of Assurance To better understand Points of Assurance, let us consider a real world scenario of a user looking to buy a product on the web: 3.0 Points of Assurance – Key Considerations Each of the above aspects has its own nuances to be considered for a robust digital assurance strategy. Here are few pointers on how to approach each of these and also identify opportunities to optimize: 3.1 Omni - channel Assurance Digital assurance strategy should focus on optimizing functional testing across channels. It is more likely to mimic a user's behavior in today's world where a customer browses for a product on the web, adds to a cart on a mobile device, completes the purchase on the web again and picks up the product in the store. An end-to-end regression strategy with test scenarios spread across channels (and not repeat regression for each channel) can save upto 30% of efforts and resembles user behavior closely. Remember, consolidating testing across channels in not Omni-channel testing. Designing a test strategy with a view of all the channels and real user behavior is! 3.1.1 Users on multiple devices With proliferation of devices, a new category seems to be originating every now and then. From phone to tablets to phablets to ultra-books, every new category brings with it the nuances of ensuring that the applications run fine on each of the devices in each of the categories. Smartphones accounted for 51.8 percent of mobile phone sales in the second quarter of 2013, with a growth of 46.5%, resulting in smartphone sales surpassing feature phone sales for the first time – Gartner (Aug 2013)2. In spite of this, according to a research conducted by Interactive Advertising Bureau, 45% of Fortune 500 enterprises lack fully Mobile-Optimized corporate websites, due to the steep costs associated with

implementation on a wide range of mobile devices. A digital assurance strategy should build in Risk-Based sampling strategies across devices and also employ automation for repeated tests on various devices3 3.1.2 Users on multiple platforms Given the rate at which a new combination keeps getting added with every new version of a browser (browser wars) or OS getting introduced, it is not only important to ensure testing is done on all possible browsers and operating system stacks, but it is also necessary to optimize testing across these combinations by using statistical sampling methods and automation framework to reuse tests 3.2 Users in multiple geographical locations 3.2.1 Enable Multivariate testing Organizations would want to test for multivariate behavior to seek feedback on instances getting most attention or to market different promotions based on geography. Digital assurance should focus on optimizing tests along with automation, to reduce effort in functional validation of multiple instances of application 3.2.2 Localization testing Internet users are spread worldwide with Asia accounting for 44.8% of internet users, followed by Europe (21.5%), North America (11.4%), Latin America (10.4%), Africa (7%), Middle East (3.7%) and Oceanic (1%). The top ten languages i.e. English, Chinese, Spanish, Japanese, Portugese, German, Arabic, French, Russian and Korean account for 81% of the world internet users.4 Are the users, spread across different geographies and cultures, speaking different languages finding the same functionality, similar semantics or more holistically perceiving the same brand experience? A digital assurance strategy should include testing for Localization and Globalization as well 3.2.3 Performance Performance tests emulating users across geographies – To model real-time behavior, tests should take in to consideration the load pattern distribution across the geography 3.3 Functional validation of end-to-end Business Scenarios By far the most important aspect in the entire assurance strategy is to ensure that an application is validated against Business expectations & functionality, as documented by the Business Process Models. Does the strategy require involvement of the Digital BAQAs (Business Analysts and Quality Assurance engineers) early in the ideation phase? Does it include creation of Business Test scenarios based on business processes beyond the functional test cases? It is important to have the right answer to these questions to ensure the recommendation engine is working right and the promotions are visible at all the right places, along with the shipping calculator working right with the new free shipping promotion for certain categories 3.4 Customer Experience and Social Integration The digital assurance strategy needs to be guided by User experience and uniform brand experience goals: Colors, grids, layout, positioning of labels & buttons, fonts, fat finger testing & number of user hops are all considerations one must test to ensure a good user experience and uniform brand experience irrespective of the channel the customer uses. Ford was one of the pioneers in the automobile industry to realize the potential of engaging customers through social media which was evident in the way they went about promoting their Fiesta model over social media almost 18 months before reentering the US subcompact car market. One of the initiatives was to award 100 social media influencers with the car and asking them to complete a set of tasks and to document their experience across various social channels. The result was astounding with more than 6.5 million views on YouTube and more than 50,000 requests generated from non-Ford drivers5. In an increasingly social world, the ability of users to seamlessly share can directly and many a times instantly

influence organizational success or failure. Recently, McKinsey Company released data which indicated that one of their telecom clients suffered an 8% loss in sales based upon negative sentiments in the social media space. In another recent survey6 71% of executives surveyed rated social media as one of the technology trends, having a significant impact on their business along with mobile and online shopping assurance strategy needs to take in to consideration social integration across channels. Digital assurance in the social world needs to go beyond the traditional boundaries of testing. Does the organization's assurance strategy take in to account what's being said in the social world about a brand and its digital readiness while testing for user experience? Does it validate an organization's social media strategy? 3.5 Assurance for Digital Assets and Content Quality From digital brochures for marketing, to digital products requiring a secure digital supply chain and voluminous digital content for web, digital assets can be of varying types. Does the organization have a robust Enterprise Content Management strategy? Are digital assets catalogued right? Is there a quality assurance checklist for digital properties to ensure consistency and standards across sites? Is the content validation process and workflow standardized to reduce review cycles with creative agencies and asset review teams and increase overall quality? 3.6 Security Assurance Applications managed by organizations are ever increasing (running in to thousands); from increasingly diverse sources (built in-house, COTS, SaaS) and hosted on multiple platforms (in-house network, cloud, web, mobile). This has raised the risk profile necessitating security testing across all these potential vulnerabilities, focusing on application profiling, authentications, authorizations, session management, data validation and encryption algorithms. Security assurance strategies can range from Vulnerability assessments to Penetration testing 3.7 Lifecycle Automation Continuous Delivery and Agility: Assurance for the multitude of channels, devices and platforms, frequent iterations for churning out builds with new features can be cost and time-intensive without a right automation framework. Traditional automation approaches of – Design a scenario, build the software, write a test and then automate, can only mean high maintenance and little ROI. Consider automating the entire life cycle with continuous integration tools, behavioral automation frameworks and business process testing methodologies. What if you can generate automated test cases right from your business processes? What if these can be triggered automatically on a code check-in and can generate a report for you to see without any manual intervention? A large retailer was able to successfully cut down release cycle time (from 3 months to a 15-day release cycle) by revamping their development & build strategy, adopting continuous integration approach and virtualizing a lot of environment requirements to increase the organization's agility and to better respond to today's connected consumers requirements 4.0 Digital Assurance across Industries Digital commerce set digital transformation in motion, but aspects like Digital Marketing, Digital Supply Chain, Digital Health, Digital Channels for customer engagement and Digital Manufacturing are all taking center stage today across the industries, like in the case of Health care where issues of traditional cost, quality, access and regulatory challenges are addressed through digital means like channels for remote delivery of care, health apps for self-monitoring, online initiatives for patient engagement, analytics on clinical data and online public health campaigns7. Similarly introduction of smart

technologies like grids, meters, and smartphones in the Utilities Sector has transformed the traditional Utility into Digital Utility. Firms target enhanced operational efficiency through remote collection of meter data and enablement of onsite work force with mobile devices which ensure better collaboration with offsite employees. End consumers have access to online portals where they manage their consumption needs, view their consumption data in real time and through forums for promoting energy efficiency programs or to aid in outage management. Manufacturing is another sector where the need for cost management, better quality and faster time-to-market have led the firms to globalize their operations through digital supply chains. It enables companies to dynamically integrate all their external suppliers and to outsource entire functions of the value chain if need be. Processing and exchange of big data generated through m2m interface, real time order confirmations to optimize production operations, advanced planning and scheduling to optimally allocate production capacity are bringing in never before seen operational process efficiencies to stay ahead of their competition. With more than 1 Billion mobile phone users expected to use their device for banking transactions by 2017, innovative offerings such as marketing services, sophisticated authentication mechanisms, location-based personalization, enhanced digital security etc. have given mobile and internet banking a completely new dimension in the Financial Services sector. Firms are providing remote advice capabilities by offering investment advice and information on complex products like mortgages via smart-phone, web chat, or video call functionality. Leveraging innovative digital capabilities such as a digital wallet for loyalty cards, spending analysis tools, third-party offers and virtual vaults to store documents are helping the Financial services sector differentiate themselves better. To add to this, firms also look to leverage internal big data and advanced analytics to introduce tailored marketing and product offers. Bottom line is that the digital transformation of banking processes are helping the firms to enhance customer satisfaction resulting in increased loyalty and wallet share from their end customers. 5.0 Conclusion The number and complexities of PoAs in today's digital world are beyond the reach of traditional quality assurance practices. Understanding of the business dimension, ability to maneuver technology challenges, access to right tools and enablers are invaluable in building and executing a robust assurance strategy. To ensure success, it is important to engage with the right technology partner who has both the breadth and depth of expertise along with the experience of being on this journey before. 6.0 References Ramesh Pai is the Practice Head for Wipro's Business Assurance Practice. Responsible for the Technology, Enterprise and Financial services verticals he has worked with various customers for organizational assurance strategy development, managing large QA program and QA CoE blueprinting with focus on Business Assurance. To know more about Wipro Assurance Services, write to digital.contact@wipro.com The speedy SaaS momentum can not only be attributed to a tight economy but also to the associated low Total Cost of Ownership DevOps enables the IT organization to break out of silos, embrace collaboration, and inject that elixir of agility to drive business success. With OSS becoming a complicated and critical function for CSPs, the benefits that can be realized by migrating OSS on the cloud has also significantly amplified. =====================

The Quality Engineering Imperative in a Cloud Transformation

----- Arcticle source ----- https://www.wipro.com/cloud/the-quality-engineering-imperative-in-a-cloud-transformation/ ----- Contact Wipro Please fill the required details to access the content The Quality Engineering Imperative in a Cloud Transformation Wipro and Zurich address quality concerns in cloud journey More companies than ever are migrating to the cloud, motivated by the opportunity for business growth and innovation. In the rush to adapt to a cloud-centric world, they are realizing that even with all its benefits, the cloud has more potential failure points than traditional business and production environments. An effective cloud system depends on a well-designed quality engineering (QE) program, one capable of predicting and preventing pitfalls. The benefits of an effective cloud system and QE program are clear. A recent global research report from Wipro FullStride Cloud Services highlights that driving cloud transformation beyond migration alone can help organizations achieve a 12 percent improvement in their bottom line and a tenfold increase in ROI on cloud investments. By implementing testing across the software development lifecycle, organizations can achieve better output and significantly improve product quality, speed to market, and the customer experience. This business potential underscores the urgent need for companies to transform their QE programs to align with digital and cloud technologies and protect their cloud investments. QE Is Not One-Size-Fits-All As they seek to adapt quickly, many organizations look for a single QE silver bullet. Incorporating quality practices early in the development lifecycle is critical, but that alone is not enough to solve today's problems. Given the complexity of modern cloud systems, enterprises must invest in strategic QE initiatives for production environments along with predictive and preventative maintenance. A robust QE strategy leverages anomaly prediction in addition to anomaly detection. Knowing what could go wrong and where it could go wrong is critical to preventing a catastrophic outage. And although many organizations believe the key to success is an automation-first approach to QE, the reality is thornier. An effective approach to automation requires investment in intelligent platforms that can "automate the automation," removing the human test engineer from the picture completely. Transforming QE with a 4M approach As business needs and underlying platforms continue to evolve, organizations must embark on QE transformation journeys to fully address quality concerns. A 4M approach — Method, Model, Machinery, Mindset — can empower organizations to launch a successful cloud migration and transformation. Method: Observability for production and nonproduction environments With the shift to the cloud, the number of latent failure points and modes of failure across apps, products, and infrastructure increases significantly, and it is vital that app owners proactively monitor for and mitigate failures at any point in time. Conventional monitoring techniques, however, provide a limited view of bottlenecks. Organizations must instead proactively engineer the quality of design deployment and operations by moving from monitoring to observability. Enabling observation of the entire IT landscape introduces an

element of controllability. It becomes possible to identify the external factors that influence what has gone wrong and to simultaneously pinpoint the faulty internal systems or components that are the root cause. Observability allows teams to ensure that site reliability engineering (SRE) principles are built with quality at the source. Model: Pod-based delivery A pod-based delivery is a federated delivery of QE that aligns with products (front-end, client-side systems) and platforms (back-end core systems), resulting in self-sustaining pods with minimal dependence on shared services for delivery. This type of delivery allows for meaningful, shared services for specialized testing enablers — namely in the management of test environments and test data — rather than for testing delivery. Pod-based delivery should also be complemented with gig economy enablers: as-a-service-based delivery for handling surges in workload with dependence on internal crowds (employees), public crowds (global crowd-sourcing platforms), or a combination of both (hybrid crowds). To succeed, this model must be supported by a QE transformation team with strong expertise in infrastructure, apps, and products to effectively create a QE strategy aligned with digital and cloud migration. Machinery: AI-based platforms for advanced test automation AI/ML-powered QE has allowed for the formation of virtual personas to execute day-to-day testing tasks with minimal human engineer intervention, an approach that aligns with continuous testing and DevOps ecosystems. Importantly, AI/ML (especially generative AI) has permeated far beyond the test design and maintenance phase. It now covers the entire end-to-end testing lifecycle, and provides significant technology coverage, spanning beyond web and API toward mobile-native and commercial off-the-shelf (COTS) products deployed in a software-as-a-service (SaaS) model. In terms of test types, generative AI-powered QE enables coverage across activities such as defect triaging and logging, unit-test scripting, test-failure analysis, defect prediction, test-data generation, and test-environment healing. The highest degree of "automating the automation" has been achieved in SaaS-based COTS products, wherein new tools can now scan the entire product instance from end to end, identifying customizations, communicating between app modules, generating test cases, and handling execution and maintenance. Mindset: Hiring QAOps engineers with a shift-right mindset A well-designed QE program cannot be built with only functionality and performance in mind. It is also vital to prioritize system availability, stability, robustness, and reliability. To drive a broader shift in mindset toward QE objectives, companies must start by hiring and developing QAOps engineers with shift-right mindsets. QAOps engineers enable organizations to create more effective QE programs and achieve better results. Their expertise means a finger on the pulse of production instance feedback, prioritizing elements such as resilience and production testing to build a QE program that is more reliable and robust. The Path Forward for QE Optimization The distributed, cloud-centric world offers unprecedented business opportunities, but its complexities come with new hurdles that modern organizations must overcome. As companies continue to embrace the cloud, they can reduce the risk of failure by making QE a top priority within the broader digital transformation of their business. For that to happen, organizations must look at testing not just as a way to deliver bug-free applications, but as part of an infrastructure that supports the rapid delivery of high-quality products and services. Such an approach ensures that QE initiatives can enable enterprises to respond more quickly

to fast-changing market dynamics, deliver a superior experience, and build brand loyalty. Moving away from the traditional dimensions of speed, skill, and structure toward becoming an integrated QE and testing organization will be the path forward for modern companies looking to drive measurable growth and innovation. For more insights, see the Wipro report, Quality Engineering in a Cloud-Centric World. About the Authors Simon Strickland UK Head of QA & Test, Release Management, Zurich Insurance Company Ltd With over 20 years of experience, Simon is a thought leader committed to high standards and dedicated to maximizing new opportunities to further evolve QE in a highly competitive and demanding world. Rituparna (Ritu) Ghosh VP & Global Head Quality Engineering and Testing, Wipro Ritu has more than 20 years of experience and leads Wipro's Quality Engineering and Testing practice. Throughout her career, Ritu has nurtured and developed high-performing teams, fostering a culture of collaboration, creativity, and continuous learning. =======================

How Changing Workplace Dynamics are Driving a New Employee Experience

----- Arcticle source ----- https://www.wipro.com/cloud/how-changing-workplace-dynamics-are-driving-a-new-employee-experience/ ----- Contact Wipro Please fill the required details to access the content How Changing Workplace Dynamics are Driving a New Employee Experience For years, businesses have focused on providing a seamless customer experience. But the 'Age of the Employee' has arrived, and companies need to take note. Changing dynamics are aloft that will significantly impact the employee experience. A job has become part of the employee's value system, and employees want to have a say in shaping their work experience. This new dynamic means that companies will need to pay more attention to the importance of the employee experience, as it has become a critical element in choosing a job. Companies must adapt to the needs and preferences of this new workforce and find ways to provide smoother employee experiences, secure remote working and more flexibility. Emerging Dynamics that Will Differentiate the Employee Experience A new generation of employees is redefining what they want from their jobs and how they want to work. This evolving employee experience is starting to impact recruiting. Companies that invest in employee experience are 4.4 times more likely to be listed on LinkedIn as North America's most in-demand employers and 2.1 times more likely to be listed on Forbes World's Most Innovative Companies. These are more desirable and succeed in attracting and retaining top employees. Multiple dynamics are reshaping the new workplace experience. Companies must recognize these preferences and respond with expanded benefits to provide a differentiated employee experience. 1. Emphasis on Diversity and Inclusion: With a more diverse workforce, companies are beginning to recognize the importance of creating an inclusive workplace culture that values and respects differences, including policies and practices that promote diversity and inclusion. 2.

Flexibility and Work-Life Balance: Younger generations, millennials and Gen Z, emphasize work-life balance and flexibility. Companies are responding by offering more flexible work arrangements, such as remote work options, flexible hours, and unlimited vacation policies. A 2022 FlexJobs Career Pulse Survey found the top two reasons employees seek new jobs are lack of work-life balance and no remote/hybrid work options. 3. Technology and Digital Transformation: With the rise of digital natives, companies are embracing technology and digital transformation to create a more seamless and efficient workplace experience. New technologies like cloud computing, artificial intelligence, and automation will streamline workflows and increase productivity. As the boundaries of traditional computing get redefined with these new technologies, it makes sense that workspace tools will also change. 4. Employee Engagement and Empowerment: As younger generations enter the workforce, they are seeking opportunities for growth, development, and empowerment. Companies are providing opportunities for professional development, leadership training, and employee engagement initiatives to foster a sense of ownership and purpose among employees. These employees have higher expectations for technology and collaboration. Companies should promote a sense of purpose and give employees a say in defining their work experience, including their technology experience. The technology experience significantly impacts the overall employee experience. Cumbersome technology and processes increase the risk of worker burnout, leading to higher turnover. For a tech-savvy generation, technology tools can make or break their work experience, efficiency levels, confidence in the role and opinion about a company. One initiative that can improve employee experience is a device choice program. Device choice programs allow the employee to choose the type of computer (and other devices). A Wipro survey found that employees with device choice programs were 71% more productive due to high levels of engagement, 73% more loyal to the company and 74% responded they were proud to work for their employers. Device choice provides the connection to values and a sense of empowerment. For companies that offer this benefit, one device is rising to the top – Mac. A global technology company with a device choice program reported that 59% of new hires chose a Mac computer and 65% of existing employees would switch to Mac given the opportunity. What is behind this growing trend? 1. Design and User Experience: Mac computers are known for their sleek and modern design, intuitive user interface, and ease of use. Many millennials and Gen Z employees appreciate these features because they value aesthetics and a good user experience. In a Wipro survey, 60% of existing PC users responded that their productivity would improve with a Mac, and 41% believe Mac devices are easier to use. Many new and existing employees want a choice of computers, and Mac computers have the same seamless experience they already know with their personal devices. 2. Creativity and Innovation: Many millennials and Gen Z employees view Mac as a tool to help them express their creativity and innovation. It should be no surprise that 84% of the world's most innovative companies use Mac. 3. A Familiar Platform: Many millennials and Gen Z employees prefer using a Mac because it is the device they have used for years in middle and high school and college. When employees start working on a tool they know, onboarding and learning curves are reduced, getting a new hire to productivity faster. 4. Compatibility and Integration: Many workplaces use other Apple products, such as iPhone and iPad which seamlessly integrate

with Mac, making it easier for employees to access and share information across devices to streamline their workflows. As a result, more employees want to use them. Ten years ago, Mac represented only 12.86% of desktops. That number has increased to 31.34%. In 2022, the Wipro Executive Committee embraced employee choice and offered new associates a device choice program. The committee anticipated an overwhelming number of candidates would choose Mac. And they did. While Wipro estimated positive impacts on company economics, employee recruiting efforts and sustainability goals, the results were astounding. The total economic impact was 55,000 hours saved in two months by the IT department, deploying 7800 Mac devices that did not require Windows imaging. The effect on recruiting was stunning. The campaign results are below. As expected, moving to Mac improved our sustainability goals. We achieved 1,428,000 KG CO_2 emissions savings, equivalent to eliminating 5,752,604 miles driven by gasoline-powered passenger vehicles. These results overlapped the findings of a 2021 Forrester Consulting study, Total Economic Impact™ (TEI), analyzing the impact of adopting Mac devices in the enterprise. The study found that organizations chose Mac because they prioritized the employee experience, Mac devices were easy to deploy and manage and leaders believed Mac to be more secure than PC. Some companies may hesitate to offer device choice due to a lack of in-house skills supporting macOS. However, support for Mac is easy. Apple and others have proven device management solutions and service programs. Mac computers are more stable than PCs because Apple controls every aspect of building and assembling their systems. Due to its UNIX roots, Apple has tight control over its software, making it more difficult to exploit. These tight controls lead to lower support costs. An Effective Strategy to Address the Changing Employee Experience Companies can no longer put every employee in the same box. Employees want a say in their work experience. Adopting a new set of benefits, like a device choice program, gives them just that. Technology choice is a good way to address employees' needs and desires to express their individuality and creativity. Device choice programs will also improve several corporate metrics like a shorter and streamlined employee onboarding experience, a lower overall cost of ownership, a better company reputation as viewed by current and potential employees and a better employee experience. And great employee experiences lead to higher employee engagement. In the age of the employee, companies that adapt to changing priorities will attract and retain top talent and be more competitive in the modern workforce. In device choice programs, Mac is emerging as the computer of choice. For the younger generations, a Mac provides a seamless transition from their personal experience with technology to their work experience. The Apple brand appeals to employees' identity and values. It has always symbolized individualism and creativity and now is becoming an effective strategy to give employees more control in defining their employee experience.   About the Author Timothy Lydon Global Apple Partnership Leader Wipro FullStride Cloud Tim Lydon is Wipro's Global leader of the Apple Partnership. Tim has executed several of largest enterprise deployments of Mac Device Choice programs. Tim advises enterprise executives on how they can improve the employee experience, reduce costs and improve sustainability by expanding the adoption of Mac. ====================

Cloud Economics Delivers More Bang For The Buck

----- Arcticle source ----- https://www.wipro.com/cloud/cloud-economics-delivers-more-bang-for-the-buck/ ----- About The Author Contact Wipro Please fill the required details to access the content Cloud Economics Delivers More Bang For The Buck With cloud investments continuing to make up a bulk of enterprise technology budgets, leaders need to be sure they're making the most of those investments. Maximizing ROI on cloud investments not only supports stronger cloud growth, but it also promotes stronger business transformation programs by laying a more solid, innovative foundation on which the business can build a future-ready enterprise. Unfortunately, this is often easier said than done with cloud. Many enterprises are seeing cloud costs skyrocket due to the unique nature of cloud spending. This is attributed to the additional processing and computing scale required to take advantage of emerging technologies like AI, generative AI and machine learning, as well as creating testing sandboxes and accommodating new user adoption. Cloud spending is also based on consumption and, therefore, is constantly variable—unlike a fixed-cost model such as a non-SaaS ERP system. However, like an ERP system, many departments and business functions use the cloud, meaning a single enterprise can have multiple functions accumulating their own cloud costs. Such siloed management can lead to duplicative spending, inflating the cost of cloud and diluting the ROI for the business. How can businesses get the control they need over cloud spending without limiting innovation or the new technologies only truly enabled through the cloud? The answer lies in cloud economics. What Is Cloud Economics? Cloud economics is becoming an increasingly popular discipline among business and IT leaders because of the clarity it brings to cloud spending. This collaborative, pragmatic process engages leadership throughout the organization (IT, operations, finance, development, business units) to define what value means in terms of cloud investments and then develop a strategy that will deliver that value to the business. In doing so, the various business functions are encouraged to look beyond optimizing costs in order to make decisions that will maximize the business value of the cloud. The shift in focus from cost to value is key to a successful cloud program. So many first-time cloud migrations deliver lackluster results because the business is focused primarily on moving to the cloud as a way to cut costs. While moving to the cloud can absolutely help make some processes more cost-effective, doing so will likely require time and money upfront. If a business is only focused on cutting costs, making those investments might seem like a failure. However, if a business is focused on saving money in the long run by incorporating AI and automation throughout its operations, for example, or enhancing data processing capabilities to become more data-driven, teams can feel confident investing time and resources in specific areas of cloud development knowing that those investments will lay the groundwork for capabilities and advancements critical to the larger business goals. Cloud economics can help businesses identify their unique cloud goals and the actions necessary to achieve them. In doing so, the businesses learn how to optimize cloud costs and maximize the value of cloud by aligning the various business

teams around shared investment goals. This is an organizational change management endeavor that requires the business to act in concert to achieve like-minded goals. As the cloud program progresses—as the spending models for these investments change or the needs of the company evolve—other tools such as FinOps can help business managers further optimize cloud spending and business value. FinOps: A Valuable Addition FinOps is a component of cloud economics that focuses on the operational aspects of cloud economics. Now that the business has moved to the cloud, how does it best manage its cloud spending to achieve its cloud goals? What are the areas of extraneous cloud spending? What areas need greater investment? How can teams focus or redirect their cloud investments without disrupting business operations? To answer these questions, FinOps uses a three-phase iterative approach: inform, optimize and operate. Through FinOps, businesses can identify areas of overspending, corrective actions and the best way to reinvest those savings. For example, through FinOps, a company may learn that it's paying for much more storage space than it needs based on average usage. Downsizing the storage could free up funds that the company could reinvest in other avenues based on the cloud goals outlined through cloud economics. FinOps is an ongoing process. Teams focus on small sections of a cloud program at a time, making changes that will deliver the most value to the organization. Low-hanging fruit investments like downsizing storage space are great starts because they can offset the costs of more significant changes with minimal disruption to the business. As the company starts making bigger, costlier changes, working in stages will make it easier to monitor success, strategize corrective action and implement those actions effectively. By implementing FinOps as part of a centralized cloud cost center of excellence (CoE), cross-functional finance, technology and business teams can collaborate more effectively to maximize business value. A cloud cost CoE governs cloud adoption and spending throughout the organization to ensure teams are making decisions that align with the organization's larger cloud goals. FinOps is integral to these decisions and can help the CoE establish a single source of truth for cloud spending, breaking down cultural silos and institutionalizing cloud economics management to promote a stronger, more successful cloud program. The value of a strong cloud program cannot be overstated. Investments in AI and other advanced technologies that require the support of the cloud are on the rise, making cloud capabilities key differentiators. Cloud economics and FinOps can help enterprises make more informed decisions about how they advance their cloud programs and feel more confident making the kinds of bold investments that will help them stand out among the competition. Industry Clouds Become Catalyst for Transformation

----- Arcticle source ----- https://www.wipro.com/cloud/industry-clouds-become-catalyst-for-transformation/ ----- Contact Wipro Please fill the

required details to access the content Industry Clouds Become Catalyst for Transformation A Harvard Business Review Analytic Services report in association with Wipro FullStride Cloud An industry cloud ecosystem can unlock the potential of data residing within the enterprise and thereby accelerate innovation not just for a single business but for an entire industry. Industry clouds are uniquely positioned to accelerate cloud adoption, because they appeal directly to the needs of business users and provide industry-specific features and benefits that companies have found lacking in commodity clouds. While industry clouds are more complex and require more effort in terms of integration and management than commodity versions, the potential payoff they offer in terms of agility, flexibility, cost savings, and increased innovation is so high that they are poised to inevitably become an essential element in most companies' cloud strategy. This Harvard Business Review Analytic Services report focuses on the continued evolution of the cloud and the often discussed yet seldom truly defined rise of industry cloud. The stories demonstrate how the combination of industry cloud and a strong cloud strategy can help even the most risk adverse businesses in highly regulated industries obtain the assurances they need to embrace cloud, become cloud-native enterprises and drive business value. Some key dimensions of the report are: Download report ======================

How The Industry Cloud Is Changing The Game

----- Arcticle source ----- https://www.wipro.com/cloud/how-the-industry-cloud-is-changing-the-game/ ----- Contact Wipro Please fill the required details to access the content How The Industry Cloud Is Changing The Game By now, most organizations have begun moving key workloads and applications to the cloud, leading cloud services providers to shift focus from generalized offerings that work for most businesses to vertical offerings tailored to the specific needs of businesses within a single industry. The industry cloud, as this approach is known, is not new. In fact, analysts from Allied Market Research predict that the market for these industry cloud solutions and platforms will exceed $350 billion by 2031. But, recent advancements have made it more powerful and practical. Today's industry clouds are capable of handling the very specific demands of highly regulated industries like financial services, manufacturing and healthcare. They can also accommodate advanced digital capabilities like analytics and AI-powered algorithms to improve monitoring, observability and operability. By converging industry-specific applications with the technical capabilities of the cloud, the industry cloud enables IT teams to deploy and manage specialized software, helping ensure it aligns with business goals. It also empowers business leaders with a deeper understanding of the technology, as well as its potential impacts and opportunities—insights that are critical to ensuring successful digital transformations. Understanding The Industry Cloud In effect, industry cloud platforms turn cloud platforms into business platforms. They do this by taking a tailored data model with customer profiles, order history or inventory levels and overlaying security guardrails

specific to an industry, enabling clients to deliver value against specific business outcomes while maintaining data integrity. For example, security guardrails such as role-based access control (RBAC) policies, multifactor authentication (MFA) and 256-bit encryption as part of the industry cloud platform can help a healthcare organization handle and store patient records in compliance with the payment card industry (PCI) and Health Insurance Portability and Accountability Act (HIPAA) regulations. Traditional cloud services have not been designed with these kinds of regulations in mind, leaving businesses in sectors like finance services, healthcare and manufacturing to build their own solutions and find ways to ensure compliance. This can be costly and risky, and it has discouraged businesses in highly regulated industries from embracing the cloud. The industry cloud helps reduce those risks and encourages greater cloud adoption by providing services specifically designed to meet regulations and accommodate new features such as advanced data processing or compatibility with AI and machine learning. By addressing the security concerns of the banking and financial services sector, for example, the industry cloud allows businesses to use more cloud applications more confidently, unlocking new opportunities for digital transformation. There Is No One-Size-Fits-All Solution Although the industry cloud provides prebuilt offerings specific to a given industry, it is not a one-size-fits-all solution. These offerings serve as composable building blocks for further innovation. Businesses use them to quickly develop core capabilities that are standard throughout the industry, freeing time and resources that can be reinvested to develop business-specific solutions. A large healthcare provider, for example, might use prepackaged industry cloud services to get the capabilities it needs to safely and securely transfer medical information, paving the way for more efficient communication and record management across all its locations. Meanwhile, a small clinic might use the same prepackaged services to enable it to develop a more intuitive patient portal. An Innovation Ecosystem The industry cloud also creates greater opportunities for connectivity and collaboration, encouraging enterprises to work together while sharing applications and services to refine solutions or create entirely new ones. Standardized offerings mean enterprises are more likely to be operating at similar levels: compliant with regulations, capable of integrating new technologies and free to explore new solutions to their own unique business challenges. As they start developing their own applications through the industry cloud, they can monetize those applications or share them with other businesses to expand their capabilities. Cloud services providers can also build on these offerings, identifying industry trends and developing new services to deliver greater value. In this way, an industry cloud ecosystem can accelerate innovation not just for a single business but for an entire industry. In today's digital economy, a strong cloud strategy is critical to making the most of advanced data processing, AI and other powerful technologies. With verticalized offerings and greater alignment of business and technology goals, the industry cloud is helping even the most risk-averse businesses in highly regulated industries have the assurance they need to embrace the cloud and become cloud-native enterprises. This article was originally published on Forbes.com About the Author   Jo Debecker - Managing Partner and Global Head of Wipro FullStride Cloud. With over two decades of industry experience, Jo is known for his expertise in leading complex transformation

projects for large global organizations and for driving consistent growth for the businesses he leads. Most recently, Jo was the Global Head of Cloud Infrastructure Services. =====================

From Consumer to Value Creator, Unlocking the Power of Generative AI

----- Arcticle source ----- https://www.wipro.com/cloud/from-consumer-to-value-creator-unlocking-the-power-of-generative-ai/ ----- Contact Wipro Please fill the required details to access the content From Consumer to Value Creator, Unlocking the Power of Generative AI In this era of digital abundance, Generative AI promises to be a transformative force, capable of enhancing service quality and user experience across industries and value chains. Early use cases have revealed opportunities to automate processes, improve customer support, and empower workers to be more efficient and creative. However, the most valuable applications are likely to require creativity from the businesses themselves. Currently, many businesses are consuming AI passively through off-the-shelf applications, chatbots, HR portals, and transcription services. For maximizing the value of Generative AI, organizations must transition from being passive AI consumers to proactive AI value creators, adapting foundation models to fit the unique needs of their business. The Transformative Power of Foundation Models Foundation models are AI models trained on very broad, vast datasets, enabling them to be easily applied to a wide range of use cases. Generative AI makes it easier to train and adapt foundation models for diverse downstream tasks. This versatility is tremendously valuable. A single model can underpin chatbots, HR self-service, marketing email generation, and legal document summarization, enabling innovation across a full spectrum of applications. The key is to see the model not as the final form of AI but a foundation on which to build. However, this can only occur if businesses are actively engaged in AI innovation and take a platform approach to AI consumption. There are three main approaches to AI consumption: Each of these approaches has its pros and cons, and most businesses should use a mix of all three. But the platform approach is where the magic happens. Rather than using another company's pre-built solutions, businesses are in control of the entire AI creation process. The platform approach makes it conducive to aggregating business data from diverse sources. Over the period with an accumulation of business data, the richness of context increases, making the output of LLMs both contextually relevant and factually accurate. Hence, the businesses can accumulate value over time giving them a competitive advantage. The platform approach uses Retrieval Augmentation Generation (RAG) to act as a bridge, connecting large language models (LLMs) to vast enterprise knowledge sources. Platform (Your Data + Your Model) = Your Unique Value Other key advantages of the platform approach include the following: As businesses navigate the evolving landscape of Generative AI, recognizing the transformative potential of foundation models is key. Shifting from the traditional task-

centric AI approach to a versatile platform approach heralds a new era where businesses don't just use AI but actively create value, defining the future contours of the AI landscape. Crucially, the platform approach focuses on creating and owning value unique to businesses, transforming them into AI value creators. In essence, the platform approach empowers businesses to be their own AI architects, tailoring solutions to their specific needs and creating a sustainable and valuable AI ecosystem in the process. It's the route to not just participating in the AI revolution but leading and shaping it. About the Author Gaurav Parakh Global Head of Hybrid Cloud Strategy & Emerging Offerings, Wipro Gaurav is a Senior Hybrid Cloud Strategist at Wipro with over 24 years of experience in IT consultancy and advisory services. He specializes in digital transformation, go-to-market and business development. At Wipro, Gaurav engages with Fortune 500 clients and partners at the leadership level, drawing on his experience designing and implementing cloud solutions, operating models, and strategies for FinOps, open source and generative AI to drive success. He also has a background in entrepreneurship, having built tech startups in 3D printing, education and AI from inception to exit. =====================

Six Cloud Evolution Predictions For 2024

----- Arcticle source ----- https://www.wipro.com/cloud/six-cloud-evolution-predictions-for-2024/ ----- Contact Wipro Please fill the required details to access the content Six Cloud Evolution Predictions For 2024 Cloud continues to be the foundational transformation platform for organizations that want to be industry leaders and adopt the most impactful emerging technologies. From GenAI and automated shop floors to software-defined vehicles and smart meters, the technology innovations promising to revolutionize industries require strong cloud capabilities and an understanding of how the cloud is evolving. The following predictions about the evolution of cloud are based on Wipro client interactions throughout 2023 and insights into the cloud space. 1. Multicloud and hybrid cloud will overtake single-cloud models in popularity. In 2024, multicloud and hybrid cloud models will become critical for organizations—not only for competitive advantage but also for regulatory compliance. Regulatory measures such as Europe's Digital Operational Resilience Act and the U.S. Treasury's risk guidelines require financial institutions to demonstrate robust cloud service failure management and disclose any concentration risks associated with their cloud providers. To maximize the advantages of a multicloud approach, businesses must establish a comprehensive set of protocols. This includes stringent data management practices, advanced security measures, seamless workload mobility and overarching governance. Strategies will increasingly focus on cross-cloud interoperability and the deployment of cloud-agnostic tools, steering away from rigid IT infrastructures to more responsive systems. 2. Interactive AI will lead a revolution in customer service with zero-touch call centers. Heading into 2024, "interactive AI" is poised to lead a customer service revolution, leveraging the expansive power of cloud computing to enhance GenAI's interaction capabilities and

more efficiently orchestrate complex interactions between AI systems and humans. By the end of the year, businesses will likely unveil the world's first zero-touch call centers, a testament to the strides made in GenAI. These centers will be equipped to perform tasks that surpass the abilities of traditional chatbots, such as handling customer histories, inventory management and sensitive communication tasks, all enhanced by advanced natural language processing. 3. Focus on sustainable cloud and offerings from hyperscalers will multiply. AWS has committed to powering its operations with 100% renewable energy by 2025 and is investing in wind and solar energy projects worldwide to achieve this goal. Google has been carbon-neutral since 2007 and aims to operate on carbon-free energy 24/7 by 2030. By 2030, Microsoft plans to be carbon-negative, and by 2050 seeks to remove all the carbon it has emitted either directly or by electrical consumption since its founding in 1975. Sustainability is becoming a prime focus in every industry, including cloud computing. Businesses now consider a cloud provider's sustainability initiatives as a critical factor in the decision-making process. In response, hyperscalers are working to optimize compute power and storage and increase the overall sustainability of energy systems throughout data centers through the use of renewable energy sources and more efficient cooling systems. AI and machine learning are already being used to optimize energy consumption in data centers. Businesses will likely continue to invest in technologies to monitor and manage the environmental impact of their cloud programs, even leveraging cloud technology to power these solutions, such as cloud-based decarbonization and carbon modeling. 4. Cloud will take edge computing to the next level. With the advent of ultra-low latency computing, particularly through 5G technology, edge computing is undergoing a renaissance. More than a technological trend, this strategic shift leverages the economies of scale inherent in cloud infrastructure, magnified at the edge. By decentralizing data processing, enterprises can significantly reduce cycle times, enabling real-time analytics and decision-making. The synergy of edge and cloud capabilities means that investments in cloud infrastructure can be leveraged more efficiently and at scale, offering businesses the dual benefits of agility and economic efficiency. Examples include the ability for automakers to incorporate more computing capabilities into their vehicles and real-time processing on factory floors to help manufacturers streamline operations and improve safety. Retailers can personalize shopping experiences through instant data analysis, while logistics companies can optimize route and supply chain management. 5. Growing interest in cloud economics will lead to more tailored cloud portfolios for enhanced ROI. In 2024, CFOs and COOs will increasingly steer the cloud consumption narrative, instilling a cost-conscious yet value-driven approach to cloud adoption. As enterprises continue to scale up their cloud infrastructure, the focus will be on optimizing ROI with a keen analysis of spending versus gains to ensure cloud investments translate directly into enhanced operational efficiency and competitive advantage. Growing interest in GenAI will play a central role in this shift. GenAI's advanced analytics and automation can help drive down costs while propelling innovation. The embrace of GenAI, facilitated by flexible cloud platforms, will help refine cost models and unlock new revenue streams, empowering businesses to harness the full potential of their cloud endeavors for superior financial outcomes. With business and technology strategies increasingly relying on each other, businesses can't afford to overlook their cloud

programs and investments. In 2024, the cloud will continue to be a strong value driver for enterprises seeking to increase their speed of innovation, harmonize their data and deliver new forms of value to customers. 6. Accelerated industry cloud adoption will transform healthcare, finance and highly regulated industries. Industry cloud is expected to revolutionize technology within industries like healthcare and finance, which are often bogged down by regulatory burdens. These specialized cloud solutions enhance data security, ensure compliance and modernize IT effectively, says Kate Leggett from Forrester Research in a Wipro-sponsored HBR report. Dilip Venkatachari of U.S. Bank echoes this in the same report, noting the cloud's potential to advance technology and enrich customer interactions. The convergence of industry-specific clouds with broader tech ecosystems marks a shift toward a more agile, targeted approach to digital infrastructure that promises to accelerate innovation and operational efficiency across the board. This targeted approach is rapidly becoming a linchpin for businesses seeking to harness the full potential of digital transformation. By 2027, Gartner's VP Analyst, Gregor Petri, predicts that over 70% of enterprises will leverage these platforms to propel their business initiatives, underscoring the growing interest in and importance of industry clouds. From data centre to cloud

----- Arcticle source ----- https://www.wipro.com/cloud/from-data-centre-to-cloud/ ----- Contact Wipro Please fill the required details to access the

content From data centre to cloud How a data centre exit strategy can prove to be more valuable than you might think The benefits of the cloud are no secret to businesses. What can often be a mystery, however, is how to adopt it smoothly. Almost all companies have a cloud strategy, aiming to capture improved operational flexibility, cost savings and innovation opportunities. The rewards for a successful migration are huge: cloud transitions can reduce total cost of ownership by 20-45%+. This process has been accelerated by the pandemic, with capabilities from data backup and disaster recovery to software development and testing becoming even more vital. Cloud can also help to reduce a business's carbon footprint, and allows for both flexibility and scalability, so that companies can scale up and down where necessary. Businesses generally accept that migrating from on-premises data centres to the cloud can be a complex, purely practical, and sometimes even painful exercise. But, what many companies might not know is that by monetising their data centre exits, they can also make money by switching to the cloud, offsetting the upfront costs that may be standing in the way. Not always simple, but worth the cost It is understandable that once the decision has been made to migrate to the cloud, businesses are anxious to move fast, and rely on tried and true internal teams. However, this underestimates the size and specific knowledge needed to complete the task in an efficient manner. Many logistical and financial barriers exist around exiting a data centre. For example, fees may apply to those who try to break their contract early, and hardware must be decommissioned correctly and within regulation in order to avoid more fines. There is also the question of where the equipment goes and whether or not companies can recoup their expenses. Addressing all these concerns can take time, but the longer businesses wait to exit their data centres, the more pressure they may feel to get ahead of the curve, resulting in rushed timelines, missed opportunities and further costs. In addition to these challenges, companies also have to transition their applications from the data centre to the cloud—a complex and time-consuming process. For example, a typical retail bank might have four data centres running over 3000 applications and 50,000 servers. Alternatively, applications might be spread out over multiple business units, regions, or thousands of virtual machines, with little coordination between them. When the migration of vital applications goes wrong, it can too often result in a 'double bubble' scenario, in which businesses find themselves stuck, mid-exit, between the data centre and the cloud. Applications tend to become more complex as the transition progresses, the data sources become harder to trace and the project can stall out, increasing costs, decreasing efficiency and exposing the company to security risks.   Similarly, any lengthy downtime for servers can be highly costly, restricting key business functions and leading to unexpected revenue shortfalls. Add to this strict regulatory requirements for certain industries, and the importance of managing the situation expertly becomes clear. All of these scenarios highlight that cloud migrations can be complicated, and working with an experienced partner can prevent issues from piling up and overwhelming an internal team's resources.   Profiting from your exit strategy Cloud migration experience can also make a surprising difference in other ways: not just avoiding unexpected costs and delays, but monetising the process too. Partners are adept at liquidating legacy assets such as hardware and facilities. Further, they can help businesses to be bought out of data centre lease commitments, meaning they aren't stuck with continued

and unnecessary costs. When large migration projects can involve cutting down twelve data centres to two, that is a lot of potential cost savings on the table. Facing the dreaded 'double bubble' problem, there are even temporary cloud-like interfaces that exit partners can equip companies with as they transition, so that they can begin to see the benefits while planning next steps—an especially important element as it means businesses can move at their own pace and work within timeframes that suit them best. By providing companies with interim solutions, these programmes free businesses from assets that are weighing them down and help them to reach a hybrid cloud state until the switch is complete. Meanwhile temporary 'single pane of glass' reporting solutions can shed vital visibility on the migration process, allaying leadership fears until the programme is complete. A successful, seamless transition There is no doubt that transitioning from the data centre to the cloud can be challenging. It can be costly, and without the right expertise, a slow and arduous process, leaving companies in a difficult position. But the rewards for getting the process right are huge. From greater cost savings, to increased flexibility and operational agility. Working with the right partner can alleviate some of the pressures associated with exiting the data centre—including costs and the technological expertise required with switching to the cloud—and empower businesses to start making the changes they need to grow stronger, smarter and even more sustainable. Cloud migration can be expensive, but it doesn't have to happen en masse, nor does it have to be handled by a company's IT team alone. In a rapid period of digital transformation and innovation, companies need to adapt; but start the transition now and you'll reap the rewards right away, as well as for years to come. This piece was developed and originally published on Technology Dispatch About the Author Jo Debecker - Managing Partner and Global Head of Wipro FullStride Cloud. With over two decades of industry experience, Jo is known for his expertise in leading complex transformation projects for large global organizations and for driving consistent growth for the businesses he leads. Most recently, Jo was the Global Head of Cloud Infrastructure Services.
=======================

AI Is Here: How Do You Control Your Cloud Spending?

----- Arcticle source ----- https://www.wipro.com/cloud/ai-is-here-how-do-you-control-your-cloud-spending/ ----- Contact Wipro Please fill the required details to access the content AI Is Here: How Do You Control Your Cloud Spending? Business technology leaders are expecting their cloud spending to grow in 2024 due to the growth of AI. Cloud economics is an intelligent management strategy that can better manage these costs as generative AI inevitably pushes spending higher. AI applications are only as good as the data they use. The more high-quality data that algorithms have access to, the more accurate and reliable their results will be. But just how much data do machine learning and large language models require? As AI use cases become more complex and resource-intensive, the expenses associated with supporting them—and particularly the cloud infrastructure for AI workloads

are increasing. Unfortunately, there's no hard-and-fast rule when it comes to forecasting what's needed to run AI models. Workload requirements and computing power vary depending on the size and complexity of the project. Natural language processing, for example, is a complex task that typically requires a lot of data for training. It also happens to be one of the more popular use cases, with companies using it for everything from email generation and document summaries to customer service. These tasks can quickly become even more complex if a business wants highly contextualized responses, such as employee self-service for a global company or help handling sensitive information in a highly regulated industry such as healthcare or finance. These generative AI models can run "10 to 100 times bigger than older AI models"; meanwhile, use cases and user bases are growing. AI's data demand is having a major impact on cloud costs at a time when many companies are scrutinizing cloud budgets. Early lift-and-shift approaches to cloud adoption have led to bloated cloud budgets, with many companies paying for cloud services that they don't need. Now that the dust surrounding these migrations is settling, companies are taking stock of their cloud consumption and taking steps to reduce overspending. However, with the explosion of AI, these cloud infrastructures must now be redesigned to handle large-scale AI use cases. This might seem like terrible timing: A promising, data-intensive technology goes mainstream just as companies are tightening their data and cloud infrastructure belts. But growing interest in cloud economics is showing companies how to maximize the value of new technology investments rather than cutting them out altogether. Applying Cloud Economics To Manage AI Costs Cloud economics is a strategic approach to managing cloud spending that goes beyond simply cutting costs or increasing efficiency. It involves conducting a thorough cost-benefit analysis to ensure that cloud investments align with business priorities and will maximize overall business value. This same approach can be applied to managing AI costs. To effectively manage AI costs using cloud economics, businesses need to consider the potential impact and business value of the new technology. It's crucial to align AI investments with broader business objectives and understand the accommodations required for successful implementation. Instead of investing in AI use cases based solely on perceived value, teams should work to understand what "valuable" means for the business and set clear expectations for how to achieve that value. All business teams that intend to leverage AI models should collaborate within a shared framework and process for approving AI-driven projects. When teams work independently to make decisions about cloud and AI investments, it becomes challenging for the business to assess the costs and benefits of those decisions. Establishing a centralized cloud economics team or a group within a cloud center of excellence (COE) can help coordinate these efforts, establish best practices and guide teams on spending, experimentation and investment. Additionally, innovation COEs can play a key role in helping businesses understand the requirements and value of new technologies, including AI. With AI advancing rapidly, businesses must grasp the potential impact and opportunities these advancements bring. By leveraging cloud economics to manage AI costs, businesses can help ensure that their investments align with strategic objectives and deliver maximum value. Optimizing AI Workloads With Cloud Economics With a solid cloud economics program in place, businesses can delve into usage data to truly optimize performance across AI and the cloud. Initially, this involves

reducing wasted spending by shutting down underutilized resources. Cloud economics can help businesses take advantage of variable cost models to support AI investments. AI data requirements tend to be high, but they're also variable. Businesses stand to save a lot of money by accurately forecasting cloud requirements and adjusting as needed. This requires a strong data analytics program capable of generating timely insights. These adjustments can free up resources, which can then be reallocated to fund more critical (AI) investments. Teams can further utilize performance data to determine the optimal cloud environments for their enterprise, incorporate intelligent workload management to automate resource scheduling and adjust cloud services based on AI demand. Using cloud economics to manage AI costs not only helps ensure effective cost management but it also enables businesses to optimize the AI workload performance. By leveraging usage data and variable cost models, businesses can make informed decisions to maximize the value of AI investments while aligning them with broader business objectives. This strategic approach will help reduce overspending and allow businesses to reallocate resources effectively, realizing the full potential of their cloud and AI investments. This article was originally published on Forbes.com About the Author   Jo Debecker - Managing Partner and Global Head of Wipro FullStride Cloud. With over two decades of industry experience, Jo is known for his expertise in leading complex transformation projects for large global organizations and for driving consistent growth for the businesses he leads. Most recently, Jo was the Global Head of Cloud Infrastructure Services.
======================

How AI Unlocks Human Potential

----- Arcticle source ----- https://www.wipro.com/cloud/how-ai-unlocks-human-potential/ ----- Contact Wipro Please fill the required details to access the content How AI Unlocks Human Potential The integration of artificial intelligence (AI) in the workplace signifies a shift toward augmented human performance in which automation complements rather than replaces human labor. Harvard Business School professor Karim Lakhani sums it up: "AI is not going to replace humans, but humans with AI are going to replace humans without AI." Partial automation is becoming the norm, enhancing human capabilities and efficiency. This evolution isn't just about automating routine tasks but also about leveraging AI to augment human intelligence, creativity and decision-making processes. As machines take on more automatable activities, humans are freed to focus on higher-value work, fostering innovation and driving business growth. But what, exactly, does that look like? In the age of AI, demand for new skills and roles such as data scientists, digital transformation specialists, big data specialists and business intelligence analysts is expected to rise sharply. But what about other areas, such as marketing and IT support, in which routine tasks are already outsourced to AI? This shift underscores the importance of reskilling and upskilling initiatives as workers transition from declining occupations to emerging ones. Embracing AI and automation is beyond mere technological adoption—it's about preparing the workforce for the future, ensuring that employees are equipped to work alongside increasingly capable machines.

By prioritizing the human touch in AI adoption, businesses can harness the power of technology to enhance, rather than replace, the workforce, creating a more dynamic, innovative, efficient and competitive future. How Professionals Are Reshaping Their Roles With AI IT support agents, to give one example of a role already intertwined with AI, are leveraging AI to transform the way they manage and resolve issues. Through AI-powered information retrieval and artifact generation, these professionals can analyze device and application data, knowledge-base articles and known issues more efficiently. AI facilitates dynamic insight generation and summarization, improving troubleshooting by correlating key information and providing step-by-step guidance to accelerate the resolution process. Through implementing low- and zero-touch remote automation-based remediations, IT support agents can significantly reduce their manual workloads (which includes the actual resolution) while improving the quality of support they provide. Marketing professionals are also harnessing the power of AI to gain a competitive edge. By utilizing AI to collect market research data and identify trends and outliers, they can develop more informed, effective marketing strategies. AI assists in drafting marketing plans, pitchdecks that highlight product features, promotional emails, videos and social media posts, streamlining the content creation process. This enables marketers to focus more on creative and strategic tasks. Similarly, HR professionals are using AI to transform the human resources function within organizations. Streamlined automated workflows powered by AI boost enterprise HR productivity by efficiently managing employee journeys. This includes tracking employee requests and cases and providing easy access to HR resources and information. AI can also help reduce biases in the hiring process by anonymizing resumes, analyzing job descriptions for biased language and ensuring diverse candidate pools by reaching out to a wide range of backgrounds. Hiring teams can use AI's predictive analytics to identify and rectify patterns of bias in historical hiring data and standardize the questioning process to minimize personal biases. In each of these use cases, the narrative is clear: AI isn't a replacement for human workers but a powerful ally that supports and enhances their capabilities. The importance of human involvement remains paramount, as it's the insights, creativity and strategic thinking of professionals that prompt AI, review its outputs and guide its responses to ensure relevance and accuracy. With AI handling routine and data-intensive tasks, employees are freed to focus on more complex, creative and strategic aspects of their roles, leading to a more empowered and fulfilled workforce. This empowerment can result in increased productivity, engagement and innovation. Ultimately, investing in the well-being and empowerment of the human workforce is a moral imperative and strategic decision that can positively impact the bottom line. How To Ensure AI Has A Human Touch Promoting a human touch throughout AI programs requires coordination across the executive, managerial and employee levels. At the executive level, leaders need to establish a clear strategic vision for AI that anticipates market trends and aligns with the organization's goals while addressing human elements such as employee and customer experience and training, as well as effective talent recruitment. This helps ensure that the integration of AI technologies is successful on both the business and employee levels—focusing on boosting performance while paving the way for greater productivity, higher quality and growth. At the management level, an innovative mindset

becomes crucial. Leaders must envision new AI use cases, lead implementation and foster a collaborative environment that empowers the human workforce to make the most of AI tools. Continuous learning about the latest AI developments equips leaders to handle uncertainties, and efficient management and collaborative engagement are vital as AI applications evolve and new ones are adopted. For employees, digital literacy is indispensable, and this will increasingly include a more advanced understanding of AI concepts. Employees must also be vigilant about eliminating unconscious biases in AI tools and making ethical decisions about their use, especially as AI systems assume greater decision-making roles. This focus on ethical decision-making and advocating for responsible AI implementation helps ensure that AI technologies are developed and used safely and successfully and are aligned with company policies and compliance. Balancing AI Advancements With Human Potential AI isn't just a tool—it's a catalyst for unlocking human potential. The human touch in AI adoption is crucial, guiding this powerful technology to enhance how businesses operate and teams collaborate. Embracing AI with a focus on augmenting human skills and creativity helps ensure that organizations can harness the full value of both AI and their workforces, paving the way for a future in which technology and human ingenuity thrive together. This article was originally published on Forbes.com About the Author   Jo Debecker - Managing Partner and Global Head of Wipro FullStride Cloud. ===================== ----- Arcticle source ----- https://www.wipro.com/cloud/joint-report-with-forbes-how-to-master-cloud-economics-and-harness-the-power-of-ai/ ----- Contact Wipro Please fill the required details to access the content Joint Report with Forbes: How to Master Cloud Economics and Harness the Power of AI We are thrilled to announce our collaboration with Forbes on a groundbreaking joint report. This report delves into the latest insights and trends shaping the business landscape, particularly focusing on the critical intersection of cloud computing and the burgeoning field of artificial intelligence (AI). Data from the 2024 Forbes Research CxO Growth 4.0 Survey, shows that more than one-third of CIOs are actively deploying more cloud solutions as part of their digital transformation initiatives, underscoring the pivotal role of cloud technology in driving organizational growth and innovation. Cloud computing serves as the foundational bedrock for cutting-edge technologies such as AI. The unparalleled computing power and data storage capabilities offered by the cloud are indispensable for the existence and advancement of AI technologies. Without access to the cloud's resources, the potential of AI would be severely limited. The focal point of the report is the concept of cloud economics—a comprehensive framework designed to elucidate the manifold benefits of cloud computing, its organizational impact, associated costs, anticipated advantages, and the imperative measures for safeguarding data. The meticulous understanding and application of cloud economics are identified as indispensable prerequisites for executives seeking to harness the transformative potential of GenAI, the next generation of AI technologies. Our collaboration with Forbes aims to provide an in-depth exploration of the future landscape of cloud and GenAI,

shedding light on the pivotal role of cloud economics in driving organizational success and technological advancement. This joint report serves as an indispensable resource for executives and industry leaders seeking to navigate the evolving terrain of cloud computing and AI, equipping them with the insights and strategies necessary to thrive in the digital era. This insightful report unveils the future of cloud and GenAI, and explains why cloud economics stands as a critical linchpin for achieving sustainable success in the dynamic business environment. Download report ===================== ----- Arcticle source ----- https://www.wipro.com/cloud/genai-drives-accelerated-cloud-investment/ ----- Contact Wipro Please fill the required details to access the content GenAI Drives Accelerated Cloud Investment Cloud continues to be the primary transformational platform for the enterprise, empowering organizations to innovate and stay competitive. "The Pulse of Cloud," presented by Wipro FullStride Cloud, is a quarterly survey series that delves into the current state of cloud adoption and digital transformation strategies. Each edition features insights on business technology topics that matter most to global enterprise executives. The Wipro FullStride Cloud Pulse of Cloud: Q1 2024 insights are drawn from a survey of over 500 business leaders in US and Europe across sectors to offer a detailed look at the latest trends and how companies are navigating the dynamic landscape of cloud computing and artificial intelligence. Below are some findings from our first report: Download the Report =====================

Accelerating Business Assurance: Strategies for SAP S/4HANA Transformation

----- Arcticle source ----- https://www.wipro.com/cloud/accelerating-business-assurance-strategies-for-sap-s4hana-transformation/ ----- Contact Wipro Please fill the required details to access the content Accelerating Business Assurance: Strategies for SAP S/4HANA Transformation With the 2027 deadline looming, strategic assurance practices offer businesses a roadmap to SAP S/4HANA migration success. In 2023, a leading retail company incurred losses of more than €78 million due to a poorly executed SAP transformation. With SAP ending support for ECC after 2027, businesses must transition to S/4HANA, but a successful migration requires more than upgrading technology. It also requires a strong assurance strategy — embracing a cultural shift towards quality that aligns with business goals, transforming testing processes well before the migration starts, and rethinking operational models. Such a comprehensive approach ensures that the migration not only meets the technical needs but also propels the company forward, supporting its strategic objectives and enhancing operational efficiency. The Role of Assurance in Migration Given how critical assurance is to a successful S/4HANA migration, it should be an integral part of every transition plan. However, many businesses focus heavily on the technical side and functional aspects of the migration, such as the system upgrade and business data migration, leaving less time for non-functional

aspects like performance, operational stability, and security. Neglecting these aspects can lead to significant disruptions, including downtime, data loss, or performance issues, which in turn can affect customer satisfaction, revenue, and compliance with regulations. A mindset shift is therefore essential to keep business objectives in mind throughout the migration. Assurance in SAP S/4HANA migration should support and enhance the company's strategic aims (e.g., mergers and market expansions, operational efficiencies or supply chain optimization), positioning quality assurance as a strategic partner rather than a mere procedural step. This involves a transformation of testing processes before migration, moving away from traditional methods to accommodate S/4HANA's modern technologies. Quality engineering (QE) leaders play a critical role in this transformation, preventing defects from reaching the production environment and ensuring a smooth transition. For organizations deeply integrated with SAP, migrating to S/4HANA might also require a significant transformation in operational models, particularly in the organization and delivery of quality engineering services. Adopting a Testing Center for Enablement model that is aligned with agile methodologies, for example, ensures the assurance process is adaptable and efficient, meeting the rapid demands of modern business and technology landscapes. Accelerating the Transition with AI and Other Technologies Artificial intelligence (AI) and machine learning (ML) are playing a pivotal role in transforming how businesses approach the migration to S/4HANA. These technologies serve as key enablers, streamlining the migration process and introducing efficiencies that were previously unattainable. AI can automate repetitive tasks, predict potential issues before they arise, and provide insights to inform decision-making, ensuring the migration process aligns with company goals. Machine learning algorithms can analyze historical data from past projects to predict outcomes, which can be used to optimize the assurance strategy. By leveraging data from past migration projects, AI develops effective testing strategies that are tailored to S/4HANA's modern technologies. This shift from traditional methods is a critical aspect of the mindset change and testing transformation emphasized in the assurance strategy, ensuring a smooth transition that minimizes risks and maintains business continuity. For example, Wipro worked with a major Australian utility company that sought to elevate its customer experience by transitioning from an outdated system to SAP S/4 HANA. Our teams utilized ML-powered intelligent test automation to ensure the migration was completed efficiently and without major disruptions. This approach not only ensured the project was delivered on time but also resulted in a 30% reduction in test cycle time, directly contributing to improved customer service and operational efficiency. Similarly, a North American Energy company, dealing with the complexity of multiple ERP systems due to past acquisitions, aimed for better system integration and data consistency by migrating to SAP S/4 HANA. Its collaboration with Wipro introduced a future-ready quality engineering model and an automation-first strategy, leading to a 30% reduction in quality engineering costs and a significant decrease in regression test cycle time. This move streamlined operations and enhanced decision-making processes, showcasing the direct value of a focused migration strategy. Other valuable use cases for AI/ML in assurance include: Adopting AI/ML not only reduces the time and resources required for migration but also significantly enhances the accuracy and effectiveness of the migration process. Wipro's

proprietary frameworks and tools, which integrate AI and machine learning, have consistently led to a 98% success rate for client migration projects, underscoring the effectiveness of leveraging advanced technologies. These tools are a direct result of hands-on experience with over 200 successful SAP S/4HANA migrations and are powered by GenAI for tasks such as test case generation, data validation, performance analysis and predictive analytics. Through its client work, Wipro has found that AI-driven DevOps introduces advanced methodologies and tools that enable faster SAP S/4 HANA migrations with reduced time-to-market (TTM). For instance, using automated test scripts, intelligent monitoring of system performance, and predictive analytics for migration risk management. Navigating Challenges and Embracing Opportunities Adopting AI and other technologies for migration assurance presents several challenges, including concerns around hallucinations and biases in AI models, data security, and the need for solutions tailored to the specific context of each business. Data security is a critical concern, as the migration process involves handling sensitive and proprietary business information. Businesses must ensure that the technologies they adopt comply with stringent data protection standards to safeguard against breaches and data loss. Despite these challenges, the strategic use of AI and other technologies in migration assurance offers significant opportunities for businesses. To navigate these challenges successfully, companies must prioritize selecting the right technology partners — those with proven expertise in AI and a deep understanding of the migration process. Early and strategic planning for migration, with a focus on incorporating these technologies from the outset, can also play a crucial role in overcoming potential obstacles. As the 2027 deadline approaches, businesses must prioritize their migration to S/4HANA, with assurance playing a critical role in this transition. Effective assurance will ensure smooth operations while mitigating risks and preventing costly disruptions. Partnering with experienced firms that excel in SAP assurance and leveraging innovative technologies like AI/ML can turn this challenge into an opportunity for growth, setting the stage for enhanced efficiency and a competitive edge in the market. About the Authors John van Geel SVP and Global Head, Wipro Digital and Cloud John is a seasoned business leader with over 30 years of experience, known for strategic leadership and business acumen that have propelled growth and success across organizations. Rituparna Ghosh VP and Global Head, Quality Engineering and Testing, Wipro FullStride Cloud With over 25 years at Wipro, Ritu leads the Quality Engineering and Testing Practice, leveraging her expertise in emerging trends and technologies to steer the practice towards the future of software development. =====================

Microservices and Cloud native Testing

----- Arcticle source ----- https://www.wipro.com/cloud/microservices-and-cloud-native-testing/ ----- Contact Wipro Please fill the required details to access the content Microservices and Cloud native Testing Go beyond interface testing and holistically assure headless/distributed architecture

performance on the cloud Wipro offers an innovative approach to testing a distributed architecture on the cloud, whether it be microservices or rehosted on-prem applications. Our approach involves an E2E testing framework for both applications and their interactions with the infrastructure they're hosted on. We provide a framework for testing microservices closer to the container orchestrator and take into account the many complexities that are part of cloud-native development. Additionally, our cloud-native testing ensures that microservices interact as expected with their underlying infrastructure, with a procedure that includes testing high availability, disaster recovery, and deployment/rollbacks. Wipro believes QAOps should work in tandem with DevOps, rather than relegate QA to unit testing only.   ======================

Quality Engineering Consulting Services

----- Arcticle source ----- https://www.wipro.com/cloud/quality-engineering-consulting-services/ ----- Contact Wipro Please fill the required details to access the content Quality Engineering Consulting Services Designing quality blueprints aligned to business outcomes Wipro's Quality Engineering Consulting Services is driven by the 'consulting crew' which acts as the thought leadership engine designing blueprints for QA imperatives for Nextgen technologies and overhauling traditional quality assurance construct to compliment 'New Ways of Working' in a digital ecosystem. Created with an objective to bring an engineering mind set to quality assurance; the 'consulting crew' advises clients on how to transform from quality assurance to quality engineering, along with solutions that addresses the shift required in machinery, methodology and mind set. Our experts' insights, backed by exhaustive research are highly valued in the industry and published as 'State of Quality' report, providing clear trends that can help CXOs and QA directors envision their approach to deal with any disruptive change. Our wide range of expertise varies from process to quality engineering techniques such as, Service Virtualization, Performance Engineering and Test Data Management. To know more, write to digital.contact@wipro.com ======================

Performance Testing & Engineering

----- Arcticle source ----- https://www.wipro.com/cloud/performance-testing-engineering/ ----- Contact Wipro Please fill the required details to access the content Performance Testing & Engineering Peak performance, extreme reliability Deploy best-in-class application performance testing to overcome the challenges of high data volumes and changing technology dynamics Wipro's Performance Testing and Engineering service provides clients with early assurance on application performance, scalability, reliability, security and user experience. This is achieved by moving QA into the early stages of

development and taking it right across the Software Development Life Cycle (SDLC) phase. The service includes consulting, strategy, assessment, capacity planning and testing along with end-to-end performance engineering, performance maintenance, code profiling and optimization. Clients using the service gain an edge through uninterrupted service, predictable and consistent application performance and optimized infrastructure usage. =====================

Quality as a Service

----- Arcticle source ----- https://www.wipro.com/cloud/quality-as-a-service/ ----- Contact Wipro Please fill the required details to access the content Quality as a Service Accelerate returns with fast flexible QA on demand Enable enterprises to achieve desired quality business/IT outcomes by providing consumption based, integrated, scalable, flexible quality assurance services. The fast-evolving landscape of technology ecosystems fuelled by disruptive technologies is revolutionizing the space of IT consumerism. This is leading to immense pressure on businesses to keep up with the rising expectations of the digital consumer, thereby creating a need for embracing smart QA services. Our Quality-as-a-Service offering, brings together the expertise of Wipro and Topcoder, ensuring that customers consume quality engineering and testing services in the "as-a-Service" model. It empowers enterprises with virtually unlimited QA capacity and flexibility in environment, infrastructure, and localization support to help speed up test cycles, expand QA coverage, resolve bugs and ensure real-world application readiness. Our QA services leverage a ready-to-work global community of vetted professionals, supported by an ecosystem of intelligent platforms. This helps in driving better agility and innovation in service delivery, ultimately driving the QA projects to success. =====================

Test Environment Management & Data Assurance

----- Arcticle source ----- https://www.wipro.com/cloud/test-environment-management-data-assurance/ ----- Contact Wipro Please fill the required details to access the content Test Environment Management & Data Assurance Efficient test environment and data management Enhance QA outcomes with holistic test environment and test data services. Our fully managed model of service offerings for test environment and data assurance areas provides end-to-end business value, ranging from consulting, provisioning, and support to the administration of tools as a service (TaaS). From a test data perspective, we deliver solutions not only for masking production data, but generating synthetic test data as well, ensuring nearly 100% test coverage. Our offerings ensure automated provisioning and the availability of test data in a self-service model, allowing test engineers to focus on more critical release tasks. Our test environment management offerings ensure complete transparency and predictability, so teams can

accordingly plan their testing tasks. Supported by automation, we provide organizations with a single pane of glass (SPoG) view of their test environments' status, along with analytics capabilities that can predict and prevent downtime.   Wipro's services can significantly improve operational efficiency and reduce data defects, leading to accelerated time to market for any production changes along with added stability. Enterprises can benefit from reliable, highly available, and fit-for-purpose test environments, built on Wipro's AI/ML-driven solutions and expertise, providing seamless experiences whether on the cloud or on-premises/hybrid hosting scenarios. =======================

intelliassure

----- Arcticle source ----- https://www.wipro.com/cloud/intelliassure/ ----- Our Expertise Contact Wipro Please fill the required details to access the content intelliassure Transforming Organizations to think Quality First! Build effective quality systems by leveraging HOLMES platform Wipro intelliassure is an intelligent quality platform powered by HOLMES to empower you to embark on a journey to build self-healable quality systems, by leveraging artificial intelligence, machine learning and advanced data analytics. Key features such as predictive quality analytics help standardize the QA Governance in a mobility enabled platform to enable IT stakeholders with actionable insights and drive transformation. Cognitive automation optimizes the test assets and reduces the test execution effort substantially. Autonomic healing optimizes the effort involved in defect life cycle management. =======================

Digital Assurance

----- Arcticle source ----- https://www.wipro.com/cloud/digital-assurance/ ----- Contact Wipro Please fill the required details to access the content Digital Assurance Digital Assurance De-risk your digital transformation journey with quality engineered at speed Wipro's Digital Assurance practice enables scalable and accelerated digital transformation driven by a quality approach that improves engineers' productivity and enhances developer experience. The above are based on key tenets of speed, experience and user analytics. Our transformation offerings consist of two key pillars - strengthening the Digital Core and expanding the Digital Boundaries. Our 'Strengthening the Digital Core' focuses on Omni- channel assurance with flavors of localization, accessibility, compatibility and visual testing, supported by application performance management and service virtualization. Whereas our second pillar, 'Expanding the Digital Boundaries' focuses on quality of next generation disruptive technologies such as Internet of Things (IoT), Cloud, GAFA and Block Chain. With a strong focus on thought leadership and innovation, we have invested in labs dedicated to Usability, IoT, Artificial Intelligence (AI) and Mobility Quality Engineering – making us a leader in our industry.   Our above state-of-art offerings are powered by digital labs and skilled digital work force, with our SDET (Software Developer Engineer in Test) professionals having delivered over 250 global engagements,

combining development, domain and technology skills. To know more, write to digital.contact@wipro.com =====================

Test Automation

----- Arcticle source ----- https://www.wipro.com/cloud/test-automation/ ----- Contact Wipro Please fill the required details to access the content Test Automation Test automation—change the rules of the game Use intelligent and cognitive processes to disrupt old world QA practices Wipro provides clients across industries with Test Automation services, a key lever in driving efficiency, effectiveness and cost reduction in test organizations. As a pioneer in the Test Automation space, we have developed open source tools and competencies to provide improved coverage, early defect detection and cycle time reduction. The service is focused on: Intelligent and cognitive automation using IntelliAssure, powered by Wipro HOLMESTM, our Artificial Intelligence platform, to achieve accelerated speed. To know more, write to digital.contact@wipro.com =====================

SaaS Application Assurance

----- Arcticle source ----- https://www.wipro.com/cloud/saas-application-assurance/ ----- Contact Wipro Please fill the required details to access the content SaaS Application Assurance More organizations are migrating towards software as a service (SaaS) models for their core, business-critical systems for reduced maintenance and overheads. Yet this requires a differentiated quality engineering and assurance approach, which traditional methodologies may be unable to keep up with.   Wipro's SaaS application assurance offering ensures that software products meet an organization's specifications and functional requirements with an automation-first approach that positions quality as an accelerator, instead of a bottleneck. We offer tailored QA offerings for various SaaS applications, such as Salesforce, ServiceNow, Microsoft Dynamics 365, Workday, PEGA, and Adobe Experience Manager. We infuse our solutions with domain expertise and process knowledge, and we test accelerator packs with a special focus on configurations, modules, and functionalities specific to low-code/no-code (LCNC) ways of development. Our offerings holistically cover test lifecycle activities as well as various types of testing, including functional, regression, and end to end, which are aimed at improving tester productivity and ensure transformation/upgrade/integration programs are delivered on time and with high quality.   ===================== ----- Arcticle source ----- https://www.wipro.com/cloud/cloud-infrastructure-testing-infrastructure-as-code-kubernetes/ ----- Contact Wipro Please fill the required details to access the content Cloud Infrastructure Testing- Infrastructure as Code (IaC) & Kubernetes Testing infrastructure should be no different or unimportant as testing application code. Wipro conducts E2E testing on infrastructures to ensure seamless performance in distributed architectures on cloud. Infrastructure as code (IaC) is critical to ensuring a single source of truth for networking, storage, virtual machines, and more. Infrastructure is expensive, and it becomes critical to ensure that enterprises receive

critical feedback from their infrastructure. Wipro IaC Test frameworks emulate the application interaction with the infrastructure to ensure the correctness of IaC. Testing IaC can also ensure conformance and compliance with domain, industry and technical standards, such as ensuring RBAC on Kubernetes clusters operate as configured and traffic flows as expected. Additionally, beyond merely scanning the dockerized applications running on Kubernetes, we can ensure how and what is exactly running. We believe that testing should not remain agnostic, but rather be tailored to the expected business workflows. Our team tests enterprise systems to ensure antifragility and agility, allowing us to mitigate errors, rather than remediate them. ===================== ----- Arcticle source ----- https://www.wipro.com/cloud/mlops-assurance/ ----- Contact Wipro Please fill the required details to access the content MLOps assurance The maturity of any ML pipeline depends on automation – not just in data analysis and modelling, but also the quality assurance process. Wipro ensures the quality of AI/ML applications through our state-of-the-art testing methodologies. Our ML pipeline testing not only ensures that the deployed AI/ML endpoint works as expected, but also that the underlying infrastructure triggers as per defined configurations. This can range from simple API triggers to changes in data or models. Additionally, monitoring and observability play key roles in AI/models, ensuring a smooth performance versus a speedy trade-off between models as per specifications. We believe that testing ML applications purely as black boxes won't be sufficient enough to bring agility to the MLOps pipeline. Wipro ensures that the three core tenets of AI/ML testing are covered: functional tests (features and data), MLOps, and infrastructure. We ensure quick deployments through A/B and canary testing on production variants. ===================== ----- Arcticle source ----- https://www.wipro.com/cloud/observability/ ----- Contact Wipro Please fill the required details to access the content Observability Conventional monitoring techniques and processes aren't well suited for multifaceted cloud environments. The duality of observability and controllability can assure businesses of their systems' reliability and resiliency. In today's cloud-first world, the number of potential failure points and modes of failure across apps, products, and infrastructures has exponentially increased. Conventional monitoring techniques fail to help businesses de-risk IT platform issues, as they are passive and provide a limited view of the issue/defect. Wipro's observability offering gives organizations a proactive approach to not only identify what has or will go wrong (the external factors) but also pinpoints the faulty system/component, along with the right root cause (the internal factors). It cuts across each IT layer of every user journey: endpoint devices and interfaces, business processes, web pages/application screens, services, data integrations, infrastructures, and networks. Compatible with all leading cloud platforms, our observability offering provides a single pane of glass view of dashboards, issues alerts to key stakeholders, and delivers customized reports in formats relevant to the stakeholder. It also provides site reliability engineering (SRE) capabilities to ensure quality performance and dependability, resulting in approximately zero down time, improved end-to-end visibility and transparency across each event and transaction, and increased confidence in IT to drive business resiliency in adverse conditions. =====================

Transformation Platform (WTP)

----- Arcticle source ----- https://www.wipro.com/cloud/wtp--wave-365-transformation-platform-/ ----- Contact Wipro Please fill the required details to access the content Wave 365 Transformation Platform (WTP) Optimize Existing Tech Investments Wipro's Wave 365 Transformation Platform (WTP) is used by clients to migrate to Microsoft SharePoint®, Microsoft.NET®, OneDrive, Exchange and drives cloud adoption. We customize our IPs to match client application complexities. This delivers predictable outcomes across the four phases of migration: Discovery, Prototyping, Delivery and Sustenance. WTP for Collaboration manages migration of portals to Microsoft SharePoint, OneDrive & Exchange. The platform provides automated tools for portal assessment, rationalization, validations, and scalable architecture to support multiple portal data sourcing. WTP for Legacy offers migration from legacy codebase to Microsoft .NET and transition of databases and business intelligence tools to Microsoft SQL server. It also helps upgrade Microsoft products to newer versions including Microsoft Biz Talk server. WTP for Cloud facilitates migration to Windows Azure cloud environments and Office 365 SharePoint online, OneDrive. The platform has a cloud based archival engine to support archival and retrieval of contents. Businesses, such as a pharma client, have migrated and archived 2,300 Lotus Notes applications eliminating redundant applications and reducing cost of maintenance. ======================

Wipro Cloud Migration

----- Arcticle source ----- https://www.wipro.com/cloud/wipro-cloud-migration-studio-and-platform/ ----- Contact Wipro Please fill the required details to access the content Wipro Cloud Migration Studio and Platform Wipro Cloud Migration Studio is a one-stop shop for migrations leveraging AWS Cloud. It focuses on delivering secured, reliable and accelerated migrations across workloads and enterprise applications. The Studio promises to be our next generation Cloud acceleration capability that industrializes and automates Cloud adoptions. It is a highly automated industrialized capability that combines Wipro IP and best of breed tools to bring together the following in a single delivery model: Wipro's Cloud Migration Studio leverages Wipro Cloud Migration Platform that uses AWS Service Catalog to productize the application deployment templates. This platform helps in organizing and managing templates. The application/product templates are secured using AWS IAM[WU1] ([SV(2] Identity and Access Management) and usages are tracked using AWS budgets. The Continuous Integration (CI) and Continuous Delivery (CD) process are accomplished using AWS DevOps Service for rapid and reliable releases. It also helps the customer in attaining "faster go to market". ======================

Wipro Cloud Data Warehouse Readiness Solution (CDRS) on AWS

----- Arcticle source ----- https://www.wipro.com/cloud/wipro-cloud-data-warehouse-readiness-solution-cdrs/ ----- Contact Wipro Please fill the required details to access the content Wipro Cloud Data Warehouse Readiness Solution (CDRS) on AWS Migrate oracle databases using AWS Schema conversion tool and Wipro's Cloud data warehouse readiness solution (CDRS) Wipro CDRS is an end-to-end self-service Cloud migration solution thatautomates the entire data warehouse migration as well as data offloading from on premise to AWS Cloud, across analytical platforms. It offers platform agnostic solution supporting Teradata, Vertica, Sybase, IQ, Oracle, DB2(and many more, with scalability and optimization on target platform. This automated solution helps customers to achieveimproved total

cost of ownership by around 40-50% through optimized license and around 40-55% reduction in time-to-market through rapid provisioning of new data warehouse platform. =====================

----- Arcticle source ----- https://www.wipro.com/cloud/wipro-data-discovery-platform-ddp/ ----- Contact Wipro Please fill the required details to access the content Wipro Data Discovery Platform (DDP) on AWS An exploratory analytics platform deployed on AWS offered as 'insights-as-a-service' model to accelerate the data to decisions value chain Wipro DDP works at the confluence of the technology and business nerve of data-driven organizations. It is an exploratory analytics platform hosted on the AWS Platform and is offered in an insights-as-a-Service model, making it easy for organizations to consume insights without worrying about the tools, technologies involved in getting there. DDP offers a set of open source and Cloud technologies in a single platform architecture to accelerate data-to-decisions value chain by leveraging the suite of services offered by AWS. Its modular, 'app (use case)-driven' model, enables flexibility and scalability to meet the growing needs of a data-driven enterprise. ===================== ----- Arcticle source ----- https://www.wipro.com/cloud/wipro-aws-launch-pad/ ----- Experience Zones Benefits What We Think Form Title Contact Wipro Please fill the required details to access the content Wipro-AWS Launch Pad A futuristic co-innovation center for customers to turbocharge their success leveraging the joint expertise of Wipro and Amazon Web Services! Wipro, a premier consulting partner of Amazon Web Services (AWS), is proud to announce its cutting-edge experience center that will enable joint customer conversations and engagements, in a whole new way. Wipro and AWS will jointly deliver enterprise-scale migrations at this multidisciplinary co-innovation center where specialized teams will craft innovative solutions leveraging AWS offerings. This center is an immersive environment where customers from a broad range of industries will collaborate to envision and drive their digital transformation journey, jointly with Wipro and AWS. The center located at Wipro Campus Kodathi, Bengaluru was inaugurated on August 1 at 10.30 AM IST. Features   Engineering innovative solutions Six areas in which we engineer and showcase solutions at the Wipro - AWS Launch Pad: Wipro – AWS Launch Pad is a facility that enables an integrated approach to enterprise-scale Cloud adoption that is: Better: Our assets leverage industry-best practices while ensuring minimal business disruption and lowering risk with higher predictability Faster: Our specialized subject matter experts accelerate cloudification of complex workloads. Optimized: Our smart approach to automation, economies of scale, and well-architected solutions help reduce Cloud costs sustainably. To know more write to: cloud.marketing@wipro.com   Winning with AWS Cloud: Wipro is an innovation-led Cloud partner for clients in their digital transformation journey. Our 'Business First' approach enables Cloud transformation for our customers with innovative solutions at the intersection of AWS with cloud

native, AI-enabled, data-aware, secure applications. Our integrated blueprint for Cloud migrations, deep expertise, and proven execution approach accelerates their transformative journey. As a Premier Consulting Partner of AWS, we have a growing list of AWS competencies, 200+ AWS professional / specialty certifications, 2600+ AWS certifications, over 75 customers and 20+ solutions engineered on AWS. Our rich repository of industry specific and technology solutions empower clients to gain true value of the 'as-a-service' economy. Wipro helps organizations envision the future and create transformational solutions. DevOps has evolved from 'breaking the silos' between operations and developers to enabling automated and streamlined processes. Wipro – AWS Launch Pad is a futuristic co-innovation center for customers to turbocharge their success leveraging the joint expertise of Wipro and Amazon Web Services. This cutting-edge experience center that will enable joint customer conversations and engagements, in a whole new way. Wipro and AWS will jointly deliver enterprise-scale migrations at this multidisciplinary co-innovation center where specialized teams will craft innovative solutions leveraging AWS offerings. With rapid advancements in robotic innovation, organizations are increasingly looking at transforming their working environments by utilizing more and more robots to work intrinsically as human collaborators.

Wipro FullStride Cloud Services API Marketplace on Google Cloud

----- Arcticle source ----- https://www.wipro.com/cloud/wipro-full-stride-cloud-services-api-marketplace-on-google-cloud/ ----- Introduction Services/ Capabilities Contact Wipro Please fill the required details to access the content Taking advantage of emerging API ecosystems Global economies are embracing open API ecosystems, through either regulations or innovation programs. The new ecosystem emerging in banking includes Fintech companies and other financial institutions, as well regulators and standards bodies. It is imperative for banks to embrace organizational strategies that drive value from this trend. There are several key challenges facing the industry as it adapts to this change: Wipro FullStride Cloud Services API Marketplace on Google Cloud helps the industry meet those challenges by providing: Wipro FullStride Cloud Services API Marketplace provides a range of services and capabilities that help companies take advantage of open API ecosystems: ====================== ----- Arcticle source ----- https://www.wipro.com/cloud/modernization-and-migration/ ----- Services Success Stories Form Title Partners News/Awards & Recognition Contact Wipro Transformation Consulting Business Aligned Transformation Cloud Transformation NextGen Application Services Legacy exit to Target In-place Modernization Data & Database Modernization Experience Transformation Cloud Conversations Data Center transformation Please fill the required details to access the content Modernization and Migration Modern enterprises require business and IT applications that are nimble and intelligent. Organizations that rely on legacy software frequently encounter obstacles such as system incompatibility, high expenses, and a lack of legacy programmers. This hinders their capacity to properly integrate new technology and procedures to meet current business needs. This translates into a pressing need for enterprises to transition from outdated technology to cloud-based solutions. However, the majority opt for the simplest "lift-and-shift" methodology to shift their workloads to the cloud. Eventually, businesses have begun to recognize that cloud computing has much more to offer than lift-and-shift, and that most of the value is created through modernization. Application technical debt can inhibit high-priority activities such as fostering innovation, increasing engineering velocity, and minimizing developer onboarding time. Wipro offers distinct end-to-end modernization solutions and intellectual property to provide quicker and risk-free transformation. Additionally, our application modernization and migration services enable businesses to erase their technical debt by

modernizing and remediating to the cloud via rehosting, replatforming, refactoring, and rearchitecting applications to set the groundwork for digital transformation. Learn More ISG Provider Lens Everest Forrester Contact us ======================

Cloud Economics

Services News/Awards & Recognition Thought Leadership Form Title Contact Wipro FinOps Application business architectures Cloud Assessment Organizational strategies Automatic scaling & power scheduling Discount instances Please fill the required details to access the content Cloud Economics As more enterprises embrace cloud as the foundation for their digital transformations, business leaders are looking for ways to maximize the return on their cloud investments, optimizing cloud consumption to increase efficiency and avoid unexpected costs. Cloud economics is a strategic approach to managing technology investments that emphasizes cost-benefit analysis as a way to deliver real business value rather than simply cut costs. With cloud economics, businesses still identify key ROIs and metrics, but the focus is on learning new ways to manage resources, teams, operations to maximize business value. Wipro FullStride Cloud has been partnering with business leaders to employ cloud economics as a strategic discipline throughout their cloud programs, enabling them to run better and more effectively in the cloud. Wipro's deep infrastructure and consumption experience, coupled with this proactive approach, empowers enterprises to drive innovation while building the necessary infrastructure to increase predictability for more complete cloud optimization. Implement well-architected services to not only ensure that cloud consumption is efficiently managed, but also effectively leveraged. Examine and reconstruct application architectures according to a "Design for Economics" principle to improve business value and outcomes. Wipro AI Control Center

----- Arcticle source ----- https://www.wipro.com/cloud/cloud-operations/wipro-ai-control-center/ ----- Our Offerings News/Awards and recognition Contact Wipro From Consumer to Value Creator, Unlocking the Power of Generative AI Generative AI on the cusp of disruption Sustainable Technology: An Urgent Need Wipro and IBM Expand Partnership to Offer New AI Services and Support to Clients Please fill the required details to access the content Wipro AI Control Center Across industries, businesses are recognizing the tremendous potential of GenAI, yet many struggle to successfully integrate the technology. In many cases, the adoption of GenAI is sporadic across organizations, highlighting a need for a more comprehensive approach and robust governance. Such organizations face challenges in implementing GenAI at scale due to the prevalence of biases and flawed outputs from the powerful yet flawed nature of large language models. Fundamental tasks like training and output management pose significant challenges that, if not managed properly, will undermine the capabilities of these platforms, jeopardizing security, regulatory compliance and performance. Wipro AI Control Center addresses these challenges directly, offering a robust accelerator for effective, responsible GenAI adoption. Built on the Wipro Enterprise AI-Ready platform, the Wipro AI Control Center simplifies the infusion of GenAI into business operations. It uses historical data to generate precise, context-aware responses, optimizing resources while ensuring accuracy and relevance. This solution provides full control over model selection, hosting, and data governance, facilitating seamless GenAI deployment across various departments such as IT, customer care, and operations. As part of our Wipro FullStride Cloud ecosystem, the Wipro AI Control Center ensures the holistic adoption of AI from initial pilot phases to full-scale production. Ensure context-rich outputs with enterprise data collection and retrieval augmented generation (RAG). Choose from various open source and proprietary models, tailored to meet specific business needs. Expedite time to value with automation blueprints, IaC scripts and AI tools. Track data pipeline performance from acquisition to final delivery through KPIs, events and metrics. Optimize vCPU and vGPU management for greater efficiency and ROI. Leverage open source or proprietary MLOps tools to enhance insights and learning. Access practical guidance on scenarios and resources to ensure a successful AI powered cloud journey. Enable users to interact with and use services in a way that's customized to their individuals profiles or personas. Ensure a seamless integration via APIs, linking various data sources to support RAG implementation. Create AI guardrails to boost risk management and complaince posture. Wipro's Lab45 explores the impact of artificial intelligence (AI) on business and society. In this special report learn about the technology fundamentals of Generative AI, the emerging business landscape and its practical integration into your business. In this era of digital abundance, generative AI promises

to be a transformative force. This report provides an overview of Generative AI, the market for it and the reasons for the hype. This report details the urgency of sustainable technology, provides insights on the sustainable tech stack, and provides an approach for measuring their tech stack. Contact Us ======================

----- Arcticle source ----- https://www.wipro.com/cloud/industry-cloud/ ----- Our Offerings Contact Wipro Cloud's Transformation of Financial Services How The Industry Cloud is Changing The Game Powering Cloud Innovation in the Energy and Utilities Industry The Cloud Growth Strategy for CMI Key Strategies for LifeSciences Cloud Innovation Re-defining Manufacturing for the Digital Era The Prescription for Healthcare Provider Cloud Success The Big Shift Industry Cloud Innovation Cloud modernizations are driving energy industry innovations Health and Life Sciences Industry Cloud: E-book Energy and Utilities Industry Cloud: E-book Wipro Named a Horizon 2 Enterprise Innovator in HFS Horizons: Industry Cloud Service Providers, 2024 Wipro is Named a Leader in 2023 Gartner Magic Quadrant for Public Cloud IT Transformation Services Wipro Named a Leader in Everest Group's Cloud Services in Insurance PEAK Matrix® Assessment 2023 Wipro FullStride Cloud + Leading Analysts Wipro FullStride Cloud + Cloud Leaders Please fill the required details to access the content Industry Cloud The value that cloud technologies deliver has grown exponentially over the last few years, providing greater business agility and new ways of working that have been greatly accelerated in response to the pandemic. Remote or hybrid workforces have become common, with people gaining access to real-time information from anywhere, anytime, on any device. Business teams are also gaining vital market insights and processing huge amounts of data, thanks to cloud-based applications, AI/ML platforms, and automation tools. In this hyperconnected ecosystem, the increasing benefits of cloud as the transformational platform to build businesses are undeniably clear, and with cloud capabilities evolving, the business opportunities are expanding. Cloud advancements and a cloud development mindset have ushered in a new era, and among the new fields and advancements is the creation of industry-specific clouds. These custom-built cloud solutions are specifically designed to address unique industry challenges and nuances to provide greater advantages than standard cloud platforms, which are limited in their ability to provide industry-focused advantages.   Empowering ENU providers to deliver the business outcomes they seek, even in the face of sector upheaval. These solutions empower our customers to retain a competitive edge while delivering therapies to their patients faster. Our best-of-breed manufacturing cloud solutions that best meet customer needs and deliver efficiency and agility. Enable financial firms to modernize their security and compliance initiatives while developing business innovations. To keep pace with the retail industry's dynamic changes, our cloud solutions are custom built to meet the unique challenges of meeting ever-changing customer demands and drive brand loyalty. A Harvard Business Review Analytic Services report in association with Wipro FullStride Cloud. Wipro's investment in strategic acquisitions along with its strong industry expertise

contributed to the company's Leader position. Our tailored approach to delivering custom cloud transformations that meets businesses where they are is why we are recognized as a Leader. Wipro's investment in strategic acquisitions along with its strong industry expertise contributed to the company's Leader position. Recognized as a global industry leader by leading analyst firms The strategic partner of choice for leading cloud services providers. Contact Us =====================

Wipro FullStride Industry Cloud Solutions for Health & Life Sciences

----- Arcticle source ----- https://www.wipro.com/cloud/industry-cloud/wipro-fullstride-industry-cloud-solutions-for-health-and-lifesciences/ ----- Wipro Industry Cloud Key Benefits for Collaborative Care Platform Contact Wipro Please fill the required details to access the content Health and Life Sciences Industry Cloud Health and Life Sciences (HLS) companies are poised to deliver unprecedented advances in patient outcomes, including personalized medicines, on demand drug production, and powerful new genetics-based and AI-derived treatments. At the same time, they face a global operating environment of increasing complexity and challenge. Product lifestyles span multiple and very different ecosystems, for basic chemical manufacture, to pharmaceutical production, to patient-facing therapies. Over the decade or more it can take to bring a ne treatment to market, companies must carefully manage costs, maintain quality control, and protect IP and data security while navigating the arrival of new technologies and new market entrants. The sector is also highly-regulated and non-compliance at any stage can be reputationally and financially ruinous. To manage these pressures and make the most of rapidly-emerging scientific and technical advances, HLS leaders are adopting industry-specific cloud solutions. These are enabling faster and more efficient operations that are speeding the production of both novel and existing treatments and lowering the costs of production while meeting heavy regulatory demands. Successful HLS cloud solutions are built on highly-specialized but comprehensive architectures that address all elements of the drug-production value chain, from clinical practice, to research and development, regulatory approval, supply chain and manufacturing logistics, and distribution. They are robust, secure, and flexible enough to make use of new technologies, processes, and data types as they become available and can ramp up production as needed to meet patient demand. Wipro's wide-ranging, best-of-breed HLS cloud solutions address customer challenges at any point in the drug creation and production process. Delivered through a rich ecosystem of partnerships with leading HLS and technology providers, and featuring tailored accelerators that increase speed to market by adding intelligence and automation to new or existing process, these solutions are empowering our customers to retain a competitive edge while delivering therapies to their patients faster and with greater effectiveness. About Collaborative Care Platform Modern drug regimens can be dauntingly complex, with specific dosage and timing requirements that might need to be recalibrated multiple times depending on a patient's response. Wipro's

Collaborative Care Platform (CCP) leverages mobility and online connectivity to connect patients, their healthcare providers, and pharmaceutical companies to maximize the chances of a successful therapeutic outcome. Designed in partnership with experts in human-centered design and featuring both pre-built accelerators for importing data from a wide range of external medical devices and plug-in modules for managing medical schedules and medical information, CCP platform solutions address a broad range of treatment challenges. These include remote monitoring and communication, regimen management, and easing the recruitment of new patients into clinical trials. Solutions built on Wipro's CCP platform are measurably enhancing the patient experience through improved engagement, better progress tracking, and strengthened care support. This both optimizes patient outcomes and raises the level of care that healthcare providers are able to offer. For pharmaceutical companies, the combination of increased compliance and improved patient outcomes makes their treatments more attractive to public and private healthcare providers and has a significant reputational/brand impact. In addition, with patient recruitment accounting for up to 30% of drug development budgets, CCP solutions are helping companies find trial participants faster, saving on recruitment costs and allowing them to bring new drugs to market faster. About Smart Labs/Smart LapOps Laboratories are at the heart of the HLS value chain, playing an essential role in drug discovery and in fulfilling downstream testing and quality control functions. But as both drug development and production rely on ever more complex technologies, and as regulatory demands evolve to match, lab operators face multiple challenges. These include process inefficiencies, data fragmentation, shifting regulations, and legacy manual tasks that are hard to automate. Wipro's Smart LabOps platform is a cloud-based solution designed to offer the advanced functionality companies want for their labs of the future, including common systems and device interfaces, data and workflow management, data integration, and decision intelligence. Built in partnership with best-in-class solution providers, the platform includes a custom built LabOps Toolkit for functions such as predictive analytics and anomaly detection to prevent Instrument downtime, a voice assistant to improve workflows, and AI-enhanced inventory management and record review. Key Benefits for Smart Labs/ Smart LabOps Wipro Smart LabOps customers report reduced lab errors and disruptions, improvements in automation, and faster-running processes, all resulting in increased productivity. That drives down operating costs and allows novel therapies to be introduced to the patients that need them faster. Each Smart LabOps engagement targets the specific requirements of the particular lab owner and includes a design consultation. Uniquely among HLS service integrators, Wipro also operates its own life sciences lab, allowing us to develop and deploy innovative new lab methodologies and apply cutting-edge technologies like AI/ML to HLS-specific data in fast-evolving areas such as pharmaceutical impurity testing and genomic analysis.   Why Wipro. As HLS providers look to adopt cloud solutions that bring new levels of efficiency, speed, and innovation to their operations, Wipro FullStride Cloud is helping them develop targeted, trusted, scalable solutions like Smart LabOps and the Collaborative Care Platform that successfully address their present and future needs. Our long experience in the sector—including HLS partnerships with Google, Microsoft, and AWS—affords us a deep understanding of existing and

emerging HLS value chains, a broad network of best-in-class partners, and an unparalleled range of domain, regulatory, data, and cloud competencies upon which to draw. Learn more about working with Wipro FullStride Cloud to embark on a future-facing transformation through powerful and cost-effective HLS industry cloud solutions. Contact Us ======================

Wipro FullStride Industry Cloud Solutions for Energy and Utilities

----- Arcticle source ----- https://www.wipro.com/cloud/industry-cloud/wipro-fullstride-industry-cloud-solutions-for-energy-and-utilities/ ----- Key Benefits for Energy Data Centricity Contact Wipro Please fill the required details to access the content Energy and Utilities Industry Cloud Energy and Utilities (ENU) providers face an era of unprecedented change. Under pressure to meet evergrowing global demand by quickly diversifying their product offerings with low carbon and renewable solutions, they are at the same time looking to reduce energy prices (and therefore costs), increase the reliability of supply, and optimize their collective energy carbon footprints. Additionally, established providers are newly focused on customer retention as sector upheaval attracts new market entrants. Successfully navigating these challenges requires speed, flexibility, and easy access to powerful new technologies and processes as soon as they are developed. Sector leaders are securing all three by investing in cloud-based solutions developed in partnership with experienced ENU technology integrators like Wipro. Wipro Industry Cloud Overview ENU Industry Cloud solutions build on the proven success of deployments in earlier moving sectors, offer a flexible and robust solution space primed for innovation. By partnering with cloud service providers, independent software providers (ISPs), and global system integrators, ENU providers can combine off-the shelf and customized services with accelerators contextualized to their needs to bring new agility and speed to their existing operations. Crucially, cloud solutions also provide

a vendor and technology agnostic platform for experimenting with new approaches to products, processes, and operations. Innovations can be easily tested and iterated on, and, once proven, quickly replicated and scaled out into full-fledged solutions. These deployments empower ENU providers to deliver the business outcomes they seek, even in the face of sector upheaval. In addition, they enable the rapid adoption of transformative technologies like AI/ML and generative AI as soon as they are developed. But they are also complex undertakings, requiring partners with deep experience in both the ENU and cloud technology spaces. Wipro has collaborated with leading companies in both areas for over 25 years and helped develop some of the most powerful and advanced cloud solutions in the sector. Industry Stack A solution stack targeted at resolving pain points. Solution Platform Cloud-native tools and accelerators enable rapid deployment. Business Outcomes Experience transformation with the ability to scale & flex as your organization grows. Energy Data Centricity Legacy software and production silos inhibit many energy companies from fully exploiting the benefits of cloud. A consortium of energy producers, cloud service providers, global system integrators, and independent software vendors have developed OSDU (the Open Subsurface Data Universe), an open platform on which energy data can be seamlessly extracted, stored, retrieved, transformed, searched, and shared as needed. This technology agnostic, standards based platform frees producers to shift technologies and forge new partnerships as needed, while reducing capital expenditures. But OSDU adoption takes money, time, and expertise that many energy companies don't have. Wipro FullStride Cloud & Wipro Energy Practice bring together Cloud Engineering and Energy Domain capabilities to offer, Energy Data Centricity (EDC) solution, a cloud and vendor agnostic framework of service offerings and accelerators designed to help operators speed their OSDU adoption. Wipro's Framework for Energy Data Centricity Key Benefits for Energy Data Centricity EDC draws on Wipro's unique combination of experience and capabilities in both energy and cloud engineering and the broad ecosystem of industry and technology partners it has developed over the last quarter century. The EDC framework includes solutions for data standardization, transfer, governance, security, and use case implementation. It significantly eases the process of platform adoption, migrating data into the platform, and then building novel use cases on top. Working within EDC, companies are accessing the benefits of OSDU faster than they could alone. They are seeing increased flexibility, new business and production efficiencies, and a smoother path to innovation. Early engagements suggest EDC can accelerate OSDU adoption, impacting both the organizations bottom line and its ability to compete in a newly dynamic sector. Carbon Value Modeling In response to increasing regulation and shifts in public opinion, energy producers are making commitments toward net zero emissions of carbon. Failure to meet these commitments can draw financial penalties from jurisdictions with carbon quotas, carbon taxes, or requirements that excess emitters buy carbon offsets, and risks reputational damage wherever companies operate. To move toward net zero compliance, energy producers are seeking comprehensive solutions grounded in accurate data that will accommodate changes in both business processes and the technologies used to measure and limit carbon emissions. Wipro's Carbon Value Modeling (CVM) solution is a comprehensive, industry-focused, best-in-class solution for net zero planning and execution. It brings

production, business, and capital project data into a common landing zone where it is quality checked, aggregated, and converted. This data is passed through public API's into an ISP solution that identifies site and activity bottlenecks throughout the operational value chain and determines drivers that have the highest impact on reducing emissions. It then provides scenario planning for improvements based on the business value and ROI of potential low carbon opportunities. Finally, a target-based future state model equipped with operational decarbonization pathways manages the expected reduction in carbon emissions from each change made. Key Benefits for Carbon Value Modeling By partnering with Wipro to implement Carbon Value Modeling, companies gain an accurate, organizationlevel view of total emissions and a choice of pathways toward increased emissions reductions, maximizing their return on their carbon reduction investments while reducing their exposure to carbon penalties and the need to purchase carbon offsets. Additionally, CVM empowers them to make strategic product lifecycle interventions and propagate those changes across all levels of the organization, ensuring continuous improvement from both an emissions and economic point of view. Why Wipro. As ENU providers look to adopt cloud solutions that bring agility, speed, and innovation to their operations, Wipro FullStride Cloud is helping them develop targeted, scalable solutions like Carbon Value Modeling and Energy Data Centricity that successfully meet industry needs. Our long experience in the sector—including co-developing the OSDU standard and receiving an Energy Sector Premier Partnership award from AWS—affords us a deep understanding of emerging ENU value chains, a broad network of best-in-class partners, and an unparalleled range of domain, sustainability, modeling, data platform, and cloud competencies upon which to draw. Learn more about working with Wipro FullStride Cloud to embark on a future-facing transformation through powerful and cost-effective ENU industry cloud solutions. Contact Us

Wipro FullStride Industry Cloud Solutions for Manufacturing

Key Benefits for Wipro's Process in a Box Contact Wipro Please fill the required details to access the content Manufacturing Industry Cloud Process in a Box Digital Logistics Solution E-book Manufacturing Industry Cloud Global manufacturing is poised for profound change. For the last century, the sector's design, procurement, build, storage, distribution, and sales processes have remained essentially discrete, with individual technologies rarely developed to improve more than a single stage in the broader manufacturing value chain. Manufacturing first movers, however, are now taking advantage of comprehensive, intelligent, cloud-based sensing and data analytics solutions to integrate and act on information from every step in the chain. Successful cloud integration solutions for the manufacturing sector are pulling data from across the enterprise into single, unified platforms that provide a real time view of any given process in the chain and can signal the consequences of any changes in the information they receive. They enable smarter and faster decision making, increased overall efficiencies and agility, and an improved ability to balance flexibility with resilience. At the same time these platforms offer new opportunities for product and service innovation, including unprecedented customization, and for demonstrating regulatory compliance. Importantly, they speed process change itself and provide greater flexibility in the face of shifting customer demand. Wipro Industry Cloud Overview While the potential gains from integrated, cloud-based manufacturing are substantial, so are the challenges. Cross-unit integration is highly complex and requires significant investment. Effective process integration efforts extend beyond individual manufacturers to include upstream suppliers and downstream sales partners, requiring manufacturers to reframe their partner relationships and work within expanded and newly-dynamic production ecosystems. Wipro's best-of-breed manufacturing cloud solutions help our customers design, build, and deploy integrated and intelligent processes that best meet their needs and deliver the efficiencies and agility they need, including the ability to thrive in the shifting ecosystems. In partnering with Wipro on process integration, manufacturers are finding new opportunities for developing novel business models, new revenue streams, and new ways to connect with, and meet the demands of their customers. Process in a Box Solution Legacy manufacturing enterprises are typically built around geographically dispersed production facilities reliant on siloed systems and information flows that are slow to deliver actionable data at either the local or organizational level. This clearly impacts local control of facility costs, quality, and productivity, requires skilled personnel to be constantly fire-fighting, and affects both asset life and availability. Just as importantly, without a source of real-time information, timely corporate-level data analysis and decision making is impossible, placing enterprises at a major disadvantage to their more connected peers who are running modern, integrated digital manufacturing platforms. Wipro's Process in a Box (PIB) is a plug-and-play digital manufacturing accelerator that is helping

manufacturers deliver a new level of visibility and operational excellence at both the individual facility level and across multiple plants. PIB gathers information outflows from across plant operations to create a single source of facility data, including in analytics, alarms, and reporting. Accelerator Solution Key Benefits for Wipro's Process in a Box PIB enables real-time decision making and collaboration for both the individual plant and across the enterprise value chain. That includes flagging production and quality issues as soon as they occur, and adjusting outputs faster to meet anticipated demand. PIB users are reporting significant improvements on key plant metrics including production quality and throughput, asset utilization, maintenance productivity, energy use, and sales return rates. At the same time, they are optimizing their overall supply chain management and building a foundation for future analytics solutions and new business models. Our customers, typically achieve a return on their PIB investment of between 1.5 and 2.5x within a year of going live. Digital Logistics Solution As manufacturers look to reduce inefficiencies and optimize supply chain management, they are under increased pressure to achieve true "just-in-time" in-bound and out-bound logistics. In-bound logistics requires tracking supplies as they arrive from multiple vendors, deciding where best to store them, and ensuring replacements are ordered in time to avoid manufacturing delays. On the outbound side, delivery trucks need to be optimally sequenced and directed as they move through the plant as well as optimally loaded and directed for delivery. Wipro's Digital Logistics Solution (DLS) is an execution system that provides an integrated, real-time view of both order sequencing/tracking and physical truck monitoring in a highly modular and scalable form. This includes the automated tracking of each stage in the process (passing security, parking, unloading/loading, weighing and exiting, etc.), and enables intelligent, demand-based management of supply chain allocation, scheduling, loading, inspection, and distribution. Key Benefits for Digital Logistics Solution After implementing DLS, manufacturers are experiencing significant improvements in operational efficiency, including reduced truck wait times at the facility of 50% or more. They also report fewer production errors, improved anomaly reporting, more efficiently loaded delivery trucks, and a reduction in personnel required to manage the overall process. Automated tracking provides comprehensive logistics data for real-time metrics reporting. The data can then be used as inputs for generating AI derived operational intelligence. Furthermore, a single version of logistics truth affords enterprise-level managers the ability to optimize cross-company logistics operations and quickly adjust when faced with shifts in the supply environment and changes in demand. Why Wipro. As manufacturers look to adopt cloud solutions that develop insights across their entire chains of production, Wipro FullStride Cloud is helping them adopt proven, secure, and scalable solutions like Wipro Process in a Box and Wipro Digital Logistics. Wipro's long-established and broad experience in the sector affords us a deep understanding of manufacturing value chains, an extensive network of best-in-class partners, and an unparalleled range of domain, sustainability, analytics, data platform, security, and cloud competencies upon which to draw. Learn more about working with Wipro FullStride Cloud to embark on a future-facing transformation through powerful and cost-effective manufacturing industry cloud solutions. FinOps

----- Arcticle source ----- https://www.wipro.com/cloud/finops/ ----- Strategy and Enablement Cloud Economics: Driving Business Value Through Discipline Contact Wipro FinOps and the New Path to Cloud Success Customized FinOps Processes Deliver Business Value Wipro Recognized as a Leader in ISG Provider Lens™ for Mainframe Services and Solutions 2023, US Wipro FullStride Cloud + Leading Analysts Wipro is Named a Leader in 2023 Gartner® Magic Quadrant™ for Public Cloud IT Transformation Services Please fill the required details to access the content Wipro FullStride Cloud Services FinOps solution provides businesses with advanced analytics of cloud datasets to effectively optimize cloud usage and help manage costs. Our approach simplifies operations, helps ensure compliance and allows businesses to navigate the complexities of running in the cloud. To optimize cloud usage, our solution provides an integrated dashboard for visibility into cloud spend, recalibration of cloud consumption to address current and future costs and chargebacks along with alerting and communication mechanisms to strategically use the cloud while avoiding unnecessary costs. Our comprehensive approach to FinOps is anchored in a deep understanding of each client's unique business challenges. After an in-depth analysis of the existing cloud environment, the business and technology goals, we design a customized strategy that incorporates advanced data analytics and cloud economics to achieve business goals while adapting to ever-changing cloud consumption patterns. Wipro FullStride Cloud Services FinOps provides strategy and guidelines to transform data from cloud service providers (CSPs) into actionable insights. Through continuous analysis of processes, our teams recommend targeted enhancements and opportunities to effectively implement long-term success in cost management, standardization and business growth.   Our strategy and enablement model is unique by helping enterprises to think beyond cost savings and identify new ways to manage investments that will enable the business to be more profitable and efficient moving forward. It's an unfortunate reality that many cloud migration programs fail to deliver the

intended results the first time around. An estimated one third of cloud spending goes to waste, with 13% of projects, on average, going over budget. Businesses set out to increase efficiency by going all-in on cloud, only to find that critical applications are too complicated or impossible to migrate, forcing them to put the project on hold while they revise their strategy. Preparing for Cybersecurity Maturity Model Certification 2.0

Contact Wipro Please fill the required details to access the content Navigating the path to cybersecurity compliance for defense contractors   The cybersecurity compliance landscape for defense contractors is rapidly evolving. CMMC (Cybersecurity Maturity Model Certification) 2.0, introduced by the

Department of Defense (DoD), is designed to protect sensitive information in the defense industrial base. Updated requirements in CMMC 2.0 will be fully integrated into DoD solicitations in Spring 2025, so the pressure to meet the new standards is mounting. Key updates in CMMC 2.0 include: With ongoing assessments and the risk of penalties for non-compliance, defense contractors must develop a robust CMMC Readiness Plan to be certified by the time contracts are awarded in Spring 2025. This includes conducting gap analyses, understanding contract scope, and investing in modern cybersecurity infrastructure. Download our eBook to learn how Wipro can help defense contractors navigate these changes and secure their competitive position in the future of defense contracting. The collaboration combines BMC Software's impressive solutions portfolio (such as smart services and operations management, business workflow automation, and reframing the mainframe) with Wipro's industry-specific experience and technology expertise. BMC Software and Wipro share a vision for empowering organizations with autonomous operations. Together, we connect and optimize digital operations, fueling efficiency, intelligence, and innovation through technology pillars like enterprise service management and AIOps. Our partnership bridges back-end systems with frontline experiences, ensuring that everyone in the organization has access to real-time insights that enable new opportunities, quick reactions, and better experience at scale. Wipro and BMC Software have built a Center of Excellence (CoE) that includes BMC HelixGPT, a new Generative AI offering that provides customers with ready-to-implement use cases across various industry verticals. BMC Software, registered on AWS Marketplace, now offers joint solutions along with Wipro on hyperscalers. The partnership has a proven track record of delivering holistic solutions and transformative value to clients across the world, enabling organizations to stay ahead in a dynamic digital landscape. Partner Level 15+ years partnership Approach Empowering organizations with autonomous operations Customer centricity Jointly developed Center of Excellence that includes GenAI offering - HelixGPT Services Wipro provides AI-driven operations management by leveraging BMC Helix operations management with AIOps through the Enterprise Digital Operations Hub (EDOH). BMC Helix provides risk mitigation by optimizing processes, identifying saturations, and projecting growth with Wipro Cloud Studio. Contact Us ======================

Accelerating Cybersecurity and Digital Workplace Transformation with Zscaler

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/zscaler/accelerating-cybersecurity-and-digital-workplace-transformation-with-zscaler/ ----- Contact Wipro Please fill the required details to access the content Accelerating Cybersecurity and Digital Workplace Transformation with Zscaler To steer forward in today's digital-first economies, organizations across industries must propel their digital workplace transformation goals or else become obsolete with time. But how can organizations design an effective and secure digital transformation strategy while enhancing cybersecurity? At Wipro, we enable organizations to realize their digital workplace transformation goals with the right set of solutions and support. Our end-to-end solutions include creating a security roadmap for digital workplaces, right from implementation, and integration to managed services - with continuous monitoring and insightful reporting. Propelling workforce transformation and cybersecurity with a powerful alliance with Zscaler We provide organizations Zero Trust solution that includes SASE with secure SD-WAN, secure application access, and enhanced user experience. Together, we deliver a cost-effective network security solution that enables organizations with their cloud transformation journey with enhanced yet simple cloud security architecture. Zscaler propels secure digital transformation by enabling organizations to rethink traditional network security while empowering the workforce to work from anywhere seamlessly. Zero Trust Exchange Platform Zscaler Digital Experience (ZDX) The power of two as one The partnership supports Wipro's efforts in transforming employee experience with its experience platform: Live Workspace™, ExperienceNXT. With ZDX, Wipro strengthens its capabilities in offering end-to-end experience monitoring and helps enable IT teams to proactively analyse and troubleshoot user experience

issues, improving business productivity and IT agility. Envisioned to be the live centre in the workplace, ExperienceNXT will leverage cutting-edge technologies such as Artificial Intelligence, Machine Learning, prescriptive analytics, etc. to provide a multi-disciplinary, multi-dimensional view of the workplace and help measure experience in a way that is comprehensible and easy to work upon. The advanced network path analytics being brought in by ZDX adds extra visibility into employee issues and helps generate intelligent insights. Together, we offer an integrated and failproof solution to help organizations detect and resolve failures in terms of cybersecurity and customer experience. We also bring forth proactive support to employees with AIOps and collective performance intelligence.

Elevating Enterprise Content Translation and Creation with Wipro & LILT

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/lilt/ ----- Contact Wipro Please fill the required details to access the content Elevating Enterprise Content Translation and Creation with Wipro & LILT Leverage a GenAI platform to translate and generate multimodal content into any language Wipro collaborates with LILT to help customers accommodate scaled demand for enterprise translation and content creation services, delivering faster, more cost-effective, and higher-quality translations and multilingual content at scale. Technology improvements have been limited to integration, process flow, and rule-based pattern matching of words and phrases from source to target languages. With this market context in mind, Wipro prioritized the partnership with and investments in large language models (LLMs) with LILT, believing this foundation was imperative to the future of enterprise translation. LILT employs an innovative human-in-the-loop approach to fine-tune LLMs. By customizing these models for each Wipro client's unique content, LILT ensures brand alignment and immediate business returns. This fine-tuned foundation incorporates cutting-edge natural language processing (NLP) advancements, surpassing the rule-based techniques employed by existing providers. Unlike legacy models that require manual training, LILT's Contextual AI engine can be instantly retrained. Partner Level Strategic Venture Partner for LLMs and GenAI capabilities. Approach Combines people, processes & technology to provide enterprise-grade language translation services. Differentiator Access to 5,000+ trained Linguists for the "human in the loop" component and supports 300+ languages. Use cases: For more details please visit Contact Us ========================

Securing SAP through Zero Trust architecture

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/fortinet/ ----- Contact Wipro Please fill the required details to access the content Securing SAP through Zero Trust architecture Wipro's joint SAP security solutions powered by Fortinet Wipro and Fortinet joint security solution assures SAP security through SAP application awareness, real time SAP traffic inspection and policy enforcement. Clients receive SAP web layer protection through WAF, load balancer and the API security feature of inspecting and authenticating JSON, XML, and SOAP. This delivers application layer attack and bot protection. The solution also provides secure access, perimeter security and segmentation, and integration of IoT and OT. Deception, threat hunting and automated response are added as a service to offer visibility that aligns to Zero Trust principles. This integrated solution is a secure, modernized platform that supports remote and local users, SAP applications hosted in private clouds, SaaS (SAP Raise) and local data centers. Wipro and Fortinet jointly offer different per-device support options to cater to the varying needs of devices and services. The services offered by Wipro and Fortinet are 24X7 technical support, advanced support, and professional services as per requirements. Contact Us ======================

Automating Cybersecurity Risk Management

This partnership integrates real-time threat insights and proactive monitoring to provide robust defense against cyberattacks and protect digital assets. Clients benefit from a holistic approach to cybersecurity, including brand protection and risk assessment, helping them navigate the complex cyber landscape with confidence. The Wipro and Cyble alliance represents a significant step in providing resilient and comprehensive cybersecurity solutions for businesses in the digital age. Collaborative Integration Cyble's AI integration plus Wipro's MDR technology stack that includes SIEM, EDR, XDR, NDR Approach Implement AI and machine learning-driven real time threat intelligence, attack surface management and comprehensive risk assessments. Partner Award Wipro named GSI Partner of the Year FY 23-24 Partner Recognitions Cyble's Monitoring Capabilities 5Bn+ Digital Assets Monitored 90% Cyber Crime Space Covered 80B+ Threat Indicators

350B+ Darkweb Records Partner Offerings Wipro and Cyble Collaboration The combination of Cyble's threat intelligence and Dark Web monitoring with Wipro's IT and cybersecurity expertise provides enterprise clients with comprehensive cyber risk management that enhances threat detection and improves incident response. Our AI-driven solutions deliver a unified view of cyber threats by collecting and consolidating intelligence from more than 15,000 dark net marketplaces to offer a more secure digital future for businesses worldwide. Listen to Wipro and Cyble leaders discuss the market significance of this partnership and the value it brings to global enterprises. Contact Us =====================

Krypton

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/krypton/ ----- Contact Wipro Please fill the required details to access the content Krypton Wipro Partnership Provides Integrated Offerings that Innovate Product Design and Manufacturing In today's market, clients want an alternative to original design manufacturers (ODMs), particularly for their engineering design needs. This partnership addresses the latest capabilities in manufacturing areas such as inline, 3D X-ray, 3D AOI, chromatography lab, enhanced RF design, and processing capability. This partnership will enable Wipro and Krypton to deliver reliable products and services to manufacturing clients, including engineering design services with leading-edge technology, differentiating features and IP, supply chain management, manufacturing services, product compliance testing, logistics, and after-market services and support for feature upgrades in hardware, firmware, and software. Manufacturers with low, medium, and high volumes can benefit from these integrated E2E capabilities. This partnership provides clients with deep industry and engineering experience with manufacturers in connectivity and computing, AI and robotics, defense and aerospace, semiconductors, medical, energy, and more. Krypton's recent awards include L-3 Concepts Prestigious Supplier of the Year, TI's 2020 Supplier Excellence Award, Blue Origin's Performance Award, and Circuit Assemblies Highest Overall Customer Rating Award. And they have earned certifications in ITAR, AS9100D, and ISO 9001:2015. Wipro Engineering Edge has 35+ years of engineering experience, 1900+ patents, 600+ products engineered in software, devices, networks, and data platforms, and Wipro's Tarang Labs for testing and certifying new engineering products. Though ODMs can provide good solutions, they have limited capability to meet client demands that vary in technology and scale. A turnkey solution requires good experience with clients' design methodology/processes, strong engineering design expertise, and manufacturing capability to deliver best-in-class integrated hardware and software solutions. With the Krypton-Wipro partnership, we offer a joint development manufacturer (JDM) model that addresses the following client needs: The Wipro-Krypton global partnership accelerates everything from engineering prototype development to volume manufacturing. =====================

Appian

Appian Discover the Power of Transformation: The Wipro and Appian Partnership Welcome to a world where innovation converges with seamless execution. The Wipro and Appian partnership brings you a transformative alliance that redefines customer experiences through agile content, marketing, commerce, and analytics solutions. With a collective legacy of excellence, we are poised to amplify value for your business in unprecedented ways. Crafting Immersive Experiences: Our partnership is built on the synergy of Wipro's strategic insights and Appian's technological prowess. Together, we create immersive customer interactions that resonate deeply, powered by Adobe's cutting-edge tools. Agility at the Core: In today's fast-paced landscape, adaptability is key. We blend design, strategy, and technology to deliver solutions at remarkable speed, helping you stay ahead of evolving customer expectations. Empowering Growth: The heart of our collaboration lies in empowering your business growth. From enhanced sales to unwavering customer loyalty, our solutions cover the entire marketing journey. Integrated Solutions: Wipro and Appian, provide seamlessly integrated solutions across marketing, commerce, analytics, and customer experiences. Gain the power to understand customers, expand your market share, and engage in personalized conversations that resonate across platforms. Platinum Partner Excellence: Our Platinum Partner status reflects our commitment to excellence and innovation. It's a testament to the remarkable value we bring to the table. Ready to Transform? Get in Touch Your journey to transformative customer experiences begins here. Reach out to us to explore how the Wipro and Appian partnership can elevate your business to new heights. QuickBase

What We Do for Employee Experience Contact Wipro Please fill the required details to access the content QuickBase If you're business isn't already investing in and planning a long term strategy around employee experience, you may find your business losing ground quickly in the coming months. Change is here, and it's positive for every organization. But it's time to dive in now. A variety of advanced technologies and cloud-based applications are making employee experience a competitive differentiator for many enterprise organizations. With the right tools, employees are gaining in productivity, reaching business objectives with ease, and finding more satisfaction in everyday achievements. This attracts talent and encourages them to remain loyal. Hybrid work models have cleared the way to smarter ways of working. But we're seeing many businesses struggle to completely adapt. This is a prime opportunity to re-think how every aspect of your business operates, grows, and thrives with the help of modern technology. What you'll gain from our combined

solutions QuickBase is a rapid application development platform for dynamic work. It powers low and no code development for business users. A leader in collaborative work management (CWM), QuickBase helps hybrid teams to see, connect and control complex projects and related processes. It enables speed and agility across teams. And as a cloud-first platform, it is easy to deploy, integrate, and maintain, while leveraging templatized vertical solutions. What Analysts Say QuickBase differentiates itself by targeting key information that supports the delivery of complex projects and programs," according to Forrester. Get Started Today Find out what's possible for your organization. Talk with an expert today. Current Industry Users Construction, Contract Management, Education, Finance, Government, Healthcare, Legal, Manufacturing, Portfolio Management, Property Management, Solar, among others. ======================

Snowflake Partnership

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/snowflake-partnership/ ----- Awards & recognitions Our Success Stories What We Think Form Title What We Think Contact Wipro Please fill the required details to access the content Snowflake Partnership Enabling modernization with Snowflake Data Cloud Realize the full potential of cloud computing and accelerate time to market by modernizing your legacy data analytics infrastructure As an ELITE partner of Snowflake, Wipro provides enterprise customers an end-to-end solution, membership in the Snowflake Data Cloud and expertise from a leading global services provider. Together, we give peace of mind to many large customers moving away from on-premise legacy environments to an all-cloud strategic deployment. Our partnership with Snowflake represents a significant, long-term commitment to help our clients streamline their operations, better serve their customers and lead in their industries. There is a massive shift in customers migrating their entire analytics infrastructure to the cloud. In response to this trend, we have established the Snowflake Center of Excellence (CoE). This strategic initiative will help enterprises adopt a modern, scalable solution, using Snowflake's platform to unlock data for all their data workloads. The CoE provides trained consultants access to Wipro's proprietary technology and data analytics expertise. The Snowflake partnership and new CoE together, enable us to deliver cloud-native solutions in a fraction of the time needed for a traditional migration. Our value proposition Wipro's partnership with Snowflake enables faster performance, lower cost of ownership, elimination of duplicate data, scalability, higher value-added tasks focus, improved visibility and responsiveness, and faster time to insight. Faster Performance Snowflake's data engine executes data integrations, reports, and analytical workloads at scale without typical performance issues. Lower Total Cost of Ownership Leverage a data engine that has low management costs, low system maintenance overhead, and lower computation costs. Eliminate Duplication & Scalability Snowflake scales easily during heavy workloads, reducing or eliminating the need for duplicate data. Higher Value-Added Task Focus The ease of database management allows teams to focus on more than just maintenance and support, delivering valuable business capabilities to the organization. Visibility & Responsiveness Easily

understand usage by business users and quickly allocate database resources to meet needs within minutes - not hours, days, or weeks. Faster Time to Insight Improve insights from the data repository for diverse datasets (sales, customer records, employee information). Quickly analyze information and find patterns that could improve business goals like boosting sales or improving customer service. Get in touch with us at Analytics-Alliances@wipro.com Snowflake partners are integral to Snowflake's growth. During the Snowflake Partner Summit, held in San Mateo on June 3, 2019, we brought together more than 150 representatives from Snowflake's partner ecosystem. The Snowflake Partner Summit provides an opportunity for key partners to plan for the year ahead, share ideas, and celebrate the joint successes we've realized through close cooperation and hard work. Fall is the time of year when we host our annual Snowflake Partner Summit. Bringing together representatives from Snowflake and our extensive partner ecosystem, the Snowflake Partner Summit provides an opportunity to gather and plan for the year ahead, share ideas and celebrate the joint success we've realized through close cooperation, open communication and hard work. Wipro selected as one of the top partners currently executing Teradata to Snowflake migrations based on customer references and feedback... The manufacturing and high-tech industry has gone through drastic changes over the past few years. The forces that are shaping the industry include intense competition, evolving customer preferences and declining revenue from traditional services and solutions. This solution unlocks insights from existing data sources at scale to drive new revenue sources for manufacturing and high-tech clients. – Kevin Miller, VP, Snowflake SI Alliances Narayan Kamat, Global Partnership Head of Wipro, talks about how Wipro is selective of its partners when it comes to strategic alliances for cloud modernization which has given us 200% growth. He also talks about the disruptive nature of Generative AI and Cloud data.

NVIDIA Alliance

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/nvidia-alliance/ ----- Contact Wipro Intelligent Document Processing (IDP) InspectAI AI for Metaverse Please fill the required details to access the content NVIDIA Alliance Wipro and NVIDIA partner to meet the business and technology needs of customers in the healthcare, automotive and telecom industries Together we are building solutions to automate the software development lifecycle and accelerate digital and business transformation. Our partnership covers everything from planning and design to implementation and project management of solutions that include NVIDIA products and technologies. Combining Wipro's expertise and research in AI and large language models (LLM) with NVIDIA's computing power and infrastructure, this partnership is paving the way for the next wave of healthcare solutions, including AI-driven strategies, products and services that are advancing generative artificial intelligence (GenAI) adoption. NVIDIA's AI competency allows Wipro to provide an end-to-end, cloud-native suite of AI and data analytics containers and pre-trained models that make AI workflows in development and production faster, more efficient. Wipro

optimizes, manages and certifies these models so they can be deployed anywhere — from the enterprise data center to the public cloud to the edge. Wipro engineers receive ongoing training on NVIDIA application frameworks in areas like GenAI, metaverse, conversational AI, and data analytics to ensure they're always knowledgeable of the latest advancements and how to best translate that knowledge to clients. Joint Solutions Wipro offerings that leverage NVIDIA platforms include an industry-leading billing and enrollment solution in the Medicare and ACA market segment, and provider and member services that leverage GenAI capabilities. Other offerings are designed to improve member experiences, increase enrollment, improve claims processing and provider data accuracy, and support claims adjudication across the healthcare industry. Accelerators Contact Wipro Please fill the required details to access the content Oracle Alliance Strategic partnership for business transformation Leveraging a successful and long-standing partnership with Oracle to build future-ready systems and enhance business velocity The Wipro-Oracle partnership, spanning more than 15 years, is a journey of helping customers transform their businesses by leveraging the power of Cloud. Oracle's market leading Cloud offerings span across all the layers of Cloud and the entire spectrum of enterprise functions. Wipro's industry domain expertise, consulting capabilities and digital ecosystem makes the Wipro-Oracle team the ideal partner to drive the customers' Cloud transformation smoothly and successfully. Wipro's Digital Navigator Assessment framework and TCO calculator help customers measure the potential impact of Cloud transformation before they embark on the journey. QuMiC, Wipro's proprietary platform helps customers get the best value from their investment in Oracle Cloud. With QuMiC, customers can migrate to the Cloud seamlessly to realize their desired business outcomes quickly. Our Zoom-to-Cloud Packs offer reliability of outcome combined with budget assurance. Our proven Change Management framework combined with the Wipro Cloud Excellence Center and our integrated Cloud delivery mechanism, delivers a smooth experience across the implementation lifecycle. The Wipro-Oracle joint value proposition centers on three pillars: Download PAC's "Expert View" report covering Zoom-to-Cloud. The move to Oracle Cloud is a large-scale initiative that encompasses a range of vital tasks, and creating a thorough adoption strategy is essential to reaching a successful outcome. As the leading telecommunications operator in Bangladesh. Rapid global expansion led to substantial growth for a pioneering Middle Eastern bank, which planned to expand its industry presence even further. Wipro leverages Oracle Cloud to drive increased end-user productivity and lower costs Since its inception in 1995, a leading southeast-Asian transport authority watched its road-transport network grow so significantly that it had become increasingly difficult to manage with existing business systems. The organization planned to enhance its application management services (AMS) and ensure its employees were benefitting from a resilient and reliable cloud-based system. Rapid growth and revenue increases compelled a U.S.-based publishing company to transform its operations to accelerate financial closure times Future-proof supply chain processes based on Oracle Fusion OTM and CPQ cloud enabled the transportation company to scale for the future A global ports operator in the Middle East launched an extensive plan to become a full logistics and transportation provider in order to better serve its customers and open new business opportunities. Wipro leverages Oracle's NetSuite Cloud solutions to help an information technology company seize new growth opportunities Wipro modernizes customer contact centers using Oracle's CX Service Cloud for a European utility company Wipro streamlines enterprise processes to improve productivity and establish a future-ready ERP for an engineering and construction products provider Wipro's Zoom to Cloud and Oracle Fusion Cloud connected and streamlined enterprise processes, improving the employee experience Wipro integrated the core trading environment with Oracle ERP Cloud for intercompany accounting Wipro drives seamless transition, round-the-clock cloud support and automation, helps the supplier's business evolve Wipro leveraged Oracle CPQ Cloud and Salesforce to implement robust processes for opportunity pipeline and quote

management Wipro leverages Oracle Cloud to help the company optimize costs and realize gains in its supply chain planning Wipro leverages Oracle Fusion Cloud to ensure best in class processes and an integrated approach Wipro leveraged Oracle Cloud to help streamline processes, improve sales effectiveness and reduce costs. With multiple inventory sources in its business units and supply chain The medical-device market has experienced rapid growth during the past few years... Since 1995, the growth in American public-transit ridership has increased at a faster... One of the world's largest technical professional services organizations needed to transform its finance, accounting, project, and procurement operations across its multinational footprint. A leading electronics manufacturer and distributor knew that to deliver on its growth plans, the company had to modernize its systems to meet the needs of its rapidly evolving procurement function. This task also required enhancing the finance and accounting processes associated with procurement. A commodities trade authority in the Middle East, one of the leading free zones globally..... A leading North American steel manufacturer had long relied on manual product-costing processes. Pure The Winery is a budding specialty-wine producer providing a new line of zero-sugar wine made in Piedmont Wipro implemented Oracle NetSuite for a scalable ERP solution and enabled automation for business processes Wipro transforms the client's technology landscape with Oracle NetSuite and leverages automation to streamline business processes Wipro leverages Oracle Service Cloud and Oracle Knowledge Advanced to establish a seamless knowledge management system for global network of dealers and agents Wipro leverages Oracle Cloud Applications to transform global service operations and enable revenue growth Wipro leverages Oracle Cloud to drive connected processes, simplified IT, and decreased-operating costs Leveraging Oracle Cloud, Wipro transforms the client's Transportation management process to achieve 45% faster quotes and 24% reduced costs Wipro implemented Disaster Recovery as-a-Service on Oracle Public Cloud, transforming the organization's disaster recovery landscape from a CAPEX to OPEX model Wipro implemented a shared-services model leveraging Oracle Cloud, reducing IT expenditure and enhancing customer experience Wipro leveraged Oracle HCM Cloud to enable a unified technology landscape resulting in transformation of HR & payroll processes Wipro leverages Oracle Service Cloud to help the client reduce customer churn by 20% 'Real Time Manufacturing' – a manufacturing execution system on Cloud enhanced operational efficiency on the factory floor Oracle HCM Cloud with payroll interface streamlines and unifies the bank's human resources function Wipro implemented a Digital Contract Automation and Storage solution with Oracle Content & Experience Cloud and Adobe Sign, to drive omni-channel content management and accelerate experience delivery Wipro leveraged Oracle EBS, Oracle HCM Cloud and Taleo to increase supplier recovery, employee experience and reduce costs Wipro integrates Oracle Sales Cloud with 3rd-party systems, leverages data to create smooth customer experience with 100% increase in Lead Potential Realization David Watkins, General Manager Finance APN Outdoor speaks on Wipro's expertise and an ability to execute Oracle ERP cloud to provide business real time, accurate information for faster decision making Consumer preferences and demands have changed. Migrating to the cloud seems like table stakes for the modern enterprise. When contemplating the move, there are a number of things to consider, cost always being high on

the list. Transitioning to the cloud bolsters an organization's ability to innovate and improves its overall economics by enhancing business agility, reducing costs, and strengthening the focus on core competencies. Protolabs, Wipro's specialized labs with expert teams and rapid prototyping processes, deliver path-breaking solutions at great speed through co-innovation One of the primary goals for every organization is to manage year-end payroll processing without a hitch. Every day, across the field service industry, thousands of field service technicians carry out operations such as repairs, maintenance, installations and configurations at customer sites. The primary focus for these field service organizations is to improve asset uptime, first-time-fix, customer satisfaction, retention and service-margin. Buying behavior of customers is ever evolving. An organization's Configure Price & Quote (CPQ) application serves as the backbone for the sales team to support this evolving buying behavior of customers. Every modern business in the world turns to its CPQ system to produce correct quotes and effectively sell its products, thereby generating revenue. Tollway operators are facing a myriad of challenges such as high labor costs, operational inefficiencies.... Every retailer today wants to provide the customer experience that large online marketplaces are known for. The global pandemic of 2019-20 has not left any industry untouched in its wake. If there is one factor that can help us defeat this crisis and rise stronger, it is knowledge. Hence, the pressing need for the knowledge juggernaut to roll on cannot be overemphasised. With increasing deregulation, expanding regulatory oversight, digitally driven customers, and pressure on revenues, utility companies are constantly looking for new business models and solutions. How utilities can meet changing customer expectations and improve business processes with Oracle Customer Cloud Service (CCS) Healthcare delivery is the most powerful and sought-after service during these tough times. As COVID-19 continues to create a climate of uncertainty, organizations across the globe are struggling with an unprecedented crisis—and most of them are still gearing up to handle the sudden impact to business. In an earlier article, we highlighted the remarkable transformation that the car rentals business is undergoing at the hands of technology. Leading rental services are using mobile apps for bookings and payments, facial recognition to improve speed and security around bookings, and data and analytics to improve customer service. The COVID-19 pandemic has created multiple impacts on supply chain activities, which warrants quick re-engineering to meet the change in demand. The art of possible with an intelligent service management assistant powered by AI and Oracle Cloud Reimagining employee benefits and enhancing experience for the future workforce How manufacturing organizations can drive business growth with IoT, automation and data Accelerate and simplify migration to Oracle Cloud with Wipro's Quick Migration to Oracle Cloud (QuMiC) platform In this paper, we focus on the top 5 automation areas that'll enable greater competitiveness for HR as a function. The benefits of using Oracle Cloud Infrastructure (OCI) are widely known: Organizations get the same familiar control, security, and high performance of on-prem infrastructure with the additional advantage of cost savings. Despite the advantages of SaaS—like ease of adoption, access to the latest and greatest features and the ability to control costs—organizations are reluctant to consider moving their on-premise Oracle EBS to SaaS. Wipro's Customer Experience Management solution for Utilities, leveraging Oracle Cloud Are you converting the right

data (and the right volume)? Organizations that adopt a new payroll system know that things can go wrong. From 2017 until now, in November 2019, the closure of brick and mortar stores in the US – like Toys "R" Us and Macy's, for example – may seem to suggest a downturn in retail. Utilities have been consistently investing in addressing two key challenges: Improving revenue and boosting productivity. Leverage Oracle's Cloud platform and enterprise applications to accelerate into the Industry 4.0 era Wipro's Quick Migration to Oracle Cloud (QuMiC) Move from 'automation' to 'autonomous' by injecting Adaptive Intelligence into your businesses Innovation in the Cloud helps us achieve better ROI on Disaster Recovery, and eliminates the costs and complexity of owning an entire facility specifically for the purpose of DR. The art of possible with an intelligent service management assistant powered by AI and Oracle Cloud Cloud-based solution to enhance customer experience, operational efficiency Power your migration with Wipro Zero Cost Transformation to Oracle Cloud Infrastructure (OCI) The new offering allows companies to migrate to Oracle Cloud Infrastructure with reduced risk by addressing challenges related to cost, quality and time East Brunswick, New Jersey, USA and Bangalore, India – July 21, 2020: Wipro Limited (NYSE: WIT, BSE: 507685, NSE: WIPRO), a leading global information technology, consulting and business process services company, today announced that it has won the 'Oracle UK & Ireland Partner of the Year 2020' award in 'Customer Experience' category. Superior customer experience (CX) possibilities through Oracle CX Cloud Building digital enterprises Organizations need solutions that enable them to keep close tabs on key performance indicators, ensuring that they stay on the right path to achieve business goals. Modernizing and Transforming Supply Chains Wipro is a global implementation partner for Oracle Integration Cloud and this partnership offers advanced services and expertise to accelerate digital transformation for customers. Empowering HR Organizations Expanding Cloud ERP Horizons Oracle cloud application management services Mitigate risk and reduce TCO by up to 30% Quick Migration to Oracle Cloud Accelerate your journey to Oracle Cloud Rapid Oracle Cloud functional set up Value realization the digital way Rapid COVID-19 Risk Identification, Response Framework & Nerve Center Accelerate your journey to Oracle Cloud Modern tollway operators face a variety of challenges, from operational and technological to financial and competitive. A managed Customer Information System (CIS) Powered by Oracle NetSuite Accelerating value creation for private equity firms with NetSuite's cloud ERP solutions and Wipro's industry expertise Universities today compete in a rapidly changing, digital educational landscape. Inventory shelf-life planning and efficient management Mitigating the challenges of procurement and supply risk

Global Logistics Powerhouse Accomplishes an Award-Winning Financial Transformation

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/oracle/success-stories/global-logistics-powerhouse-accomplishes-an-award-winning-financial-transformation/ ----- Contact Wipro Please fill the required details to access the content Global Logistics Powerhouse Accomplishes an Award-Winning Financial Transformation Ambition A leading contract logistics provider embarked on an ambitious journey to revolutionize its financial operations by deploying Oracle Cloud ERP across 49 countries. This initiative aimed to consolidate financial operations onto a unified platform, enhancing efficiency and decision-making capabilities across its vast network. The project's scale was significant, targeting more than 1,500 core finance users and more than 30,000 self-service users, and spanning diverse regulatory landscapes. Building on the initial progress, the project opened an opportunity for collaboration, leading the client to partner with Wipro. This decision was inspired by Wipro's comprehensive experience as an Oracle partner and their demonstrated agility in technology services and consulting. Wipro's mandate was clear: to accelerate the project's delivery, ensuring the achievement of its ambitious goals without compromising quality. Action Wipro's transformative journey was launched with a strategic, focused plan aimed at minimizing disruptions and ensuring continuous progress. The initiative moved forward through deep client engagement, developing a concise transformation roadmap. This roadmap emphasized targeted leadership engagement, comprehensive training, and strict metrics, all directed towards the implementation of a unified Oracle Cloud instance globally. The journey unfolded with a targeted "Beach Head" approach, initially rolling out new business processes in pilot countries - Australia, Austria, and Germany - before expanding to a global Oracle Cloud instance across all client locations. A key element of enhancing efficiency was Wipro's takeover of managed services and the introduction of a pioneering Gen AI solution for supplier inquiries. This innovation delivers precise, tabulated insights with minimal manual intervention, streamlining the process significantly. This approach not only unified data and optimized operations but also marked a significant advancement in the client's transformation journey. It underscores Wipro's strategic and focused methodology in driving transformative change, demonstrating its dedication to crafting and implementing cohesive global solutions that ensure progress and minimize disruptions. Ambitions Realized The collaboration between Wipro and the logistics provider not only achieved its set objectives but also led to the project winning a prestigious industry award. This accolade recognized the project's innovative approach to digital transformation, its significant impact on operational efficiency, and its contribution to the logistics industry at large. The project's key achievements included Wipro not only transformed the client's operations but also established a new industry standard for facilitating complex, global ERP implementations. ======================

Tibco

Overview of the partnership Success Stories Solutions Contact Wipro Please fill the required details to access the content TIBCO Alliance Enabling a digitally connected enterprise with TIBCO Driving innovation at digital enterprises with our platform, tools and methodologies and leveraging AI, IoT, APIs and Cloud TIBCO products fulfill crucial needs. They Interconnect Everything with API Management, Messaging, Event Processing, Process Management, and Integration (application, blockchain, cloud, containers, IoT, low-code, microservices) and also Augment Intelligence with Data Visualization, Data Management, and Advanced Analytics (AI, Machine Learning, streaming BI). Organizations across industries are embarking on technology transformation programs to effectively engage with the digital economy. With the TIBCO partnership we are able to enable digital transformation that helps organizations quickly innovate and execute, reduce risk, and increase efficiency and customer satisfaction. Wipro is an Elite Partner for TIBCO. We offer consulting, implementation and managed services across all TIBCO platform technologies and leverages digital integration platforms, APIs, Cloud, DevOps and event processing to deliver connected experiences and create an agile and integrated enterprise. Wipro's TIBCO COE Wipro is well positioned to help organizations build compelling mobile and social customer engagement solutions. Our dedicated TIBCO Center of Excellence (CoE) focuses on product evaluation, proof of concept, refining methodologies, building solution accelerators and reusable components of TIBCO products. Platforms and Solutions Wipro's Digital Integration-as-a-Service platform brings together integration runtimes, tools, frameworks, support services, templates, accelerators and best practices to cut down the time it takes for large enterprises to deploy their next-generation integration platforms. Tools and frameworks: DevOps tools/ processes, service/API and event governance, comprehensive monitoring and management, and collaboration portals Managed File Transfer as-a-Service (MFTaaS): A unified, one-stop Cloud-hosted solution that enables seamless integration across heterogeneous partner systems and enterprise application Industry-specific accelerators: Packs that combine pre-built application connectors, APIs, data models and analytical models specific to an industry, e.g., Connected Airports Pack—a Wipro-TIBCO joint solution to help airports quickly rollout Smart Airport use cases TIBCO product portfolio with Wipro Next-gen integration platforms: TIBCO BusinessWorks Container Edition, TIBCO BusinessWorks 6, TIBCO Cloud Integration, Mashery Streaming analytics: TIBCO StreamBase, TIBCO Live Datamart, TIBCO ActiveSpaces, TIBCO BusinessEvents BPM and Case Management: TIBCO ActiveMatrix BPM Analytics and Master Data Management: TIBCO Spotfire, TIBCO MDM, Data Virtualization Managed File Transfer: TIBCO MF AWARD Business Innovation Excellence Award – B2B/MFT 2014: Wipro at the TIBCO NOW Conference, San Francisco, November 3-5, 2014. APAC telecom services provider: Implemented real-time customer experience management system to help the organization reduce customer churn in a highly competitive market Leading hi-tech manufacturer: Modernized the

customer's middleware platform by setting up a hybrid integration platform, API-based integration, API Management and DevOps tooling for continuous and agile delivery Wipro's Automated Shelf Replenishment (ASR) is a game changer for retailers, allowing them to minimize manual restocking efforts, improve product availability, and enhance customer experiences. =======================

Automated Shelf Replenishment (ASR)

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/tibco/automated-shelf-replenishment/ ----- Contact Wipro Please fill the required details to access the content Ensuring retail brands can efficiently restock products and drive sales Navigating the Latest Retail Challenges "Deliver what the consumers want, when they want it." It's the oldest retail axiom out there, but retailers cannot overstate the importance of getting it right. More than two-thirds of customers have left a store because the product they sought was not available. As a result, revenues are missed, stock is possibly squandered, and the bottom line suffers. Sales and margin growth are becoming increasingly difficult to come by as many disrupting factors affect global retail operations for brands and suppliers, but businesses have a clear opportunity to generate value to customers and shareholders. Innovating Stock Replenishment Operations Wipro's Automated Shelf Replenishment (ASR) is a game changer for the retail industry. ASR's continuous shelf-scanning functionality works in conjunction with AI/ML-based algorithms and planogram data to accurately identify the replenishment amount needed on a specific shelf. With Wipro's ASR solution, retailers can modernize their shelf to avoid replenishment issues and more effectively deliver profitable customer experiences. As a cloud solution, ASR is built on the IoT-compatible platform, TIBCO Project AIR, which provides computer vision capabilities for analyzing shelf images or camera streams in near real time. Retailers can also configure ASR's intelligent replenishment rules to automate and optimize routine replenishment and inventory allocation tasks, resulting in improved employee productivity and greater sales opportunities. ASR Features Benefits for Retailers Innovate restocking workflows and drive business opportunities with Wipro's ASR. =====================

----- Thought Leadership News, Awards & Accolades Contact Wipro Please fill the required details to access the content C-suite executives are embracing the cloud to future-proof their companies. Modern businesses require agile and intelligent systems and business applications. Legacy software poses challenges such as system incompatibility, high costs, and talent shortages, hindering the adoption of cutting-edge technology. To overcome these hurdles, businesses urgently need to transition to cloud-based solutions. Wipro FullStride Cloud brings clients comprehensive cloud services focused on delivering transformational business outcomes. Wipro's extensive engineering and infrastructure experience uniquely positions the FullStride team (a powerful force of nearly 70,000 cloud-focused innovators) as a strategic partner for cloud services. Whether it's migrating to the cloud, modernizing existing systems, or building cloud-native applications, Wipro provides end-to-end solutions that drive value to businesses. Wipro FullStride Cloud's application migration and modernization services enable enterprises to swiftly harness the entire potential of the cloud through comprehensive strategic support and cutting-edge digital solutions. The application migration and modernization practice is powered by around 8,000 employees who bring extensive expertise in enterprise cloud for the following Google product services used for different industry sector customers: Under FullStride Cloud, Wipro Cloud Studio is a one-stop marketplace that enables our customers to reimagine their cloudification journey and accelerate cloud adoption. Cloud Studio acts as a strategic ecosystem integrator, leveraging Wipro's platforms, intellectual property (IP), and talent. The Cloud Studio also leverages Cloud Centre of Excellence (CCOE) assets, architecture blueprints, platforms and delivery frameworks, and partnerships products and tools. Cloud Studio is a unique platform that delivers migrations of different workloads to cloud in an "Industrialized as-a-Service" model, helping global clients reimagine, modernize, and transform

their business processes and IT landscape. Our Cloud Studio has a proven track record of achieving up to 5x faster cloud adoption at 30% lower cost, 90% automated post-migration activities, and 3x faster business acceptance. This innovation lab combines Wipro's expertise with Google's approved frameworks, tools, methodologies, and AI capabilities to further enhance efficiency, agility, innovation, and time-to-market. In the last few years, Wipro has assisted more than 60 clients in successfully migrating more than 8,000 applications and 55,000 servers from on-premise to Google Cloud. Wipro FullStride Cloud Studio, in partnership with Google Cloud's Rapid Migration Program (RaMP), offers a comprehensive migration strategy focused on business outcomes. This end-to-end program leverages expertise, best practices, and automation to reduce risk, control costs, and simplify your path to cloud success. Google RaMP and Wipro Fullstride Cloud Studio have fully aligned and integrated to deliver accelerated cloud migration and modernization capabilities for clients. As a trusted Google Cloud partner, Wipro empowers customers to leverage the best of the Google Cloud platform. Our comprehensive cloud assessment and migration approach enable enterprises to develop and manage cloud-native business applications with agile methodologies, enabling faster time-to-market, increasing scalability of applications, and seamlessly integrating them with both external and internal IT systems. Wipro has been awarded multiple Google Cloud Partners of the Year awards, including a 2024 award for Data Center Transformation & Industry Solutions Supply Chain and the Google Cloud Migration Partner of the Year 2023 award. We are also the first accredited RaMP launch partner and are recognized as one of the only partners that combines a cutting-edge accelerator (Cloud Studio), a migration factory, and Enterprise Digital Operation Hub (EDOH). Wipro also operates a dedicated Google Cloud Academy, upskilling our team through diverse training programs, certifications, and boot camps in collaboration with Google Cloud. Our certifications from Google Cloud highlight our industry-leading capabilities and our commitment to long-term investments and proven customer success. In 2024, Wipro boasts 6,600+ GCP certified professionals, with numbers doubling annually in recent years. Ramp up your cloud migration and modernization journey today. Get connected to an expert =====================

Wipro FullStride Boundaryless Enterprise - Hybrid Cloud Solution delivered with VMware and Google Cloud

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/strategic-google/wipro-full-stride-boundaryless-enterprise/ ----- What We Think Form Title Contact Wipro Please fill the required details to access the content Wipro FullStride Boundaryless Enterprise - Hybrid Cloud powered by VMware and Google Cloud Agile and Modern Hybrid Cloud Rapid digitization is disrupting business models and modern enterprises are

moving to multi / hybrid cloud to accelerate innovation and quickly respond to change. This dramatic shift, further accelerated by COVID, has resulted in significant complexity and challenges, such as the need to exit data centers and quickly move to cloud, while ensuring operational consistency with on premises, and lower costs. For clients who want to use public cloud to modernize their existing IT environments, Wipro Boundaryless Enterprise (BLE)-Hybrid Cloud solution powered by VMware and Google Cloud provides a consistent roadmap for increasing business agility and reducing total cost of ownership (TCO). Wipro Hybrid Cloud powered by VMware and Google Cloud builds on Google Cloud VMware Engine (GCVE), a joint offering from Google Cloud and VMware. Wipro Hybrid Cloud powered by VMware and Google Cloud provides a collaborative service framework that helps reduce lead time and overall effort, while making it easier to scale the application to production via enterprise-wide service level agreements. Wipro's deep industry expertise and a robust partner ecosystem helps our clients stay focused on business results by helping to plan, execute and manage their cloud journeys. Wipro FullStride BLE- Hybrid Cloud solution powered by VMware and Google Cloud: Wipro FullStride Cloud Services combines industry-leading business solutions with a high-touch, business outcome based approach to help enterprises maximize the true transformative potential of the cloud. Our technology accelerators and dedicated team of experienced domain and technology consultants lead clients through each step of their cloud transformation journey, reducing migration risk. Partner with market leaders Wipro FullStride BLE Hybrid Cloud powered by Google Cloud VMware Engine solidifies Wipro's position as one of the trusted partners of choice for enterprises looking to create a strategic roadmap for low risk migration to GCVE and managed services. Wipro is a VMware Principal Partner and a Google Cloud Premier & Managed Service Provider. Wipro FullStride BLE, delivered through Global Cloud Studios, provides future-ready cloud lifecycle services for GCVE. It incorporates workload-centric cloud assessments and R-Lane decisions to arrive at the right treatment for each application, landing zone designs for GCVE, automated migration planning and execution using VMware HCX, and machine-learning-driven managed services.
=======================

Accelerate cloud migration with lower risks and TCO

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/strategic-google/accelerate-cloud-migration-with-lower-risks-and-tco/ ----- Contact Wipro Please fill the required details to access the content As companies embark on their cloud journey, they often need to quickly exit data centers and reduce migration risks while ensuring operational consistency with on-premises environments. The Wipro FullStride Boundaryless Enterprise (BLE) solution accelerates the journey to cloud with reduced risks and lower TCO while helping enterprises meet sustainability targets. The solution builds on the Google Cloud VMware Engine (GCVE), a powerful joint offering from Google Cloud and VMware. Delivered through Global Cloud

Studios, BLE provides future-ready cloud lifecycle services for GCVE. Wipro FullStride BLE incorporates workload-centric cloud assessments and R-Lane decisions to arrive at the right treatment for each application, landing zone designs for GCVE, automated migration planning and execution using VMware HCX, and machine-learning-driven managed services. Key Features Wipro is a VMware Principal Partner and a Premier and Managed Service Provider partner for Google Cloud with expertise badges in infrastructure, data analytics, application modernization, and more. Key Benefits Wipro received VMware's 2022 Partner Lifecycle Services award and Google Cloud's 2021 Specialization Partner of the Year for Application Development award. Wipro FullStride Cloud Services Portfolio Our technology accelerators and dedicated team of experienced domain and technology consultants collaboratively lead clients through their cloud transformation journey. With deep industry expertise and a robust partner ecosystem, Wipro FullStride Cloud Services helps customers stay ahead of the curve by improving business outcomes. Migrating Workloads to the Public Cloud with Google Cloud

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/strategic-google/migrating-workloads-to-the-cloud-with-google-cloud/ ----- Contact Wipro Please fill the required details to access the content A simple checklist for seamless execution Cloud adoption and migration are accelerating, with nearly 50% of enterprises now running their workloads and data in the public cloud and demand for public cloud growing each year. While self-provisioning new workloads in public clouds may be seemingly straightforward, migrating existing services to the cloud demands thorough preparation. The migration can be complex, time-consuming, and risky, but with proper planning, effective migration practices, and the support of new migration technology, enterprise IT organizations can expedite the process while mitigating risks. "Migrate workloads to the public cloud: an essential guide & checklist" provides vital tips to navigate the four crucial stages of the cloud migration process: assess, plan, migrate, and optimize. The paper also includes a comprehensive checklist that outlines the tasks associated with each phase. Download the paper to start accelerating your cloud migration journey! Download Checklist =====================

Delivering Next-Gen Customer Service with Gen AI

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/strategic-google/delivering-next-gen-customer-service-with-gen-ai/ ----- Contact Wipro Please fill the required details to access the content Delivering Next-Gen Customer Service with Gen AI Customer service has always been a priority for businesses, but in this digital era it is taking on a new sense of urgency

due to competency growth and technology advancements. Across nearly every industry, customers have come to expect immediate responses to their queries, personalized support, even the ability to help themselves through self-service. The integration of artificial intelligence (AI) has helped contact centers keep up with these demands by making information more accessible. Now, rapid advancements in AI and generative AI (Gen AI) technology are making virtual assistants even more capable, paving the way for streamlined efficiencies that empower both agents and customers, maximizing business value. Combining AI with Cloud To make the most of any AI application, companies first need a strong cloud foundation. The large language models often require tremendous compute power, and the ability to access huge volumes of data in real time. This requires scalability and accessibility that can only be found in the cloud. As a result, cloud hyperscalers are playing a key role in AI development, offering capabilities and tools that keep pushing the envelope. Google Cloud's Contact Center AI (CCAI), for example, has helped companies go beyond the limited capabilities of traditional chatbots to offer faster resolutions and truly elevated customer service. CCAI combines natural language processing capabilities with the data security, enterprise AI foundation model and accessibility of Google Cloud to instantly connect agents and customers with the information they need. The platform can scan requests to help agents better direct customers to the appropriate channels, gather necessary documents, and extract information from those documents. It can also follow along with conversations to provide real-time support, and later draw insights from those conversations to train human agents as well as the platform itself. Because Google CCAI services are flexible and customizable, they are compatible with numerous enterprise tech stacks and use cases. Real-Time Support for More Human Interactions At the same time, rapid advancements in Gen AI are constantly revealing powerful new use cases. New features offer even greater support for agents and customers through real-time analysis and recommendations, while enhanced language processing continues to make engagements more natural and helpful. Wipro's Agent Assist, a unique solution developed on Google Cloud, uses Gen AI capabilities to identify the language used by high-performing agents and coach other agents to ensure quality customer services throughout the company. The platform also transcribes calls in real time and offers suggestions to address customer issues, leading to more efficient and successful resolutions. Products like this represent the next phase of AI implementation for call centers, building on the existing AI groundwork to make processes more efficient and useful. Consider a familiar example: A banking customer calls because their credit card has been blocked. Because this is a relatively common request, agents likely know how to resolve it quickly. But solutions like CCAI and Agent Assist can expedite a resolution before the call is even transferred to an agent by extracting the intent of the request (unblock credit card, dispute/verify charges) and preparing the agent with the information they need to assist (displaying the account and card information, the problematic charges, authentication questions, and steps for resolution). Extracting information from an email or a service ticket may not seem revolutionary, but using that to streamline such a common, time-consuming process can have a major impact on the overall customer service landscape. Agents handle tremendous call volumes. If companies can automate the right processes, they can lessen the burden of

those volumes significantly, reducing the amount of time agents spend on routine tasks such as gathering information and freeing up more time for making sure the customer feels truly supported. Continuous, Dynamic Training As enterprises leverage Gen AI to support customers, they can also leverage it to train and support customer service teams. Using Gen AI to analyze customer interactions and suggest responses can make training more dynamic and continuous. The platform can offer step-by-step guidance to walk new agents through the process, offer suggestions for how to best respond to additional concerns the customer may have, and even help redirect the call if necessary. With Gen AI, scripts are no longer static documents that only apply to a handful of instances; they're created in real-time, drawing from similar interactions in the past and learning from them. As the platform learns from the top-performing agents, it can share those best practices with agents throughout the company, enabling teams everywhere to learn from each other. Data Security and Responsible AI Process automations like these can be very helpful for agents and customers, but they can also pose security challenges, especially in highly regulated industries like financial services and healthcare. Companies want to be sure that their data and their customers' data will be safe. To maintain data security and ensure compliance with regulations, companies need to implement the proper guardrails and responsible AI practices. Google has made a point to prioritize data security and privacy in its Gen AI practices, only transferring data through encrypted channels that are within Google's control and not using that data to train its own Gen AI model. Similarly, Wipro's four dimensions of responsible AI (individual, social, technical, environmental) take a comprehensive approach to AI risk mitigation so organizations can safely harness the full potential of Gen AI. A common refrain among AI evangelists is that the technology is intended to work with, not replace. This goes for people as well as operations. The best Gen AI use cases for customer service will likely be the ones that leverage existing cloud capabilities, learn from past customer interactions, and support human agents in upholding the values of the organization. By harnessing the strengths of people and processes rather than replacing them outright, companies can multiply their impact and accelerate their growth. About the Authors Swapnil Zarekar Senior Practice Manager, Wipro Swapnil is a seasoned AI practitioner and consultant with over a decade of experience. He is senior practice manager with AI practice of Wipro Ltd and an expert in the Google Generative AI space. Three Impactful Gen AI Strategies for Financial Services

Contact Wipro Please fill the required details to access the content Three Impactful Gen AI Strategies for Financial Services The technical advancements in artificial intelligence (AI), machine learning (ML), deep learning (DL), and generative AI (GenAI) are moving fast. For most of 2023, GenAI dominated the news. A recent report found that 67% of companies have added GenAI into their corporate AI strategy, proving it's not hype and here to stay. To be fair, business solutions that leverage AI are not new. What is new are the advancements that GenAI brings to the table, particularly in language creation, data handling, and content generation. In the financial sector, some companies are already beginning to embrace GenAI for content creation, operational efficiency, and risk assessment strategies to drive growth. Two GenAI Models to Know About What makes GenAI so impactful? Broadly speaking, it can consume and analyze large datasets to create normalized human responses, making it valuable for many internal uses and customer journeys. GenAI's power features will be transformational in the financial services industry. These features include: The chat-bison model, on the other hand, excels at understanding language, generating language, and handling conversations. Financial companies will find this model ideal for text-intensive tasks that require back-and-forth interactions, such as investment-related inquiries and application navigation assistance. To support such models, the Google Cloud platform is leading the GenAI space in providing 360° features including infrastructure (VM with GPU/TPU), data services (Vertex AI) and AI services (GenAI Studio). Google's GenAI solutions provide game-changing features like cloud-driven scalability, training pipelines, and more. Companies can customize the models, control default behavior, and evaluate output performance. Company data in model training is kept private and not used to train the broader model — a critical security and governance imperative, particularly in the context of sensitive financial data. Three Strategies to Drive Value with GenAI Using the GenAI models above, financial services institutions can start driving value with content creation, new operational efficiencies, and improved risk assessment processing.   Recently, Wipro and Google's GenAI models and the three aforementioned strategies to address a financial firm's investor onboarding program. Wipro trained Google's chat-bison model with the bank's proprietary data (offers, accounts, loans, processes, etc.). The resulting chatbot responds accurately to open-ended customer questions such as "What is the process to open an account?" and "What are the fees?". Integrating Google Doc AI into the model is also helping the bank accelerate customer document verification by identifying missing or incorrect information on customer forms. Customers and prospects now have seamless and efficient customer journeys for onboarding, service, and account setup Another bank wanted to improve its investor experience. Wipro trained Google's text-bison to analyze investment options particularly related to investment risk. Using the chat-bison integration, financial advisors can provide real-time summaries of different investment

instruments by sector or any scope of time. GenAI is a Game-Changer that Requires Responsibility The accelerated advancements in GenAI have led to an explosion in computer-generated content. As a result, GenAI is also raising ethical and legal questions, and answering these questions is the critical final piece of any resilient GenAI strategy. While government regulatory guardrails continue to evolve, Google and Wipro align on addressing risks with the principles of Responsible AI. Any use of the technology should protect and enhance human dignity. It must safeguard privacy and champion the security of personal information. GenAI must not discriminate or undermine an individual's identity, language, or background, and it should improve society and strengthen the values that bind us together. GenAI is a game-changer that will transform enterprise operations and enable new growth opportunities. To help companies benefit from GenAI, Wipro and Google expanded their partnership with Google Cloud and AI services. This partnership will help companies extend the benefits of GenAI across numerous enterprise functions, from customer experience and marketing to supply chain, financial modeling, and more. GenAI solutions powered by Google Cloud In an era where innovation is paramount, Wipro, in partnership with Google Cloud, is proud to introduce a groundbreaking approach to Generative AI, designed to transform the landscape of business solutions. Leveraging the power of Google Cloud's advanced AI technologies and Wipro's industry-leading expertise along with a dedicated center of excellence, we are set to redefine what's possible. Together, we are delivering solutions that enhance operational efficiency, innovate product development and improve customer experience. Accelerate your innovation journey with Wipro's Generative AI Framework and AI Studio offering expert consulting and engineering services in large language models (LLMs) and related technologies. We deliver exceptional AI value through a diverse portfolio of robust accelerators, meticulously designed to tackle real world challenges faced by global enterprises. Experience transformation at scale and unlock new opportunities with our advanced AI solutions. Rapid GenAI Prototypes Accelerate deployment with ready-to-use applications like investor onboarding chatbots and intelligent email automation. FullStride Cloud Studio's GenAI Lab Bring bold ideas to life with help from the AI Innovation Lab and Creative Workshop. Strategic Consulting and Planning Maximize impact with AI frameworks and strategies shaped by experts from Wipro and Google. Our Solutions Empower contact center agents to instantly find solutions and documents, resolving customer tickets faster. Streamline loan origination with instant processing, minimizing response times and alleviating workloads. Tackle contact center bottlenecks with real-time email traffic monitoring and task reduction. Connect investors with personalized recommendations and instant responses to investment queries. Instantly connect health insurance customers with policy information. Leverage GenAI to easily access data insights, translating natural language queries into actionable SQL. Unlock insights from over 50 research documents through LLM search, summarized results, speech-to-text, and more, empowering research exploration. Generate deeper insights from internal and external data to optimize supply chain costs, achieve real-time inventory visibility, and improve delivery times. Collaborate with AI to craft product slogans, pitches, social media posts and product images with little more than a brief description. Streamline code reviews and documentation processes with this developer assistant powered by Google Generative AI and the "Codey" model. Streamline enterprise search across more than 50 documents for more efficient SDLC workflows with seamless auto-tracking of requirements, code, and test cases. Extract key points and generate concise summaries from complex, multimedia content. Leverage internal and external data to optimize supply chain performance, achieve real-time inventory visibility and improve delivery times. Enhancing Service Desk Operations with GenAI

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/strategic-google/case-studies/enhancing-service-desk-operations-with-genai/ ----- Contact Wipro Please fill the required details to access the content Enhancing Service Desk Operations with GenAI Client: Leading German Wholesale Company Industry: Retail Solution: CORDS Solution - Strategic Integration of Confluence and JIRA Key Technologies: Google Cloud's Vertex AI Search and Vertex AI PaLM Large Language Models (LLMs) Target Audience: CXOs, Directors, VPs, General Managers Background: The client sought to enhance their service desk operations by reducing the time new agents spent understanding and resolving tickets, ensuring adherence to service level agreements (SLAs), and cutting incident support costs. Challenge: Service desk agents, especially new associates, struggled to quickly access the necessary standard operating procedures (SOPs) and past tickets within the client's Confluence platform. This hindered their ability to respond promptly to customer queries and maintain SLA compliance. Solution: Wipro introduced the CORDS solution, strategically integrating Confluence and JIRA. This innovative approach harnessed both unstructured SOP documents and structured SQL database entries. The solution was designed to summarize resolutions, provide comprehensive contexts for LLMs, and generate step-by-step guidance for agents. Utilizing Google Cloud's Vertex AI Search, the system fetched relevant SOP documents tailored to each specific ticket. The Vertex AI PaLM LLM enhanced the understanding and summarization of complex SOPs, making information more accessible to agents. Results: The implementation of the CORDS solution yielded transformative outcomes: Conclusion: The strategic integration of Confluence and JIRA through Wipro's CORDS solution revolutionized the client's service desk operations. This case study illustrates how targeted technological solutions, especially those leveraging GenAI, can address specific business challenges, leading to substantial improvements in performance metrics and overall business outcomes. =====================

Sales Insight Assistant for a Leading North American Medical Devices Manufacturer

Contact Wipro Please fill the required details to access the content Sales Insight Assistant for a Leading North American Medical Devices Manufacturer Client: Leading North American Medical Devices Company Industry: Healthcare Solution: Conversational BI Assistant on GCP. This GenAI-based solution enables business users with little knowledge of SQL to query and derive value out of data existing in relational databases using natural conversation-based queries. The solution converts the queries into SQL, pulls data from the database, and present the data in tabular as well as graphical formats. Key Technologies: Google Cloud's LLM, Code Bison Generative AI model, Text Bison Generative AI model, enterprise guardrails Target Audience: CXOs and GMs Background: The client sought to empower their sales agents with a conversational assistant capable of generating SQL queries through natural language processing. This assistant was designed to streamline the process of obtaining sales insights, which traditionally required expert intervention and was time-consuming. Challenge: Previously, the client's reliance on complex, manually written SQL queries hindered their ability to swiftly derive data-driven sales insights. The existing legacy systems were cumbersome, necessitating frequent adjustments to the SQL queries by experts. The goal was to eliminate the dependency on manual SQL query writing and expedite the retrieval of actionable sales data. Solution: Wipro developed a standalone solution built on Google Cloud's LLM, tailored to handle natural language requests from users. This innovative assistant transformed these requests into SQL queries, extracted insights from the sales data, and presented the results in a comprehensible format, enhanced with relevant charts and graphs. The solution incorporated the Code Bison and Text Bison Generative AI models, alongside enterprise guardrails for responsible AI implementation and deflection logic for managing irrelevant queries. Results: The implementation yielded transformative results: Conclusion: The strategic integration of GenAI models and enterprise guardrails revolutionized the client's approach to sales strategy planning. This case study highlights how targeted technological solutions, particularly those leveraging GenAI, can address specific business challenges, resulting in substantial improvements in performance metrics and overall business outcomes. =====================

Streamlining Contract Management for a Leading North American Medical Devices Company

Contact Wipro Please fill the required details to access the content Streamlining Contract Management for a Leading North American Medical Devices Company Client: Leading North American medical devices manufacturing company
Industry: Healthcare and Life Sciences Solutions Provided: Key Technologies: Python, GCP Search & Conversation, Text Bison (LLM), BigQuery, GCS Bucket, Dialogflow Target Audience: CXOs, Directors, VPs, General Managers Background: The client aimed to reduce costs and improve adherence to policies in their supplier agreement and contract management processes. Challenge: The primary challenge was to minimize the time and expense associated with contract management while enhancing accuracy and compliance with policies. Solution: Wipro, in collaboration with Google Cloud, developed a prototype based on Google Generative AI (GenAI). The solution featured a standalone model capable of searching and displaying specific clauses from a set of contract documents and generating contract documents in plain text. Additionally, the model provided crisp summaries of Statements of Work (SOWs), generated supplier agreements, and answered general questions within the agreements. Results: The implementation of this solution resulted in: Conclusion: The collaboration between the medical devices company, Google Cloud, and Wipro led to a highly effective solution that significantly improved the efficiency and accuracy of the client's contract management. The integration of advanced AI and machine learning technologies played a crucial role in achieving these outcomes. This case study highlights the transformative potential of such technologies in optimizing business operations.

Modernize Operational Databases on Google Cloud Platform (GCP) with Wipro

Data Strategy & Planning Modernization & Transformation Data Integration & Management Operational Excellence Futureproofing Your Data Estate Contact Wipro Please fill the required details to access the content Modernize Operational Databases on Google Cloud Platform (GCP)

with Wipro In today's data-driven world, unlocking the true potential of information is essential. Legacy systems often result in data silos and sluggish decision-making. This is particularly true for databases, where migration to the cloud is key to boosting overall business performance for customers. As the adoption of Generative AI becomes increasingly widespread, transitioning to AI-enabled databases and tools is imperative. Enterprises can automate database operations and expedite code conversions through these advanced technologies, significantly enhancing efficiency, simplifying complexity, and promoting rapid innovation across the organization. The groundbreaking partnership between Google Cloud Platform (GCP) and Wipro elevates the capabilities of leveraging Wipro and Google Cloud databases to unprecedented heights. However, significant concerns loom over the migration of operational databases to the cloud, including: Wipro's Database Modernization to GCP offering, strengthened by the formidable Wipro Data Intelligence Suite, directly addresses these concerns. It meticulously streamlines customers' data estates, encompassing data stores, pipelines, and visualizations. This offering significantly accelerates the cloud migration journey by leveraging low-code/no-code tools, AI/ML capabilities, pre-built solutions, and offering multi-cloud flexibility. Importantly, it provides comprehensive guidance throughout the migration of operational databases to the cloud, ensuring a seamless transition. Wipro's Google Cloud capabilities includes wide experience in heterogenous database consolidation, with 50+ implementations. Additionally, in-house solutions and accelerators such as WDIS and Cloud Studio helps drive productivity improvements of up to 40%. Foster Innovation Automate database operations to enable faster innovation. Reduce Complexity Reduce operational overhead and complexity in managing, scaling, governing, and optimizing databases. Optimize Costs Leverage GCP's extensive portfolio of incentives to achieve near zero-cost database migration. Services Reimagine your data strategy, assess your current maturity level, and define a modernization roadmap aligned with cloud-first principles. Design and build a scalable data architecture, including data modelling, migration, performance optimization, and legacy system modernization. Implement solutions to integrate your data from various sources, ensuring seamless flow and efficient management. Leverage automation, monitoring, and best practices to optimize costs and accelerate time to market with Intelligent DevOps practices. Evolve your data capabilities, scaling your maturity level towards a next-generation data infrastructure. Contact Us =====================

Wipro Earns Advanced Specialization in AI and Machine Learning on Microsoft Azure

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/microsoft/wipro-earns-advanced-specialization-in-ai-and-machine-learning-on-microsoft-azure/ ----- Contact Wipro Please fill the required details to access the content Wipro Earns Advanced Specialization in AI and Machine Learning on Microsoft Azure This advanced specialization demonstrates Wipro's extensive knowledge of AI and machine learning, and experience helping customers deploy these technologies on Microsoft Azure cloud. Advanced Specialization can only be earned by Microsoft partners that meet stringent criteria around staff skilling and technical certifications, solution partner designation and customer success as well as pass a third-party audit of their AI and machine learning technical practices. Wipro has a strong track record helping organizations leverage AI and machine learning to address their business challenges, improve employee and customer experience – and continues to build on these capabilities. In July 2023, Wipro announced plans to invest $1 billion in AI development over the next three years, and launched Wipro ai360, an end-to-end AI ecosystem to accelerate enterprise transformation. Learn more about Wipro's AI and machine learning solutions. What the AI and Machine Learning on Microsoft Azure Advanced Specialization Means for Wipro and Its Customers Partners like Wipro with the AI and Machine Learning on Microsoft Azure Advanced Specialization have the tools and knowledge necessary to develop AI solutions per customers' requirements, build AI into their mission-critical applications and put responsible AI into action. "Achieving the AI and Machine Learning in Microsoft Azure Specialization is a proud moment for us, showcasing our deep expertise through third-party audit validation," said

Don McCormick, Vice President and Head of the Wipro-Microsoft Partnership. "It also highlights our commitment to foster a strong partnership with Microsoft, utilizing our solutions and accelerators built with Microsoft technologies to empower our clients to fully realize the benefits of AI and machine learning. This is our fourteenth Microsoft Advanced Specialization and we are honored to be recognized for our partnership with Microsoft. We look forward to continuing to work together to drive innovation for all our customers." Learn more about Wipro's partnership with Microsoft Azure. =====================

Build a privacy resilient workplace

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/microsoft/build-a-privacy-resilient-workplace/ ----- Sensitive and Personal identification data leads to significant risks. Should you fortify data privacy and protection? Build a Resilient Privacy Workplace Contact Wipro Please fill the required details to access the content Microsoft Priva and Wipro Data Privacy Services New applications and technologies have impacted digital transformations and triggered an explosion in personal data collection. But with every powerful new business capability comes new challenges. Security systems with built-in protection tools have improved but cannot keep pace with the growing number of security threats. Data-breached organizations face costly penalties, brand-damaging headlines, decreased user satisfaction, and greater government enforcement – creating an urgent need to fortify data privacy and protection programs. Wipro and Microsoft are strengthening data privacy and protection programs by combining Wipro data privacy risks services with Microsoft privacy management solutions. Data privacy presents new challenges for every organization. Wipro and Microsoft have created an eBook called "Build a Resilient Privacy Workplace" that outlines the primary obstacles IT teams face and provides a guide for monitoring all personal data shared online through emails, chat groups, and document folders, regardless of the data collection purpose. It also identifies government regulation gaps that make data compliance (or anticipated data compliance) much more complex. This eBook provides a risk-assessment framework to guide you through your data privacy journey and explains how to deploy Microsoft Priva across your workplace. Privacy can't wait – get started today! Learn how Wipro and Microsoft help global organizations build resilient privacy workplaces. Just complete this form to download your copy. For more information about Wipro Data Privacy offerings, please contact us at wipro.com/cybersecurity-experts. Download eBook =====================

Navigate Multi-Cloud Environments with Consistency and Confidence

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/microsoft/multi-cloud-environment-with-consistency-and-confidence/ ----- Contact Wipro Please fill the required details to access the content Workloads are changing, business models are evolving, and the need to distribute risk and control costs is paramount. The solution is simple: It is to choose a multi-cloud environment that is flexible, meets compliance requirements, and runs services anywhere while allowing businesses to continue leveraging their on-premises investments. How can organizations effectively manage the growing cloud complexity? Wipro FullStride Cloud Service and unified dashboard management with Microsoft Azure Arc can help organizations simplify their multi-cloud deployment. Organizations can then enjoy full control of their resources in Azure and even extend it to other public cloud platforms such as those on-premises, AWS, Google Cloud, and VMware. Download the ebook to learn how your organization can thrive amid multi-cloud complexity. It explains how to: 1. Manage infrastructure across hybrid and multi-cloud environments from a centralized dashboard 2. Choose from a mix of bare metal, Windows and Linux servers 3. Apply universal governance and security policies at scale across all servers 4. Run data services anywhere Download the ebook =====================

Wipro Launches the Azure OSDU PaaS
Competency and Experience Center

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/microsoft/wipro-launches-the-azure-osdu-paas-competency-and-experience-center/ ----- Contact Wipro Please fill the required details to access the content Wipro Launches the Azure OSDU PaaS Competency and Experience Center Wipro has been an active member of and contributor to the Open Subsurface Data Universe since its inception. The OSDU data platform is transforming energy companies around the world, yet OSDU adoption remains inconsistent across the industry. To accelerate OSDU adoption, Wipro is launching the Azure OSDU PaaS Competency and Experience Center (CEC), which will allow both customers and ISVs to explore and test Microsoft's OSDU Azure native open-source data platform in a Wipro-hosted virtual environment. This new innovation engine is an outgrowth of Wipro's FullStride Cloud Services and its strong partnership with Microsoft as an industry-leading cloud provider. The Center will be a hub for exploration,

allowing companies to explore the potential of OSDU adoption and envision how the OSDU data platform will solve core business challenges, drive upstream digital transformation, release intelligence trapped in legacy systems and data silos, and orchestrate value across operational landscapes. The new Center will allow customers to visualize: Wipro designed and developed the first releases of OSDU on Microsoft Azure and has deployed and implemented OSDU solutions for multiple oil and gas companies globally. This deep expertise, coupled with Wipro's engineering, data management and E&P consultancy capabilities, provides a 360-degree domain-driven service capacity. With the establishment of the Azure OSDU PaaS Competency and Experience Center, Wipro is ideally positioned to be the deployment partner of choice for any OSDU adoption journey. For more information, contact Wipro at info@wipro.com

Microsoft Dynamics 365

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/microsoft/microsoft-dynamics-365/ ----- Contact Wipro Please fill the required details to access the content Microsoft Dynamics 365: Building A Foundation for Collaborative Engagement Building a Foundation for Collaborative Engagement Today, a company's technology is key to keeping up with customers and operating efficiently and competitively. But legacy systems can be inflexible, making it difficult to deploy important new capabilities, such as omnichannel e-commerce and customer service, and employee and customer self-service. What's more, those systems are often not connected, making it hard to access the data needed to run the business or understand customers, leading to inefficiency, a lack of agility, and frustrated customers and employees. Wipro helps you tap into the power of Microsoft Dynamics 365 to meet those challenges and create a modern foundation for collaborative engagement. With 900 Dynamics 365 consultants worldwide, we leverage our technology and consulting expertise to deliver solutions that are tailored to your needs and connect your data, processes, and people with intelligent business applications. To help you make the most of the technology, we can assess and redesign your processes, conduct change management programs, and provide ongoing support for your systems. And our suite of Dynamics 365-based solutions cover everything from supply chain management to e-commerce, as well as solutions developed for specific industries such as retail, utilities and healthcare. With Wipro and Microsoft Dynamics 365, you can achieve a range of benefits, including:

Microsoft Business Applications

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/microsoft/microsoft-business-applications/ ----- Solutions What We Think Form Title Contact Wipro Please fill the required details to access the content Microsoft Business Applications: Transforming for the Customer Transforming for the Customer Enterprise customers have ever-rising expectations, but many companies struggle to meet those expectations. That's because functions, systems and data are often siloed. Comprehensive data about the business and customers is difficult to pull together. And older technologies are complex and difficult to keep updated. As a result, the company can't work as a coordinated team to deliver the right customer experience. Leveraging Wipro FullStride Cloud Services, Wipro helps companies leverage Microsoft Business Applications – Microsoft Dynamics 365 and Power Platform, to drive customer-centric business transformation. We build on the robust built-in capabilities of these Microsoft technologies to create solutions tailored to your business. And we can assess and redesign processes, manage the change to new technologies and provide support to help you get the most from your solutions. We also build on Microsoft Business Applications to create ready-made solutions that target key industries, such as banking and financial services, retail, manufacturing and healthcare, as well as cross-industry solutions for providing remote service for products, managing employee work shifts, and enabling people to report safety issues via their smartphones—and more. Ultimately, we help you leverage Microsoft Business Applications to: Today, a company's technology is key to keeping up with customers and operating efficiently and competitively. Today, easy-to-use, "low code-no code" application development is helping companies empower business users to use their technology to respond quickly to changes and opportunities. In a new e-book—entitled "Driving Customer Centricity Through Technology: Industry Examples"—Wipro and Microsoft explore three technology-enabled capabilities that are key to shaping and delivering a superior customer experience

Enabling M&As and Divesture with Microsoft Data Graph Connect for Data Classification

M&A and Divesture with Microsoft Data Graph Connect for Data Classification Wipro leverages Microsoft Data Graph Connect (MGDC) to classify data across Office 365 workloads for effective tenant-to-tenant migrations. Because mergers, acquisitions and divestures have considerable impact on the IT and user workloads of all companies involved, special care should be taken to ensure that disruptions are minimal – that no content is lost, that communications (especially legal, compliance, and auditory) remain open, and that operations keep running. This can be challenging, even when the organizations are migrating within the same platform. As the preferred workplace platform for global corporations, Microsoft Office 365 is integrated with many organizations' on-premise Active Directory or cloud environments. Any activity stemming from a merger or divesture therefore involves multiple teams (infrastructure, security, procurement, management, and compliance/risk) and requires a strategic, data-driven approach to navigate successfully. By combining the rich data of Microsoft Graph with the advanced capabilities of Microsoft Graph Data Connect, businesses can utilize the advanced capabilities within Office 365 like Outlook's intelligent experiences, Azure Cognitive Services language models, and AI-driven features in SharePoint, to chart a more successful course through the M&A process. To see how, consider the following example. Divesture Use Case As part of corporate strategy, a group of business units of Pharmaceutical Company A is spinning off into newly formed Company B, which Company A will later divest in to focus on other high-risk, high-reward ventures in drug development. Certain users from Company A will migrate to Company B in a new Active Directory structure, making Azure Active Directory rationalization a common thread. The Office 365 tenant and users across both companies will still need to be able to collaborate throughout the process and Azure AD will create common access for all users in these M&A scenarios. Company A, the Office 365 tenant, has a huge inventory of SharePoint Online and MS Teams sites, around 140,000, with collaboration portals and unstructured data that has been accumulating for 10-15 years. The data in those 140,000 sites has grown significantly over the last 3-5 years, so the data size is huge – tera bytes. Key Considerations A new tenant must be created for Company B and all user data and other assets must be migrated to that new tenant from Company A. All Office 365 workloads – AAD, SPO, ODB, EXO, Yammer, Teams – must also be migrated to the new tenant while maintaining the data integrity and sanctity in terms of data ownership and permissions. SharePoint Online and MS Teams are shared between Company A and Company B users, so the businesses must be able to identify the assets that belong to Company B and are available for

divestment. This requires some additional considerations for the content shared between the two organizations: Because the data size is so large and spread across the organization, the business must leverage tools, frameworks and automation to improve the productivity and velocity for this migration to classify the data for segregation. Security, in terms of content compliance and regulations, is also critical while doing the content migration. As assets are migrated, teams must be sure to maintain proper authorization rules for who can access what. Solution Framework There are four key phases to consider when outlining a migration approach: discovery and assessment, planning and design, migration and verification, UAT and deployment. Breaking down the various steps in each of these key phases can promote a more comprehensive, seamless migration. 1. Discovery and assessment 2. Planning and design 3. Migration and verification 4. UAT and deployment Conduct all necessary validations, updates, trainings to support a smooth transition: Scoping Framework for Data Classification It's important to define the business rules across Office 365 workloads for scoping the data classification patterns for these scenarios. The diagram below shows the steps in data classification for MS teams and SharePoint Online sites. In the context of M&As and divestment scenarios, it is very important to classify data across the Office 365 workloads to perform the migrations more effectively. Microsoft Graph Data Connect can help in classifying and tagging the right data by formulating and aligning with the customized business rules. Data classification and assignment to stakeholders can be fully automated with auto tagging options, and tightly integrated with third-party or native solutions, reducing manual effort for an easier, more effective data migration strategy for large tenet-to-tenet migrations. Wipro has partnered with Microsoft to define and strategize the Microsoft Graph Data Connect based solutions for more successful M&A's and divestures for data classification scenarios. To learn how, contact the Microsoft Graph Data Connect team or click the link below to schedule a demo. Contact us ======================

Is There a Better Way to Upgrade SD-WAN?

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/strategic-cisco/is-there-a-better-way-to-upgrade-sd-wan/ ----- Contact Wipro Please fill the required details to access the content Is There a Better Way to Upgrade SD-WAN? A legacy SD-WAN may be holding your business back. But

successful modernization requires updating more than your network Ongoing advancements in cloud, AI and other technologies are presenting a wealth of opportunities for businesses. But to make the most of this progress, they first need to upgrade their digital networks. Legacy SD-WAN networks just aren't flexible enough to keep pace with rapid technology advancements, sudden changes in bandwidth or the demands of today's hybrid work environments. At the same time, one-off upgrades risk making the already complex task of network modernization even more complicated, diluting returns on investment. As enterprises look to upgrade their digital networks, can they also streamline those networks? Is it possible to build an SD-WAN solution that is both more capable and easier to use? With a focus on orchestration, absolutely. Orchestration is one of the most important elements of an advanced SD-WAN, enabling teams to deploy, manage and reposition network resources in real time. Centralizing management of all aspects of an SD-WAN amplifies the benefits of a modern digital network. Greater connectivity supports the flexibility and dynamism of multi-cloud environments and hybrid work models. It also increases transparency, paving the way for greater control over operations, improved efficiency, lower costs. This CIO publication, in collaboration with Cisco and Wipro, dive into the many benefits of orchestration in a modern SD-WAN network and spotlight a powerful next-gen solution in orchestrated SD-WAN-as-a-Service . Read the full piece to learn more, including how to upgrade to a new digital network that empowers hybrid and multi-cloud applications. Download Report ======================

Driving Business Value with Multi-Cloud

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/strategic-cisco/driving-business-value-with-multi-cloud/ ----- Contact Wipro Please fill the required details to access the content Driving Business Value with Multi-Cloud Orchestrating cloud capabilities across hybrid cloud environments is the key to cloud success. After years of looking to cloud mainly as a way to boost efficiency and cut costs, enterprises are finally realizing that cloud can address more business-focused challenges such as scalability, data management, new ways of working and the adoption of new technologies. This shift in focus has opened new doors for businesses. It has also paved the way for new challenges. Hybrid- and multi-cloud environments are enabling enterprises to customize cloud environments to meet their unique business needs, but these complex environments can be difficult to manage, preventing many enterprises from making the most of their cloud investments. Before enterprises can make the most of hybrid-cloud environments, they need to learn how to streamline services and manage them effectively. "Driving Business Results with Cloud Transformation" shows how technology partners are empowering enterprises to navigate these transformations, transforming their cloud and underlying network capabilities for greater control over their hybrid-cloud environments. The report focuses on as-a-service solutions from Wipro and Cisco that enable enterprise clients to "create customized cloud journeys based upon

individual business needs and goals," giving them "a cloud-like experience from a costing perspective for their entire IT infrastructure." "Global business leaders," the report states, "outperform competitors with prudent yet bold initiatives." Read the full report to learn how cloud leaders are tapping technology partners to support such bold moves, enabling them to reduce operating costs, boost planning and decision-making, and improve risk management and compliance efforts . Improve customer consistency, efficiency, proactively and with complete visibility by harnessing the power of ServiceNow. Expand your business capabilities, extend your operating efficiencies, and increase stakeholder experiences. Bring power to the people by optimizing the employee experience and enabling global shared services. Elevate your financial operations with automation, analytics, and streamlined processes with AI-driven automation. Optimize supplier relationships and proactively manage risk while harnessing the power of AI for smarter decisions. Embed risk and resiliency best practices into your day-to-day operations; manage risk in real-time. Case Studies Featured Resources ServiceNow and Wipro are revolutionizing Global Business Services (GBS) with their innovative partnership and vision by creating engagement platform that enables faster, efficient work for both employees and customers. By adapting to the customer needs in the world by leveraging the ServiceNow Platform's powerful features and Wipro's digital expertise enhance the customer and agent experiences with AI, robotic process automation, and machine learning. These technologies help automate workflows, optimize processes, and provide insights and solutions. Contact Us =====================

Transforming the Employee Experience

Solutions Contact Wipro Please fill the required details to access the content Transforming the Employee Experience In an era of changing employee expectations and unprecedented levels of employee attrition, providing connected and unified employee experiences has become critical-and a competitive necessity. A key element in that experience is the nature of employees' interactions with the company, ranging from setting up medical leaves and vacations to changing payroll deductions and updating their HR profiles. Too often, however, these important "moments that matter" require employees to navigate through a complex array of HR, payroll, IT, legal, management and facilities systems. The result: A negative experience that leaves employees frustrated and unhappy. Wipro helps companies like yours transform the employee experience to improve employees' work lives. We define and map the ideal employee journey, and then use the Now Platform from ServiceNow and predefined employee workflows to design, architect and build the right solution for your company. This gives your employees a powerful "system of engagement" that manages the complexity of various back-end systems through a single intuitive solution, creating a simplified, faster and more seamless experience, whether they work onsite or remotely. With Wipro's approach, you can: Building a high performance enterprise workforce Empowering on-boarding teams and new-hires with digital capabilities of ServiceNow ======================

Bridging the Gap

About the Author Contact Wipro Please fill the required details to access the content Bridging the Gap One of the biggest challenges for businesses when it comes to meaningfully engaging their customers is the messy middle, or middle- and back-office process integration and flow. Businesses make significant investments in enterprise service management to promote digital customer engagement, but experiences can be underwhelming due to disjointed systems and processes with many manual steps. By not addressing the gaps caused by this messy middle, businesses risk lackluster engagements with their customers and employees. Unfortunately, many businesses merely mind the gap rather than trying to bridge it, leading to pressing challenges that can negatively impact the brand immediately and down the line. Rodney Hobbs, Chief ServiceNow Technologist for Wipro APMEA, describes the mindset shift that businesses must undergo to develop more meaningful, digitally enhanced customer experiences, and explains how a strategically implemented digital fabric can help them bridge costly gaps in their enterprise layer. "Organisations need to change their mindset, not only their toolset. They need to move from disjointed, siloed operations, to a

frictionless, interconnected, hyper-automated system of action that allows processes to be carried out seamlessly across the enterprise." Read the full piece to learn how businesses can initiate this shift and bridge the gaps to deliver more successful, personalized customer experiences. Download Now =====================

Enhanced ERP Transformation with Clean Core and ServiceNow

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/servicenow-alliance/enhanced-erp-transformation-with-clean-core-and-servicenow/ ----- Contact Wipro Please fill the required details to access the content In today's digital age, businesses need to be agile to stay competitive, and this requires streamlined systems that can adapt quickly to changing business needs. However, organizations with heavily customized SAP environments often struggle to maintain their systems, leading to poor performance and high maintenance costs. A clean core approach can help organizations declutter core systems, remove customizations and streamline the SAP core, yet for many organizations, the process can seem too daunting to start. With a full suite of capabilities and solutions, the ServiceNow platform can serve as a system of action for ERP modernization, helping to get it started and ensure a smooth, efficient transformation throughout. Rodney Hobbs, Chief ServiceNow Technologist for Wipro APMEA, describes how organizations can utilize these ServiceNow capabilities to declutter the core, refine operations – even deliver a more compelling engagement layer to enhance customer experience. "The ServiceNow platform provides a range of benefits, including increased agility and reduced risk. The platform can be used to automate and orchestrate workflows across departments and throughout the organization, resulting in improved collaboration, increased productivity, and better customer experiences." Read the full piece to learn how businesses can utilize ServiceNow to accelerate their ERP transformations. =====================

How to Elevate Your Customer Experience and Efficiency in Field Service with Wipro and ServiceNow:
Download the Solution Brief

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/servicenow-alliance/wipro-and-servicenow-unlocks-field-service-excellence/ ----- Contact Wipro Please fill the required details to access the content Wipro and ServiceNow Unlocks Field Service Excellence Field service organizations are grappling with a few challenges, ranging from digital

expansion to complex risk management. The eBook underscores how ServiceNow, alongside its technology partners, is striving to address these issues and propel innovation in field service management. However, the true value lies not just in the solutions themselves but in their correct implementation within your organization. That is where Wipro, in partnership with ServiceNow, comes in. Our focus is on empowering your workforce, streamlining processes, and enhancing customer satisfaction through solutions like Augmented reality (AR), Artificial intelligence (AI), and IoT (Internet of Things) sensor capturing capabilities. 1. Upskill Your Workforce Bridge the expertise gap by fostering knowledge sharing, enabling remote support and empowering on-site technicians with interactive 3D augmented reality (AR) models. 2. Proactively Detect and Resolve Issues Harness the power of IoT sensors to schedule timely repairs, diagnose problems remotely and optimize field worker efficiency. 3. Improve Efficiency Enable self-service for end-users, streamline processes and increase first-visit resolutions though the use of Augmented Reality. Wipro, in collaboration with ServiceNow, offers a comprehensive suite of field service solutions, including: Access our eBook to explore how Wipro and ServiceNow can revolutionize your field service operations. Elevate your customer experience, cut operational costs, and stay ahead in the ever-evolving field service landscape. It's time to work smarter and achieve field service excellence. But as apps grow in capability and complexity, they can become difficult to maintain, secure, and debug. Our application management services provide ongoing, specialized support for enterprise apps, including monitoring and releasing patches, writing code, managing projects, and running applications. We're ready to build a supportive partnership with you that accelerates the value of your organization! We can provide a complimentary IT infrastructure or applications audit. Outsourcing Is Sound Business Leveraging our management services liberates internal IT teams and other employees, enabling them to focus on driving business growth, instead of app maintenance. When it comes to ensuring apps deliver reliable, high-quality performances, Wipro provides the expertise needed to keep business operations running as expected and continually evolving as new versions and security updates are released. Enterprise Asset Management (EAM) Services Wipro EAM consultants have extensive experience in strengthening productivity and minimizing operational costs across various industries, including manufacturing, healthcare, facility and utility management, equipment rental, fleet, and oil and gas. Using the Hexagon EAM solution, we provide application development and management services that help modernize asset monitoring operations, and with our AI/AR and IoT-based platforms, Wipro offers a comprehensive approach to enterprise asset needs. =====================

Transformer Monitoring: The Key to Smart Energy Management

The global energy consumption is estimated to be 580 million terajoules per year, with about two-thirds accounting for electricity consumption alone. Global electricity generation is expected to reach nearly 45 trillion kilowatt-hours (kWh) by 2050. The demand for energy is ever-increasing. The pandemic put a brief pause on this growing demand, with a fall of 1% in 2020, but it came back up quickly and is expected to grow by 4% this year. The usual suspects – population, economic development, and advances in technology – are the key drivers for this growth in demand. How is this energy produced? Today, much of the energy consumed is sourced from fossil fuels such as oil, coal, and natural gas. High energy-consuming countries such as China, India, and the US are still reliant on fossil fuels, with 71% (China), 59% (India), and 61% (USA) of energy coming from these sources. However, fossil fuels are rapidly depleting and also hampering climate goals. Governments and organizations worldwide have recognized this and are equally and heavily invested in identifying new sources of energy - sources that are cleaner for the environment and the planet. Energy generation from renewable sources such as wind, sun, and water is set to increase over the next few years. Renewable energy sources accounted for close to 30% of the global electricity generation in 2020. By 2050, renewable sources are expected to contribute to 80 to 90% of global energy consumption. There are, of course, several challenges to the widespread adoption of renewable energy sources - the prohibitive cost of installation, their distributed nature, the need for new transmission infrastructure, unpredictability due to weather, political influences, and market conditions. Given this juxtaposition of factors, governments and energy bodies globally urgently need a solution to optimize energy production, distribution, and consumption from multiple sources. Enter Smart Grid: The way forward for smart energy management This is where Smart Grid comes in. A Smart Grid is an electrical grid with automation, communication, and technology that help monitor the flow of power from its point of generation to the point of consumption, thereby controlling or curtailing the load to match the generation of power in real-time. Primarily leveraging IoT technologies, a Smart Grid helps to proactively detect and respond to consumer needs. It enables analysis, and communication of information to enhance efficiency and transparency across the supply chain, optimize energy consumption, and improve the reliability of the supply. Smart Grids help to make transmission efficient, identify and resolve outages, predict the peaks and troughs in demand to optimize utilization and reduce wastage, improve operational costs for utility companies, and enable smoother integration with renewable energy systems. In this way, Smart Grids provide the advantage of connected distributed energy resource assets, including renewable energy sources. Efficient transformer

monitoring at the core of the Smart Grid Transformer monitoring is a key element in the move toward Smart Grids. It provides power producers the transparency to make critical decisions on power production and optimize power consumption. Transformer monitoring also enables demand analysis - what is being consumed by every household or industry or commercial establishment, in which areas is the consumption higher, and what are the peak periods of demand. Let's take a look into the types of transformers that utility companies typically deal with: Electrical transformers constitute the largest share of investments in any utility system. Hence, replacing the electrical transformers frequently for better efficiency is an expensive proposition for most industries. The average lifespan of a transformer is 30-40 years. However, the costs of transformer failure are high, up to $15 million. So, it's critical to ensure that the best monitoring and control system to maintain the transformer is in place. Globally, transformer fleets are operated beyond their designed life and with higher average loads resulting in catastrophic failures. Causes of transformer failure There are several reasons why a transformer fails. Evaluating aspects such as the technical condition of the transformer, based on an analysis of its make and model, features, number of years of usage, location, and other factors can help determine the risk. Figure 1 gives an overview of the key technical causes of transformer failure. When it takes 7 days or more for investigation, remedial work, or replacement, it is considered a major failure on a transformer. To mitigate the risk of failure, it's important to determine the probability as well as the consequences of failure. Unexpected failures can also have significant cost impacts. How transformer monitoring systems help to optimize power distribution and usage As renewable energy sources are increasingly providing power across the globe, the distribution systems are also changing. Hence the greater role of transformer monitoring. Transformer monitoring can be done in two ways – offline and online. Offline monitoring allows technicians to perform condition testing without any constraints. However, the major drawback is that the transformer has to be taken off the grid, which is both cumbersome and expensive for the power company. Online monitoring leverages technologies that don't require taking the transformer offline. In addition, the offline monitoring system can only provide a historical overview of the health of the transformer, unlike an online monitoring system, which can provide updates in real-time. The former can lead to the aging and deterioration of insulation which causes the most catastrophic transformer faults. With an online system, real-time interventions can help predict failures and plan for such events. For producers of power from renewable sources such as wind and solar energy which are unpredictable, the ability to predict transformer failure and proactively repair or replace parts, especially when the energy is not being produced, is invaluable. Hence, with an online monitoring system, the standard offline diagnosis limitations can be easily mitigated. In a nutshell, an online monitoring system: Powering into the future with Smart Grids Given the prohibitive costs of replacing a transformer as well as the cost incurred in maintaining them to last an expected lifespan of 30-40 years, transformer maintenance is key to profitability for utility companies. However, costs are not the only aspect of transformer maintenance. With the increasing demand for energy resources, downtime or outages are not an option. The world's reliance on fossil fuels will eventually reduce, and renewable energy sources will contribute significantly to energy production.

As we move towards this scenario, optimum utilization of all the resources with minimal wastage is a priority for all concerned. Leveraging new-age technologies such as IoT, automation, and even AI or ML, to make the Smart Grid even smarter and for effective online monitoring of transformers is the way forward. Purushottam Konar Purushottam is the Global Head of Product and Solutions Engineering at Wipro. He has over 22 years of experience in design, development and deployment of enterprise solutions and products for large multifunctional organizations across different verticals. Transforming Legacy Estate for the Journey to Cloud

----- Arcticle source ----- https://www.wipro.com/infrastructure/transforming-legacy-estate-for-the-journey-to-cloud/ ----- About the author Contact Wipro Related Blogs Optimizing Field services Through AR Transforming the leave-of-absence experience into an employee-retention tool A Smarter Way to Collaborate and Build Applications with Azure DevOps Please fill the required details to access the content Transforming Legacy Estate for the Journey to Cloud Digital transformation as a buzzword has been around for a while now – 70% of companies had a digital transformation strategy in place even before the pandemic . However, the pandemic accelerated and accentuated the shift toward digital transformation propelled by the need for agility to adapt to the 'new normal' of work and life as well as the onslaught of new connected technologies including 5G, Edge and other AI-powered solutions. In most instances, digital transformation is a gradual evolution, a process where organizations leverage digital technologies consistently to transform their existing legacy business processes and services to meet evolving market and customer needs. To be truly successful, this evolution requires a paradigm shift in the way businesses operate and deliver products and services to their customers. Digital transformation drives innumerable benefits for organizations including real time access to vast amounts of data, as well as scalability, agility and innovation. With data-driven insights, organizations can understand customers better and align business strategies for success. Accelerating digital transformation with the cloud Today, organizations are focusing on agility and leveraging automation to facilitate faster time to market. The cloud is a key driver for this renewed focus and forms the foundation for the new agile business world. For organizations that have depended on traditional data centers, migrating mission-critical IT workloads to the cloud helps meet the need for agility and scalability. Is cloud adoption easy? Is it for everyone? The statistics are overwhelming and the writing on the wall is clear. There is no doubt that the cloud is the way forward. And yet, there is no single proven framework for the success or type of cloud computing that works for enterprises. There are different computing models and services

that have evolved to meet the technology demands of organizations. Primarily, enterprises choose between three options for cloud deployment methods —public cloud, private cloud, or hybrid cloud. In addition, service models could range from software as a service (SaaS), infrastructure as a service (IaaS), or platform as a service (PaaS). The deployment methods and services depend on business needs. However, for organizations, the choice is far from being simple, given the history of their tech stack and existing infrastructure provisioning. Let us examine some history of the evolution of cloud migration to understand why the cloud migration journey can be complex for organizations. Over seven decades ago, IBM led the pack in creating the computing age and developed critical applications, sophisticated modeling for large scale transactions, and workloads for large organizations as this offered stability, security and scalability. There have been several innovations and developments in the computing world subsequently, but the mainframes have prevailed. Consider this: about 67 of the Fortune 100 and 45 of the 50 top banks are still on mainframe servers. However, the mainframe servers did not address the needs of medium to small sized businesses. And so, the IBM Power processor was launched in the 1980s, in the RS6000 and AS400 servers. The RS6000 was running AIX, IBM´s Unix version and the AS400 was designed for OS400 (now called IBM i). Organizations are looking at migrating IBM Power workloads to the cloud to improve flexibility and reduce risk. They also seek cloud-native services that enhance core business applications and support agile development and innovation. The cloud also ensures high availability and disaster recovery capabilities for business connectivity. Plus, several businesses run traditional and mission-critical applications on these servers. However, a lift-and-shift approach is challenging for the IBM Power workload migrations, given that these applications are written for IBM Power Systems server hardware. And moving them to the major public clouds cannot be done without refactoring and rewriting significant amounts of application code — associated resource, time, and cost considerations are also significantly huge. How to bridge the need gap in cloud migration Skytap on Azure is a cloud computing service that runs traditional enterprise workloads natively in the cloud. Skytap allows companies of any size running IBM AIX, IBM i, Linux based operating systems, or traditional x86 workloads to easily migrate workloads to Azure. It helps to mitigate risks in the migration, reduce complexity, and minimize disruptions to business continuity. The Skytap environments replicate on-premises data center environments, including infrastructure, storage, networking, OS, middleware, memory state and applications. Organizations can migrate complete environments with agility, depending on the size of the workload. With Skytap, companies get access to core cloud infrastructure capabilities including capacity on-demand, self service provisioning, high availability, and associated benefits. In addition, organizations can also manage the diverse portfolio in their IT landscape. With Azure, these organizations can leverage the benefits of the cloud faster and innovate better with the integration of existing legacy applications to other Azure services. Skytap enables IBM Power workloads to run on Azure without any rewriting, thus creating a faster path to the cloud at lower costs. It provides developers with the ability to innovate across these applications at speed and scale through integration into Azure's full suite of other services such as analytics and compute, along with the added benefit of instant core cloud

infrastructure capabilities. Further, Skytap provides opportunities to: A new lease of life to traditional infrastructure with Skytap on Azure There are several use cases for leveraging Skytap on Azure that can enhance the migration of existing enterprise workloads to the cloud and enable smoother functionality: Wipro is a certified Microsoft Gold Partner and MSP expert. Wipro, Skytap and Microsoft Azure provide a joint service framework that helps reduce lead time and effort while enabling our customers to scale the application to production easily and quickly with enterprise-wide service level agreements. Wipro's research revealed that companies expect success from their cloud journeys, and 80% of them expect the cloud implementations to be partially completed, if not fully on the cloud. The goal of any transformation initiative is to modernize applications to gain greater insights into the business through the availability of data-driven insights. A fragmented application landscape across different infrastructure does not allow the business to deliver on its goals. Hosting a few applications on the cloud and some others on an on-premises, mid-range server may lead to security risks, not to mention that gleaning data to gain business focused insights would be difficult. Hence, leveraging Skytap on Azure helps enterprises truly realize the benefits of the cloud. To know more, please get in touch with us at Azure-Marketing@wipro.com Rajiv Kumar GM & Presales Head - Cloud, Cloud & Infrastructure Services, Wipro Rajiv has about 23 years of experience in the IT Industry. He has played a crucial role in developing next-generation transformative offerings like Azure Stack and rapidly growing the cloud practice across geographies. He is a member of the Association of Enterprise Architects and has many leading certifications like TOGAF, Azure Cloud architect Expert, Google Professional architect and AWS Solution Architect. In the evolving landscape of digital workplaces, efficient field service operations are critical in ensuring reduced downtime... appy employees usually stay at their jobs, frustrated workers often don't. Chief human resource officers (CHROs) tell us that the corporate leave of absence (LOA) process is one of the most common sources of employee frustration. Employees often rank their LOA experiences low on the satisfaction scale, using descriptors such as complicated, confusing, inconsistent, time consuming, and unresolved. In a world where business is evolving at the speed of thought, rapidly changing market conditions pose several challenges for enterprises across industries.

The Future of Work: Redefining Employee Experiences in the New Normal

----- Arcticle source ----- https://www.wipro.com/infrastructure/the-future-of-work-redefining-employee-experiences-in-the-new-normal/ ----- About the author Related Articles Contact Wipro Please fill the required details to access the content The Future of Work: Redefining Employee Experiences in the New Normal August | 2022 A hybrid workplace is becoming the new norm. The pandemic acted as a catalyst in accelerating the remote work

model much faster than most enterprises and employees anticipated. The Microsoft Work Trend Index for 2022 — covering 31 countries and backed by an analysis of "trillions of productivity signals in Microsoft 365 and labor trends on LinkedIn" — found that 53% of respondents are likely to consider transitioning to a hybrid model in the year ahead. The report correctly called this an inflection point. Enterprises worldwide are discovering that the remote work model is more than a solution to a one-time crisis. It is also prompting enterprises to lean more heavily on digital and accelerate their transformation journeys. While hybrid is expected to be the default work model by 2024, businesses are struggling to adapt, with 72% of businesses still lacking a clear hybrid work strategy. Many are apprehensive about switching to a hybrid model because it impacts every aspect of their organization's infrastructure. Even minor flaws in strategy and technological choices could affect employee productivity and impact device, application, network, and data security. Our experience shows that enterprises focusing on digitization initiatives powered by cutting-edge workplace technologies such as Artificial intelligence (AI) and Machine Learning (ML) for automated workflows are finding success. Creating an efficient hybrid work model Wipro's implementations of hybrid work technologies for global industry leaders show that success requires a focus on three vectors: Leveraging the possibilities of remote management A critical fabric of the remote-first mindset is a change in the technology used by the workforce. Employees demand devices that offer ease of use and seamless experiences. However, ensuring the security of remote devices without interrupting the workforce from doing their job poses a challenge to IT teams. Astute investments in remote management solutions must be made in sync with the changes in technology used by the workforce. These solutions should maintain security while improving employee experience and safety. Our collaboration with Intel and VMware allows us to harness cutting-edge technologies for remote management. Solutions like Intel vPro® platform and Intel® Endpoint Management Assistant (Intel® EMA) enhance remote field support services with both in-band and out-of-band remote management capabilities. This enables IT teams to be smarter, faster, and more efficient with remote troubleshooting. Similarly, VMware Workspace ONE® Intelligence™ suite offers data-driven insights to improve employee experience, strengthen security compliance, and optimize business operations. Technological choices are crucial to ignite and build a remote-first organizational culture. Cloud-native, zero-trust security is paramount to a hybrid workforce. The right technology partners enable enterprises to empower on-site and remote employees to go about their jobs efficiently and securely without additional stress or interrupting their regular work patterns. We believe that three aspects will define the future of the workplace: To make the right strategic choices that enable a hybrid workforce and select the most appropriate remote management solutions, tune into this Prediction Panel on Driving Workplace Dexterity: Modern Manageability at the Edge for a Productive, Distributed Workforce — that features Sidharth 'Sid' Mukherjee—GM and Global Practice head for digital Workplace Services at Wipro, Yasser Rasheed— Global Director at Intel, and Josh Olson—Global Director at Intel Corporation, Experience Solutions & GSI Sales at VMware and Mrinal Rai – Senior Manager and Principal Analyst at ISG. Sidharth Mukherjee Sidharth Mukherjee, Global Practice Head of Wipro's Digital Workplace Services, is a dynamic leader and a true technology enthusiast at heart. He comes with

more than 18 years of rich, holistic experience in driving cutting-edge cloud and infrastructure services transformations for Fortune 500 organisations. Sid has a passion for delivering "what's next" and technologically improving "what's now" for enterprises, while keeping a keen focus on employee experience and innovation. He has an academic background specializing in IT & Management and is currently engrossed in harnessing the power of AI, cognition, blockchain and analytics to create an intricate workspace metaverse aligned to the future of work. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. AIOps & Observability – Journey Towards Business Composability

----- Arcticle source ----- https://www.wipro.com/infrastructure/aiops-observaility-journey-towards-business-composability/ ----- About the Author Related Articles Contact Wipro Please fill the required details to access the content AIOps & Observability – Journey Towards Business Composability August | 2022 Business composability provides flexibility, agility, and the pace for business applications. However, with distributed architecture accompany the challenges of governance, security, and an immense pool of data. AIOps & observability plays a vital role to address these challenges. Organizations with high composability have seen better success rate than their peers. They are faster and more effective at developing new partnerships, pursuing new opportunities, offering innovative products and being more responsive to customers and clients. Why the composable enterprise is necessary for organizations Digital transformation from monolithic applications to a composable enterprise model opens up new possibilities to integrate business applications with new technologies at a competitive pace to serve customers. Flexibility - A composable business enterprise provides a platform to incorporate new age technologies. The modular structure makes it easier to implement the best fit tools and technologies to create a robust system. A large enterprise becomes a structure of smaller independent blocks, making it simpler to upgrade, replace, or decompose the block as needed. Innovation - A composable enterprise encourages new skills and talent among their staff, and provides them a platform to experience with minimum risk of failure and effect on other business lines. Faster releases - The composable approach to development allows enterprises to release new features and updates as a packaged business capability with a faster rate due to reusable code and modular design principles. Happier customers - In this competitive world, it is important to cater to each customer's need with agility. The composability in structure provides the ease of creating customized requirements for each

of the customers with the modular approach enabling it to be delivered at pace. The capabilities can also be provided to customers as self-service tools empowering the customer to choose the features as per need. Future state vision - The composable approach induces functional independence at each layer of the business applications and process, simplifying it for the future. This could include upgrading the technology stack, introducing new features, migrating to new cloud provider or coming up with a new line of business altogether. This helps the enterprise to be always ready to embrace any new futuristic trends to remain cost effective and upbeat in the market. How Wipro's AIOps and observability framework helps in building composable enterprises Every business has data, and data is what AIOps consumes – understanding and using it to empower operations to become more durable, adaptive, and agile. AIOps enables real-time efficiency of digital operations, microservices and cloud computing, further driving composability. Wipro's AIOps & Observability framework is designed to offer you the three key features to achieve composability: Data collection and analysis - AIOps work on two basic principles: data collection and data analysis. Data collection needs visibility across the complete stack. The massive data collected needs to be stored and analyzed, requiring enormous algorithms based on AI/ML to process and generate crisp and contextual insights for various persona in the organization. Wipro's Observability solutions provide the mechanism to collect all metrics, logs, traces, and events, giving complete insight of what is happening in the system and its connected systems. AIOps provide the powerful AI/ML algorithms for data analysis for deducing predictions and reliability signals. Wipro's AIOps & Observability framework is designed based on the concept of data-lake where the data is ingested from numerous sources, analyzed via ML models to provide actionable insights to various personas such as business, DevOps and Site Reliability Engineers (SRE). "Monitoring as a code" - Wipro's AIOps breaks the standard barrier between ITOps and DevOps by injecting monitoring with development, making it an integrated part of CD/CI pipeline increasing the possibilities for tracing through the code. This increases the observability at each layer of the application enabling a better insight to govern and track any changes in an application, real time, making the system more reliable for business. Wipro's AIOps provide a second level of tracking via its intelligent change analytics offering which helps SRE trace both authorized and unauthorized changes. Orchestration - Due to the composable nature and high complexity of data generated, automation and orchestration play a key role in ensuring the equilibrium on constant enhancements (deployment of new features) and maintenance of existing ones. Wipro's Observability framework provides constant feedback for identifying the improvement areas while AIOps provide tools to automate and orchestrate the environment. Wipro's "No Ops" make the system self-resilient by performing auto remediations using AI based recommendation actions.   Enterprises working toward a composable business should assess not only their processes and functions but also their maturity with AIOps and Observability, considering that observability needs to be present in the organization's DNA, tracking each module for security and performance. Wipro's AIOps & Observability self-assessment tool kit is just the right tool to help you to measure the maturity not only in ITOps but across all practices such as DevOps, SecOps, Cloud Ops and SRE. AIOps makes IT operations more self-governing and well-orchestrated within the business.

Embark with us on journey to business composability. Check our AIOps & Observability offering at Wipro Business service management solutions | AI for IT operations - Wipro Ankur Jalpota Global Practice & Delivery Head for BSM & AIOps, Wipro Ankur works with technology partners in advancing and modernizing the tooling space and aligning the overall offering with the ongoing evolution journey. He is an evangelist for humanizing technology that focuses on end customer usability and ground level business impact. Ankur has played key roles in developing next-generation transformative offerings and executing growth strategies at Wipro in AI & cloud. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. ===================== ----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-fullstride-cloud-services-and-skytap-on-azure/ ----- What We Think Contact Wipro Please fill the required details to access the content Find out how businesses can increase the resilience and speed for their IBM Power workloads in the cloud. Most Fortune 500 companies are missing out on the full range of cloud benefits, running their traditional business-critical applications in the data center on AIX, IBM i, or Linux on IBM Power Systems. Taking your company to the cloud unlocks immediate benefits, keeps your business agile and scalable, and saves you money—so why wait? With the help of Wipro Fullstride Cloud Services and Skytap on Azure, you can move IBM Power to the cloud right away, with minimal risk and no refactoring. In addition, Wipro's partnership with Microsoft spans two decades, where we have jointly helped our clients enhance their customer experience and delivered connected insights and focused outcomes. Leverage the combined power of the Wipro FullStride Cloud Services and Skytap on Azure joint services framework to reduce lead time and effort. Download the ebook now to learn the following: 1. How to future-proof your business with cloud migration 2. The steps being taken by businesses to leverage the power of Azure, improving operational efficiency, and eliminating management costs 3. What experts in the industry are recommending to help enterprises unlock new value and successfully build in the cloud =====================

4 strategies for sustaining a secure, flexible financial workplace

----- Arcticle source ----- https://www.wipro.com/infrastructure/4-strategies-for-sustaining-a-secure-flexible-financial-workplace/ ----- About the author Contact Wipro Related Articles Optimizing Field services Through AR Is your Mobility Landscape Harnessing the Full Potential of Mobility Managed Services & Security? Addressing the Next Big Puzzle for Application Agility

in the DevOps Era with Distributed IT Please fill the required details to access the content 4 strategies for sustaining a secure, flexible financial workplace September | 2022 Almost three quarters (74%) of banks and insurers in the UK have experienced a rise in cyber-crime since the pandemic. More than two-fifths (43%) believe that remote working models - with work systems being moved online more than ever before - are to blame for making their organizations less secure. In part, this is due to many banks having quickly implemented a remote working model to satisfy employee and business needs during the pandemic. An often-piecemeal approach to delivering this model meant that the attack surface expanded and exposed gaps within a long-term security strategy. While these remote models worked in the short term, they were not future proof. When cybersecurity risks increased, the banking industry experienced a 1318% increase in ransomware attacks in 2021, according to a Trend Micro report. How can banks ensure they are not only protecting sensitive data right now, but managing security effectively for the next five years and beyond? And how can they do so without impacting the user experience and collaborative capabilities of hybrid workforces? This is a particularly pertinent question for IT leaders, with almost four fifths (80.7%) claiming they are finding it more difficult to spot IT security or business risks brought about by employees working as part of a hybrid workforce. This is where great user experience and workspace security become symbiotic; remote workers faced with obstacles thrown up by inefficient access to systems might take digital shortcuts. Simple examples of this include the use of insecure file-sharing tools, signing up for said tools with personal email addresses, or using a BYO device already infected with malware, which could potentially steal data unbeknown to the user. So how can organizations simultaneously ensure that workplaces have the right virtual collaborative tools and infrastructure to adapt to changing workplace dynamics? How to find harmony between seamless access and robust security As the tension builds between C-suite executives calling for seamless access for employees to drive retention and attraction, and IT leaders - who need to maintain application and device security across cloud-enabled dispersed networks - financial institutions need solutions that create harmony between these conflicting priorities. Banks, financial services and insurers, who want to build a holistic, future-proof security strategy that does not restrict user freedoms, will be required to implement proactive monitoring, collaborative, flexible, yet secure technologies, which can be accessed everywhere to improve employee experience (EX) and productivity. These are the four key steps IT decision makers can take to deliver a successful transformation from the 'sticking plaster' measures of the early pandemic to a future-proof model: Choosing the right partner can relieve the challenge of mitigating threats. Leveraging the power of advanced technologies to lead your organization into a successful future isn't difficult with the right partner to support you. Indeed, it presents banking, financial services and insurance organizations with many exciting opportunities - not least the chance to liberate employees from stale working practices and offer true flexibility around when, where and how work gets done. By harnessing the right tech and taking advantage of managed consultancy services, the sector can put in place a strategic vision to balance the twin priorities of seamless user experience and robust cybersecurity. Wipro and Citrix have partnered for over a decade to help enhance business outcomes for some of the biggest

names in the banking, capital markets and insurance sectors. To find out how you can benefit from a secure hybrid work solution with superior user experience, visit our dedicated banking, financial services and insurance site. Gopal Tadepalli Gopal Tadepalli heads Global VDI sales at Wipro Technologies. He leads VDI practice and business development along with delivery. With more than 25 years of experience in the IT industry, he worked on End User Computing transformations such as User experience management, Digital workspace, DaaS, VDaaS, Cloud journey etc., in the last 15 years. In the evolving landscape of digital workplaces, efficient field service operations are critical in ensuring reduced downtime... Enterprise Mobility Management (EMM) involves the process management and IT services needed by any organization to acquire, provision, and support the mobile devices (tablets, smartphones etc.) and other devices used by the organization's work force. Digital transformation and end user experience drive businesses to innovate with new applications and enhance core applications flexibility. ======================

Pillar focus: Hybrid cloud and service delivery

----- Arcticle source ----- https://www.wipro.com/infrastructure/pillar-focus-hybrid-cloud-and-service-delivery/ ----- About the author Contact Wipro Related Articles Optimizing Field services Through AR Is your Mobility Landscape Harnessing the Full Potential of Mobility Managed Services & Security? Addressing the Next Big Puzzle for Application Agility in the DevOps Era with Distributed IT Please fill the required details to access the content Pillar focus: Hybrid cloud and service delivery How a secure hybrid working model helps insurers attract talent and reimagine service delivery September | 2022 As the insurance industry continues through radical technology transformation - with 85% of insurance CEOs saying the pandemic has accelerated digitization of their operations and creation of next-gen operating models, according to KPMG - much of the current focus is now on rebuilding the talent acquisition processes and pipelines. As insurers look to increase their number of digital employees and attract top talent, they need to enable a flexible, hybrid working policy. And to do this, they must offer a hybrid working environment, which allows staff to thrive from wherever they work, while remaining fully compliant as they fulfil customer requests remotely and collaborate with dispersed colleagues. In fact, since the pandemic, insurers have successfully transformed their service delivery models in line with their hybrid workforce needs, providing remote insurance advice, and the ability to handle policy sales and routine claims management remotely. However, insurers now need to be able to integrate new platforms and applications without compromising network reliability, customer, and employee experience, and the security of highly confidential information. Doing all this is key to transforming the short-term success of pandemic adaptation into the long-term triumph of hybrid working. So, how can insurers continue to deliver new, secure, digital services while guaranteeing that functions can be fully deliverable from anywhere, over any device? To ensure seamless delivery for back-office

functions, such as claims processing and policy underwriting, and customer-facing functions - such as customer onboarding and claim submission and settlement - firms need a hybrid cloud solution that guarantees continuous superior service delivery, next-level security and reliability. As a number one priority, insurers should invest in hybrid cloud technology to fuel the service reliability that powers their essential offerings and products of differentiation. The key is leveraging the right tools, such as Virtual Desktop Infrastructure (VDI) or next-generation Desktop-as-a-service (DaaS) - a plug-and-play preconfigured delivery models that offer a unified control plane for any workload, whether working on the Cloud or Hyperconverged Infrastructure (HCI). These solutions will power liberated and secure hybrid workforces - along with driving seamless user experiences and product differentiation, and elevating service quality. There are three key considerations for insurance firms to make when deciding on which technology to invest in: 1. Open finance models, hybrid working, and hyper personalization using data, analytics, AI and automation to provide relevant and timely targeted customer experiences are examples of insurance industry trends that continue to gain traction. However, for an insurance organization to continue to innovate and stay ahead of the curve in these areas, advanced hybrid cloud infrastructure - with the power to adapt, scale, and inter-operate to meet changing demands - is a pre-requisite 2. When time to market, guaranteed performance, and scalability are primary indicators of success, a plug-in-and-play preconfigured delivery model such as an integrated Desktop as a Service (DaaS) solution can empower insurers to overcome complex implementation projects quickly. With this kind of delivery model, insurers can virtualize, manage, stream, and remotely display applications and desktops with minimal upfront costs and no deployment delays. 3. Adopting a managed approach, with an outcomes-based focus, can prevent downtime in the migration process and enable teams to work productively. Additionally, as the need for technological skills in the sector is set to increase by more than half (55%) through to 2030, process standardization and automation can bridge the labor gap in manual processes. As the talent squeeze continues across many verticals, it will be vital for insurers not just to enhance the user experience for employees but to also account for gaps in the workforce - the gaps where they don't have the resource to implement these solutions - by partnering with the right managed services providers. Implementing these measures will realize two vital goals for insurance firms: 1) the ability to retain and attract top, digitally savvy talent - and 2) the ability to guarantee optimized service delivery for customers. With the nature of insurance not defined by an exchange of physical products, it's vital the sector differentiates itself in the form of superior experiences. For customers this looks like the provision of a quick and highly personalized service, underpinned by flawless connectivity. For employees this looks like seamless network connectivity, which enables collaboration across dispersed teams, end-to-end visibility, security - and the flexibility to work from anywhere on any device. Successful hybrid working can also broaden the potential talent pool available to insurers, who will no longer be limited to hiring based on geographical location and can instead look further afield to find the best possible people to drive their organizations forward. And with the capacity to continually optimize service delivery and bring new products to customers, firms can simultaneously drive business outcomes - such as higher revenues, lower cost-to-serve and

better retention. Recent research from Statista reveals that more than half of senior insurance executives surveyed globally said their employees would follow a hybrid work model throughout 2022. One fifth of them said their employees will be required to come to the office on specified weekdays but can work remotely some or all other days - and 35% said their employees will follow a rotating schedule and should work in the office when it's their designated day or week. With hybrid working here to stay, it's an exciting time for insurers to grasp the opportunity for successful transformation. The technology and expertise now exist to help reimagine when, where and how work is done, and workforces can be liberated from outdated work processes to thrive from anywhere, and on any device. Wipro and Citrix combine best-in-class cloud technology with maximum data and application security. Our digital workspace is a secure, high performant Desktop-as-a-Service (DaaS) built to empower productive, seamless enterprises. The partnership is reloading the future of insurance work and transforming IT by driving business outcomes, improving employee experience, and enhancing operations visibility and service delivery with single-pane-of-glass health monitoring. We have partnered for over a decade to help enhance business outcomes for some of the biggest names in insurance. To find out how you can develop a secure, productive hybrid working model for the future of insurance, visit our dedicated site here: Gopal Tadepalli Gopal Tadepalli heads Global VDI sales at Wipro Technologies. He leads VDI practice and business development along with delivery. In the evolving landscape of digital workplaces, efficient field service operations are critical in ensuring reduced downtime... Enterprise Mobility Management (EMM) involves the process management and IT services needed by any organization to acquire, provision, and support the mobile devices (tablets, smartphones etc.) and other devices used by the organization's work force. Digital transformation and end user experience drive businesses to innovate with new applications and enhance core applications flexibility. ======================= ----- Arcticle source ----- https://www.wipro.com/infrastructure/hi-techs-inevitable-destination-is-cloud/ ----- Related Articles Contact Wipro Please fill the required details to access the content Hi-tech's inevitable destination is cloud The ability to reimagine business infrastructure and operational workflows is separating hi-tech leaders from the rest of the industry. As modernized hybrid cloud operations take the uncertainty out of the future, these companies can flow with the economic tide while shaping dynamically effective customer delivery methods. For many tech-based organizations, cloud platforms have primarily been used to accommodate spikes in workloads through their additional capacity. Since then, cloud computing has driven architecture and process modernization, providing a greater understanding of what cloud technologies can deliver and helping many tech organizations move beyond one-dimensional approaches. By expanding cloud adoption and implementation, hi-tech players are leap-frogging traditional competitors stuck in outdated development and delivery models, making progress toward the industry's inevitable destination.   Primary cloud benefits for hi-tech enterprises Industry-wide advantages are expanding, enabling more enterprises to adopt cloud migrations that align with a variety of business

objectives. With increasing data challenges and the greater need for productivity, cloud platforms empower the industry to gain a range of transformative benefits. Greater agility to meet changing demands Agility is on everyone's list of things to improve, and for an industry that nearly all other industries heavily rely on, cloud-based solutions enable hi-tech brands to gather customer data and rapidly understand end-user expectations, needs, and challenges. In addition, cloud solutions enable greater speed to market for global consumer electronics companies, semiconductor makers, and telecom providers. Companies can respond faster to industry changes, economic shifts, and natural disasters. With cloud, speed enables greater agility and scalability, sharpening the competitive edge for every hi-tech business while adjusting to customer needs with ease. Improved processing-power scale Using scalable cloud platforms that drive stronger processing power than on-premises systems, organizations can handle ever-increasing amounts of data and accelerate workflows to keep up with the speed of the market. The increased computing power drives the ability to derive valuable insights more quickly and uses machine learning and artificial intelligence technologies to improve the flow of information, improving uptime and reducing troubleshooting time for many tech-based organizations that rely on cloud for service and product delivery. Stronger ability to innovate Maintaining a competitive edge is essential in every market. By enhancing cloud-based infrastructure and operations, more companies can further innovate their products, delivering advanced sophistication with stronger reliability. Teams can modernize products to be available in next-gen as-a-service business models using cloud-native or cloud-agnostic features. The results are better customer experiences and expanded business opportunities. The impact on hi-tech operations In addition to the overall benefits, cloud platforms are empowering hi-tech fields with new ways to transform operations. Silicon manufacturing is one of the world's most complicated manufacturing processes, which has been an ongoing factor in the current chip shortage. With cloud platforms, semiconductor producers and EDA teams can integrate their entire value chain from design to computer simulation to post-production. This provides unprecedented levels of efficiency as well as greater collaboration among teams regardless of location. Cloud platforms also provide greater visibility into the entire digital supply chain to pinpoint where improvements are needed or strong performance should be maintained. For engineering teams, cloud platforms provide a pathway to modernizing legacy systems and implementing cloud-based applications. They also prevent teams from being limited to the capacity of an on-premises system. With cloud-based "infinite capacity," tech engineers can keep as many workflows running as necessary and remain flexible as demands change. The built-in scalability of cloud platforms enables them to focus on creating next-gen products without being restricted by storage, memory, or computing hindrances. Developing a cloud performance strategy After gaining an understanding of the benefits in reach, developing a strategy for enhancing cloud performance or planning a migration will be a vital foundation for achieving successful results. Partnering with a cloud expert is the most effective way to create a thorough plan that fits an organization's specific business needs. It's important to ensure that an enterprise can preserve what works in its current system while implementing improvements to fully utilize what cloud and advanced technologies can provide. Working with a team of experts will

also enable a faster, more reliable path to realizing cloud-driven business value.   A comprehensive strategy would be based on an evaluation of an organization's cloud platforms, business processes, and goals. These dictate the most effective way to design and develop a solution, migrate systems, and then deploy them. The strategic decisions done at this early stage are vital to achieving benefits later on, and collaborating with an experienced partner can ensure that a company will develop greater cloud maturity or adopt new cloud functionalities.   Taking a hybrid approach is common for many companies as it provides a balance of both on-premises and cloud advantages benefits, allowing security, workforce productivity, and flexibility. Regardless of the goals, preparing a strategy with a cloud expert that has extensive industry experience will be key to achieving cloud benefits now and into the future.   Moving toward the inevitable destination of cloud Staying competitive requires that a company continuously evaluate its tech systems and infrastructures. Competition is powerful within the hi-tech industry and is getting stronger as businesses and consumers continually advance the way they do business. As companies in the field seek to adopt new innovations, cloud platforms are delivering the ability to enhance agility, adopt greater processing power, accelerate workflows, and modernize products. These transformative benefits are fueling business growth and new revenue streams, and to reach cloud's fullest potential, it's necessary that business teams embrace the technology, not just IT experts, due to the efficiencies and business opportunities it can open. As workloads and business requirements change, cloud is poised to play a significant role in the industry's future. Taking a proactive, rather than reactive, approach to the latest cloud advancements can result in greater tech maturity and stronger digital resiliency. Although a full cloud adoption may not be necessary or advantageous for some hi-tech brands, it's clear that the technology will have a larger presence in the months and years to come, and optimizing cloud infrastructures for business growth will play a crucial role in helping hi-tech brands maintain their leadership.   Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Mastering Cybersecurity Strategy: How to Prevent Cybercrimes and Threats

----- Arcticle source ----- https://www.wipro.com/infrastructure/mastering-cybersecurity-strategy-how-to-prevent-cybercrimes-and-threats/ ----- About The Author Related Articles Contact Wipro Please fill the required details to access the content Mastering Cybersecurity Strategy: How to Prevent

Cybercrimes and Threats Very recently, JBS USA Holdings Inc., the world's largest meat supplier had to shut down its systems to slow down an online attack. The company paid $11 million to a criminal ransomware gang to regain control of its systems. This is just one instance of a business, among thousands, that has been at the mercy of cybercriminals. Regardless of how big or powerful an organization is, today's sophisticated cybercriminals can bring it down. A recent Intel study reported that most small and medium sized businesses had dealt with malware (77%), ransomware (63%), data theft (63%), phishing attempts (75%), and focused hacks (67%). Two in three IT decision-makers agreed that the pandemic accelerated the expansion of their overall digital footprint, increasing their vulnerability. Simultaneously, the world of cybercrime is getting more sophisticated. Hackers use Artificial Intelligence (AI) and Machine Learning (ML) to launch attacks. Deep Learning approaches that can guess passwords use Generative Adversarial Network techniques to make phishing look old-school. Making things more difficult is that hackers are turning to exotic languages such as Go, D, Nim, and Rust to evade detection. Even when discovered, expertise in these languages is not readily available, delaying defensive actions. Nothing short of military-grade defense can stop today's sophisticated breaches. Organizations are acutely aware that as technologies and trends such as IoT, mobile, 5G, work from home, and state-sponsored cyber war grows, they need to increase their focus on security. Analysts forecast that the security market, valued at $150.37 billion in 2021, will reach $317.02 billion by 2027. With significant investments being planned, how should organizations strategies their security for maximum impact? Wipro and Intel have created a joint approach to answer that question. The method ensures organizations create a threat defense architecture and bring AI/ML techniques into play for superior threat detection. In addition, Wipro simplifies recovery from an attack using automation for service-level tasks. This helps accelerate vault-to-production data recovery. Click to access a complimentary Gartner® research on Innovation Insight for Leveraging Isolated Recovery Environments and Immutable Data Vaults to Protect and Recover From Ransomware. Recommendations for a cyber resilient organization The hallmark of an excellent security strategy is that it attempts to reduce the time taken to identify, analyze, respond, and recover from an attack. There are five cornerstones on which an organization can build its ability to do this: Technology elements for cyber-resilient data management Wipro's cyber resilience program focus on the cornerstones by including: The reimagined 3-2-1 Resiliency Principle It is time for organizations to re-evaluate the classic 3-2-1 Resilience Principle in a hybrid and multi-cloud environment. The principle requires an organization to keep at least three copies of its data—two on different media and one offshore. With distributed IT, data mobility, and increasing exposure to the cloud, it is best to use a solution that offers air-gapped and multi-cloud tertiary copies. Our reimagined approach (see Figure 1) balances cost, protection, manageability, and recovery speed. Wipro's Enterprise Recovery Vault (ERV) Wipro leverages Intel's technology to deliver a nextgen ERV. The service comprises end-to-end consulting, planning and design, implementation, and managed recovery operations. Organizations use our service to set up their ERV, a clean room and a landing zone. These enable periodic tests and validation and post-incident forensic analysis. Intel's foundation for a secure and scalable ERV Intel's latest chipset and Xeon scalable processors provide

breakthrough technologies for security and performance. The most important building blocks for nextgen ERV include: a. Optane, Intel's revolutionary high-performance, persistent, non-volatile memory used to expand storage. b. A Trusted Platform Module (TPM) with Intel's Unified EFI and TPM cryptography ensures a trusted execution of the boot process throughout the virtualization layer and the operating system's secure login process. Without UEFI Secure Boot, malware developers can exploit pre-boot vulnerabilities. ERV uses this feature to ensure safe operations from BIOS to the data landing zone. c. Intel Xeon Virtualization, where 3rd Gen Intel Xeon Scalable processors allow more VM density per server and hence more applications with inline encryption. d. Intel's CPU integrated memory controller (IMC), a key component for performance with features such as tiering hot data closer to the CPU on the L3 Cache. IMC also increases memory bandwidth and enhances data management. Core ERV solution The ERV is built on modern backup and data management (see Figure 2). The main components of the ERV solution include: Typical vault sizing begins with the minimum solution and expands to 500VMs, 2000 VMs, and 5000VMs as per the sizing of the applications. The security baseline and governance are managed as per managed ERV: The Wipro-Intel advantage Wipro's managed ERV solution allows clients to rapidly expand capacity and run security operations in conformity with local data regulations. Wipro's team uses its expertise in Risk Intelligence, Data Management, Security Management, and IAM to focus on standardization and automation using ServiceTheatre and best-in-class solutions. Intel's technologies reduce costs, provide SLAs for data recovery and enhance security. Closing note Wipro's partnership with Intel provides the right capabilities for assessment, solution architecture, and lifecycle management for organizations keen on creating military-grade security. Gartner, Innovation Insight for Leveraging Isolated Recovery Environments and Immutable Data Vaults to Protect and Recover From Ransomware, Jerry Rozeman, Michael Hoeck, 28 September 2022 Gartner is a registered trademark of Gartner, Inc. and/or its affiliates in the U.S. and internationally and is used herein with permission. In his current role his charter includes driving overall strategy and priorities at Wipro for DC practice. He has spent over 20+ of his 24+ years' experience in Wipro being part of niche practices and offering. He has rich experience in strategy and operations entailing building the niche solution offering and new business development. Mayur's sound understanding of Infrastructure Technology Outsourcing (ITO) has helped Wipro acquire new business while handling many deals of varying sizes. He has broad exposure of developing solutions for several industry verticals in both domestic and global market. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with

the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Business and Security Risk

About The Author Related Articles Contact Wipro Please fill the required details to access the content Business and Security Risk Moving from Reactive to Proactive November | 2022 From outdated server infrastructure and operating systems to manually maintained network gear and unpatched end-user compute: there are many ways that technology can expose organizations to increased security risks and outages. To avoid these risks, businesses need to fully understand the health of their IT systems and take a proactive approach to managing the IT infrastructure that is running all workloads, not just the critical ones. There are many resources that can help organizations evaluate their current security posture and move from a reactive position to a proactive position. It is critical that IT organizations become not just the providers of these services, but partners to the businesses implementing them. Maintaining the compute power How well do you know the health of your business's compute power? Are you sure it's not putting your company at unknown risk? Whether your compute power is located on-prem, in a co-location, or in the cloud, there are multiple layers of maintenance that need to occur on a regular basis. If not properly maintained, each device and layer of its maintenance is a potential security risk There are three parts of the compute layer that need to be considered: the firmware of the hardware components, the operating system (OS) itself, and the major software components that control functions within the OS. 1. The firmware layer Updating firmware helps address critical problems, such as unresponsive servers, which can put your system at risk. Firmware updates also correct product issues such as ROM or processor functionality to improve system performance, and make the system easier to service. Keeping firmware up to date is critical to maintaining system stability, performance, and security, yet investigating firmware is not part of regular maintenance for many organizations. Some do not check it at all. It is important to update firmware (also called "flashing the ROM") as part of regular service maintenance, and to check for specific firmware updates between regular updates for optimal performance. 2. The OS layer The OS layer includes the OS of the virtualization layer and the OS of the physical or virtual server. All OS vendors provide regular patches or updates from their operating systems. Many organizations rely on third-party solutions to handle these updates, which can sometimes lead to issues if the processes are not fully understood and co-managed. For example, when a new patch is released that supersedes a prior patch, third-party systems may report that the prior patch is "compliant" because it is no longer needed, even though it was never installed. Or there may be prerequisites missing; the system has not installed many of the required patches, but reports that the patching process script is complete even if the patch installation does not. Business restrictions on system reboots can also cause issues. The patch is completed, but some operating systems will continue using the old code

until they are rebooted. These are common scenarios that can increase security risks and jeopardize system stability. 3. The software layer The third layer is the major software components — drivers or other code that is managed by the OEM or third parties — that control system functions within the OS. Like OS patches, these major software components are critical to maintain performance, stability, and security. For the most part, these three layers exist in all the hardware components in the datacenter, whether on-prem, co-location, or cloud. (Some hardware does not have reprogrammable firmware or has parts that are not reprogrammable. Some operating systems are controlled by a peripheral supplier and therefore are out of scope from "normal" operations.) With cloud computing, businesses pay hyper-scalers to manage firmware and physical machine maintenance, as well as their virtualization layers, but the organization is still required to manage the rest. Network modernization Do you have a holistic understanding and uniform set of practices across the whole network? IT networks are the fabric connecting everything in the modern enterprise, so it is critical that they are adequately maintained. Ransomware and other cyber-attacks can proliferate through design or maintenance issues throughout networks. However, keeping networks up to date can be challenging, and even necessary maintenance such as updating operating systems and installing patches can put networks at risk. Many organizations do not have full redundancy in all their switching layers, leading to single points of failure, meaning one failed device can bring down multiple other devices and applications. Businesses concerned about potential routing issues sometimes avoid rebooting at all costs because there is a risk that a switch may not come back on after it is rebooted, or that it will come back on improperly and require remediation. Changing consumer and industry demands have exacerbated these issues. Businesses feel pressure to provide services that their IT program does not currently support (or does not adequately support) and go outside of IT to pursue new technologies without a proper implementation strategy. In the rush to embrace cloud computing, for example, some businesses have failed to properly enroll IT in the transition, forcing IT to take a reactive role that can lead to gaps in security and usability. To keep up with business shifts and the growth of cloud, organizations need to expand their networks while maintaining IT performance and resiliency. Wipro sees a lot of organizations that are working toward software-defined networks (SDN), but these networks are sometimes implemented only in the greenfield spaces rather than holistically across the network. This approach increases complexity, cost, and risk down the line because the SDN is not being integrated with the legacy system. Piecemeal modernizations are fine, but they need to be done strategically, working toward a goal that accounts for the entire network. Another major risk area is how the legacy networking environment was put together. This is both a business risk and security risk. Manually coded rules controlling user movement or ports, for example, are not always consistent. Sometimes there is less accessibility management in legacy data centers, or one admin might have started by excluding everything and opening as need while others have started by allowing everything and blocking as issues arise. When security events occur, complex and inconsistent network management increases downtime and vulnerability, leading to more penetration points for cyber-attackers. Workplace security and mobility With the push for zero-trust environments, the need to be diligent is increasing as well. What is

your current level of risk? Are your most precious assets really protected and are they helping to protect the enterprise? Whether on site or remote, employees are a risk to the business. It can be easier for organizations to manage how employees access company networks when they are working in the office rather than remotely, but human error and underdeveloped security strategies still pose risks. To reduce these risks while still enabling flexible ways of working, organizations need to focus on a few areas in particular. Hardware Like server infrastructure, one of the most often overlooked areas of the worker environments is the hardware, including desktops, PCs, and mobile devices. While most companies have processes in place to bring machines up to spec when they are ordered, some assume incorrectly that machines come from the OEM with the latest hardware firmware loaded. All new machines need to be processed, their hardware brought up to current firmware revisions to address any issues with applications, stability, or security vulnerabilities. Operating system After the hardware is fully updated, the operating system, drivers, and agents need to be updated to eliminate any business or security risks. Businesses sometimes think that they are saving money or streamlining processes by skipping this step, but those costs are almost always deferred to the end user. Employees cannot do their jobs effectively if they are fighting with their devices. And if the operating system on those devices is out of date, employees may be putting the company at risk just by doing their job. Maintenance Once companies set employees up with the right hardware and OS assets, businesses need to ensure they have the processes in place to maintain those assets. There are many elements to a proper maintenance program, such as scanning and maintaining of all the hardware code from the BIOS to potential firmware of the embedded devices (drives, graphic processing units, network interfaces) as well as all the increasing variation in peripherals. This can be increasingly extensive with additions of things like AR and VR. There is also the software for the OS, drivers and agents that need to be maintained. Finally, it is important to make sure, especially for critical security patching, that reboots occur. End users tend to put off reboots, especially in the engineering and factory worlds, to avoid downtime, but the risk of exposure increases until all necessary reboots are completed. Getting proactive instead of reactive It is critical for companies to transition from a reactive IT program to a proactive one — working to understand what their business needs will be in the future and how to apply technology to achieve them while addressing any associated security risks. What's preventing your organization's transition from reactive to proactive? Are you working with a lot of legacy tech debt? Are outages and security incidents taking too much time? Do your teams need upskilling and cross training? These questions can help you identify priority areas in your business's digital transformation. Working with an experienced technology partner can help you better understand the transformation your business needs and strategize the best path forward. Why 5G? Isn't 4G good enough?

----- Arcticle source ----- https://www.wipro.com/infrastructure/why-5g-isnt-4g-good-enough/ ----- About The Authors Contact Wipro Please fill the required details to access the content Why 5G? Isn't 4G good enough? December | 2022 As of late 2021, mobile networks carry around 300 times more traffic than they did in 2011. 5G networks are predicted to have more than 1.7 billion subscribers and account for 25% of the worldwide mobile technology market by 2025, according to the GSM Association and Statista. Why should you switch to 5G? The answer lies both in technology's march forward and the explosion of mobile devices that are hungry for the increased capacity of an upgraded network. 5G's promise to business is to reimagine and optimize company operations. It's a big promise in a world of pronouncements of transformative technology. Why transition from 4G to 5G? The primary reason for upgrading the network is to support the growing number of devices that demand internet access. These devices require so much bandwidth that the existing 4G network can't deliver long-term.   By transitioning to the 5G network from 4G, mobile phone users soon notice that connections are more reliable with less latency. Latency refers to the delay between sending and receiving information. In other words, less time waiting for things to happen, plus fewer dropped calls. 5G also improves signaling with no packet loss. Feature comparison between 4G and 5G 5G's enhanced broadband, ultra-reliable latency, and fit with machine-to-machine communications also opens the door to mission-critical applications, industrial automation, augmented reality, smart cities, and telemedicine, to name a few. The point is, it's a future made possible with 5G that is impossible with 4G. As a result, the great 5G network buildout is well underway. 5G features and capabilities Features of 5G stand out that will usher in new capabilities and use cases. The timetable for evolving to 5G Transitioning from 4G to 5G won't happen overnight. The pre-launch phase occurred in 2020. The period now is the launch stage with services starting (day 0+), and then an explosion in new use cases and products happening in 2023 and beyond (Day 1+).   Moving to 5G requires new spectrum and technology 5G and all its promises couldn't take place without three categories of spectrum and technology: new spectrum, spectral energy and efficiency, and new network architecture. Understanding 5G Core 5G Core refers to 5G's service-based architecture (SBA) that enables authentication, security, session management, and aggregation of traffic from linked devices. It's a sophisticated integration of network activities with integrations based on http/rest APIs. 5G Core Elements – How 5G

functions? User equipment (UE) like 5G smartphones and 5G cellular devices link to 5G core through the 5G New Radio Access Network and then use DN for internet connections. User Plane Function (UPF) oversees transporting IP data traffic between UE and external networks. Mobility Management Function (AMF) is the entry point for the UE connection. Based on the service requested, the AMF selects the right Session Management Function (SMF) to handle the user session. The Authentication Server Function (AUSF) lets the AMF verify the UE authenticity and grant access to 5G core services. Other functions provide the policy control framework, apply policy decisions, and grant access to subscription information to govern network behavior. 5G is an evolutionary step forward from 4G Network traffic has grown exponentially, demanding 5G's new architecture. Many new and exciting 5G services will be here in a matter of months. Industrial use cases and consumer examples already exist. Moving from 4G to 5G offers improvements in latency, security, capabilities, and more. The 5G uses cases for specific industries offer a glimpse into what is possible. 4G was good and infinitely better than 3G. However, 5G has the potential to be great, transforming industries and improving the lives of billions.   Shalvi Yadav Senior Consultant - 5G and IoT Practice, Wipro Shalvi has over 14 years of experience in presales, delivery management, customer success, partner enablement, packet pore operations & implementation, network security implementation. She has the presales, delivery, and implementation expertise in various packet core technologies 2G, 3G, LTE (4G), 5G as a service, Cisco security portfolio, application centric infrastructure and routing & switching. She is currently working on various 5G solutions for multiple industries. Ashish Khare General Manager & Practice Head – IOT & Smart City, Wipro Ashish has over 26 years of experience in Consulting, SI & Manage Services in IT & OT. He is currently working on various 5G and IoT solutions for multiple industries. He heads the 5G, IoT and Smart City CIS group. He is working on IT-OT convergence & Service Management framework for IoT. He owns multiple IP's including Wipro Smart i-connect™, Platform for Smart Spaces & IoT, won innovation awards. =====================

From broken experiences to breakthroughs: accelerating healthcare success in a hybrid working world

----- Arcticle source ----- https://www.wipro.com/infrastructure/from-broken-experiences-to-breakthroughs-accelerating-healthcare-success-in-a-hybrid-working-world/ ----- About The Authors Related Articles Contact Wipro Please fill the required details to access the content From broken experiences to breakthroughs: accelerating healthcare success in a hybrid working world With more options about where, how and for whom employees want to work, the life sciences and healthcare sector must not only adopt digital methods of working – but design for the future human

experience. This means not just creating one-size-fits-all hybrid workspaces but designing solutions that meet each employee's priorities, both now and in the future. Hybrid working is here to stay, but the often-piecemeal approach to digital transformation taken by organizations in the early stages of the Covid-19 pandemic – out of necessity, rather than vision – must now be transitioned into a long-term strategy for flexible, secure, and productive working models. Already, organizations in the sector are responding to this need, with Deloitte reporting that 82% are planning to continue the digitalization of services beyond those pandemic-enforced changes. This sector is not alone in adopting hybrid working for the long term; it has become the norm across multiple verticals. However, the healthcare and life sciences sector relies more than most on in-person work and collaboration — from time in the laboratory to field research and conducting trials. To continue conducting these activities successfully while also facilitating employees' ability to work productively from anywhere, the sector needs to adopt technology that provides superior, joined-up user experiences. Fractured experiences such as fragmented communications and poor accessibility to critical resources can damage the user experience, and worse still, hinder progress to potentially life-saving research and development. These employees rely on the ability to communicate information accurately, seamlessly and in real-time - and they also need to do so securely, without having to worry about compliance concerns. In fact, a study on digital workplace productivity, including life sciences respondents, revealed that employees achieve just 60% of their potential work output due to poor connectivity and application experiences, making intuitive remote working tools and environments a top priority. The sector has already shown it can work quickly and with huge success throughout the pandemic, delivering life-saving vaccines while also driving other medical and scientific research forwards, including the development of a novel drug for Primary-Progressive Multiple Sclerosis and a 'Squirrel Parkour' study that represents a breakthrough in robotics. With hybrid working firmly established and continuing to evolve, companies in this sector must grasp the opportunity to achieve successful transformation, ensuring breakthroughs like this continue to be made in a new working model. Focusing on the power of a human, user-centered approach will help to achieve this, while leveraging technology to improve interactivity between dispersed teams will accelerate research, development and release cycles. In focusing on a long-term, future-thinking approach to the workspace, the sector must take the following key considerations into account: Fortunately, UX software, virtual desktop platforms, and Desktop-as-a-Service (DaaS) managed services will optimize audio-video collaboration capabilities, preventing delays and leading to a rich, high-definition user experience on any device - and enabling reliable service delivery on a hybrid cloud platform. Solutions that allow for 3D graphics cards to be present on a few servers, where users can access them from shared sessions, help to provide visually rich images from any mobile device, too. For life sciences firms, having the most powerful tech solutions as part of their infrastructure is essential for innovation and exploration. Take cutting-edge Cryogenic Electron Microscopy (CRYO-EM) - a next-generation imaging technique that allows scientists to observe biomolecules in thrilling detail at sub-nanometer resolution. For this, specialized digital tools transform cryo-EM samples - encompassing thousands of high-resolution (4K) two-dimensional images -

into 3D models and motion clips. And so, only next-generation future-fit technologies will do. The optimal user experience and flexibility of the digital solutions we've discussed, coupled with robust security, also facilitate agile collaboration between dispersed teams, thus streamlining the communication of crucial project information. By harnessing this technology, healthcare and life sciences companies can realize their long-term visions with a successful transformation of working models. The world relies on the sector to continually work towards creating new treatments that help people live longer and healthier lives - and this makes it vital that organizations get their digital transformation just right. The good news is, implementing advanced technologies to bring this about needn't be a daunting task. Together, Wipro and Citrix support healthcare and life sciences organizations to future fit their workplaces, with a secure, high performant Desktop-as-a-Service (DaaS), built to power productive, seamless enterprises. To find out how you can benefit from a secure hybrid work solution with superior user experience, visit our dedicated healthcare sector focused site here: Seshu Venkata General Manager and Global Head for Wipro Virtuadesk (co author) Seshu is an Experienced Technology and Business Leader with a demonstrated history of working in the management consulting industry. Satya Gadepalli Head of Platform Engineering for Wipro Virtuadesk (Author) Satya is a Digital transformation leader with more than 25+ years' experience in large product engineering. Currently he is building products & solutions around user centric experience metrics for DaaS Platforms based on SRE, Observability, FinOps, Rapid DevOps and User Experience. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

How 5G Networks will Accelerate the Journey from Smart Cities to Cognitive Cities

----- Arcticle source ----- https://www.wipro.com/infrastructure/how-5g-networks-will-accelerate-the-journey-from-smart-cities-to-cognitive-cities/ ----- About The Authors Related Articles Contact Wipro Please fill the required details to access the content How 5G Networks will Accelerate the Journey from Smart Cities to Cognitive Cities January | 2023 The digital evolution of cities has gained tremendous momentum in the last few years. The cities today are increasingly connected, competitive, prosperous and sustainable, and are rightly known as Smart Cities. Accelerated innovation

has led to new opportunities, optimization of infrastructure and urban activities in these Smart Cities. 5G networks are now here to further the journey of Smart Cities to Cognitive Cities, that will be empowered by advanced technologies and will be more proactive and predictive in nature. 5G networks would enable collaborative decision making and analyze multi-dimensional consequences of an event and its impact on society by the convergence of siloed systems, which would lead to faster and effective response. 5G networks will play a very important role as an enabler for cognitive computing to enhance the performance of urban services. As we see, today's Smart City is set to transform into a Cognitive City, thanks to 5G technology. In fact, Gartner predicts that by the end of 2024, 60 percent of communication service providers will commercialize 5G service covering Tier-1 cities. Smart Cities, an evolution of cities adopting digital transformation for monitoring, managing and reporting the overall performance of the city with citizens as a stakeholder, began a few years ago. However, the road ahead is still a long one. Evolution and adoption of digital transformation technologies like AI, machine learning (ML), 5G, Big Data and Internet of Things (IoT) serve as catalyst, equipping city management to be more dynamic and shift from a Smart City to Cognitive City. Cities are already adapting to technologies that enable monitoring of various city parameters like energy and water consumption, waste management, traffic analysis etc., helping urban authorities with consumption pattern and trend analysis. This helps them take appropriate steps like traffic diversions, improved water supply planning and other remedial measures. At the same time, cities are experiencing persistent operational challenges due to siloed functions, which impact faster decision making and holistic development of the city. This need to be resolved with systems interacting with the population and helping to take faster, informed and collaborative decisions by authorities aimed to improving the quality of life for the citizen. Therefore, the pace of urbanization in some of the major cities calls for disruptive technologies that allow intelligent decision-making at the source with less human interventions and fewer delays. 5G Network plays a pivotal role as an enabler for a shift from Smart City to Cognitive City technologies. 5G enabled cities utilize technologies like artificial intelligence (AI) and cognitive computing to enhance the quality and performance of urban services.   Smart City to Cognitive City enabled by 5G Network City management is a large-scale operation that needs communication between multiple systems with different types and volume of data moving from sensors to applications. At present cities use a mix of wired and wireless media for communication depending on the use case, which leads to complex network operations and limitations for breaking the silos. A common wireless network with multiple bandwidth slices, catering to multiple city systems would be an appropriate choice for communication infrastructure. 5G Network is better suited to meet this requirement of cognitive cities because of multiple connectivity options like the massive Machine Type of Communication (mMTC) for low bandwidth and high density requirements, especially as it supports up to one million device connections per square kilometer. This will enable high-density deployment of a massive number of IoT devices within a small geographic area. Similarly, 5G network can offer very high bandwidth for large volume of data, like video streaming, for specific use case of city surveillance and traffic monitoring. 5G networks with improved network slice management

and dynamic access will play a key role in cognitive computing for the city systems. Cognition for a collaborative decision making Cognition, in the context of a connected city, is the process of continuous learning by different urban systems through an enhanced automated workflow powered by suitable Internet of Things (IoT) interventions and reliable communication like 5G, which allow them to learn from the past and adapt to regular changes. Cognition enables city authorities to better manage the challenges of rapid urbanization. Cognitive IoT, and AI/ML based systems and technologies advance smart city architecture to support innovative applications. Some of these applications place high demands on bandwidth, but can have huge potential to improve critical aspects of cities like intelligent intersections for road safety, location-dependent services for better mobility, vehicle to infrastructure (V2I) for better traffic management, and in-vehicle internet to support autonomous vehicles. By combining cognitive analytics with 5G communication, Cognitive Cities can perform collaborative decision-making in various departments within city government, which helps to achieve a dynamic, ever-changing cityscape that is flexible and resilient. For example, if a hyper-localized weather monitoring system predicts heavy rain in a city area, the traffic management system can divert the traffic to avoid water-logged areas as well as trigger emergency response team and other urban authorities to be ready for evacuation of citizen in that area or handle any untoward incident, through a faster collaborative decision making, involving multiple agencies. A confluence of 5G, IoT and Edge AI empower Cognitive Cities 5G, IoT, and Edge AI are transforming the world we live in. Cognitive deployment in different sectors within a city like transportation, utilities, health care and construction, among others, ease operations and management, thereby reducing the scope of manual interventions. 5G, along with Edge AI, will enhance this experience multifold, resulting in real-time monitoring and control, better resource utilization, and reduced cost. Traditional urban intelligence can be freed from silos and integrated to give a holistic view of the city. The infrastructure of cloud-edge combination powered by 5G communication will facilitate a seamless connection between urban systems and the various stakeholders. Think of a city with a water distribution network with zero leakage and zero waste, and no human intervention to operate valves — all driven with close loop need-based water distribution with cognitive capabilities. Similarly, this can impact city traffic with near zero wait time at junctions and near zero accidents. Citizens at the core of cognition initiatives 5G network can communicate within 1 milli second in comparison to 4G, which is above 40 milli second. The combination of high density — the speed to upload and download data — and low latency, which compresses the time between sending and receiving signals, will transform cities. Most of the 5G and IoT infrastructure being created in the urban space is aimed at catering to the people who live in urban areas. This transformation of a city from smart to cognitive with 5G as a catalyst, will significantly improve several quality-of-life indicators. The reimagined city will be resource conscious as the cognitive ability offers a real-time performance and utilization in terms of faster communication between different sensors to application and between siloed systems, and that will unleash other dimensions that analyze and predict consequences. It eventually will be beneficial for citizens, city governments and, eventually, economic growth in the long run. Raj B.R Practice Director – 5G IoT & Smart City Raj heads the

new-age-solutions team with the charter to develop IoT solutions for the 5G era. He is the Practice Director of Wipro's global Smart City team and plays a key role in consulting and business initiations with global clients. He has 28 years of experience in multiple domains with proven track record for innovative technologies, customer centricity and passion for excellence. Ashish Khare General Manager & Practice Head – IOT, 5G & Smart City, Wipro Ashish has over 30 years of experience in Consulting, SI & Manage Services in IT & OT. He is currently working on various 5G and IoT solutions for multiple industries. He heads the 5G, IoT and Smart City CIS group. He is working on IT-OT convergence & Service Management framework for IoT. He owns multiple IP's including Wipro Smart i-connect™, Platform for Smart Spaces & IoT, won innovation awards. Enterprise business leaders need to deal with the new volatile, uncertain, complex and ambiguous This paper provides an overview on how CIOs should transform the underlying elements of Datacenters – Infrastructure, Applications, People and Processes - to be able to quickly Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. =====================

Offloading TETRA traffic to 5G Mobile Service

----- Arcticle source ----- https://www.wipro.com/infrastructure/offloading-tetra-traffic-to-5g-mobile-service-tetra-systems-role-in-a-5g-world/ ----- About The Authors Related Articles Contact Wipro Please fill the required details to access the content Offloading TETRA traffic to 5G Mobile Service: TETRA system's role in a 5G world TETRA system's role in a 5G world November | 2022 How will TETRA system's role change as the world migrates to 5G? User needs and use cases will no doubt play a factor. TETRA has coexisted with different generations of mobile network from 2G to 4G. While mobile networks witnessed exponential popularity and expansion amidst users, TETRA saw its own share of growth. TETRA never faced competition from mobile networks. This PoV evaluates whether TETRA and 5G can coexist or if 5G will replace TETRA. TETRA is a TDMA (Time Division Multiple Access) mobile radio system defined by ETSI TS 100 392-XX-XX series of specifications. TETRA has been a choice of services like Utility, Hospitals, Airport, Railways, Fire, Police, Warehouses and Mines and many more for more than last two decades. The users of PMR (Professional Mobile Radio) or PAMR (Public Access Mobile Radio) find TETRA quite useful. Comparison of TETRA and 5G Features TETRA offers benefits and levels of service that mobile technologies and networks were unable to provide in certain scenarios. 5G network can handle features such as network slicing in its own way. Blocking Traffic There is no blocking in TETRA system, which implies that calls can get through in all the cases. The mobile networks of past were designed with certain amount of traffic calculations mostly supporting from 0.1 Erlang to 0.3 Erlang of traffic. The 5G mobile Technology enables the Network Slicing function. By the capability of

network slicing, certain services can be given a better QoS (Quality of Service) or non-blocking traffic capability. Direct Mode Operation While many of the calling features can be replicated in 4G/5G mobile networks, DMO (Direct Mode Operation) feature is one of the benefits of the TETRA Radio System. It enables the handset to communicate with another handset for a limited distance without involving the base station or other elements of the network. This is an extremely useful feature in case of disaster. Deployment of 5G system enables use of various commonly available phones and a hybrid operation that enables much higher network availability. The hybrid mode of 5G deployment offers great advantages. Hybrid mode is private 5G and Telco provided 5G network working in combination. This scenario is quite useful in the telcos deployed 5G SA (Standalone) networks. Data Network Support in instrumentation is another requirement that is expected from a communication network. The instrumentation requires much higher bandwidth as compared to voice. Most of the major users of TETRA are also deploying IoT or Industry 4.0. A new specification of TETRA 2.0 is introduced to increase the bandwidth of data on TETRA. Still the best-case bandwidth is few hundreds of Kbps. Apart from this, using TETRA radio for data communication from machines requires a modem that is too large and requires a bigger antenna due to lower frequency of operation. The 5G modules-based modems are quite small, and they support bandwidth of the several hundreds of Mbps (Theoretically 20 Gbps). Not only this, 5G can enable uRLCC, mMTC or eMBB type of services offering better QoS in such cases. Hardware TETRA has simple architecture, but it requires custom hardware, and maintenance team needs to inventory more spares. On the other hand, due to network function virtualization, 5G has the majority of the system requirement that are met using cloud or COTS products that makes supporting a private 5G network a less cumbersome activity. Coverage Coverage area may be challenging for TETRA for certain applications like police or fire that require covering a vast area. In such cases, having a captive or private network is a challenge. The challenge in using the existing mobile network has been the availability of channels during emergencies. With the 5G network, along with network slicing, a guaranteed QoS can be given to such services, plus an advantage of wide geographical coverage can also be augmented. This would save users from requiring separate spectrum with TETRA. There are 5G flavors like 5G CBRS and DECT NR+ that can operate in license-exempt band. Applications in UE (User Equipment) While TETRA radio handset supports a few applications, developing applications for such system is tedious. On the other hand, it is quite easy to develop applications for a 5G mobile handset working on commonly available operating systems. Moreover, 5G handset/UEs offer better cost benefits than the TETRA radio handset due to economies of scale. Working with contemporary technologies Increasingly, the workplace is using technologies like automation, AI, Analytics and IoT. To enable these technologies, a large bandwidth with low latency is required. Even machines used in normal or emergency operations require high bandwidth and low latency to implement automation and AI. Apart from these popular applications, there are a number of scenarios that require two-way video streaming. In such situation, 5G is the inevitable choice. Conclusion While both technologies have their advantages, it really depends on the use case. In many of the applications where high baud (bandwidth) rate or low latency is important, 5G has an edge. However, certain applications like

underground mines where voice communication is critical and LoS (Line of Sight) is difficult to obtain, TETRA has an edge. In some cases, 5G and TETRA can both be deployed, and the unified system can be connected at the trunk. In such cases, people would appreciate the option of having both technologies. Some areas can be covered by private 5G while others are serviced by TETRA. For example, in environments like hospitals, warehouses, oil & gas refineries and airports, where communication happens above the ground surface and data communication is important, it makes sense to use private 5G or hybrid 5G. The handsets are small and mobile users can access all their applications, thanks to 5G technology and the Network Slicing function.   In addition, a great advantage of 5G is the ability to hook to any network in case of an emergency. 5G for emergency use, along with automation, AI, Analytics and IoT, make 5G an excellent choice for developers. In the short term, both technologies will coexist. However, in the long run 5G is expected to take over the majority of TETRA traffic. ======================

Improving Sustainability and Reducing Cost in Oil and Gas Industry

----- Arcticle source ----- https://www.wipro.com/infrastructure/improving-sustainability-and-reducing-costs-in-oil-and-gas-industry/ ----- About the Authors Contact Wipro Please fill the required details to access the content Improving Sustainability and Reducing Cost in Oil and Gas Industry February | 2023 People around the world use gasoline for transportation every day. For consumers and businesses, the most noticeable thing about

each fill-up is its fluctuating price, but they often know little about the complex process of extracting crude oil and refining it into motor fuel. For example, few are aware that crude oil only accounts for one-tenth of what is extracted at the typical well site. The other 90% is toxic wastewater. This creates significant friction for the business. Operational impacts include the need for increased scaling in wells, more corrosion of equipment and more energy consumption. Having so much wastewater also means less treatment capacity for the oil that brings revenue in the first place. The operational impacts also cause sustainability problems. Processing large volumes of water requires more energy consumption and creates additional CO_2 and NOx discharges. It also requires the use of large volumes of biocides, corrosion inhibitors, and other chemicals. For oil and gas companies, these operational and environmental impacts also create enormous pressure on the bottom line. As per industry sources, it is estimated that 45% of capital investment in the typical well, and 65% of its operating costs, go toward the management of toxic wastewater. These massive financial costs result in a significant increase in the lifting cost of a unit of oil or gas. Significant Improvement Is Possible Even many inside the industry assume that the wastewater to crude oil (90% : 10%) ratio is fixed and cannot be improved. The fact is, making the overall operation more efficient reduces wastewater and brings down per-unit production costs by up to 23%. This overall potential cost reduction can be the result of efficiencies gained throughout the process, as shown in Figure 1. By optimizing operations at the progressing cavity pumps (PCPs), organizations can realize a 10% reduction in energy costs and reduce chemical use at the wellhead by 7%. By having to process less water, the first-stage and second-stage production separators can see further reductions in both power consumption and chemical use, and the emulsion breaker also requires less energy. Finally, less volume means huge savings in the cost of treating, transporting, and disposing of the wastewater. This includes 40% less chemicals used in the treatment process and 13% less in the pipeline; and a 27% reduction in power consumption for treatment and a 40% reduction for disposal. The reason that such significant savings are possible is because of inherent inefficiencies that have remained unaddressed in the drilling process for decades. These points of friction are so ingrained at many organizations that even longtime veterans may be skeptical of resolving them. The problem is that each element of the very complex process of drilling has historically been managed in a silo. To optimize operations, improve efficiency and reduce the volume of wastewater, organizations must take a holistic approach, using automation to optimize each step in the process and minimize waste. Architecting a Solution With an advanced and unified orchestration and analytics platform, all elements of the drilling process seamlessly work together to ensure maximum efficiency and minimal waste. The platform is built around data concentration units (DCUs)— computational units that acquire data and orchestrate different data sets between an advanced analytics platform, a digital ecosystem platform and the drilling and processing infrastructures (Figure 2). Actuation sensors and actuators measure and control the flow at the rig site and at the pumps. Micro Edge Computing infrastructure enables data processing onsite before it is transferred to the DCUs. Since drilling rigs are typically in remote location, this transfer is enabled by satellite communications. At the refinery, MECs are again used to process data from all aspects of the

process. This information uses a secure data exchange (SDX) solution to transfer the data to the DCU. The SDX tool also facilitates the integration of the operational technology (OT) systems that provide plant automation and controls with the DCU. Doing significant computation at the edge and rapid transfer of data by satellite results in data collection and analysis in real time, enabling organizations to make drilling adjustments on the fly to reduce water production. It also builds both efficiency and resilience into the overall process, making it more likely that problems are solved before they become unmanageable. Improving Sustainability and the Bottom Line By taking a holistic, strategic approach, it really is possible to reduce the amount of wastewater that results from drilling, thus boosting operational efficiency. This, in turn, significantly reduces chemical use and power consumption throughout the process, resulting in big savings in operating costs. And as the orchestration and analytics platform is standardized across an organization, leaders can anticipate less wastewater for future wells— resulting in savings in capital expenses for new projects. Needless to mention that this supports sustainability, has a positive impact on the global economy and makes the earth a better planet. Purushottam Konar Global head of Products & Solutions Engineering Purushottam is the Global Head of Product and Solutions Engineering at Wipro. He has over 24 years of experience in design, development and deployment of enterprise solutions and products for large multifunctional organizations across different verticals. Decode business value with a strategic approach to cloud migration

----- Arcticle source ----- https://www.wipro.com/infrastructure/decode-business-value/ ----- Download the ebook now to explore the following: HOW WHAT WHY Contact Wipro Please fill the required details to access the content eBook - Unlock the true potential of agile cloud infrastructure Why is it critical for enterprises to design a seamless cloud migration roadmap? How does it help in driving real business value? Today, a cloud-first strategy has become paramount for enterprises across industries. Shifting towards a cloud-first strategy enables enterprises to keep pace with the dynamically changing business environment while adopting scalability, agility, and security. However, designing a strategic move to the cloud

comes with its own set of complications. While migrating to cloud many enterprises grapple with challenges such as refactoring business applications, eliminating technical challenges, managing the time taken for the migration, and optimizing investments. Wipro's Boundaryless Enterprise (BLE), powered by VMware Cloud on AWS, provides a consistent roadmap for increasing business agility and reducing total cost of ownership (TCO), enabling a seamless and streamlined cloud migration. Wipro's Boundaryless Enterprise (BLE), powered by VMware Cloud on AWS, brings in the collaborative power to help enterprises reduce lead time and overall effort while making it easier to scale. With deep industry expertise, the partnership helps enterprises pivot business outcomes, and strategize, execute and manage their cloud journeys. to steer the migration plan and avoid a prolonged stall. is an optimized way to upgrade infrastructure while lowering resource requirements. is it important to integrate an end-to-end solution that brings together the critical elements for a seamless and safe cross-cloud migration. =====================

Service Desk of the Future: Smart, Fast and Efficient

----- Arcticle source ----- https://www.wipro.com/infrastructure/service-desk-of-the-future-smart-fast-and-efficient/ ----- About the Author Contact Wipro Please fill the required details to access the content Service Desk of the Future: Smart, Fast and Efficient Wipro Live Workspace™ OneDesk: Shaping the future of the workplace with differentiated services March | 2023 Evolution of the service desk The service desk has been a cornerstone of IT departments for decades, but the evolving needs of employees are now significantly changing the future of work. The help desk is transitioning from a reactive, manual intervention-based service model to an approach that is proactive, intuitive, and digitally enabled. This transition is taking a quantum leap forward through the adoption of new-age, next-gen technologies leveraging a multi-channel approach. The digital service desk of today is adding more and more capabilities, not just to keep up with business progress, but for acting as a catalyst for transforming the workplace into a strong, technology-driven, and customer-centric organization. Technology enablers Digital transformation, prolific cloud adoption, and the evolution of next-gen technologies are the compelling, overarching drivers shaping the future of work across industries. The service desk must align with these changes to stay relevant for organizations. For example, cloud capabilities enable organizations to access and analyze large swathes of data and drive the analytics that help them serve customers better. As global enterprises turn to the cloud, the service desk must do so, too. Intelligent automation, AI, and chatbot technologies Automation is being integrated into the service desk to provide faster and more efficient service as it helps streamline processes, reduce errors, and save time. Organizations can achieve quicker responses to inquiries and more efficient handling of tasks such as resetting passwords, creating new accounts, and managing software updates. Intelligent virtual assistants (IVA) also augment automation in the service desk workflow. Empowered

with natural language understanding (NLU) capabilities, IVAs can further enhance the self-service capabilities with keywords and phrases from the organization's knowledge base. AI- and ML-driven hyper-automation can automate mundane and repetitive tasks, identify patterns and anomalies, and streamline operations. Hyper-automation can improve the employee experience by automating the service processes. ML algorithms can identify trends by analyzing employee information. Also, ML algorithms and techniques such as clustering or classification can identify trends by analyzing employee information. By clustering or classifying employees together, the algorithm can identify patterns and trends that might not be apparent when looking at individual employees, thereby enabling organizations to target specific activities or incentives toward that group. Self-service is the way forward The traditional help desk is also poised to transition from a transactional first-level IT support to a zero-touch service desk, implying an intelligent, automated approach to resolving issues with as little human involvement as possible. With this, organizations will steadily move towards self-service solutions enabling employees to access needed services wherever and whenever. Self-service will be especially beneficial for large organizations with multiple geo locations or employee bases, giving IT workers more time to focus on complex issues. Examples of self-service options in service desks of the future include virtual agents, chatbots, and automated systems that can reply to customer inquiries. These solutions will let employees access required information easily, cutting down on wait times and increasing employee satisfaction. Overall, self-service solutions will make the services more cost-effective, while enhancing the employee experience. Personalization of the employee experience The one-size-fits-all era has ended. The service desk of the future will incorporate persona-driven methodology to create user profiles of the employees based on their roles, devices used, and workloads, for instance. The profiles can further hyper-personalize the resolutions offered based on the key parameters. Personalizing the service desk involves tailoring it to meet the unique needs of everyone. This can include customizing the service desk interface, personalizing service requests, and providing customized responses. By using employee data, service desk teams can also create more efficient processes such as automated ticket routing and automated response systems, ensuring the best possible service for each employee. Data analytics meets the service desk Data and analytics have become the new global currency, revolutionizing the core of modern businesses by combining the power of robotic process automation (RPA), AI, and ML to glean meaningful insights across functions, including the service desk. Leveraging data and analytics at the service desk can help monitor usage patterns, identify areas for improvement, increase employee engagement, provide a more integrated and elevated employee experience, and bring greater employee satisfaction. Using analytics to track employee service requests can help service desk staff better understand factors that are impacting resolution time, resource utilization, and overall efficiency. Data analysis is also critical for providing more personalized services because service desk agents can use employee request histories to better anticipate their needs. To foster a data-driven culture that democratizes service desk analytics, companies can adopt the following features: An experiential service desk Ultimately, the service desk will evolve into an experience desk that maps employee journeys. Under an XLA-based approach, the outcome-based

service desk will foster continuous improvement and help build a customized knowledge base with feedback accumulated from experienced professionals across touch points throughout the organization. An experience-based service desk aims to offer employees an engaging, customized one-on-one experience, with seamless and agile resolution. Employees will get their questions answered even more directly and efficiently. Sidharth Mukherjee General Manager and Global Practice Head- Digital Workplace Services, iCORE-CIS, Wipro Sidharth Mukherjee (Sid) is a dynamic leader and a true technology enthusiast at heart, with over 18 years of rich, holistic experience in driving digital sensitivity and cutting-edge cloud and infrastructure services transformations for Fortune 500 organizations. Sid has a passion for delivering "what's next" and technologically improving "what's now" for enterprises while keeping a keen focus on employee experience and sustainable innovation. Currently, he is engrossed in harnessing the power of AI, cognition, blockchain, and analytics to create an intricate workspace metaverse aligned with the future of work. He is an alumnus of IIM Ahmedabad and specializes in Business Strategy, IT and Management. =====================

Engage in the virtual world of work

----- Arcticle source ----- https://www.wipro.com/infrastructure/engage-in-the-virtual-world-of-work/ ----- About the Authors Contact Wipro Please fill the required details to access the content Engage in the virtual world of work May | 2023 The Metaverse has taken the world by storm. But what exactly is the Metaverse, and how will its adoption change the world of work? The opinions on what the Metaverse is vary, mainly because the idea is still evolving. However, the time is right to explore how this technological revolution will reshape the way we work. Industry-leading analyst firm Gartner, defines the Metaverse as "a collective virtual space, created by the convergence of virtually enhanced physical and digital reality." In simple terms, the Metaverse leverages new technologies to enable the movement of people and objects across the real and digital worlds. Although still in its infancy, the Metaverse will profoundly impact virtually every aspect of business operations, including recruitment, employee meetings, strategic marketing, manufacturing, and account and asset management. Ultimately, every asset, process, or person within and related to an enterprise will be replicated virtually – and connected. Gartner estimates that by 2026, 25 percent of people will spend at least one hour a day in the Metaverse, using metaverse platforms and technologies. The Metaverse is backed by the convergence of technologies such as Web3, VR/AR, AI, blockchain, spatial technologies, social media, digital currencies such as NFTs, and connectivity technologies like 5G, IoT, and cloud. It is also device-independent, meaning the Metaverse can be accessed from a PC, Mac, tablet, TV, smartphone, or any other digital device. The Metaverse will bring significant changes to the workplace. For instance, immersive environments enabled by augmented VR and AR, that will allow employees to manipulate 3D digital replicas of equipment from their desks, providing them with practical product design

experience and training. Another example is the use of mass simulations and AI technologies, which will leverage data streams from across and beyond the enterprise to help senior executives predict future trends with high precision. As remote and mobile workforces continue to rise, the workplace is rapidly revolving. In reimagining the future workplace, businesses must prepare for what lies ahead. Now is the time to harness the power of new and emerging Metaverse technologies. The potential benefits include improved collaborations, human resources, support operations, and asset management, among others. And this is just the beginning. Discovering innovative models for communications and collaboration A productive workplace must be engaging and provide a sense of belonging and community. From this perspective, the Metaverse is a game changer that can boost meeting effectiveness with unprecedented flexibility and new immersive experiences. With the help of AR and VR technologies, employers can improve hybrid workplaces by bringing in-person and remote teams together. Employees can collaborate in virtual meeting rooms on virtual objects such as 3D models of new designs. In addition, organizations can create realistic 3D avatars that mirror the body language of employees. Businesses can even set up virtual campuses, enabling employees to move around and interact freely through their avatars. The Metaverse offers a vast environment with a range of shared and immersive experiences that enable all kinds of collaboration and co-creation opportunities for users. This unlocks new ways for customers and enterprises to interact. For instance, clients can customize a jacket to see precisely how it will look on an avatar that resembles their shape and size. Remote coworkers can also work together to create a new product in a virtual design studio. The number of interesting use cases for the Metaverse is practically infinite. Here are a few examples across industries. Thus, the Metaverse will significantly influence both physical and social interactions, and its impact will be driven by the integration of key technologies such as AR, VR, and AI. Fostering talent via virtualized training, onboarding, and recruitment Virtual environments will facilitate more effective talent identification and acquisition to keep pace with the hybrid working model. By embracing the Metaverse, organizations will take their employee onboarding and training processes to the next level, accelerating skills acquisition, and creating new opportunities for career advancement. Organizations will hold events that let workers experience physical office onboarding from the comfort of their remote offices. The Metaverse will also provide an immersive, interactive, and safe environment for equipping employees with the right skills, helping them be better prepared to face real-world scenarios. This will be done using AR and VR technologies that enable simulation-based gamification and product usage training. Reinventing support operations, improving support quality Companies across industries will be able to improve brand identification by leveraging the Metaverse for innovative approaches to large-scale events, holding product launches and customer meetings in virtual expo halls. For manufacturers, on-site data visualization and remote access to operational information will introduce a multitude of productivity and efficiency gains. These gains will range from real-time maintenance monitoring to providing assembly instructions on the equipment itself. Organizations will establish virtual assembly lines for employees to follow. This will lead to increased efficiency, optimized workflows, fewer errors, and decreased need for physical manufacturing facilities. Through VR, companies will be able to

create virtual prototypes of products, accelerating testing before items are manufactured. Virtualization for quality control will allow manufacturers to slash downtime and enhance the accuracy of their inspections. Data collection from various sources like IoT sensors, PLM, ERP, and MES will make it possible to generate digital twins of factories. Powering risk management with blockchain capabilities In the Metaverse, a blockchain ledger facilitates the recording of transactions and the management of tangible and intangible assets. Through blockchain technology, tasks like reporting, balancing P&L statements, and cash flow management will become easier, besides saving time for companies to focus on their core businesses. Blockchain makes transactions secure and reliable by ensuring that each transaction is validated. It also reduces the risk of virtual assets or vulnerabilities, resulting in more robust workflows. Inventory management using blockchain When managing inventories in large warehouses, the main aim of enterprises is to find opportunities to reduce costs. With blockchain, it becomes easier to achieve this since it ensures complete transparency in the network, helping employees keep track of any product's exact path. Since everything is made visible in real-time in the Metaverse, controlling surplus inventory, clearing out stocks, managing stock-outs, and reducing employee errors are all made much easier. Further, inaccuracies can be easily corrected, leading to reduced costs and increased revenue, helping achieve the primary goal of all businesses. Also, blockchain helps enterprises plan necessary implementations and changes by keeping track of the production and sales cycle daily, helping the business in the long run. Leveraging Spatial Computing in the Metaverse Our lives have already been made easier and inextricably linked by spatial computing. It accelerates the idea of a parallel, three-dimensional virtual reality that engages with the real world. It never shuts down, as it fuses AR, VR, and MR to realize the Metaverse concept. It enables real-time simultaneous interaction between the virtual and physical worlds. Through virtual meeting rooms, the spatial computing component of the Metaverse makes conferencing and presenting more convenient and exciting. As avatars, you may work, converse, and socialize in a detailed, three-dimensional digital environment that closely resembles the actual one. Spatial computing has developed into a significant class of technology by enabling us to manipulate and access 3D spaces for better experiences. Spatial computing has many applications, which is conclusive evidence that it will be the next phase of digital transformation. It will affect almost everyone, including retail customers, patients, doctors, employees, and CEOs. Additionally, it will be crucial in enhancing the efficiency of machine-to-machine communication. Humans are powerful because of their capacity for collective thought. The same will be made possible by spatial computing, which will enable millions of people to communicate without using words. To power this, the collective human knowledge about every person, place, and thing will be captured graphically. Additionally, the use of AR cloud infrastructure will ensure this capability is accessible instantly to everyone. Whether it is the digital twin concept or the Metaverse, along with a gamut of other opportunities, the possibilities for spatial computing technology are limitless, implying that exciting times are ahead. The time is here for the paradigm shift to an enterprise Metaverse It can be said with certainty that the Metaverse is here to stay. The potential is enormous, and companies must start evaluating how to leverage these technologies. Wipro has already begun to offer its

Specialized Metaverse Value Proposition to organizations keen on leveraging this technological revolution. The service is based on a futuristic approach, XLA-based design, AI and IOT integration, and is driven by ensuring equitable experiences to employees. Furthermore, by leveraging capabilities from partners like Virbela, Wipro is building world-class immersive virtual worlds engineered to meet an enterprise's exact needs and redefining the future of work. Sidharth Mukherjee Global Practice Head of Wipro's Digital Workplace Services Sidharth Mukherjee (Sid) is a dynamic leader and a true technology enthusiast at heart. He has more than 18 years of rich, holistic experience in driving digital sensitivity with cutting-edge cloud and infrastructure service transformations for Fortune 500 organizations. Sid has a passion for delivering "what's next" and technologically improving "what's now" for enterprises while keeping a keen focus on employee experience and sustainable innovation. He is currently engrossed in harnessing the power of AI, cognition, blockchain, and analytics to create an intricate workspace Metaverse aligned with the future of work. He is an alum of IIM Ahmedabad and specializes in Business Strategy, IT, and Management. Alex Howland President & Co-Founder, Virbela Alex Howland, Ph.D., created Virbela, a virtual world for work, learning, and events, and one of the pioneering Metaverse companies in 2012. Virbela was later purchased and made public by eXp World Holdings in 2018. Alex leads the development of Virbela's products and services — continuing to expand the platform to accommodate not just business workspaces but also classrooms, event spaces, and recreational areas. Prior to co-founding Virbela, Howland was an instructor in the Psychology Department at the University of California, San Diego, where he taught Industrial and Organizational Psychology to undergraduate students. His expertise in organizational psychology gives him a unique perspective on creating virtual work and education spaces. Howland has a bachelor of science in psychology from Providence College and his Ph.D. in organizational psychology from Alliant International University, San Diego. =====================

Why IT personas hold the key to experience and resilience

----- Arcticle source ----- https://www.wipro.com/infrastructure/why-it-personas-hold-the-key-to-experience-and-resilience/ ----- About the Authors Contact Wipro Please fill the required details to access the content Why IT personas hold the key to experience and resilience March | 2023 While the family of technologies which make remote work possible have been developing and evolving for a long time, recent shifts have suddenly planted them in a central position of essential technology enablement for businesses. Hybrid work is now part of our daily lives, sitting on a brand new spectrum between at-home and in-person modes of productivity. In this new world, technology, culture, and personal habits are all playing catch-up in a way that can leave businesses which prioritize the employee experience feeling like they're swinging on a pendulum between differing demands and expectations. If you wish that your hybrid work strategy could stop reacting to trends and start building a resilient, long-term approach, you are not

alone. The way to do this is to put your real users at the heart of things by creating detailed, nuanced IT user personas and design your infrastructure around their needs. That was the big takeaway from Wipro and Citrix's recent discussion panel , where our experts came together to share the latest thinking from different perspectives and specialisms about what good hybrid work looks like today. Our panelists agree that, while many businesses have spent recent years on technological catch-up – trying to mature from VPN-based offerings to modern, secure remote access at record speed – now is the right moment to build proactively for the future. The importance of personas is about recognizing what stays the same and what changes between different job roles. Those differences are obvious between different industries. In healthcare, for example, telehealth and connected medicine have been launched into the spotlight in recent years. However, both the data at hand and its usage in this scenario contrasts heavily with the kinds of security and assurances required by financial services businesses. Differences can be just as stark within businesses too. A clinician working on the floor of a ward has different IT needs compared to one giving advice over a video link, and granular access to sensitive data is different for a bank's customer services agent compared to its portfolio manager. Fully understanding these roles and mapping out their needs means that more informed and lasting decisions can be made around overcoming the technological hurdles that these situations have in common. Here are three important benefits of starting with personas when building a hybrid workplace strategy: 1: Resource-based security Security is a challenge that every business must reckon with when building an effective hybrid work environment, and one which might come second only to the overall employee experience. While traditional approaches have emphasized hardening devices against misuse and compromise, this is becoming more difficult in the context of a growing diversity of device types. Using virtual desktop infrastructure (VDI), businesses can instead focus on controlling data and application resources. When VDI is established with well-designed personas, sensitive data can be made accessible only to those who have authorization to use it. This also keeps the data inside the well-secured central system rather than requiring tech teams to tackle the much tougher task of maintaining the highest security standards on every remote device. At the same time, this resource-based security approach simplifies users' lives by automating access based on who they are rather than repeatedly inputting passwords. 2: Autoscaling infrastructure Using persona modelling also creates the potential for service improvements in other areas. A financial analyst, for instance, might spend almost all of his or her time working in everyday productivity software like Office 365, but occasionally require higher-performance computing in order to extract fresh insights from large real-time datasets. Without well-architected virtualization, businesses are left with unsatisfactory options, such as providing employees with a device that is over-specified for most of their needs or requiring them to seek assistance from a second person to run their analysis. When a VDI deployment is aware of the employee's workflow, the power available to them in the virtualized environment can be automatically scaled up when it is needed and scaled back down to save on costs when it is not. 3: IT management The panel also discussed how businesses exploring VDI for hybrid work are uncovering opportunities to improve the IT workflow. In particular, AI-based service delivery management is now coming into scope

as a viable option to deliver better on key objectives. With a clearer picture of what needs to be enabled for different user personas in order for the business to function well, AI tools can in fact go beyond accelerating the response to network failures and proactively eliminate problems before they interrupt productivity. With this kind of predictive analytics, we can now begin to speak seriously about building self-healing systems which – together with user-facing tools like AI chatbots and IT quality-of-life improvements   – free up IT professionals to focus on more strategic work that delivers growth opportunities. Virtualization has been in the industry for a long time, but the last few years have been an exponential growth phase for the technology. That process has created a real wealth of experience and insight around how VDI delivers for different sectors. To hear more and get the full picture on persona-led hybrid work strategy, you can watch the panel discussion today. Gopal Tadepalli Global VDI Sales and Presales at Wipro (Author) Gopal Tadepalli heads Global VDI sales at Wipro Technologies. He leads VDI practice and business development along with delivery. With more than 25 years of experience in the IT industry, he worked on End User Computing transformations such as User experience management, Digital workspace, DaaS, VDaaS, Cloud journey etc., in the last 15 years. Mahesh Chandra Senior Vice President and A2 Sector Head, Cloud and Infrastructure Services at Wipro (Co-Author) Mahesh heads Wipro's Cloud and Infrastructure Business (CIS) Unit. He looks after the growth of the CIS business within the Americas market. This includes driving overall strategy, orchestrating delivery and managing both the sales team and the Americas segment results. Mahesh also spearheads sales and client engagement on large transformation and digital programs. Under his leadership, Wipro has been established as a leading innovation partner for this firm. Mahesh firmly believes that well-executed partnerships lead to more partnerships – a philosophy he uses to lead his team and achieve results for both his clients and for Wipro.

EDGE COMPUTING UNDERSTANDING THE USER EXPERIENCE

----- Arcticle source ----- https://www.wipro.com/infrastructure/edge-computing-understanding-the-user-experience/ ----- ABOUT THE AUTHOR Contact Wipro Please fill the required details to access the content EDGE COMPUTING UNDERSTANDING THE USER EXPERIENCE March | 2023 As we'll see below, edge computing brings business and IT benefits like cost savings, bandwidth optimization, and enhanced security, all of which benefit end users indirectly. Yet edge computing also brings direct benefits to end users, including faster application response times, improved support for collaboration, greater personalization, more productivity, and a heightened user experience. DIRECT BENEFITS TO BUSINESS AND IT 1. Maximizing Bandwidth The need to optimize available bandwidth is critical and will continue to increase. New technologies like 5G, 6G and WiFi6 are becoming

available and satellite connectivity is making progress, but the amount of data moving between points will keep rising. Think about something as simple as the cameras in cell phones. In comparison to years past, these cameras are capturing and uploading massively more data today per photo and video. All the while, people are taking a lot more photos and videos. In moving this increased amount of information, constant monitoring and optimization of the bandwidth utilization is required so that the end user experience remains topnotch. Through the use of edge technology, data can be processed closer to the source. Data compression and data deduplication can be used to limit the amount of data. Technologies are also available to prioritize and optimize data movement through the pipes.   2. Lowering latency Latency is another key reason to look into edge computing. Network latency refers to the delay between when data is spent and when it is received. For most topologies, latency in the last mile is usually the highest and most impactful. The lower the amount of latency, or delay, the better the end user experience will be for interacting with applications and data. This is especially important for legacy applications and interactive applications that are more sensitive to network latency. Here are five ways in which edge can help with latency: 3. Leveraging workload distribution Workload distribution, an important aspect of edge computing, is about moving the workloads closer to the end user as well as spreading workload processing across a higher number of devices, zones and regions. This strategy can improve the end user experience in three ways: 4. Enhancing Security The security of an edge computing server, if compromised, doesn't require an entire network shutdown. In the event of an attack, it is easier for the business to shut down the affected server without disrupting the entire network. Due to the distributed nature of the architecture, work can be redirected to other edge nodes or back to the cloud. 5. Optimizing IT spending Edge computing reduces some of the inhouse demands of traditional computing, while introducing IT hiring needs associated with the new environment. The demand for jobs like system administrators, database administrators, admin, and support functions will be affected by the improved automation, resiliency and performance brought about by edge computing. On the other hand, job roles in edge computing projects, software development, network maintenance, and analysis will see a rise. Are there certain areas in your business where specific workloads can benefit from improved bandwidth utilization, lower latency, and workload distribution? Do you need help in understanding your current infrastructure topology to be able to plan an edge strategy? APPLICATIONS FOR EDGE COMPUTING Edge computing can be applied to many different workloads. Here are three of the most critical areas that companies are investigating today. 1. Manufacturing For manufacturers who rely on data for rapid decision-making, edge computing offers an opportunity to move away from traditional data closets to a more resilient and flexible infrastructure. The data gathered through sensors and robotics can be analyzed and applied to improve processes, maintain systems, and respond to real-time issues on the factory floor. Sophisticated sensors, for example, can improve quality control and monitor maintenance. Industrial robots can operate autonomously and communicate with manufacturing systems. Introducing or expanding the use of augmented or virtual reality (AR/VR) devices can help improve safety and training for industrial workers and reduce downtime of factory maintenance events. How can manufacturers harness the full

potential of these advanced data-driven technologies, such as the IoT, AI, and robotics, to boost productivity, streamline processes, and increase flexibility? How can they scale the smart factory initiatives that will help them stay ahead of the competition, while maintaining data privacy and security? 2. Field services Some examples of edge computing for field services are enterprises in the industrial, manufacturing, mining, energy, and oil and gas industries. Many of these companies are working to take advantage of the edge to let them run the core elements of their solutions locally. Local devices can save their state, interact with each other, and send important alerts and notifications. Even if the Internet connectivity goes, the edge processing in the factory, warehouse, industrial site, or mine keeps working, enabling continuity of business processes and operations. These advantages are spurred by mobile edge computing devices that capture data directly from equipment or from sensors attached to legacy equipment. Organizations are using these edge computing capabilities to translate out-of-date machine protocols into more modern languages and interact with the modern equipment. Companies can then compute a variety of data coming in from different sensors to provide operational information with increased accuracy and reliability, or to produce intelligence that can be used for other purposes. How can your organization utilize edge computing to run core elements of your network in local regions? Is it feasible to integrate IoT data into your edge computing solution? 3. Real-time and near real-time processing Edge computing can minimize the network and bandwidth issues associated with moving large amounts of data to or from IoT devices and reduce reliance on the network. During edge analytics, the processing control of all applications, services, and data is then shifted from the cloud to the edge of the network, where a physical contact is made with the data source. Edge analytics has been adopted by many vendors for use on servers, allowing businesses to pre-process their data near its creation instead of transmitting and processing in the cloud. Companies are looking to edge solutions that can process data at the source and provide summary information about what's going on. These solutions eliminate the need for the SIM cards, data plans, and other network costs that would accrue when the data is instead transported from the device to a network. Edges can use simple logic or advanced AI algorithms to understand and build summary information. How can pre-processing data and the increasing reliability of operations on edge technologies support your corporate initiatives? Are there areas within your business that have the ability to acquire insights faster to reduce time-to-market, operational expenses, or allow for predictive maintenance? DIRECT BENEFITS TO THE USER EXPERIENCE Beyond the many IT and business benefits with indirect advantages to end users, organizations are also realizing direct end user benefits that can improve abilities to attract, retain, train employees and make the workplace a more productive environment. 1. Faster response times One of the major complaints IT organizations face from end users is the response time of the applications they work with on a daily basis. End users do not understand the underlying complexity of connecting the applications to their data, nor should they need to do so. Improving response time by bringing the various different parts closer enables employees to work more efficiently and effectively. Customers, too, obtain a better engagement experience. The goal is to give end users the perception that their environment is close at hand, when it really might not be. Sometimes users are working with data

that's been distributed from the cloud to the edge, and sometimes the data there is thinner and optimized for their ingestion.   2. Easier collaboration More and more of the work performed by employees does NOT happen in the siloed world of the past, where one person creates something for someone else to consume independently and serially. Organizations are uncovering an increased requirement to use technology to enhance collaboration, especially with the rise in remote work since the pandemic. Edge computing enables and enhances collaboration by allowing for faster and thinner data access. At the same time, technologies like augmented reality/virtual reality (AR/VR) in the workplace are allowing for real-time collaboration in the workplace, in contrast to approaches of the past which were limited to audio communication at best. Solutions like Virtual Desktop Infrastructure (VDI) and engineering VDI (eVDI) or graphical VDI empower users to share information rapidly and quickly by minimizing the movement of data. Combining those technologies with edge can reduce the networking path, enhancing end user experience and significantly improving end users' perception of the ecosystem. 3. Individualized experience Finally, by bringing edge technologies closer to end users and customers, businesses can offer more personalized experiences. These can include improvements in the collection of information such as customer sentiment while shopping, for instance. Improvements in data collection can lead, in turn, to greater efficiencies in supply chain and distribution. It's possible with edge technologies to create regional, local and even personal experiences for users. The data and the people can be nearly co-located, with no need to keep connecting back into the cloud and/or the datacenter. What are the best ways for your organization to harness the power of edge computing for improved collaboration, personalization, productivity, and satisfaction? Are you looking at incorporating live streaming video, AR/VR, or VDI into your edge computing solution? SUMMARY Edge computing opens up new worlds for improving the user experience through faster application response time, bandwidth optimization, reduced latency, and better support for personalization and remote collaboration. Edge also provides an optimal environment for innovative new technologies such as live video streaming, VDI, and AR/VR. The results? Improvements to business processes, productivity, and employee and customer acquisition and retention. After all, ultimately, edge computing is about the end user. To learn more about Wipro's approach to Accelerating Your Innovation, visit Innovation. Nicholas Holian Global CTO and GM, Wipro FullStride Cloud Nicholas Holian serves as the Global CTO and GM for Wipro's FullStride Cloud business unit with a focus on customer growth strategic transformations using new and emerging technologies and methodologies. Nicholas has been helping customers understand how to take advantage of cost savings, automation, cloud and other technologies to accelerate their business transformations to meet their customer demands. =====================

How Human-Centric Work Leads to Digital Transformation

How Human-Centric Work Leads to Digital Transformation July | 2023 After three years of experimenting with remote work models, businesses and employees appear to finally be striking a satisfying balance with hybrid work. Employers have been able to cut down on overhead costs by downsizing their office spaces to accommodate fewer on-site employees and staggered in-office schedules. Remote work has allowed businesses to reach top talent in other geographies, increasing diversity and capabilities throughout the workforce. Meanwhile, employees are saving time on commuting and finder greater work-life balance. Even business infrastructure is benefiting, with businesses upgrading legacy systems to accommodate hybrid models. With so much value coming from new work models, it seems clear that hybrid work is here to stay. The question is, In what form? What is the best way for business leaders to balance the needs of the business with the needs of the employees? Yes, there have been advancements over the past three years, but is there still room for improvement? The past few years have offered some insights. What sets the most successful hybrid work models apart is their shift from an office-centric to a human-centric approach to work. What Is a "Human-Centric" Approach to Work? At its most basic, a human-centric approach to work is one that prioritizes the employees rather than the office. But this a deceptively simple definition. The most successful hybrid work solutions are successful not because they allow employees to split their time between the office and remote locations; they're successful because they focus on empowering employees rather than empowering the office. This subtle shift helps business leaders to consider what's really best for both the business and the employees because what's good for the employees is likely going to be great for the business. Employees who feel supported in their roles are more likely to be engaged at work, leading to increased productivity and creativity. This might mean a modern office space where teams can meet for a few hours a day. It might also mean a stronger remote work capabilities to increase virtual collaboration. What's important is that businesses invest in solutions that better serve the needs of the employees, rather than adopt new solutions and hope employees adapt. With a human-centric approach to hybrid work, business leaders consider what the employees need to be most effective and uses these considerations to guide the development of their working models. How Human-Centric Drives Digital Transformation Shifting focus from the office to the employees helps businesses move away from legacy systems in favor of more flexible cloud-based and as-a-service models. These kinds of enhancements allow businesses to offer more advanced capabilities to support remote work. Cloud computing, for example, can increase accessibility for teams, paving the way for greater collaboration and stronger DevOps programs. As-a-service offerings can flex to accommodate changing demands – scaling with the company and its workforce, providing the latest software or infrastructure services while reducing costs and technical debt. In this way,

a human-centric approach to work can actually accelerate digital transformation by identifying the technologies that will be most helpful and therefore most likely to be integrated quickly, used effectively, and to show quick returns on investments. Consider cybersecurity, which is a growing concern for organizations. Remote work is risky for businesses because it extends the threat perimeter, exposing the business to new threats from private devices and public networks. At the same time, studies have shown that flexibility of a hybrid work model improves performance, making employees three times as likely to be high performers. A Gartner survey found that an organization would risk losing up to 39% of its workforce if it were to go back to an entirely onsite arrangement. The office-centric solution is clearly not the best options, so employers have had to find a way to provide the flexibility of remote work while maintaining the security of working onsite. The human-centric approach directs organizations to upgrades in virtual desktop infrastructure (VDI), bring-your-own-device (BYOD) programs, along with investments in more flexible security models like zero-trust and secure service edge (SEE) for browser-based web applications. These remote-friendly options also focus on building a more scalable infrastructure that the company can manage. Zero-trust security, for example, allows organizations to limit access to specific assets rather than specific physical locations, so security is maintained onsite and offsite. By combining zero-trust security and SSE with virtual desktop infrastructure, companies can provide more secure remote access to company applications and data from any device or platform. There is no one best hybrid work model, and even the great ones will change over time to meet the changing needs of employees and the business. A human-centric approach to working models can help businesses stay ahead of the curve, illuminating new ways for technology to empower employees, wherever they choose to work. =====================

AI-Powered Strategies for Cloud Cost Optimization

----- Arcticle source ----- https://www.wipro.com/infrastructure/ai-powered-strategies-for-cloud-cost-optimization/ ----- Contact Wipro Please fill the required details to access the content AI-Powered Strategies for Cloud Cost Optimization With AI, organizations are unlocking the full potential of their hybrid and multicloud investments, achieving cost efficiency and operational excellence. The rise of hybrid and multicloud environments has been a game-changer for businesses, offering unprecedented scalability, flexibility, and pathways to innovation. Yet, this adoption has also brought to light a significant challenge in managing costs associated with cloud services. As companies dive deeper into the multicloud environment, they're finding that managing the associated expenses is more complex than anticipated. Resource usage can become a significant challenge. Achieving comprehensive visibility into resource usage, performance, and costs across hybrid and multicloud environments is difficult because companies often lack comprehensive insights and control over their diverse IT landscapes. This leads to overrun budgets and underutilized resources, highlighting a

critical gap in effective financial management within cloud environments. Enter artificial intelligence (AI) and machine learning (ML). These technologies are proving to be invaluable tools for companies looking to get a handle on their cloud costs in a hybrid/multicloud environment. AI and ML dive deep into data on resource usage and business operations, uncovering insights that can lead to more informed decision-making. With these technologies, businesses can predict demand more accurately, optimize costs automatically, and monitor performance more effectively. This isn't just about cutting costs; it's about optimizing the entire cloud environment to ensure that every dollar spent is driving value, maintaining performance, and adhering to compliance standards in a risk-managed way. Common Challenges to Managing Hybrid and Multicloud Programs Driven by the business need for greater flexibility, resilience, and access to best-in-class services across different cloud providers, multicloud and hybrid cloud strategies are on the rise, creating a labyrinth of services and pricing models. This complexity is not just a matter of navigating different platforms; businesses also struggle to integrate these services so they function as a cohesive unit. The diversity in operating and billing structures across cloud providers complicates the management process. Another challenge is the lack of overall visibility and control over cloud resources. In the absence of comprehensive monitoring tools and clear governance policies, organizations struggle to get a holistic view of their cloud spending and usage patterns. This lack of transparency can lead to inefficiencies, as decision-makers might not have the insights necessary to make choices about current resource usage, allocation, and cost management. Without a detailed understanding of where and how cloud resources are being consumed, it becomes nearly impossible to identify areas of waste or opportunities for optimization. Navigating Cloud Complexity with AI AI/ML offers a pathway to not just mitigate the complexities of today's hybrid cloud environments but to transform them into opportunities for optimization and cost savings. These technologies predict and respond to demand, refine cost management and enhance performance monitoring with a level of precision and foresight previously unattainable. To be successful in integrating AI into cloud financial management and instilling financial prudence, businesses must further prioritize the accessibility of quality data, invest in training for their teams, and establish clear governance and oversight mechanisms. AI's potential to transform cloud cost management is amplified when it is fed high-quality, comprehensive data, enabling more accurate forecasting and decision-making. Furthermore, fostering a culture that values data-driven insights and continuous learning can empower teams to leverage AI tools more effectively, driving innovation and efficiency. Establishing robust governance structures ensures that AI's integration aligns with the organization's dual strategic objectives: cost optimization and operational excellence. The integration of AI into IT financial planning for hybrid/multi cloud environments marks a critical step forward for businesses seeking to optimize their cloud investments. While this shift may seem daunting to less digitally mature organizations, it is essential for harnessing the full potential of cloud in a rapidly evolving digital landscape. By embracing a change in mindset, prioritizing strategic integration, and leveraging AI's capabilities, organizations can achieve a more dynamic, predictive, and cost-effective approach to cloud management. As a larger more strategic approach to managing costs organizations the practice of cloud economics can also come

into play to maximize business value. For businesses, this journey will continue to unfold and will require insight and collaboration to navigate these changes successfully. By taking the right steps organizations can realize significant cost savings but also gain a competitive edge through enhanced agility and strategic foresight. About the Author Gaurav Parakh Global Head of Hybrid Cloud Strategy & Emerging Offerings, Wipro Gaurav is a Senior Hybrid Cloud Strategist at Wipro with over 24 years of experience in IT consultancy and advisory services. He specializes in digital transformation, go-to-market and business development. At Wipro, Gaurav engages with Fortune 500 clients and partners at the leadership level, drawing on his experience designing and implementing cloud solutions, operating models, and strategies for FinOps, open source and generative AI to drive success. The new generation of airports uses sophisticated digital and IoT systems to plan and execute operations, support operations teams, and efficiently manage the flow of passengers. Wipro's Smart i-Airport solution hosts independent airport systems for airlines, passenger queuing, baggage management, ground fleet management, dwell time analysis, IT/OT

management, utilities, building management, asset management, etc. In addition, the platform can integrate applications for current and future requirements while its Central Command Center provides process KPIs and visualization for intelligent real-time decision-making. The platform includes the following key capabilities: Virtual Queue Management System ensures passengers can join queues remotely (via a QR code or a link), monitors queue status, and dynamically manages them (counter and queue number allocation) using predictive analytics based on customer profiles, travel schedules, and customer standard classifications. The system can be integrated with FIDS, employee resource management, and Airline Operations Control Center. Airports using the system can easily integrate it with advertising solutions that improve revenue and with email and SMS gateways for passenger alerts and notifications. The benefits of the Virtual Queue Management System include the following:

Smart i-Campus

----- Arcticle source ----- https://www.wipro.com/infrastructure/smart-i-campus/ ----- Contact Wipro Please fill the required details to access the content Smart i-Campus Improve campus performance and strengthen user experience with persona-focused digital transformation. Leverage an IoT-led solution that delivers a modern, sustainable, and smarter campus In modern society, citizens spend most of their lives on campuses. These campuses include commercial complexes, manufacturing plants, refineries, airports, seaports, warehouses, universities, and hospitality, among others. Many campuses house thousands of people simultaneously, making comfort and safety a priority. Wipro's Smart i-Campus solution provides persona-led design to improve campus infrastructure performance and strengthen user experience. The preventive and prescriptive insights provided by the solution for proactive management through IT/OT systems also create non-linear value for enterprises and improve asset ROI. The solution covers the following areas: Utility Management: Optimizes energy, water, and gas consumption and manages all utilities in line with sustainability goals. Environment Monitoring: Ensures the health and well-being of users through AI-driven indoor air quality monitoring, thermal management, light and noise level control, and odor management. Safety & Security: Provides integrated monitoring and management of surveillance systems, evacuation

systems, fire control systems, worker safety, and access controls. It also includes an integrated command center that automatically detects, responds, and recovers from incidents using AI and advanced analytics. Sustainability: Enables energy savings, supports green energy, drives water savings, and facilitates better waste management that reduces the burden on landfills. Connectivity: Provisions easy-to-deploy, low-latency, secured, high-speed wireless coverage using private 5G and Wi-Fi 6. Customization: The modular design, flexible workflows, and feature-based deployment models make the solution scalable, configurable, and adaptable for various user needs. The Smart i-Campus solution transforms facilities with an open standards architecture and persona-led experiences, which subsequently help to drive sustainability while elevating data security, and improving user experience. =====================

Smart i-Rig

----- Arcticle source ----- https://www.wipro.com/infrastructure/smart-i-rig/ ----- Contact Wipro Please fill the required details to access the content Smart i-Rig Rig management, along with security and HSE compliance, to create a safe operational environment Bring real-time asset and environment monitoring to rigs with a solution that can be integrated with existing systems. Rigs are unpredictable and hazardous environments. Winds, tides, heat, cold, humidity, slippery work surfaces, extreme noise, poor visibility, etc., constantly expose workers and equipment to risk. Safety is a primary concern, and non-compliance to Health, Safety, and Environment (HSE) processes can threaten life and assets. Early monitoring and tracking of abnormal asset performance, the operational environment, and threats inside and outside the plant help prevent accidents and business loss. Wipro's Smart i-Rig solution allows rig owners and operators to monitor assets and environments, explore predictive maintenance in critical equipment, and enables 5G and edge-based operations. It also provides comprehensive device management and AI and ML-based algorithms to boost safety, reduce operational downtime, and increase asset lifetime. The solution can be integrated with existing upstream and downstream systems to monitor supply chain performance and avoid failures pertaining to pipeline health, leakages, etc. In addition, enterprises using the Smart i-Rig solution also benefit from generating data-driven business decisions that prevent disruptions and improve operational efficiency. Wipro's Smart i-Rig solution is designed to: =====================

SAP on Google Cloud Platform

----- Arcticle source ----- https://www.wipro.com/infrastructure/sap-services-on-google-cloud-platform/ ----- Our Success Stories Form Title What We Think Contact Wipro Please fill the required details to access the content SAP on Google Cloud Platform Fastrack your digital transformation with SAP applications on Google Cloud Platform (GCP). Transform your enterprise with risk free migration with SAP on Google Cloud Platform (GCP) As businesses transform rapidly, companies need to be more agile, innovative,

and cost efficient than ever before. While some companies have begun their journey to the cloud, many others are still exploring ways to use cloud technology to become scalable, sustainable, intelligent, innovative, and cost effective. Wipro's innovation arena offers end to end services for SAP application migrations, including assessment and discovery, cloud migration, and support on Google Cloud. It ensures a risk free migration with speed and agility for our customers. Our robust SAP cloud migration framework called "Safe Passage to Cloud" is uniquely designed for the Google Cloud Platform, and it incorporates SAP best practices, cookbooks, 20+ tools, levers, and partner accelerators to deliver a risk free, on-time, on budget, and nondisruptive migration. Additionally, our migration manager (MigMan), augments our safe passage framework to help plan and execute migration projects with accuracy and quality. Wipro is Google's partner of choice for SAP implementation and Google has recognized Wipro for its "SAP on Google Expertise". The company has the experience and scale to support large and complex cloud migrations across verticals and varied business requirements. We are also a strategic partner of Google's Cloud Acceleration Program (CAP), which gives our customers exclusive access to partner incentives for cloud migration. Leveraged cloud functionalities and improved customer experience with SAP Hybris How Wipro is helping its customers with their SAP transformations on Google Cloud Platform by leveraging its SAP on Google Cloud Expertise. Running your SAP on Google Cloud Platform is cost effective and increases... =====================

Wipro's AppAnywhere

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipros-appanywhere/ ----- Contact Wipro Please fill the required details to access the content Wipro's AppAnywhere Managed service to automate the container based IT Lifecycle AppAnywhere is a managed service comprising a set of tightly integrated technologies to deliver end-to-end automation of container-based IT lifecycle to enterprises AppAnywhere is an industry-leading managed service from Wipro for customers adopting containers. It addresses the operational and security encounters of multiple Kubernetes clusters, and provides managed services for monitoring, logging and observability of multiple Kubernetes clusters. With AppAnywhere, Kubernetes can be included as a service for hybrid Cloud/ multi-Cloud and implemented as managed Cloud-native platform as a service. In addition, you can avail the "pay-as-you-use" models like GKE, AKS and EKS, on-premise or SaaS. AppAnywhere brings DevOps autonomy to ensure autonomy and control, storage acceleration with no I/Q blender or granular control, simplicity with workload drives and details and freedom from lock-ins to move the workloads across Clouds and manage Cloud exposure. The key differentiators of AppAnywhere include an efficient use of hardware utilization with lower TCO and the usage of best-in-class Kubernetes – RedHat Openshift, SuSE, etc. Gecko platforms helps with Observability, Chaos engineering and cross-cloud data migration. =====================

Remote Support with Intel vPro

----- Arcticle source ----- https://www.wipro.com/infrastructure/remote-support-with-intel-vpro/ ----- Contact Wipro Please fill the required details to access the content Remote Support with Intel vPro What to do if remote resolution isn't working? Utilize Intel® vPro for increasing the effectiveness of remote field services While traditional remote services are crucial for providing support to remote workers, there are still issues where traditional remote support still doesn't work, e.g. fixing BYOD issues, device driver corruption issues, or OS corruption issues. Wipro's LiVE Workspace™ Digital Field Services (DFS) provides augmented out-of-band remote support for your remote workforce by utilizing the inbuilt functionality available on Intel® vPro chipsets that are available in 80% of the enterprise estate. The service provides your remote support teams with the ability to manage issues that they traditionally could not, such as OS corruption, device driver corruption and the famous blue-screen-of-death, thereby increasing end user productivity, user satisfaction and reducing the pressure on both your field services as well as your remote support groups.

Home is the New Branch

----- Arcticle source ----- https://www.wipro.com/infrastructure/home-is-the-new-branch/ ----- Contact Wipro Please fill the required details to access the content Home is the New Branch A business continuity solution for secure & seamless remote working We are living in uncertain times amidst a global pandemic. Organizations are taking all measures to ensure safety of their employees and customers, while maintaining business continuity. As part of this effort, organizations are adopting new ways of working. With the majority of the workforce locked down in their homes, the need of the hour for enterprises is to enable these employees to deliver their responsibilities remotely, in other words, make the employee's home a 'new branch office'. Wipro's #WANFreedom, a secured SD-WAN solution, ensures that users get seamless access to authorized applications irrespective of their location - office or home. The secure internet access ensures that users have the right level of protection and apply the same policy while they are on the campus, branch or working from home. Home is the New Branch 'Home is the New Branch' solution, delivered with #WANFreedom, enables secure remote access to the work-from-home users, who are originally connected to their enterprise network. This gives the remote users seamless and secure access to the applications sitting at cloud and private cloud data centers. While the user is at the branch, security is ensured by the branch edge SD-WAN part of the #WANfreedom secure network. The user is allowed in the corporate local area network with an active directory-based authentication. Once the user is authenticated, the access to all applications is controlled via WAN segmentation and application policy as part of SD-WAN solution. Wipro's Home is the New Branch solution ensures the same level of access and security even at home. The secure tunnel which gets established from the

user machine to the secure cloud over the internet creates a micro-tunnel to enable access to the authorized app for a given user. This ensures corporate apps have protected usage, which is achieved using secure authentication of the user to the secure internet cloud. High-level architecture of Home is the New Branch solution Key highlights of the solution Office wireless experience at home Home is the New Branch solution enables Office Wireless Experience at Home, which provides office SSID and Wi-Fi experience at Home. This is enabled with a special Wireless Access Point (WAP) at home, which automatically creates an IPSEC tunnel to the headquarters and enables access to corporate or cloud applications. The WAP is completely controlled and managed by the Wi-Fi solution for the corporate local area network. This ensures: Office wireless experience at home Empowering remote workforce Wipro, along with its strategic partners, stand committed to support our valued customers in these uncertain times to deliver and enable business continuity services on priority. Wipro's managed services and global services delivery model is fully equipped to support organizations to run their business with minimum disruption. Wipro's InsightixTM based consulting approach will help you select the right access methodology and design for the Remote Working solution. =====================

Digital Concierge – Cognitive AI Office

----- Arcticle source ----- https://www.wipro.com/infrastructure/digital-concierge-cognitive-ai-office/ ----- Contact Wipro Please fill the required details to access the content Digital Concierge – Cognitive AI Office Help eliminate boring repetitive tasks for employees Help accelerate the digital journey of your organizations by deploying bots that eliminate non-value added tasks across business and IT Enterprise IT is still struggling with the general adoption of Virtual Private Assistants (VPAs), given the rapid pace of change in cognitive platforms. The sheer choice - from Microsoft's Bot framework to Amazon's Lev, makes finding the right platform a challenge. Furthermore, these platforms are still built for developers, hence their reusability and application of analytics are key challenges. Wipro's Digital Concierge –Cognitive AI Office solves these problems by providing an integrated platform that allows IT and business users to develop use cases with agility through a drag and drop UI. Its suite of services helps discover new use cases and leverages inbuilt analytics to determine user sentiment and utilization of business use cases. All of the above services are delivered through our digital factories using our unique DLAD (Design Led Agile Delivery Methodology) that drastically reduces the time to value from 12-18 months in a traditional engagement to less than 12 weeks. =====================

Wipro's ServiceTheatre

----- What We Think Contact Wipro Please fill the required details to access the content Wipro's ServiceTheatre Platform to embrace digitalization Services platform that enable internal API economy by exposing callable services and delivers autonomous operations as outcome-driven approach for complex heterogeneous IT Wipro's Service Theatre delivers fully-programmable industrialized services platform that exposes callable services via API mediation and adaptive automation workflow engine. The platform abstracts complex heterogeneous technologies and deliver outcome driven automation assets which are discoverable and each used as managed API. Platform radically simplify and centralize the automation asset creation by its theatre concept and balance it with efficient consumption and reuse model to deliver speed, agility to deliver new services aligned to changing business demands. Service Theatre anonymize the underline technologies and skills required to manage it which allow protecting existing investments (even traditional infrastructure) and seamless adoption of new age technologies. One can deliver callable services for consumption by applications on premise and on Cloud, called as part of business process or application workflow and enabled as self-service. The workflows and services integrated with AIOps engine delivers intent driven autonomous operations for overall IT lifecycle management. ServiceTheatre enable internal API economy and enable knowledge automation with ultra-efficient reusability of services leveraging centralized repository. It enhances the velocity of DevOps or micro-services roll out by empowering end user and unlocking technology potential to enhance their pipelines. Transform your IT ecosystem from complex to outcome-oriented

Rebooting business into new ways of working through Wipro virtuadesk™

Our Success Stories Form Title Form Title Form Title Form Title What We Think Form Title Form Title What We Think What We Do News and Events Form Title Form Title Contact Wipro Please fill the required details to access the content Rebooting business into new ways of working through Wipro virtuadesk™ Making the hybrid office and work from home a possibility Virtual Desktop Infrastructure (VDI) is instrumental in helping businesses stay abreast of the changing digital economy and create an efficient next-gen digital workspace. Wipro's flagship virtuadesk™ is a transformative application and desktop delivery platform, powered by 14 patents (granted and filed) across the globe in the areas of artificial intelligence, analytics,

automation led managed services. We offer packaged solutions that combine leading cloud and hyper converged infrastructure (HCI) technologies, to deliver workplace transformation and seamless user experiences. Wipro's virtuadesk™ approach provides an enterprise-grade virtual workplace, enabling access to remote desktops, laptops, and operating systems anywhere, anytime. The virtuadesk™ offers an as-a-service model that leverages simplified and integrated architecture for a cloud-hosted desktop, to deliver an unconstrained experience. It includes critical features such as service monitoring and automation, service visualization and management, enterprise marketplace, and application performance monitoring, to enable a modernized and consumption-based framework. Wipro's virtuadesk™ also helps optimize costs and scale quickly. It enables businesses to update enterprise software tools and allows employees to run multiple operating systems on the same machine. They can also use their own devices to enhance productivity while ensuring data and application security. We support over 600k users globally, with more than 1000+ VDI experts across multiple verticals. We have built in-depth technical expertise and fine-tuned our solution approach throughout numerous engagements and technology partnerships with leading companies across geographies. Our focus has been integrating with proven technologies from leading partners and expert consulting teams to offer innovative and stable solutions, to drive enterprise transformation. A leading Europe-based media and digital company implements Wipro virtuadesk™, a complete desktop virtualization solution in 3 months, leading to 25% cost savings and digital transformation A large oil and gas exploration company attains mobility, seamless collaboration, flexi-workspaces by deploying VirtuaDesk™ Platform A leading UK-based electricity and gas company implemented Wipro virtuadesk™, a complete desktop virtualization solution, leading to two times improvement in stability and performance of desktops Wipro's virtual desktop facilitates secure remote work and ensures excellent user experience What is Virtual Desktop Infrastructure (VDI)? A technology that enables your global workforce to securely access company data on their personal devices without sacrificing security. Global research and advisory firms envisage a new normal with businesses not returning to the pre-pandemic work model, and reveal a Hybrid Working trend Pharmaceutical companies aim to address their requirements around disease-focused early stage drug development Covid-19 pandemic is impacting people and enterprises globally. The top priority for enterprises is to keep employees, Organizations are quickly embracing flexible arrangements that blend working from home with going into a highly altered office environment. Enable a safe remote working environment for your employees, advisors and channel partners Stay connected to lead your business Making the hybrid office and work from home a possibility Be prepared to lead your business through unanticipated crises DaaS: Minimizing business disruption during and post the pandemic Wipro Limited (NYSE: WIT, BSE: 507685, NSE: WIPRO), a leading global information technology, consulting and business process services company, today announced that Wipro VirtuaDesk™, Wipro's Desktop as a Service solution and Wipro's Digital Workspace solution, will join forces with Citrix Systems, Inc. (Nasdaq: CTXS) and Microsoft to help customers drive business continuity while executing operations within the boundaries of social distancing and other limitations that have currently become the new normal. The ISG report highlights that Wipro offers a strong support

services portfolio with increased focus on automation.

Wipro's 5G-Edge Services Solution Suite

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipros-5g-edge-services-solution-suite/ ----- What We Think What We Think What We Do Contact Wipro Please fill the required details to access the content Wipros 5G-Edge Services Solution Suite Uberization of 5G-Edge Services Comprehensive platform driven by gig economy, AI and AR/VR offering complete lifecycle management for telcos and enterprises Wipro's 5G-Edge Solution Services Suite offers EdgeCent, Digital Design Studio, BoundaryLess Universal Edge platform - BLUE and Tririga catering to telecom operators, cell site infrastructure providers, tower companies and enterprises/networks. 5G, along with Edge services demand innovative and revolutionary change due to high network and device densification requiring radical transformation in telco operations. The capital intensive infrastructure and technological refresh of the network is fundamental to deliver ultra-reliable capabilities - high bandwidth, low latency and macro scale communication promised by the 5G technology. This solution addresses the operational and management complexity faced by the telecom industry.   Discover how the solution's integrated modules deliver Telcos & enterprises end-to-end solutions related to 5G & Edge Uberization of 5G-Edge Services Over the last few years, growth of the telecom industry in North America has been quite static. The subscriber market has saturated. The movement of subscribers from one operator to another is driving the growth of cheaper service providers. Interestingly, the number of postpaid subscribers has increased as compared to prepaid subscribers, adding to the revenue potential. This describes how MVPDs actively need to deploy their services over MEC platforms to be able to cater to the growing demands of Video consumption Mobile communication providers are facing increasing competition from OTT players while simultaneously battling diminishing ARPU (average revenue per user). Re-imagining your business transformation journey ======================

Monetize and Modernize IT – The 'new normal' proposition for your business

----- Arcticle source ----- https://www.wipro.com/infrastructure/overcome-covid-19-impact-by-monetize-and-modernize-it/ ----- What We Think Contact Wipro Please fill the required details to access the content Monetize and Modernize IT – The 'new normal' proposition for your business Transform your CapEx investment into OpEx to fund your IT initiatives Monetize and modernize IT with data center and asset buyout and move to a public Cloud

with 'consumer as a Service' for hybrid Cloud Setup Monetize and modernize – With numerous offerings and incentives from OEMs, CSPs and partners, it is essential to build the right proposition that will help customers achieve a balance between their long- term aspirations and short-term challenges. While it is imperative to continue the modernization journey to stay ahead as well as to maintain compliance and security, it is necessary to curtail the capex spend on non-business activities. To self-fund IT, it is necessary to look at the consumption-based pricing model, partner/ CSP offerings such as payment deferrals, cash incentives and discounts and leverage investments made by partners on IP, process, platform and process to expedite the modernization (or Cloud) journey. As a vendor neutral IT services partner, Wipro will primarily look at the customer's long-term plan that aligns with their objectives and build a proposition that makes use of these incentives and accelerators to arrive at improved TCO. Wipro will overlay financial support from our partners with a set of highly automated solutions that will help your clients to significantly reduce ongoing operating costs besides modernization. 'Monetize and Modernize' proposition is created by Wipro keeping in mind the current challenges for IT to support new normal solutions, transformations to support with reduced/shrunk budgets =====================

Wipro's SAP Infrastructure Modernization Offering

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipros-sap-infrastructure-modernization-offering/ ----- Contact Wipro Please fill the required details to access the content Wipro's SAP Infrastructure Modernization Offering Realize the full potential of your SAP investment On demand optimized and certified SAP infrastructure and value-added services to help you adopt SAP solutions faster. Speed, agility and innovation are essential in today's fast changing competitive world driven by AI, analytics and IOT. To achieve these, only moving applications to the Cloud is not enough; and public Cloud may not be the right option for every organization. Lack of in-house application centric infrastructure expertise will neither optimize performance nor help you realize the maximum business value of the application. Wipro's SAP Infrastructure Modernization solution helps your organization accelerate innovation, drive growth and reduce risk. The service offers you a validated, certified and customized SAP infrastructure platform optimized for performance, scale and TCO. Moreover, the solution can be hosted in your own data center or off premise in a secured, private and dedicated environment. The solution is professionally managed by Wipro's Infrastructure and SAP experts. The services are modular and customizable to each organization's unique needs ranging from infrastructure management to business process alignment. =====================

Collaboration using Moogsoft Situation Room

----- Arcticle source ----- https://www.wipro.com/infrastructure/collaboration-using-moogsoft-situation-room/ ----- Contact Wipro Please fill the required details to access the content Collaboration using Moogsoft Situation Room Enhancing operations during COVID-19 Wipro's alliance with Moogsoft to provide continuous assurance on connectivity for collaboration During the COVID-19 crisis, it is estimated that nearly 70% of delivery and operations teams are working remote. There is increased usage of collaborations platforms, such as WebEx, Skype and Teams, and higher demand on network bandwidth. However, the performance of all critical collaboration platforms is degraded due to heavy usage, poor network and/or inadequate mobile connectivity on the remote end. As a leading managed service provider, Wipro uniquely positions its services as an IT operations management (ITOM) aware collaboration solution that goes beyond simple point solutions by leveraging Moogsoft Situation Room. This solution reduces the voice-based collaborations for non-critical and non-major incidents, and eliminates chat interactions where not necessary. This ensures good performance levels for end user support, network bandwidth chokes and reduces cost incurred from voice-based collaborations for incident management. It also helps retain the knowledge and history of the incident management unlike remote working where knowledge capturing on incident tickets may be missed. =====================

BLUE powered by IBM Edge Application Manager

----- Arcticle source ----- https://www.wipro.com/infrastructure/blue-powered-by-ibm-edge-application-manager/ ----- What we Think What We Think What we Do Contact Wipro Please fill the required details to access the content BLUE powered by IBM Edge Application Manager Intelligent Edge application lifecycle management An autonomous Edge offering for end-to-end management of Edge applications. The transformation from centralized computing to Edge computing results in thousands of heterogeneous servers and devices in several remote locations with a high rate of changes in variability and scale. Wipro's BLUE integrated with IBM Edge Application Manager helps in managing these challenges. This solution is built on the foundation of OpenShift and Container technology and helps in autonomous lifecycle actions on thousands of edge nodes. This solution solves operational and management complexity faced by the enterprises. IBM Edge Application Manager is an intelligent and flexible platform that provides autonomous management for edge computing. This describes how MVPDs actively need to deploy their services over MEC platforms to be able to cater to the growing demands of Video consumption Mobile communication providers are facing increasing competition from OTT players while

simultaneously battling diminishing ARPU (average revenue per user). Uberization of 5G-Edge Services ======================

#WANFreedom – Wipro's SDWAN solution

----- Arcticle source ----- https://www.wipro.com/infrastructure/sdwan-solution/ ----- What We Think Form Title Form Title Form Title Our Success Stories Analyst Speak Form Title Our Success Stories Form Title Contact Wipro Please fill the required details to access the content WANFreedom – Wipro's SDWAN solution Accelerating transformation in the new normal Take control of your WAN investments and drive superior performance across clouds The new ways of working have made traditional wide area network (WAN) architecture obsolete, paving the way for the widespread adoption of SD-WAN. Some of the key drivers of SD-WAN include rapid cloud adoption, rise of hybrid WANs, internet links with business-class SLAs, network hardware & software decoupling, and standardized interfaces. #WANFreedom, Wipro's SD-WAN managed services offering, allows organizations to move away from legacy network architectures and helps them improve WAN utilization, reduce costs and enhance WAN agility. It seamlessly incorporates connectivity to cloud service providers in addition to the existing branch and regional office connectivity. It also addresses traditional challenges of the treatment of voice and video and the prioritization of business-critical applications. #WANFreedom creates best fit solutions for the customer's specific requirements and delivers applications across private and public clouds. Customers adopting the SD-WAN solution can take advantage of our comprehensive life-cycle services that include consulting, planning & design, product procurement, implementation, and managed network services. Explains SDWAN business case the widespread migration of networks and datacenters to Cloud, the growth in end-user wireless devices and bandwidth hungry applications are forcing CTOs to re-examine how they architect, provision and manage their enterprise networks. Software Defined Networking (SDN) and Network Functions Virtualization (NFV) have revolutionized the world of networking. Virtualized Branch Networking with the power of hyper-convergence is the new approach that is geared-up to address the shortcomings. : #WANFreedom, Wipro's SD-WAN managed-services offering, helps organizations take control of their WAN (Wide-Area Network) investments and optimize performance across cloud networks. Powered by Cisco's industry-leading SD-WAN technology, #WANFreedom delivers superior monitoring, maintenance, and managed services, flexibly, and at a lower cost. The next wave of SD-WAN adoption will require an unprecedented degree of automated intelligence, including pervasive visibility and extensive security capabilities. The client had a complex IT network distributed across 40+ countries and managed by over 100 vendors. This made operations very difficult and cumbersome, and resulted in. ======================

Wipro Surfonomics Offering

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-surfonomics-offering/ ----- Contact Wipro Please fill the required details to access the content Wipro Surfonomics Offering AI powered multi-cloud and container optimization Autonomous advisor augmented by AI driven insights that saves over 40% of your cloud spend, with assured performance Enterprises are accelerating their digital transformation initiatives like never before to address the disruption caused by COVID-19. Multi cloud and modern applications have become vital enablers to power this journey. This dramatic shift has raised many pertinent questions - How do we size the right capacity from day 1 as we move to the cloud? How do we ensure that resources are optimally sized on an ongoing basis to reduce costs? How do I schedule workloads only when needed and decommission unused workloads? How do I decide the right purchasing strategy – reserved instance versus on demand? Can we do all of this without impacting application performance? Wipro's Surfonomics offering for multi-cloud and container optimization addresses these business challenges and delivers business outcomes by lowering TCO by 40% while assuring performance across multi cloud and container environments. The unique solution capabilities include - The offering comprises of advisory services and ongoing execution leveraging Wipro Cloud Studios. Customers get a standard service from Wipro that surfs, senses and recommends optimization avenues. The Surfonomics autonomous engine possesses recommendation and automated executions with integrations into enterprise service management processes. All of this happens securely without impacting application performance. =====================

BoundaryLess Universal Edge (BLUE)

----- Arcticle source ----- https://www.wipro.com/infrastructure/boundaryless-universal-edge-blue/ ----- What We Think What we Do Contact Wipro Please fill the required details to access the content BoundaryLess Universal Edge (BLUE) Universal Edge Lifecycle Management Framework BoundaryLess Universal Edge (BLUE) is Wipro's holistic framework to address the different aspects to delivering robust and production grade edge services. Wipro brings in a range of accelerators with the BLUE framework, including a ready to adopt end-to-end cloud-based solution, reference architecture, reusable components, and shared services that are tuned to address the complete lifecycle. 5G is here and it brings in a set of features that will be of significant interest to businesses who would want to leverage the new features like ultra-low latency, high bandwidth, high density M2M communication etc. to create new use cases and services. But the low coverage radius and high densification will mean elements of 5G network like Multi-access Edge Compute (MEC) will need to be deployed in thousands of locations. Edge computing is also a crucial element for

developing the next generation of digital services. However, a production grade deployment of edge services brings several challenges for the stakeholders. BLUE provides a way to address the challenges - Wipro's BLUE brings together a range of our capabilities into a single framework to seamlessly manage and orchestrate 5G edge application services and telco workload across core, edge and Remote office/Branch Office (ROBO) sites. Smart Edge infrastructure lifecycle management Uberization of 5G-Edge Services =====================

Wipro's Cyber Recovery Vault as service

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-cyber-recovery-vault-as-service/ ----- What We Think Contact Wipro Please fill the required details to access the content Wipro's Cyber Recovery Vault as service Last line of data protection against destructive cyber attacks A comprehensive, end-to-end service with a multi-layered approach to protect backup data against ransomware and detect and rapidly recover from an attack Data is the currency of the internet economy and a critical asset that must be protected. Cybercrime has been called the greatest transfer of wealth in history, and hence it's even more critical to protect data. Cyber-attacks continually expose businesses and governments to compromised data, lost revenue, reputational damage, and regulatory fines. The impact of being unable to recover critical data and resume business operations after an attack can be devastating. In addition, avoiding ransomware is of utmost importance to CIOs and CISOs. Wipro's Cyber Recovery Vault service protects critical data assets with much-needed cyber recovery resilience, automation and integration with security operation center, unified dashboard, forensic tools and uses machine learning techniques. Shield mission-critical Applications and business data with military grade data safe guarding against destructive cyber attacks =====================

Wipro's Edge Cloud

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipros-edge-cloud/ ----- Contact Wipro Please fill the required details to access the content Wipro's Edge Cloud Cloud-Like Experience and Economics for Edge Tiered, edge cloud catalogue-based, secure, integrated, and programmable infrastructure platform led solutions with autonomous operations and agility Today, Edge is becoming more important with the number of devices and user expectations continuously increasing. With legacy, edge estate has numerous constraints, including but not limited to: Pointed, tailored, vendor-dependent, and siloed solutions, longer build time, management complexity, higher TCO, less flexibility and non-compliant nature. Wipro's Edge Cloud offerings bring unique value proposition to meet edge estate requirements for telco and non-telco with best-of-the-breed solutions using hyper-converged infrastructure (HCI)-based programmable infrastructure platform

supporting virtual machines and container ecosystem coupled with autonomous operations in an agile way. Edge Cloud delivers cloud experiences with improved ROI by protecting the investment with API based platform. Offerings are more secure and compliant while delivering more compute with intelligence at the edge, thereby addressing latency-specific requirements. These offerings are standardized and customized with the freedom to choose OEMs and technologies to integrate with for various core cloud services. Edge catalogue based offerings deliver scale of economics, assured performance with lesser time-to-market, and ease to scale out, consume and manage. In response to edge market demands, Wipro is offering edge solutions in collaboration with strategic partners.
=======================

IBM AIX Modernization and Migration

----- Arcticle source ----- https://www.wipro.com/infrastructure/ibm-aix-modernization-and-migration/ ----- What We Think Contact Wipro Please fill the required details to access the content IBM AIX Modernization and Migration Modernize IBM Power Systems with Cloud Flexibility Accelerate and cost-optimize your journey from on-premises-only infrastructure to Power Systems Virtual Server on IBM Cloud IBM Power Systems clients who have typically relied upon on-premises-only infrastructure can now quickly and economically extend their Power IT resources onto IBM Power Systems Virtual Servers, while mitigating the large capital expense or added risk involved when migrating essential workloads. Wipro accelerates the journey with hybrid integration of existing on-premises IBM Power System workloads to IBM Power Systems Virtual Servers. Wipro's state-of-the-art accelerator provides an automated migration program which delivers business agility (through digital transformation) by abstracting infrastructure, nextgen application packaging, and orchestration with DevOps to deliver faster and cost-optimized modernization. Our accelerator also abstracts the complexity of configuring, managing, and life-cycling compliant traditional technologies and delivers management with data services. Modernize the AIX Enterprise Power Infrastructure with Cloud Flexibility =====================

Legacy Microsoft Server Application Migration

----- Arcticle source ----- https://www.wipro.com/infrastructure/legacy-microsoft-server-application-migration/ ----- What We Think Contact Wipro Please fill the required details to access the content Legacy Microsoft Server Application Migration Innovative one touch approach Automatically migrate your Microsoft Windows 2003 and 2008 server applications to modern server platforms Organizations running unsupported operating systems are exposed to heightened cyber security risks such as malicious attacks or

electronic data loss. They also encounter problems with software and hardware compatibility since new software applications and hardware devices may not be built for Windows Server 2003 or 2008. In addition, security regulatory obligations may find they are no longer able to satisfy compliance requirements while running Windows Server 2003 and 2008 servers. Wipro's customized transformation approach provides automated assessment and remediation for Windows 2003 and 2008 application workloads with zero input from the customers' business owners. We enable our customers to modernize the underlying Microsoft server operating system and the applications deployed to modern servers. Innovative one touch approach ======================

Wipro's Boundary Less Data Management (BLDM) powered by NetApp (Building a Data Fabric for a data-centric world)

----- Arcticle source ----- https://www.wipro.com/infrastructure/boundary-less-data-management-bldm/ ----- What We Think Contact Wipro Please fill the required details to access the content Wipro's Boundary Less Data Management (BLDM) powered by NetApp (Building a Data Fabric for a data-centric world) Migrate quickly, deploy instantly and achieve cloud storage optimization Accelerate your hybrid/multi cloud journey with a single management platform with versatile data management/orchestration The most compelling benefit that hybrid multi-cloud offer to enterprises is flexibility – the freedom to choose where and how to deploy workloads. However, a disjointed approach, with no clear strategic plan that aligns business goals with technology investment, can increase risk and complexity of business operations. Siloed implementation of new technologies brings unpredictable cost and performance as well as a lack of data management control across an organization. Wipro's BLDM powered by NetApp helps you determine the right cloud model strategy for your business to reduce IT complexity and risk, improve IT agility and performance and enable faster technology adoption. With a comprehensive data management capability, Wipro's BLDM powered by NetApp can help you align your business and technology goals and design, deploy and manage your new environment to achieve the flexibility your business needs. The solution provides flexibility in data management, enhanced data sovereignty and compliance, availability, and durability. Operationalize hybrid multi-cloud and optimize your cloud storage costs ======================

Protect business critical data assets effectively Wipro's Cyber Recovery solution powered by Dell Technologies and Wipro's Cyber Recovery services helps enable enterprises to battle a joint war against cyber-attacks and protect critical data assets. Data is the currency of the internet economy and a critical asset that must be protected. Cybercrime has been called the greatest transfer of wealth in history, and it is all about the data. Cyber-attacks continually expose business and governments to compromised data, lost revenue, reputational damage, and regulatory fines. The solution is an outcome of strong integration of the Dell cyber recovery solution into Wipro's cyber resiliency framework providing the much-needed cyber recovery resilience, automation and integration with security operation center, unified dashboard and forensic tools, using machine-learning techniques. Wipro Cyber recovery vault services powered by Dell is integrated with Wipro FLUID IT ASPIRE and Service Theatre framework to reduce the deployment time and automated and orchestrated workflow for faster recovery. Protect your critical data assets effectively from cyberattacks powered by analytics, machine learning and forensic tools Data is the currency of the internet economy and a critical asset that must be protected, kept confidential and made available at a moment's notice. Protect your critical data information assets effectively to withstand and recover from adversity arising from cyber space, powered by analytics, machine learning and forensic tools. =====================

Service Assurance using Splunk

----- Arcticle source ----- https://www.wipro.com/infrastructure/service-assurance-using-splunk/ ----- Contact Wipro Please fill the required details to access the content Service Assurance using Splunk Open up innovative opportunities through continuous service assurance, intelligence, and predictive analytics The only AIOps platform that enables teams to prevent incidents before they impact customers. Wipro's IT operations management (ITOM) aware solution goes beyond simple point solutions offered by Splunk. It targets ITOps, bringing data to IT operations, enabling infrastructure monitoring and ensuring business and IT service monitoring. At the same time, the AIOps platform utilizes machine learning for predictive alerting and auto remediation. This helps get visibility into the entire migration process, cloud provider infrastructure, applications and workloads running in the cloud. In addition, the intelligent alerting, automated event clustering and prioritization capability helps in faster incident resolution. The ITOM aware solution also simplifies and unifies insights across container environments and the entire technology stack for providing better visibility into faults, events, capacity, configurations, and security of server elements. This allows companies to create a single, streamlined and rapid monitoring experience for ensuring higher VMware stacks uptime. =====================

Wipro Enterprise Recovery Vault Powered by Cohesity

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-enterprise-recovery-vault-powered-by-cohesity/ ----- Contact Wipro Please fill the required details to access the content Wipro Enterprise Recovery Vault Powered by Cohesity Delivering Enterprise-Class Data Protection & Management as a Service Safeguard your data against cybersecurity threats while ensuring business continuity and disaster recovery readiness Data is an enterprise's most valuable and targeted business asset. Cybersecurity experts predict that in 2021, cyber-attack incidents will occur every 11 seconds, and cybersecurity-related attacks will cost the global economy $6.1 trillion. Hackers are creating increasingly sophisticated and focused attacks that now target organizations' last line of defense—backup data. Wipro and Cohesity have partnered to bring you peace of mind with industry-leading data protection and disaster recovery—Wipro Enterprise Recovery Vault Powered by Cohesity. The joint offering is aligned with NIST Cybersecurity Framework 1.1 with an immutable data protection solution that protects, isolates, detects, and most importantly, rapidly recovers data to reduce downtime and ensure business continuity. Wipro Enterprise Recovery Vault Powered by Cohesity integrates with Wipro FLUID IT Aspire and Service Theatre framework to reduce deployment time and ensure faster recovery through automated workflows. Together, Wipro and Cohesity provide modern, secure data protection and disaster recovery customized to your unique needs and delivered as-a-service for your convenience.

Wipro LiVE Workspace's myUniHub, is a unified, intelligent and integrated user enablement platform that provides employees with consumer grade user interface coupled with industry leading solutions. It offers an extensible API bridge to enhance employee experience and drive employee productivity. The result is a digital workspace, which provides consumerized experience enabled through harmonized multichannel interfaces supported by smart automation and data insights. myUniHub helps in creating design-led features to simplify user journeys while aligning to enterprise technology roadmap to maximize returns on investments. The solution provides: ======================

Live Workspace™ - WaaS360

----- Arcticle source ----- https://www.wipro.com/infrastructure/live-workspace-waas360-choice-experience/ ----- Contact Wipro Please fill the required details to access the content LiVE Workspace WaaS360 – Choice & Experience Reimagine Device-Focused Digital Experiences with Workspace-as-a-Service Enable digital dexterity with increased "remoteability" by adopting a synergistic combination of multiple companies under a single contract and enjoy results that range from enhanced employee experiences and productivity to reduced operational redundancies in a Workspace-as-a-Service model Being modular and flexible, WaaS360 can be easily customized to meet any device-focused requirement– be it fostering a dynamic business environment, rapid expansion, or just looking to move to a

digital workplace model. The WaaS360 offering is built around the following primary tenets that Wipro helps translate into tangible benefits for the customer: - Enhanced employee experience with the right spec-matched devices. - Reduced TAT on service and incident requests.. - Free CapEx and internal resources to focus more on core business activities. - Multi-pronged optimizations, including TCO, resources, efforts, contracts, and supply chain. WaaS360 is an integrated offering of devices, employee services, and additional third-party services, all bundled in a single global contract that enables customers to optimize outflow and, therefore, focus more on their core business activities. With WaaS360, Wipro ensures availability of choices of devices from multiple OEMs along with persona-mapped experiences. While it's managed centrally, we support it locally as we act as the single point of contact while leveraging core competencies of multiple parties, all stitched together in a seamless fashion. This flexible and modular offering addresses the challenges of workplaces today while being ready for the challenges to come tomorrow. ======================

Wipro's Boundaryless Data Protection Powered by Dell Technologies

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipros-boundaryless-data-protection-powered-by-dell-technologies/ ----- What We Think Contact Wipro Please fill the required details to access the content Wipro's Boundaryless Data Protection Powered by Dell Technologies Holistic data protection solutions for modern and legacy workloads across hybrid cloud ecosystem Wipro's Boundaryless Data Protection Services Framework combined with Dell Technologies' Data Protection Suite protects our customers' workloads with unified data protection and management. As organizations leverage cloud platforms and services to realize their digital and IT transformations, the need to efficiently protect and secure the organization's data capital and intellectual property is even more critical. Wipro's Boundaryless Data Protection (BLDP) powered by Dell Technologies protects your data, wherever it lives – on the edge, at your core or in multi-cloud, by providing protection across traditional and cloud-native workloads. This results in significant cost savings and improved operational efficiency. Wipro's BLDP is a holistic, cloud-agnostic data protection platform, supporting multi-cloud environments to address end-to-end data protection scenarios. BLDP provides a single-pane-of-glass management solution to connect, secure, backup, recover, manage and control enterprise-wide data, increasing operational efficiency and ensuring consistency across on-premise and public clouds. Dell's proven data protection portfolio enables our customers to efficiently protect traditional and modern workloads and ensure cyber-resilience across platforms while mitigating risk and reducing complexity. Wipro's Service Theatre, at the heart of BLDP, delivers agile and flexible automation to orchestrate various data protection tasks to efficiently manage the lifecycle of data protection across edge to core and multi-cloud. This also covers pre-defined runbook to enact various scenarios for

frictionless workload recovery. This is delivered by tightly integrating with various components of the Dell Data Protection Suite through API integration and plugins. Data is the most critical asset for today's enterprises. It enables them to deliver new and innovative services to enhance the customer experience, increase loyalty and drive revenue.

Google Cloud Infrastructure Modernization

----- Arcticle source ----- https://www.wipro.com/infrastructure/google-cloud-infrastructure-modernization/ ----- Wipro's Service Offerings on Google Cloud Platform Wipro's Google Cloud Solutions Migrate Virtual Machines (VM) to Google Cloud Google Cloud VMware Engine (GCVE) SAP on Google Cloud Microsoft on Google Cloud Bare Metal Solution on Google Cloud Contact Wipro Please fill the required details to access the content Google Cloud Infrastructure Modernization Accelerating cloud journey by modernizing infrastructure As customers look to modernize their infrastructure to control costs and at the same time drive innovation, public cloud services are playing an integral part in this transformation. Gartner predicts 40% of enterprise workloads will be hosted on public clouds by 2023 against the current 20%. The latest Gartner IT spending forecast shows a 10% decline in spend on data center systems. In contrast, spending on cloud system infrastructure services is expected to grow from $63 billion in 2020 to $81 billion by 2022.The growth is further accelerated by current pandemic crisis. Global companies are looking to adopt public cloud, to unlock business value from data swiftly and meet unpredictable demand from their user base. Wipro as a Managed Service Partner with Google Cloud has perceived that selecting the right migration strategy for workloads is of paramount importance instead of "one size fits all" approach. As a trusted Google Cloud partner, Wipro is helping customers leverage the best of Google Cloud platform as they develop and manage cloud native business applications, enabling faster time to market, increasing scalability of applications, and integrating them with external and internal systems in the IT landscape. Wipro's team of certified professionals help accelerate the customer modernization journey, increase agility, and adaptability with a razor sharp focus on business outcomes. Google and Wipro jointly offer key solutions for successful modernization of workloads by adopting Google Cloud. Data center exit solutions provides a fool proof architecture to land and expand in Google Cloud tagging the workloads with the right migration strategy. Hybrid cloud solutions using Google Anthos to run containerized apps on Managed Kubernetes in cloud, on premise and at edge. Run your VMs on the world's largest private and ultra fast network with Google Cloud, with pricing that meets your needs. Google sustained-use discounts can allow you to get discounts up front—without year-long commitments—and automated right-sized recommendations can help you save even more money. Google Cloud VMware Engine, is VMware as a Service offering, is your simplest, fastest, and cheapest "on ramp" to Cloud. GCVE allows customers to bring VMware-based environments to cloud without major

modifications. SAP and Google Cloud have had a strong relationship and have worked closely together ensuring Google Cloud capabilities meet the needs of SAP systems. Google Cloud developed large VMs to support SAP HANA Program and we have a 12TB VMs instance in production today. Google's VMs enable customers to provision HANA in a few minutes and deploy entire SAP landscapes including high availability & disaster recovery (HA & DR) in 60 minutes or less. Offers a first class experience for MS workloads like SQL Server and any Windows server-based applications, all backed by enterprise grade support. Moving Windows workloads to Google Cloud lets you increase IT agility and reduce your on premise footprint. Google Cloud can also help optimize your license expense and exposure by increasing the license usage efficiency on the underlying infrastructure through innovative features like custom VM shapes and sole tenant nodes. It is a purpose-built certified hardware for high performance mission critical workloads like Oracle databases that provides support and billing from Google Cloud for all bare metal needs. Bare Metal Solution is built in close proximity to Google data center with dedicated interconnect providing flexible ways to leverage existing DBAs or to bring partners to manage specialized workloads. =====================

This

huge shift in the workplace dynamics necessitates maintaining the basic principles of operating system stability and system performance without compromising on security perimeters and ease of operations. Wipro's TruRemote is a part of Wipro LiVE Workspace™, and capitalizes on the exponential demand for remote field support services. Wipro's cost-effective and unique solution leverages out-of-the-band remote management which can connect to home or office devices from anywhere in the world through wired or wireless connections. The offering is powered by cutting-edge hardware technologies from Intel - Intel vPro® Platform, Intel® Active Management Technology (Intel® AMT) and Intel® Endpoint Management Assistant (Intel® EMA). Intel End Point Management Assistant software as part of Intel AMT allows Wipro to remotely and securely manage devices on known Wi-Fi networks beyond the firewall too. Backed by Wipro's global experience in delivering diverse solutions, it empowers you to adapt to changes and drive sustainable future business. The COVID-19 pandemic brought in many changes and established a new normal. The current pandemic has triggered "new age remote working", or, as the industry refers — the "hybrid work era". =====================

Datacenter GoBig program

----- Arcticle source ----- https://www.wipro.com/infrastructure/datacenter-gobig-program/ ----- Our Solutions Contact Wipro Please fill the required details to access the content Datacenter GoBig program Joint Solutions Brief Description Of The Solution BLE Hybrid cloud Boundaryless Enterprise solution, which is a flagship, market-facing offering to deliver Hybrid cloud services. Industry is targeting to move to HCI as transition from converged infrastructure like V-Block FluidIT - Cloud OnPremise Client expect cloud experience even on private cloud deployments. FluidIT - CloudOnpremise deliver consumption based cloud solution on premise leveraging Wipro accelerators and innovative Intel and OEM technologies Accelerated Hardware Refresh & Legacy modernization While we transform client estate for BLE and CloudOnPremise, there are enough workloads, which are still legacy windows, Linux and Unix like AIX, Solaris. This offering aims to bring opportunity to leverage new generation Intel hardware and Wipro accelerator for modernization of Legacy OS and currency management in BAU lifecycle with dramatically reduced dependencies on application team. Digital database as a service This solution is engineered to consolidate and run heterogeneous database engines on HCI platform. This Database CloudOnPremise solution bring down the overall DB instances and rationalize licenses cost. This is coupled with Wipro Service TheatreTM accelerator and runs on HCI technology. We have planned to test various Intel accelerators on this track throughout this year. SAP HANA Automation Huge opportunity and mandate for migrating from traditional SAP to HANA solution. This track focuses on creating differentiators for this solution on premise or on cloud. Leverage PMEM and Nextgen Intel processors. CSP Benchmarking & Golden Image An unique proposition in the industry that would bring paradigm shift in the way the Cloud Architecting and Cloud solutions are marketed to rationalize the expense borne by customer to get the value for money. CSP Benchmarking on selected workloads and based on the results defining the Golden Image which would be the game changer for Wipro & Intel.

Wipro's Virtual Walk-In – for 100% remote ticket resolution

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipros-virtual-walkin-for-100-remote-ticket-resolution/ ----- What We Think Form Title Contact Wipro Please fill the required details to access the content Wipro's Virtual Walk-In – for 100% remote ticket resolution Truly Remote – 'No more / Zero' Field Support tickets Enhance productivity and reduce downtime with Wipro's Virtual Walk-In The fast-emerging hybrid working models have caused stress and pressure to remote support and field services teams to deliver effectively on-time to solve their customer needs. Though it is possible for remote field support to resolve and remediate several issues,

it is not feasible to handle hardware and device replacement related requests remotely. 90% of the service desk tickets are resolved remotely with in-band capability, while ~10% of tickets are escalated to field services teams. Wipro's unique offering of Virtual Walk-In kiosks is a blend of several cutting-edge technologies that make 100% remote ticket resolution a reality. The offering has several use cases across industries such as banking and retail. Required IT support services are deployed to provide first contact resolution to the end users who walk into the Virtual Walk-In center with issues related to IT infrastructure. User experience is enhanced with the IT concierge services and easy access to Expert Desk. They get an ATM-like experience wherein they can walk in and have all their issues resolved with a single escalation in this support center. Upon reporting the problem, users are assigned a support executive who will interact with the users, understand, diagnose the issue and provide resolutions that will address all the issues. The video kiosks allow users to interact with experts to resolve IT issues on-demand by docking into the kiosk, enabling remote troubleshooting of the issue and providing an integrated onsite + remote support model. Wipro adopts a tested approach to onboard and train the Expert Desk associates on a common curriculum at the Virtual Walk-in Academy to ensure a standardized and consistent experience across client environments in different locations and geographies. The ongoing global pandemic has irreversibly entrenched work-from-home and hybrid working
======================

Wipro's WANFreedom powered by VMware

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipros-wanfreedom-powered-by-vmware/ ----- Contact Wipro Please fill the required details to access the content Wipro's WANFreedom powered by VMware Enabling WAN virtualization to pave the way for digital innovation Traditional WAN architectures were focused on data center applications delivery using proprietary hardware, complex routing protocols, and substantial carrier dependencies. The unprecedented rapid changes in the IT ecosystem due to digital transformation have rendered the legacy infrastructure obsolete. Today, enterprises need a WAN solution that delivers applications from cloud, SaaS, and data centers over any combination of underlying transports including MPLS, LTE and broadband, while enforcing performance, security, and compliance policies. This has compelled organizations to rebuild the entire architecture with a software centric approach catering to current and future business needs. SD-WAN technology virtualizes the network functions by decoupling the network software services from the underlying hardware links. Wipro's #WANFreedom, powered by VMware, is a carrier neutral SD-WAN managed services offering that enables organizations to transform their legacy network architectures to a software defined, scalable solution. This helps improve WAN utilization and optimize costs with enhanced WAN agility. VMware SD-WAN is a cloud enabled overlay network that can work across any combination of underlying infrastructure delivering seamless

connectivity, assured application performance and simplified cloud management with on-ramp to cloud. The solution includes cloud on-ramp services via a global network of cloud gateways, cloud orchestrator, and edge appliances (hardware and software). Wipro's 15-year-old strategic partnership with VMware has helped generate an end-to-end portfolio of services across end users, applications, cloud, and networks space. VMware's SD-WAN product portfolio backed by Wipro's industry recognized managed network services and strong consulting capabilities helps customers to choose the appropriate SD-WAN solution for their infrastructure, delivering synergistic benefits. SAP HANA as a Service

----- Arcticle source ----- https://www.wipro.com/infrastructure/sap-hana-as-a-service/ ----- What We Do Contact Wipro Please fill the required details to access the content SAP HANA as a Service Seamlessly transform your IT infrastructure into a real-time enterprise SAP released their new core ERP product S/4HANA in 2015 and mandated all its customers to migrate to this product by 2027. Unlike technical upgrades, converting legacy SAP ECC systems to S/4HANA are large transformation projects. SAP S/4HANA's in-memory database engine requires a SAP certified compute architecture capable of scaling physical memory inline with the size of the HANA database. Cloud is an option to meet the constantly changing infrastructure requirements but , a public cloud strategy might not be suitable for every organization. The move to S/4HANA present challenges such as: SAP HANA as a service, a joint solution from Wipro with HPE Greenlake, provides a lucrative alternative. This solution combines the IP, service offering, and center of excellence (CoE) from Wipro. It also includes a complete set of solutions and services from HPE with SAP HANA Tailored Data Center Integration (TDI) configurations and HPE base configurations to create new possibilities for your business. The solution offers public cloud-like experience in the data center of your choice. You get simplicity, agility, and economics of public cloud combined with the security and performance benefits of on-premise IT. Transform your IT infrastructure into a real-time enterprise with Wipro, Hewlett Packard Enterprise, and Equinix.

=======================

SAP HANA as-a-Service with Wipro, Hewlett Packard Enterprise, and Equinix

----- Arcticle source ----- https://www.wipro.com/infrastructure/sap-hana-as-a-service/sap-hana-as-a-service-with-wipro-hpe-and-equinix/ ----- Contact Wipro Please fill the required details to access the content SAP HANA as-a-Service with Wipro, Hewlett Packard Enterprise, and Equinix Transform your IT

infrastructure into a real-time enterprise with Wipro, Hewlett Packard Enterprise, and Equinix. Make the deployment of SAP HANA simple with the combined power of an edge-to-cloud platform, SAP modernization services, and a secure hosting platform Powerful digital technologies are rewriting existing business models. At the heart of this change is the ability to manage and use data to deliver better customer experiences. Intelligent enterprises are turning toward data platforms that combine transactions and analytics to make instantaneous insight a reality, and SAP HANA does just that. It leverages in-memory data processing for real-time data access and advanced analytic capabilities to bring significant benefits to the enterprise. To take full advantage of SAP HANA and complete the transition without disruption, enterprises must first replace their existing databases and implement servers built for in-memory computing. SAP is transitioning its existing deployments to S/4HANA. SAP S/4HANA's in-memory database engine requires an SAP-certified compute architecture capable of scaling physical memory in line with the size of the HANA database. All customers must migrate to S/4HANA and SAP Cloud Platform as legacy SAP reaches its end-of-life in 2027. SAP HANA as-a-service, a joint solution from Wipro, HPE, and Equinix, addresses the challenge of the complex transformation. The solution combines the Intellectual Property service offering, and Center of Excellence from Wipro and a complete set of HPE GreenLake consumption-based solutions and services from HPE, including the latest HPE mission-critical technologies and SAP HANA Tailored Data Center Integration (TDI) configurations. To complete the transformation, Equinix provides world-class, industry-compliant data center and interconnection services. The Equinix components make it simple for businesses to create and leverage infrastructure already securely connected to thousands of technology ecosystem partners, including major public cloud providers. To read more about the solution, download the brochure.

Wipro's Digital Database Platform Services 2.0 Powered by Nutanix

----- Arcticle source ----- https://www.wipro.com/infrastructure/digital-database-platform-services-2-0/ ----- Contact Wipro Please fill the required details to access the content High-performance database environments for faster time-to-market, accelerated innovation and simplified operations Wipro's Digital Database Platform Services 2.0, built on Nutanix and integrated with Wipro's ServiceTheater redefines database lifecycle management, improving productivity and accelerating infrastructure modernization. With the proliferation of database engines and increasing complexity of database management in an evolving application landscape, a robust Database-as-a-Service platform becomes critical to success. Challenges engulfing legacy database management are multiple, including storage cost, infrastructure maintenance, longer provisioning cycles and lack of automation of complex legacy databases. Wipro's Digital Database Platform Services 2.0 (DDPS) is a fully managed Database-as-a-Service (FMDBaaS) offering that hosts traditional and next-generation databases on

a unified platform in a hybrid-cloud environment. Built on Nutanix cloud technology, and integrated with Wipro's Service Theatre, DDPS provides enterprises with database self-service provisioning, autonomous lifecycle management, flexible consumption model, developer-friendly APIs for DevOps integration and simplified management. What's more, Wipro's DDPS 2.0, integrated with Service Theatre built on Nutanix database service, Nutanix cloud infrastructure and Nutanix cloud manager delivers effortless database administration, improved IT infrastructure management, simplified operations and scalable business solutions. Wipro's DDPS 2.0 enhances scalability on a single console while self-configuring to meet the evolving demands of the end-user. It integrates public cloud platforms with existing databases while leveraging web-scale cloud infrastructure. DDPS 2.0 supports faster growth, stimulates innovation, offers impetus on return on investment (ROI) and promotes cost governance. Wipro FullStride Cloud Services: Boundaryless Enterprise – Hybrid Cloud powered by VMware and AWS

----- Arcticle source ----- https://www.wipro.com/infrastructure/boundary-less-enterprise-hybrid-cloud-powered-by-vmware-and-aws/ ----- Our Expertise Services/Capabilities Strategic Partners Contact Wipro Cloud Transformation Services Application Modernization services Cloud Operations Please fill the required details to access the content Rapid digitization is disrupting business models and modern enterprises are moving to multi/hybrid cloud to accelerate innovation and quickly respond to change. This dramatic shift has resulted in significant complexity and challenges such as the need to exit data centers and move to the cloud rapidly while ensuring operational consistency with on premises and reduced costs. Wipro has partnered with VMWare and AWS to address these challenges and meet your cloud business objectives leveraging our deep expertise in this arena. Wipro FullStride Cloud Services: Boundaryless Enterprise Hybrid Cloud Solution Powered by VMware and AWS enables leading enterprises create a strategic roadmap for risk-free migration to cloud by providing end-to-end life cycle services across transformation and operations. Wipro is a VMware Principal Partner, Master Services Competency Partner for VMware Cloud on AWS and Managed Service Provider (MSP) expert partner for AWS globally. The joint solution leverages VMware cloud on AWS, an Enterprise Infrastructure-as-a-Service (IaaS) that runs natively on dedicated bare-metal AWS infrastructure. This solution offers the ability to quickly and seamlessly migrate or extend existing VMware workloads from on-premises environments to global AWS infrastructure with ability to modernize the applications using Tanzu portfolio or a variety of native AWS services like AWS EKS (Elastic Kubernetes Services), S3, RDS (Relational Database Service) s etc.

Customers get a chance to protect their VMware investment by leveraging the existing tools and skillsets while ensuring operational agility, innovation, and stability that AWS offers.   =====================

Wipro FullStride Digital Omnichannel Banking Solution on Google Cloud

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-full-stride-digital-omnichannel-banking-solution-on-google-cloud/ ----- Overview Benefits Our Success Stories Analyst Speak Contact Wipro Please fill the required details to access the content Wipro FullStride Digital Omnichannel Banking Solution on Google Cloud Recently, the Banking & Finance industry has been undergoing a sea of changes due to shifting customer attitudes and behavior and the emergence of new technologies. To keep up with the rapid pace of this change and stay competitive, banks have embarked on transformational journeys to enable digital banking and omnichannel modernization. Banks need the flexibility of cloud solutions to address rapidly changing customer expectations and provide the options consumers want when it comes to their financial needs. Omnichannel customer experiences, coupled with robust cloud capabilities, will enable financial institutions (FIs) to reimagine the customer journey. The Wipro Google Cloud partnership is uniquely positioned to help FIs design omnichannel customer experiences, transform data and analytics, better manage risk, and improve operational efficiencies. In addition, Wipro FullStride Cloud Services draws on strategic industry knowledge and technical and functional expertise to design and develop the best solution for FIs, leveraging the flexibility, scalability and robustness of Google Cloud. To pick the right cloud solution and make the cloud migration journey seamless for FIs, Wipro FullStride Cloud Services applies a strategic digital omnichannel banking framework powered by six unique transformational levers: identifying the high cloud-propensity areas and the right cloud approach; conducting a complexity-impact assessment to identify priorities: navigating various business and system layers for transformation; mapping the business function scope; and reimagining the customer journey. In this session Michael Rennie, Chief Operating Officer, Cynergy Bank, and Srinivasaa HG, Vice President, iDEAS, Europe, will discuss how Cynergy, in a bid to transform the services to their customers, partnered with Wipro & Google Cloud to undertake one of the boldest initiatives in the BFSI industry by radically transforming their IT estate. Download this IDC Spotlight on Wipro FullStride Digital Omnichannel Banking solution on Google Cloud =====================

Smart i-GreenIT

content Smart i-GreenIT Cut energy consumption of IT equipment by one third Move toward sustainability by reducing the carbon footprint of IT operations Today's IT systems are energy guzzlers. Enterprises can unlock considerable savings in their IT-related energy costs and reduce their carbon footprint using sophisticated AI and ML for power management. Wipro's Smart i-GreenIT is a network-based solution for PC, laptop, gateway and server-grade systems that dynamically improves energy efficiency during the idle time of devices without losing productivity or performance. The agentless architecture of the solution guarantees better on-premise or cloud deployment. The Smart i-GreenIT solution is equipped with best-in-class power management tools and near real-time monitoring capabilities. Coupled with remote need-based control of connected assets. The key features are: Clients using Wipro's Smart i-GreenIT solution can leverage dynamic AI and ML-based algorithms for predictive analytics and expect to reduce energy consumption by 30% plus.

Smart i-Building

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-smart-i-building/ ----- Contact Wipro Please fill the required details to access the content Smart i-Building Leverage digital twin, data and analytics, to make building management and sustainability simple and effective Wipro's Smart i-Building solution improves traditional BMS by providing a central, integrated facility control center using powerful collaborative environments and innovative technologies. Its vendor-agnostic technology and open-source interfaces are extremely well-suited for controlling all intelligent building systems (including bookings for desks, meeting rooms and parking; wayfinding, occupancy management, environmental monitoring, OT asset management, AV monitoring, CCTV surveillance, and lighting, energy, water, and waste management). The scalable solution has several advantages, which are as follows: =====================

Smart i-Retail

----- Arcticle source ----- https://www.wipro.com/infrastructure/smart-i-retail/ ----- Contact Wipro Please fill the required details to access the content Smart i-Retail Boost customer experience and employee productivity while improving store profitability Provide seamless monitoring and control of stores while enabling consistent decision-making across stores. Providing customers with a smooth in-store shopping experience is a resource and time-intensive activity. Today's retail chains need a central and secure technology-driven solution to communicate with stores, track inventory, manage multiple devices and assets, and ensure compliance while helping customers acquire the products and services they want. Wipro's Smart i-Retail solution provides seamless monitoring and control of all geographically dispersed stores, distribution centers, assets, and business processes. It is designed to improve communication, boost employee productivity, reduce manual intervention, drive customer engagement, and

positively impact store compliance and profitability. The Smart i-Retail solution addresses and improves: =====================

Smart i-TIM: Smart & Intelligent Telecom Infrastructure Management

----- Arcticle source ----- https://www.wipro.com/infrastructure/smart-i-tim/ ----- Contact Wipro COOs NOC managers Site technician Please fill the required details to access the content Smart i-TIM: Smart & Intelligent Telecom Infrastructure Management Improve telecom site availability, utilization and optimization using AI based monitoring and management. Optimize operations cost and improve real-state utilization for telecom sites. Wipro's Smart i-TIM solution is designed for telecom providers keen on boosting the reliability, efficiency, and consistency of their sites and networks. This sophisticated solution combines built-in customizable applications and automation. Its capabilities include managing—and, in some cases—automating power, security, and environment-related tasks. Smart i-TIM's four technology modules address the needs of site technicians, NOC managers, and leadership: =====================

Smart i-YMS: Smart and Intelligent Yard Management System

----- Arcticle source ----- https://www.wipro.com/infrastructure/smart-i-yms/ ----- Contact Wipro Please fill the required details to access the content Smart i-YMS: Smart and Intelligent Yard Management System Accelerated warehouse and dispatch management with improved operational efficiency and sustainability Leverage digital systems for visibility into operations and eliminate bottlenecks affecting yard operations. Organizations with significant logistic and dispatch support requirements face several challenges, like limited visibility of yard utilization, demand for more parking space, data inadequacy in standardizing processes, increased security risks, end-to-end goods traceability, and limited data on fleet tracking and compliance management. Wipro's Smart i-YMS is an IoT platform-based integrated and collaborative solution with a user-friendly interface that enhances warehouse services and increases productivity. The scalable Smart i-YMS uses various modules to provide data insights across all associated services of yard management operations and functional requirements. The modules include: Warehouse Management: It fulfills the functional requirement of ensuring right goods at right place, monitor accurate delivery details while automating the process for quicker dispatch. The data insights for tracking & automation are achieved by integrating the

services with dispatch management systems, warehouse management & RTLS of Fork lifter in the warehouse. Integrated storage automation using robotic and automated storage management system from Wipro PARI. Dock Management: A key business requirement is to ensure faster availability of loading and unloading bays. The Dock Management module, driven by integrated computer vision analytics, accurately tracks bay utilization and quickly assigns vehicles to respective bays. Automated Gate Management: An automated gate management module is integrated with ANPR-based vehicle tracking solutions and RFID-enabled boom gate operations to maintain a safe and secure environment for goods dispatch. This service provides the vehicle license plate information, vehicle count, and vehicle classification. It also helps dispatchers with vehicle arrival notifications. In addition, the module is supplemented by an image analytics-based goods verification system. Workforce Management: This module helps dispatch managers and warehouse supervisors monitor yard jockeys and dispatch vehicles. It also auto-assigns work orders to enhance operational efficiency. Fleet Management: Real-time tracking of goods delivery vehicles provides ETA to enhance user experience and improve customer satisfaction. The module also monitors driver behavior and planned yard space utilization and integrates directly with vehicle OBD devices, GPS-based location tracking, and cold chain management to increase the quality of services.

Intuitive Workspace

----- Arcticle source ----- https://www.wipro.com/infrastructure/intuitive-workspace/ ----- Contact Wipro Please fill the required details to access the content Intuitive Workspace Enhance employee and visitor experience along with operational excellence and optimization An intelligent, real-time workspace management solution that improves employee productivity and reduces operational costs Workspace optimization makes a considerable difference in employee productivity while providing visitors and employees with an improved experience. For an enterprise, effective workspace management improves employee-to-desk ratios while also lowering real estate requirements and operational costs. Wipro's Intuitive Workspace solution improves the user experience, increasing ROI in facility investments. The solution uses an interface accessible from mobiles, laptops, desktops, and kiosks to simplify the booking process of workspace infrastructure. The solution can be integrated with various systems, including Outlook 365, real-time occupancy sensors, NFC and RFID-enable devices, and end-user displays to provide real-time control over workspace assets. The solution's key modules include: Meeting Room Management: Allows users to book meeting rooms that have the desired size, setup, and equipment. It helps streamline meeting invites with real-time notifications and alerts, along with auto cancellation during no-shows. Insights based on real-time analytics of meeting room usage and occupancy levels let administrators make data-based decisions leading to reduced facility management costs. Hot Desk Management: Helps employees to locate and book a desk, enables better utilization of desks, and contributes to increased employee productivity by eliminating wasted time searching for available

desks at the workplace. The system includes real-time alerts and notifications, while desk usage and occupancy level data let administrators make data-based decisions leading to reduced operational costs. Visitor Management: Pre-registration and on-site registration of visitors with a self-service check-in app provides a great user experience.The solution provides visitor arrival notifications and can restrict/ enable visitor access to buildings/ areas based on business requirements. Navigation: Static and dynamic navigation for visitors and employees. AV Monitoring: Real-time 24X7X365 management and monitoring of AV equipment & assets and integration with incident management system. Smart Parking: Employees can look up and book parking for themselves/visitors across locations at the slot level, notify visitors of their parking information, and provide live parking status to the facility management team. Slot Booking: Allow users to view available appointment windows, select and book the slot for walk-up locations. These slots can be booked in walk-in centers, global immigration centers, travel desks, courier dispatch or collection centers, health centers, cafeterias, etc. Light Management: Optimizes lighting based on space occupancy and usage with remote monitoring and management. Lowers energy costs using standard controls – such as dimming, occupancy sensors, and daylight harvesting. Enterprises using Wipro's Intuitive Workspace solution can expect to improve employee and visitor experience, unlock savings in operational costs, increase employee productivity, and scale the system for a multi-tenant model. =====================

Wipro OTNxT

----- Arcticle source ----- https://www.wipro.com/infrastructure/wipro-otnxt/ ----- Contact Wipro Transforming Operational Technology Using Platform Services Please fill the required details to access the content Wipro OTNxT Drive Cost Savings and Standardization with End-to-End Managed Services for OT and IoT Infrastructure. In most organizations, information technology service management (ITSM) , ITIL and other standards has not been pressed into service to cover operational technology (OT) systems. Support of OT and IoT systems is largely reactive instead of proactive. This poses several challenges in monitoring SLAs, causes delays in fault identification and results in higher resolution time, loss of productivity due to sudden failures, and higher maintenance costs. By implementing a structured approach to manage OT systems, which includes supervisory control and data acquisition (SCADA), building management systems (BMS), human-machine interfaces (HMIs), servers, controllers, and IoT devices, it is possible to resolve the issue at hand. The adoption of an OTNxT approach can bring about numerous benefits, such as improved service quality, increased transparency, better compliance, enhanced customer satisfaction, and greater accountability for IT teams. Wipro OTNxT is an end-to-end managed service that covers the entire spectrum of OT and IoT systems, from devices to networks to the edge, WAN, cloud and applications, all in a proactive manner. It works in tandem with the client's OT strategy, enabling real-time decision-making, while minimizing unexpected downtime. Additionally, Wipro OTNxT offers the added advantage of reducing capital and operational expenses by eliminating unnecessary hardware and software.

Clients using Wipro OTNxT can expect the following benefits: An IDC white paper sponsored by Wipro on the long-term value of a platform-based OT solution. Contact Us ===================== ----- Arcticle source ----- https://www.wipro.com/infrastructure/form/ ----- =====================

Wipro positioned as a 'Leader' in IDC MarketScape:

----- Arcticle source ----- https://www.wipro.com/infrastructure/form/wipro-positioned-as-a-leader-in-idc-marketscape-asiapacific-excluding-japan-managed-cloud-services-2019-vendor-assessment/ ----- Contact Wipro Please fill the required details to access the content Wipro positioned as a 'Leader' in IDC MarketScape: Asia/Pacific (Excluding Japan) Managed Cloud Services 2019 Vendor Assessment Using the IDC MarketScape model, IDC studied nine organizations in 2019 that offer managed cloud services in Asia/Pacific excluding Japan (APEJ). Although many of the participating vendors deliver services globally, there are a few whose focus is on specific markets within Asia/Pacific. According to IDC MarketScape, Wipro, a major IT services vendor, has a comprehensive portfolio aimed at assisting clients in their cloud journey. It includes assessment, app modernization, and a phased approach for cloud migration as well as integration of legacy systems with the cloud. Wipro has a strong track record and capability in helping its clients upgrade legacy infrastructure to either a private or public cloud infrastructure. Wipro's Cloud Studio — an integrated collection of tools, technologies, and processes aimed at automated discovery, cloud-readiness assessment, cloud migration planning, scheduling, and execution — represents a differentiating asset in its arsenal. The Wipro-AWS Launch Pad, which is Wipro's state-of-the-art co-branded cloud innovation center in Bangalore, allows Wipro to effectively showcase to prospective customers the best of its offerings for AWS Cloud. =====================

Wipro is a Leader and Star Performer in Verification and Validation Engineering Service Providers 2020

----- Arcticle source ----- https://www.wipro.com/infrastructure/form/wipro-is-a-leader-and-star-performer-in-verification-and-validation-engineering-service-providers-peak-matrix-assessment-2020/ ----- Contact Wipro Please fill the required details to access the content Wipro is a Leader and Star Performer in Verification and Validation Engineering Service Providers 2020 In this report, Everest Group studied the vision and capabilities of 17 service providers. It also identified two service providers as the '2020 Verification and Validation Engineering services Market Star Performers' based on the strongest forward movement demonstrated on the PEAK Matrix year-on-year. "Wipro has been positioned as a Leader in the Verification and Validation (V&V) space on the back of significant investments in dedicated V&V infrastructure, including the Tarang labs. The company's development of solution accelerators and frameworks involving themes such as Artificial Intelligence (AI), Machine Learning (ML), and analytics to provide predictive analysis of test data and enhance V&V service delivery has also helped create meaningful differentiation in the market. Customers have acknowledged Wipro's V&V engineers' technical skills, and they appreciate the value of Wipro's engineers' expertise in test automation." - Akshat Vaid, VP, Everest Group Supriyo Das, Vice President and Global Practice Head – Software Engineering, Industrial and Engineering Services, Wipro Limited said, "We are thrilled with this recognition. Product complexity is ever increasing with growing digital adoption, proliferation of software across industries, need for seamless end user experience and minimal product recalls. At Wipro we have invested in infrastructure, talent, industry focused solutions and strong partnership to help our customers overcome these challenges. Our investments in new-age technologies such as 5G, Artificial Intelligence (AI) / Machine Learning (ML), Robotic Process Automation (RPA) Internet of Things (IoT), Blockchain, Certification & Compliance Labs and talent has started reaping benefits. We are confident that our offerings and solutions powered by Wipro EngineeringNXT platform will continue to meet and exceed customers' expectations. This recognition is a testimony to our commitment towards achieving excellence." Download report ======================

The Next Wave of SD-WAN Adoption

----- Arcticle source ----- https://www.wipro.com/infrastructure/form/the-next-wave-of-sd-wan-adoption/ ----- Contact Wipro Please fill the required details to access the content The next wave of SD-WAN adoption will require an

unprecedented degree of automated intelligence, including pervasive visibility and extensive security capabilities. Integrated AIOps will feature heavily too, ensuring networks and the applications that traverse them perform optimally, securely, and cost-effectively. As features are added and extensibility grows, enterprises will place a premium on SD-WAN offerings that abstract the inherent complexities of provisioning, managing, and securing the WAN. Complexity incurs the expenditure of time and resources, which slows the speed at which business can move. Simplicity will take the form of easily consumable turnkey offerings that involve no compromise in the functionality and performance of both the SD-WAN overlay and the underlying network transports. As enterprise buyers of the next wave of SD-WAN evaluate the available options, the partnership of CloudGenix and Wipro is well placed to help them achieve their digital-transformation objectives. This partnership will help deliver business benefits such as greater employee productivity, enhanced digital engagement with customers and partners, faster time to market, great WAN cost optimization (CapEx and OpEx), improved business agility, and ultimately, greater competitive advantage in a world where challenges come from traditional rivals as well as digital natives. Wipro's FluidIT can bring about seamless business transformation with expansive IT fabric, on-demand composability, and participative design while maximizing cloud infrastructure to blend organizational expertise and new technologies. This joint whitepaper by IDC, Wipro, and Intel defines hybrid multicloud management and provides in-depth coverage of the Wipro FluidIT platform. The whitepaper presents the proprietary BoundaryLess Enterprise framework of Wipro's FluidIT platform and its three key components: ASPIRE, Service Theatre, and APPAnywhere. The whitepaper discusses the architecture, which supports integration via APIs as well as any form factor for any location. To gain control over resources and assets, provide consistent visibility, ensure governance, and enable automation in a multi-cloud paradigm, enterprises increasingly turn to managed service providers, who can extend hybrid multi-cloud management capabilities. Innovation to Market faster with Cloud CRM

----- Arcticle source ----- https://www.wipro.com/cloud/faster-innovation-to-market-with-salesforce-cloud-crm/ ----- Related Articles Contact Wipro Please fill the required details to access the content Innovation to Market faster with Cloud CRM Wipro enabled CRM transformation for a large electronics conglomerate in 17 markets across 52 countries with salesforce.com Client Background The client is a leading engineering and consumer electronics conglomerate based in Europe, with over 122,000 employees and operations in more than 100 countries. Industry Landscape Most industries adopt an end-to-end value chain approach which includes three core processes areas -

Idea-to-market, Market-to-order and Order-to-cash. Manufacturers are facing unprecedented challenges in designing the right customer value chains and delivering on time in a highly competitive environment. Moreover, changing demographics, R&D pipeline productivity and evolving business models selling processes have compelled leading enterprises to embrace CRM for a complete process transformation. Opportunity The client had disparate systems across the 'Market-to-order' (M2O) process area leading to longer cycle times and process redundancy. Sales representatives did not have visibility across the entire sales process. The client needed to implement a unified CRM solution, with standardized sales tools and processes, aligned to their vision of customer centricity and enhance sales efficiency across all three divisions globally. Solution Wipro enabled the client to streamline their "Market-to-order" process using Salesforce CRM and brought together their three divisions under a single, unified SaaS CRM eco-system. The solution highlights include Global Template to optimize and standardize processes in 17 client markets across 52 countries. Business Impact Wipro successfully built a continuous delivery platform for a leading investment bank, enhancing business agility and lowering the environment provisioning lead-time from 21 days to 3 hours. Wipro Data Discovery Platform on Azure Cloud enables business process transformation and data monetization. 9 TB of data migrated, resulting in 30-35% reduction in current spend. =====================

Cloud-Based Automation for a Leading Investment Bank

----- Arcticle source ----- https://www.wipro.com/cloud/cloud-based-automation-for-a-leading-investment-bank/ ----- Related Articles Contact Wipro Please fill the required details to access the content Cloud-based Automation for a Leading Investment Bank Wipro successfully built a continuous delivery platform for a leading investment bank, enhancing business agility and lowering the environment provisioning lead-time from 21 days to 3 hours Client Background The client is a leading US-based investment management and services company, uniquely focused on helping clients manage and move their financial assets and succeed in the rapidly changing global marketplace. Industry Landscape With the advent of cloud, enterprises are not only looking at automating their infrastructure but also their application release management process. Over the past few years, many enterprises, especially banks, have implemented in-house private cloud and have deployed or started their journey towards building a continuous delivery platform to transform their software development lifecycle to an on-demand, self-service, and automated environment. A recent industry survey shows that with DevOps on Cloud solution, some of the high-performing organizations can deploy code 30 times faster with 50 percent fewer failures. The Opportunity The client had adopted extreme programming for their Software Development Lifecycle, but the underlying release process was manual, sequential and hence, time consuming. They were looking for a scalable, agile and cost-effective solution to render state-

of-the-art services to large financial institutions and banks. This necessitated that they move from their current systems to an agile cloud platform that would enable them to: The client was looking for a capable partner to help them in their journey to define and build this agile cloud platform. Solution Our team helped the bank define governance between Development and Operations teams cutting across people, process, and technology, and introduced a continuous delivery platform for DevOps on Cloud. The implementation enabled the bank's IT team to deploy environments across the application lifecycle, in an on-demand basis, while leveraging its proprietary tools and frameworks. Some key highlights of the engagement are: Our DevOps solution enabled agile self-provisioning of Infrastructure and the entire environment for developers, reducing managed service cost and TCO through automation and consolidation. Business Value Delivered Wipro successfully embarked the client on their DevOps journey and drastically lowered their application roll-out time. The engagement brought together the benefits of operational excellence and continuous delivery models merging them with the dynamic potential of cloud architectures to achieve: Wipro enabled CRM transformation for a large electronics conglomerate in 17 markets across 52 countries with salesforce.com Wipro Data Discovery Platform on Azure Cloud enables business process transformation and data monetization. 9 TB of data migrated, resulting in 30-35% reduction in current spend. =====================

Medtech company achieves insight-driven

advantage with Azure Cloud

----- Arcticle source ----- https://www.wipro.com/cloud/business-process-transformation-enabled-through-data-monetization/ ----- Contact Wipro Please fill the required details to access the content Medtech company achieves insight-driven advantage with Azure Cloud January | 2020 Client background Client: Leading US based MedTech organization Industry: Medical devices Products or services: Medical devices, consultancy, instrument systems Geography or areas of operations: Worldwide Number of employees: Over 60,000 Challenge A leading US based MedTech company wanted a partner to help them realize their vision of transitioning into an insights-driven organization that delivers business value to its end customers. The purpose of the engagement was to embed data, analytics and reasoning into their decision-making processes and empower the business in making intelligent and informed decisions. The client had the following challenges: Solution Wipro delivered the desired outcomes leveraging its Data Discovery Platform (DDP) on Azure Cloud. Wipro helped in building an analytics platform that enabled the business teams to collect, ingest, process and analyze data to derive insights and improve business outcomes. Business impact Wipro solution helped the client shorten their time to generate reliable insights and achieve high predictability of their IT assets. They are able to conduct experiments with pre-defined budgets

leveraging a catalog-based sizing approach that determines the type of data load, recognizes the insights hidden in the data, thus allowing agile interpretation and action. Our solutions delivered the following benefits: "Wipro helped the client to consolidate and leverage enterprise wide data (structured and unstructured) to harness the power of Big Data and build an insights-driven organization leveraging Wipro DDP on Azure Cloud." -Nidhi Garg Global Client Partner, Health BU, Wipro

How a leading tech company got its cloud migration strategy right

----- Arcticle source ----- https://www.wipro.com/cloud/improved-speed-in-production-and-reduced-maintenance-costs-with-aws-cloud/ ----- Related Articles Contact Wipro Please fill the required details to access the content Improved speed in production and reduced maintenance costs with AWS Cloud January | 2020 Client background Client: An American multinational technology company Industry: IT, IT services, IT consulting Products or services: Computer hardware, computer software, IT services, IT consulting Geography or areas of operations: Worldwide Number of employees: Over 49,000 Challenges The technology conglomerate wanted to adopt a standardized approach to cloud migration on AWS. They wanted a partner who could help them identify the right workloads, the right migration methodologies and propose a resilient governance model to run effectively on a cloud set up. They also wanted to address the following requirements; Solution The client wanted a cloud environment to improve speed of production and reduce maintenance costs. Wipro did a full analysis of their current landscape and provided the following solution; Business impact Wipro helped the client to minimize cost of operations by moving on-premise Vertica Database to AWS and cost of managing licenses for reporting environment, reduced significantly. "Wipro provided a scalable architecture on Cloud leveraging AWS Direct Connect Service, which helped the client to consolidate its reporting environment and achieve significant performance improvement. Automation, optimization, cost reduction and speed to production was their key asks, and our solutions coupled with our 'business first' approach helped them embark on their cloud migration journey with minimum disruptions to business." -Ankit Ghosh Head – Cloud Transformation Solutions, Tech BU, Wipro Limited. Wipro enabled CRM transformation for a large electronics conglomerate in 17 markets across 52 countries with salesforce.com Wipro successfully built a continuous delivery platform for a leading investment bank, enhancing business agility and lowering the environment provisioning lead-time from 21 days to 3 hours. Wipro Data Discovery Platform on Azure Cloud enables business process transformation and data monetization. ======================

How a Fortune 500 company ensured

data security on the cloud

Related Articles Contact Wipro Please fill the required details to access the content How a Fortune 500 company ensured data security on the cloud January | 2020 Client Background Client: A Fortune 500 company Industry: Cloud computing, Data Management Products: Data services and data storage devices Geography or areas of operations: Worldwide Number of employees: Over 10,000 Challenge Today, most data backup solution providers are making cloud the secondary storage for backup, and provide subscription-based backup storage solutions. The client, a data management services provider, had an on premise data backup solution and wanted to move data from the primary storage device to a secondary storage device. The client was looking for a partner who could help them launch a cloud data backup solution delivered as a SaaS model with anywhere-anytime data backup management for its end customers. The key requirements were: Solution Wipro leveraged a two-phased approach for enabling a Data Protection platform on cloud for the client. The first phase was a cloud application launched from AWS MarketPlace and the second phase was a SaaS model hosted on AWS. The Data Protection platform was developed as a highly available and scalable service leveraging cloud-native services, while keeping the design completely cloud-neutral. AWS services like S3 and SQS were used in combination to create a low latency and, secure message passing infrastructure for on-premise to cloud (hybrid cloud) communication. AWS services EBS, availability zones, and application load balancer were used to provide high availability across regions and on-demand scaling. The data protection platform was developed leveraging micro-services architecture using Java Spring Boot, deployed on docker containers. Feature-rich UI implementation was done using Angular JS. The cloud backup data was stored in S3 bucket and, configuration and metadata was stored in Elastic Search deployed in HA (high availability) environment across availability zones. The other key aspects of the solution include: Business Impact The cloud data backup solution delivered as a SaaS model enabled data backup management from anywhere, anytime for their end customers through a highly scalable, highly available and a secure cloud environment. The DPaaS solution orchestrated from a hybrid cloud helped the client gain a competitive edge by providing: "Wipro delivered a highly scalable and portable cloud-agnostic data backup solution with the right balance of cloud native and cloud neutral architecture. The solution enabled better customer experience with intuitive workflows and UI. With a clear roadmap and our 'business first' approach we enabled the client to embark on a cloud adoption journey." -Ankit Ghosh Head – Cloud Transformation Solutions, Tech BU, Wipro Wipro enabled CRM transformation for a large

electronics conglomerate in 17 markets across 52 countries with salesforce.com Wipro successfully built a continuous delivery platform for a leading investment bank, enhancing business agility and lowering the environment provisioning lead-time from 21 days to 3 hours. How a large food company took control over its

complex technology landscape with Azure IaaS

----- Arcticle source ----- https://www.wipro.com/cloud/how-a-large-food-company-took-control-over-its-complex-technology-landscape-with-azure-iaas/ ----- Related Articles Contact Wipro Please fill the required details to access the content How a large food company took control over its complex technology landscape with Azure IaaS January | 2020 Client background Client: Multinational food and drink processing company Industry: Food processing Products or services: Dairy products, baby food, breakfast cereals, coffee, confectionery, etc. Geography or areas of operations: Worldwide Number of employees: Over 300,000 Challenges The client wanted a technology partner to consolidate and migrate their enormous technology landscape across three regions – USA, Europe and APAC to a single cloud platform. Also, the client was contemplating to move their APAC operations from Australia to Singapore. They needed a partner who could deliver Cloud Brokerage Services to help them manage the use, performance and delivery of cloud services provided by multiple suppliers and service providers. In effect, they were facing the following challenges: Solution Wipro implemented a best-in-class hybrid cloud solution that helped the client accomplish the migration journey seamlessly without any disruptions to their business. Implementation highlights: Business impact The flexible and extremely scalable solution brought down client's IT spends, and improved efficiency and time-to-market. The hybrid cloud solution enabled seamless consolidation of the client's huge technology landscape. Cloud Brokerage Services, set up on a futuristic cloud architecture, ensures elasticity, efficiency and customer delight. Some key benefits include – "Wipro brought in a wide-range of expertise with global infrastructure capabilities. With deep expertise in delivering global multi-cloud migrations, Wipro helped to move the client's IT landscape to a dynamic cloud-based environment on Azure Cloud leveraging EDOC, one of our key accelerators that helps in managing hybrid cloud set-up. This transformation clearly helped the client to reduce their physical infra-footprint, improve performance, gain uninterrupted availability and lower total cost of ownership significantly." -Subramanian Krishnan General Manager & Global Client Partner, Consumer BU, Wipro Limited. Wipro enabled CRM transformation for a large electronics conglomerate in 17

markets across 52 countries with salesforce.com Wipro successfully built a continuous delivery platform for a leading investment bank, enhancing business agility and lowering the environment provisioning lead-time from 21 days to 3 hours. Wipro Data Discovery Platform on Azure Cloud enables business process transformation and data monetization.

Insurance company optimizes digital

marketing platform with AWS

----- Arcticle source ----- https://www.wipro.com/cloud/insurance-company-optimizes-digital-marketing-platform-with-aws/ ----- Related Articles Contact Wipro Please fill the required details to access the content Insurance company optimizes digital marketing platform with AWS January | 2020 Client background Client: Fortune 500 US-based company Industry: Insurance Products or services: Insurance, Mutual funds Area of operations: US Number of employees: Over 15,000 Challenge With the rapid advancement of technology, digital channels and tools are becoming the primary route to serve investors and advisors better. The client's content management platform (AEM), a mission critical application, was accessed by investors and finance professionals (over 27K users), and tightly coupled with 14 interfaces. This platform was built on Red Hat Linux, and its SQL Server database and active directory were hosted on Windows servers. One of the key pain points was the lead time taken to retrieve historical data from tape drives while meeting compliance needs. They wanted to rebuild and migrate their digital platform to public cloud. For this, they were looking for a partner who could understand their business values, and bring in the right set of technology and bring in the right business credentials. Solution Wipro put together a comprehensive approach to deliver the solution strategy. We provided development services, managed services, and moved their private cloud infrastructure to public cloud to drive business value. Wipro enabled migration of the AEM platform to AWS cloud. The entire migration was completed in a span of 18 weeks, which included discovery/assessment, design and set up of AWS architecture, data migration and integration, user acceptance testing, cutover and go-live. Business impact The client built a reliable, flexible and transparent cloud infrastructure platform for AEM and laid the foundation for delivering great digital experiences. The client is now not only realizing the value of infrastructure flexibility gained through this migration to AWS, but is also having a footprint from where they can take advantage of technologies like AI and ML. Key benefits include: "This engagement reinforces Wipro's 'Digital first' strategy and differentiated offerings on AWS Cloud. We helped the client transform their digital marketing platform to a highly scalable platform on public cloud. The migration was carried out with minimal disruptions and zero-outage, thus ensuring business continuity." -Pankaj Misra General Manager, Finance Solutions, Wipro Limited. Wipro enabled

CRM transformation for a large electronics conglomerate in 17 markets across 52 countries with salesforce.com Wipro successfully built a continuous delivery platform for a leading investment bank, enhancing business agility and lowering the environment provisioning lead-time from 21 days to 3 hours. Finance company connects customer

experience to business value

----- Arcticle source ----- https://www.wipro.com/cloud/finance-company-connects-customer-experience-to-business-value/ ----- Related Articles Contact Wipro Please fill the required details to access the content Finance company connects customer experience to business value January | 2020 Client background Client: Financial services company Industry: Finance Products or services: Investment, insurance and banking products and services Geography or areas of operations: Australia and New Zealand Number of employees: Over 5000 Challenges The client's core business was to empower their customers by delivering seamless personalized solutions and proactive engagements. Their existing customer data and analytics platform was not delivering the capability to understand customer needs and provide better service. It lacked the ability to capture and provide better insights to create relevant and engaging experiences for their end customers. Solution Wipro assessed and defined the client's platform architecture, established processes and prime environment and implemented customer analytics environment to host all the applications and tools. Wipro developed a modular customer analytics solution consisting of three streams – Platform, Data Preparation and Analytics. The new analytical output provided a clear amd comprehensive view of their customers and their relationship with the client. Key features of the solution include: Business impact With a new environment, the client now has the capability to explore customer information and create actionable insights to eventually support better and informed decision making. Besides, the client also achieved the following business benefits: "Our customer analytics solution enabled the client to organize and analyze their customer data to develop actionable insights, provide a consistent view of performance and ultimately drive better customer experience. Leveraging our 'business first' approach, we delivered a new analytics platform build on AWS Redshift that aids rapid and real-time decision-making during customer engagements." - Alex Roopesh Abraham Client Partner, APAC Field Force, Wipro Limited. By design, these solutions bridge the gap between existing and emerging technologies – enabling you to innovate faster, with less risk, in the race to digital transformation. =====================

Incorta Alliance

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/incorta-alliance/ ----- Contact Wipro Please fill the required details to access the content Incorta Alliance Powerful, easy-to use unified data analytics platform Wipro's Partnership with Incorta: Bridging the gap between raw data and valuable insights We're helping enterprises adopt Incorta's data analytics platform to accelerate business decisions while lowering costs. Using the Incorta data analytics platform, Wipro has enhanced the analytics

value chain by allowing companies to get insights into their business needs quickly. Together we're helping organizations gain greater value from their transactional data to better understand their customers' demands and become more competitive in their markets. By partnering with Incorta and aligning on a strategy of insights transformation, Wipro offers our customers an end-to-end data analytics platform that enables them to start their transformative migration from legacy systems to more advanced analytics platforms. This results in a reduction in costs as well as the amount of effort required to deliver insights to business users. The solution also provides customers with ready-to-deploy, pre-built dashboards for monitoring business functions. Supported by a strong Center of Excellence (CoE) and solution team, Wipro's Data Science practice and consulting services ensure an efficient delivery of Incorta solutions that drive the analytics process, from data extraction and integration to gathering valuable insights. The origin of our partnership Wipro's partnership with Incorta began in 2015, when Wipro and Incorta jointly collaborated on a project for semiconductor and software company Broadcom. It's one of the largest deployments of Incorta working with Wipro during the early days of our partnership. We helped Broadcom's management team gain quick data insights after onboarding a new business as the result of an acquisition. Today Incorta has become the analytics platform of choice for all Broadcom's analytics needs across its organization, replacing their legacy Oracle system. Wipro's Broadcom implementation of Incorta remains one of Incorta' s largest and complex deployments, which covered over 500 tables, 4 billion records, 3,000 dashboards, and 4,000 users, with several use cases implemented. Wipro's commitment to Incorta and the value its platform delivers resulted in Wipro's investment team (Wipro Ventures) deciding to invest in Incorta in November 2019. Following the investment, Wipro experienced a widespread adoption of this platform by Wipro internal teams as well as customers. This also led to Wipro being named GSI Partner of the Year 2020 by Incorta. Combining strengths to deliver streamlined analytics solutions Wipro's partnership with Incorta enables us to help our customers on their journey to become an intelligent enterprise. With our tech expertise and Incorta's platform, we deliver solutions that result in faster performance and insights, a lower cost of ownership, the elimination of duplicate data, greater scalability, improved visibility, and increased agility. The Incorta platform also reduces time to market for any given analytics use case by eliminating the need for extract, transform, and load/data warehouse (ETL/DWH) operations due to its Direct Data Mapping™ technology. In a recent study, Forrester revealed that Incorta's Direct Data Platform™ enabled a business to achieve an ROI of 313%, with total benefits of more than $14 million over three years. We're giving our clients these kinds of results, and our previous experiences include working with one of the world's largest semiconductor companies, a pipe and precast product manufacturer, a Thailand-based food product company, and a large technology conglomerate. Today Wipro has 1,400-plus consultants cross-trained and 100-plus certified on Incorta, one of the largest pools of trained and certified professionals of Incorta's partners. The top reasons to choose Wipro for an Incorta project Our experience leading one of the largest Incorta implementations Domain & technical solutions Trained & certified Incorta experts Quick POCs delivered on the Cloud Strong functional knowledge Our diversified offerings for delivering insights OBIEE/OBIA modernization: Migrating to Incort Items

CIO PLAYBOOK

Enabling a device choice program for employees For many CIOs, Apple® devices presented a daunting challenge to their traditional approach, refined over 30-plus years, of using traditional PCs. CIOs are risk averse—a trait that seems to come with the territory—and have naturally been resistant to the trend. However, times are changing. One industry study showed a rise in Mac® and iOS device adoption. We have developed a Playbook for CIOs to explain the benefits of offering device choice to their key stakeholders. We lay out a roadmap to embrace Apple devices in your enterprise IT ecosystem. You will learn how to transform your employee's device experience, while ensuring compliance to the corporate policies and reducing total cost of ownership. This playbook shares sharpened approaches, proven strategies, and best practices from experts to get you started on the transformation journey. We provide insights into gaining support from your stakeholders, managing your deployments, and delivering new user experiences so that you can successfully transform your enterprise IT landscape using Apple devices. Download the CIO Playbook ======================

Why Device Choice Matters to Employees

Wipro partnered with Coleman Parkes Research to better understand the impact when organizations allow employees to choose which type of device they use for work (Mac® or PC). In October 2019 Coleman Parkes Research interviewed 500 US-based IT leaders to better understand the viewpoint of next generation IT leaders when it comes to choice of devices and laptops in the workplace. The survey confirmed that organizations that allow employees to choose between Mac and PCs, increases their attractiveness for new hires and strengthens loyalty for current employees. IT Leaders are recognizing that equipping employees with their preferred type of device will allow them to be more efficient and productive. This is evidence of how being flexible in IT decision-making can be better for a company, rather than the traditional

"one-size-fits-all" approach. Designing and deploying a corporate-provisioned employee choice program that incorporates Windows and Apple® products within your existing IT infrastructure can be daunting. Wipro makes it easier. Click here to find out more

The Total Economic Impact™ Of Mac In Enterprise

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/apple/articles/the-total-economic-impact-of-mac-in-enterprise/ ----- Contact Wipro Please fill the required details to access the content Cost Savings And Business Benefits Enabled By An Employee Choice Program Apple commissioned Forrester Consulting to conduct a Total Economic Impact™ (TEI) study and examine the potential ROI enterprises may realize by deploying Mac. The purpose of this study is to provide readers with a framework to evaluate the potential financial impact of Mac on their organizations. Mac provides another option for end user machines, compared to a standard enterprise PC deployment. To better understand the benefits, costs, and risks associated with this investment, Forrester interviewed seven customers with experience deploying Mac in their enterprise. The interviewed organizations decided to implement an employee choice program and enterprise Mac deployment due to: Mac being easier to manage; a desire to improve the employee experience; and Mac being a more secure platform. This resulted in significant benefits, as detailed in this case study. With Mac, organizations reduced IT support costs, improved employee productivity and engagement, and improved overall security Forrester developed a composite organization based on data gathered from the customer interviews to reflect the total economic impact that Mac could have on an organization If you would like to have a customized TEI report done for your organization please contact us at – Apple.Experts@Wipro.com Click here to find out how switching to Mac will save your organization money. =======================

How to choose the Right MDM solution

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/apple/articles/how-to-choose-the-right-mdm-solution/ ----- About the Author Contact Wipro Please fill the required details to access the content Cloud and mobility have changed how we work and created an environment where employees want access to corporate applications and data anytime, anywhere, from whatever device they choose. Organizations increasingly realize the power of a flexible mobile work environment, and in many ways, the post-COVID-19 pandemic world has significantly accelerated the need for mobility. These assists employees in striking a balance between their professional and personal life and helps companies establish seamless

communication between employees and the office. However, enterprise mobility may lead to critical security concerns for business data, apps, and devices if not managed and secured efficiently. Thus, enterprises need a powerful, secured mobile device management (MDM) solution to meet today's security challenges. An MDM solution safeguards and controls the devices used by the organization's employees. It allows access to corporate apps, data, and content under assured security. Enterprise mobility involves challenges, and organizations must choose from several mobility solution providers in the market. Before selecting an MDM solution, companies should complete a detailed requirement and feasibility analysis. After the study, the company can prepare a comprehensive report of their pain points that will give them an informed position from which to choose an MDM solution. Understanding the pros and cons of any MDM solution is essential before deciding if it is the best fit for your organization. To ensure enterprises choose the right MDM solution, essential factors must be considered. INTEGRATION An MDM solution's smooth, painless integration into your ecosystem is imperative to protecting existing technology investments and avoiding rip and replacement costs. Most solutions provide options for on-premises, cloud-based or hybrid installation and integration. Integration with other management, support and reporting tools significantly adds to the overall service. Consider a solution that integrates easily with existing device management tools and vendors to share information on device state. ADMINISTRATION MDM solutions often carry hefty administrative overhead. Keeping overhead to a minimum should be one goal so that you can focus your time on more pressing tasks. Consider a cloud-based solution to manage and secure devices. This can always reduce your total cost of ownership (TCO) because it is self-healing and always available. It's also essential to examine solutions through which you can manage access to applications based on user groups and individual roles and automate security patches and updates, further reducing your administrative overhead. You'll save time and money by acknowledging the cloud data risk adequately. DEVICE AND DATA SECURITY Organizations should be able to enforce security policies to reduce the risk of breaches and prevent vulnerable or unsecured devices from accessing sensitive data. Security policies are unique to each organization, and you should be able to customize policies based on the risk associated with specific applications. For example: is the device using passcodes and biometrics? Is encryption turned on? What OS and browser versions are installed, and are they up to date, properly configured and patched? Device security status will help you detect and stop out-of-date and vulnerable devices from gaining access. It also only allows devices whose security posture conforms to the baselines established by the organization. Consider a solution that provides insights into the security posture of all devices and empowers you to enforce security policies rather than prescribing them on paper to ensure adherence. That way, you can set consistent policies across applications, whether on-premises or in the cloud, to deliver a seamless user experience. USER EXPERIENCE The process of enrolling devices in your chosen solution is often overlooked. Still, with an increased emphasis on user experience by all major platforms, it's essential to evaluate the features and capabilities of the solution. Consider a solution that offers users flexible onboarding options like automated enrollment, self-enrollment and self-service for support. It eases the burden on administrators and promotes confidence in the user

without requiring additional training. UNIFIED VISIBILITY Most endpoint visibility solutions are siloed. They are often designed exclusively for Windows, Macs, or mobile devices. A solution specific to each platform results in a massive productivity drain and major administration headaches. A solution offering a unified, comprehensive view from a single dashboard into all managed, unmanaged endpoints and platforms can streamline administration and reduce complexity. TRANSPARENCY Most MDM solutions are considered intrusive. Users fear their privacy may be invaded, and they will lose control of certain features and functions of their devices. Keeping users informed about what information is being collected or how it's being used establishes a mutual trust between administrators and users that often results in a higher level of compliance. A transparent solution that only collects a device's security information is optimal. The less personal data collected, the better – and notify users what type of information will be collected and examined. INVENTORY MANAGEMENT Many MDM solutions cannot provide a detailed device inventory. A device inventory gives you additional information and reduces the burden of device lifecycle management while eliminating the surprise of unknown devices accessing your applications. Consider a solution that enables you to identify all devices that access your environment and tag assets to specific users so you can understand which device is assigned to whom, how many devices are being used, and which applications are being accessed. COMPLIANCE AND REPORTING Most organizations adhere to strict compliance regulations, such as HIPAA, PCI DSS, NIST, SOC 2, or ISO 27001, requiring all devices to comply. A good solution for your company might enable you to generate user and device reports and security logs with just a few clicks to help meet compliance requirements for tracking and security event logging, as well as provide valuable assets for audits, incident response, and recovery. SERVICE AND SUPPORT Support and after-sales services are the deciding factors for many organizations when evaluating and selecting new solutions and services. Many MDM solutions have varying tiers of support, depending on customers' requirements and needs. Look for a solution that offers multiple tiers of support options for the type of devices you'll be managing. Thoroughly review and vet SLAs of every opportunity along with support available in different regions and languages. Chris Potrebka Wipro Senior Consultant– Apple Device Services. Chris is a System Engineer and Solutions Architect specializing in integrating Apple devices in large multinational corporations. He has held similar positions in multiple organizations, promoting, creating, and delivering devices as a choice programs. He's a member of Apple's Consultant Network and various other Apple-centric forums. He loves travelling, cycling, and volunteering. =====================

Employee Choice Is Better for Business

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/apple/articles/employee-choice-is-better-for-business/ ----- Contact Wipro Please fill the required details to access the content This article is part of our

Employee Choice series, in which we explore the trend and impacts of encouraging workers to choose their own devices and operating systems. When we speak with organizations about Macs in the enterprise, many support organizations express concerns about them, from questions about device management systems to doubts about enterprise security, it often seems easier to consider Apple products to be consumer-only. However, the data shows something different: allowing the choice of Apple products among a set of approved options actually lowers support costs, reduces capital costs, and increases productivity significantly for those who choose Macs as their primary systems. SECURING ENTERPRISE SYSTEMS The majority of security professionals today use Macs due to their Unix-based foundation and the native security of the hardware and software. In fact, during the time of recent widespread malware attacks, in one healthcare organization, more than 80% of Windows machines were affected and 100% had to be isolated until the infection was completely cleaned. Macs were the only systems able to continue operations, and the incident team used them exclusively I have spoken with CIOs and IT leaders and found increased overall productivity per person with no increase in overall support costs. In fact, many were able to increase the staff by more than 100% while actually reducing overall end-user support costs. NATIVE SECURITY For companies looking to offer device choice, it is important to take into account the security protections of the platform, including hardware, operating system, and applications, as well as productivity and hardware lifetime cost. In fact, we found native protections provided the majority of necessary security for the platform. For example, macOS has (additional security protections) [https://www. apple.com/macos/security/], protecting the kernel and operating system from attack with runtime protections and application sandboxing. Further, Apple reviews all applications submitted through the App Store as well as provides its Gatekeeper technologies to limit application installations and provide warnings to users as they install non-App Store apps. This extensive set of protections— architected into macOS— provide substantial out- of-the-box protection for Macs in the enterprise. While we deployed applications, we also learned that beyond the native protections, enterprise management from third-party enterprise products allowed our IT team to manage systems and information on the Macs in much the same way they are able to manage their other client and server systems. From using the Apple T2 chip with the Secure Enclave, secure boot, and protection for encrypted storage to TouchID and FileVault 2, the native capabilities of Macs are enterprise-class. THE CHOICE FOR CHOICE Through this ongoing series, we will expand on each of these areas to give you more information and understanding as you consider your own plans. The bottom line is that Macs provide not only a viable alternative, but for a significant portion of an organization's staff, they represent an opportunity to save money while increasing productivity, making a choice program worth considering. ======================

How Macs Bridge the App Gap

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/apple/ articles/how-macs-bridge-the-app-gap/ ----- Contact Wipro Please fill the

required details to access the content How Macs Bridge the App Gap Employees want device choice in their workplaces. When given that choice, employees choose Mac 75% of the time. Still, hesitation about device choice persists among corporate executives and IT professionals. They're looking to ensure that Macs can integrate with existing PC-based systems and support essential applications and software. IT experts often fear a macOS app gap — an inability to run certain crucial line-of-business applications. Well, wonder and worry no more. Apple has you covered. By designing, creating, and controlling the hardware, software, and cloud services, Apple creates a more unified and secure platform — all while maintaining the highest quality products, delivering a compelling end-user experience, and keeping your employees connected and productive regardless of platform. Apple provides layers of protection to help ensure that apps are free of known malware and tampering. Additional protections guarantee that access from apps to user data is carefully mediated. These security controls provide a stable, secure platform for apps, enabling thousands of developers to deliver hundreds of thousands of apps for iOS, iPadOS, and macOS — all without impacting system integrity. Users can access these apps on their Apple devices without undue fear of viruses, malware, or unauthorized attacks. If you still need access to a legacy app that's missing from the Mac repertoire, Mac likely offers effective and efficient alternatives. Because they're built by Apple, they'll be doubly secure. Finally, Wipro's virtualization services can help ease your challenge. Providing the ability to run Windows legacy app on a Mac. Wipro's in-depth industry knowledge and wide-ranging experience in delivering infrastructure solutions provide you a solid virtualization offering that's secure, scalable, and flexible. Opening your enterprise up to device choice and Mac products has benefits for both your business and your employees. Allowing employees to choose Mac can lower your support costs, reduce capital costs, and increase productivity for your enterprise. Employees gain the familiarity of Mac at work and seamless connectivity with their personal Apple devices at home or in their pocket. Plus, Macs are currently so ubiquitous in higher education that the youngest members of your current and future workforce will likely choose to work on Macs in even greater numbers. Offering them that choice will be a natural extension of their experience and an attractive recruiting tool for your business. Now you have a choice: Choose Wipro LiVE Workspace for Apple and you can empower your employees with device flexibility. Giving your people that one simple choice — Mac or PC — will make them feel more productive, more engaged, and more proud of their work and their team. We'll help you seamlessly integrate and secure iPhone®, iPad® and Mac devices with your existing systems, automate deployment and management with modern best practices, augment AppleCare support, and give your workforce customized help throughout their device lifecycle. There's no app gap when you choose Wipro and Apple. About the Author Timothy Lydon Global Apple Partnership Leader Wipro FullStride Cloud Tim Lydon is Wipro's Global leader of the Apple Partnership. Tim has executed several of largest enterprise deployments of Mac Device Choice programs. Tim advises enterprise executives on how they can improve the employee experience, reduce costs and improve sustainability by expanding the adoption of Mac.

Mac@Work in the Enterprise

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/apple/ articles/mac-work-in-the-enterprise/ ----- Contact Wipro Please fill the required details to access the content Mac@Work in the Enterprise Empower your digital workplace and workforce with Mac With AI taking centre stage in digital transformation, Mac is emerging as a critical player in the future of enterprise technology. Adopting Mac will empower organizations to enhance productivity, foster innovation, and adapt to the evolving demands of the modern workplace. By choosing Mac, companies prioritize employee choice and flexibility, driving satisfaction and helping retain top talent. Wipro's Mac@Work survey affirms that Mac's advanced encryption, system integrity, intuitive user interface, and security provides a secure foundation for AI. Its seamless interoperability with other devices ensures a cohesive digital workspace that drives efficiency and employee satisfaction, and its intuitive design, ease of use, and reliable performance makes it highly attractive to enterprise users. Create an Agile, Secure, and Productive Workplace with Mac. Download the Report ======================

A Harmonious Workplace: Wipro and Mac Bridging the Digital Gap

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/apple/ articles/a-harmonious-workplace-wipro-and-mac-bridging-the-digital-gap/ ----- Contact Wipro Please fill the required details to access the content A Harmonious Workplace: Wipro and Mac Bridging the Digital Gap Workers want their at-work digital experiences to match their at-home and on-the-go experiences in ease of use, multitasking abilities, security, operating systems, and versatility. When given a choice at work, employees choose Mac 75% of the time compared to PCs. Mac's compatibility ensures smooth data synchronization and workflows, fostering an environment where digital boundaries blur and business technology becomes an effortless extension of everyday life. The renowned out-of-the-box experience starts when powered on for the first time. Mac users are guided through a streamlined, intuitive setup process that requires no hands-on tech support. Pre-installed macOS ensures users can quickly access productivity tools, business applications, and AI services without requiring extensive manual installations or updates. From the start, built-in security features provide robust protection against threats. This plug-and-play simplicity dramatically reduces the burden on IT departments. It lets employees focus on their tasks immediately, translating into greater efficiency and a more enjoyable user experience. Wipro discovered in its 2024 Mac@Work in the Enterprise survey2 that: Mac and Wipro Empower the Modern Workplace Mac compatibility with both contemporary and legacy enterprise systems, make it a robust choice for businesses eager to avoid disruptions caused by technology shifts. This compatibility lets businesses transition smoothly without sacrificing access to vital legacy software or existing databases associated with long-

established operational systems. Mac offers a competitive edge through a powerful ecosystem and unified hardware and software design. Features such as the advanced Apple silicon chips, known for speed and efficiency, can handle demanding applications and multitasking, maximizing productivity and AI applications. Apple's rigorous App Store guidelines and frequent security updates also help protect businesses from cyber threats and unauthorized data access, ensuring that sensitive information is kept secure. With Mac, businesses can take advantage of continuous advancements and maintain a leading position in technology competitiveness. Wipro's LiVE Workspace for Apple integrates Mac with existing systems, enabling businesses to continue to run without any interruptions. Whether employees use Adobe Create Cloud, Microsoft Office, Google Workspace, Zoom, or Webex, etc., Mac ensures full operation and smooth cross-platform collaboration. Mac and Wipro work together to provide a stable environment that ensures technology shifts won't disrupt businesses. MacOS integrates seamlessly with the hardware, resulting in fewer system crashes and lower downtime than other platforms. Apple's commitment to long-term software support and regular updates helps businesses maintain a secure and up-to-date operating system without experiencing compatibility problems that often arise with other platforms. This focus on stability and long-term operability means employees can remain productive without the relentless learning curve associated with newer/updated operating versions or handling unexpected technology malfunctions. Wipro's LiVE Workspace for Apple helps businesses integrate Mac within existing environments, automate deployment and management with modern best practices, augment support, and provide customized help throughout the device lifecycle. Conclusion Mac offers an unparalleled blend of compatibility and security for enterprises with diverse technological environments. Mac's seamless ability to bridge contemporary systems with legacy applications helps maintain business continuity, providing the resilience needed amidst the ever-evolving demands required to stay competitive. This multifaceted compatibility solidifies Mac as an invaluable resource for modern enterprises striving to achieve operational efficiency and future technological alignment. Wipro's in-depth industry knowledge and wide-ranging experience in delivering infrastructure solutions provide a secure, scalable, and flexible offering. Safeguarding Your Workplace: The New Age of Cybersecurity

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/apple/articles/safeguarding-your-workplace-the-new-age-of-cybersecurity/ ----- Contact Wipro Please fill the required details to access the content Safeguarding Your Workplace: The New Age of Cybersecurity The rapid evolution of cyber technology presents exciting opportunities for IT decision-makers to showcase their experience and adaptability. As infrastructure grows, cyber threats—including sophisticated malware, ransomware

attacks, and phishing scams—are growing staggeringly fast, often doubling faster than unwanted spam emails (which studies suggest up to 85% of all emails sent worldwide). Using sophisticated tools like Mac, and innovative solutions supported by Wipro, organizations can confidently navigate the digital landscape. This dynamic combination doesn't merely address challenges; it champions proactive and strict defenses, ensuring a fortified and secure infrastructure. The future of cybersecurity will require mastery in protecting vital digital assets. Organizations can confidently lead cybersecurity by implementing Mac security and leveraging Wipro's support, ensuring a robust and well-protected infrastructure. The combination of Apple devices and Wipro services marks a new era in enterprise security. With its extensive IT services experience, Wipro enhances Mac's inherent security features, providing customized solutions that boost business efficiency and innovation. Mac and Wipro services propel organizations into a future where speed, safety, and seamless operations come together. Wipro Mac@Work in the Enterprise Survey1 Wipro's Value Add Wipro augments the robust foundation established by Apple's integrated approach to security and management by offering deep expertise and comprehensive solutions that enhance safety and productivity. Mac infrastructure is designed with a balanced focus on security, user experience, and manageability, giving users built-in tools and controls needed to maintain a secure environment without sacrificing usability. Wipro complements this by providing advanced analytics, risk management services, and extensive support, which help businesses optimize Mac's security features. Wipro's 2024 Mac@Work in the Enterprise survey also discovered that: Considering Mac in the Enterprise Increasing numbers of IT departments are integrating Mac into their infrastructure, driven by a strong belief in the enhanced security attributes of macOS. ITDMs across various operating system landscapes think Mac is more secure than other computers. Security is a crucial factor driving continued Mac adoption, closely followed by the ease of deployment and management. Organizations benefit greatly from the built-in security of every Mac, which combines hardware, software, and services to provide maximum protection while enhancing user experience and IT management. IT teams can deploy and manage devices efficiently with endpoint security APIs, Apple Business Manager, and mobile device management (MDM). Mac hardware security ensures robust encryption and secure boot processes. System security features and secure software updates offer additional layers of defense while built-in encryption safeguards data at rest. Enhanced app security, malware protection, and secure networking and services ensure comprehensive safety. The seamless integration of security measures and transparent user experience fosters ease of adoption for employees. Apple's commitment to privacy ensures the protection of corporate and employee data through innovative privacy technologies. Conclusion Security is and will continue to be a top concern for IT professionals as they navigate tight budgets and impending hardware refreshes. To optimize investment, evaluate vendors for cost savings, security, and efficiency. Organizations can boost their security posture and employee satisfaction by implementing best practices around authentication and zero-touch deployments and opting for hardware that naturally integrates these shifts. Selecting vendors that seamlessly blend built-in security features and data encryption without compromising on productivity is essential. The synergy between Apple

devices and Wipro services ushers in a new era of enterprise security, combining elite functionality with robust protection. Every Mac combines hardware, software, and services designed to work together for maximum security, creating a seamless and fortified ecosystem. By leveraging the inherent security on Mac and Wipro's deep expertise, organizations can achieve unparalleled efficiency, innovation, and safety. Apple products not only elevate the user experience with intuitive and powerful features but also address the comprehensive management needs of IT departments, ensuring ease of deployment and administration. The strength of Wipro's service offerings coupled with Apple devices ensures a seamless and secure digital landscape, empowering businesses to lead confidently knowing digital assets are safeguarded. For More Information Mail - info@wipro.com For more details click here apple partner page References and Notes The Mac@Work in the Enterprise survey was conducted in July 2024 and included 500 respondents from various industries, including automotive, banking/financial services, health/life sciences, manufacturing, retail, energy/utilities, and telecommunications. The respondents were crucial decision-makers, including CIOs, CFOs, CTOs, CSOs, Security VPs, and IT Directors, providing a comprehensive view of the benefits of Mac devices in the enterprise. =====================

In-Office or at Home: How Mac Delivers Cost Savings & Business Value in the Enterprise

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/apple/ articles/in-office-or-at-home-how-mac-delivers-cost-savings-and-business-value-in-the-enterprise/ ----- Contact Wipro Please fill the required details to access the content In-Office or at Home: How Mac Delivers Cost Savings & Business Value in the Enterprise Whether working at home or part-time in the office, times are changing, and so too are the tools to empower a new generation of workers. The digital employee experience (DEX) has become a critical factor in determining an enterprise's success and equipment purchases, which affects costs associated with their capital and operational expenditures (CAPEX and OPEX). In today's digital workplace, the ease employees have using enterprise technology can significantly affect the organization's productivity, effectiveness, and overall efficiency. When employees effectively adopt new digital tools, they are more likely to utilize the equipment to its full potential and reduce the need for extensive training or ongoing technical support. Moreover, intuitive and reliable digital experiences can enhance job satisfaction and productivity, reducing direct and indirect costs associated with maintaining enterprise equipment. This leads to higher employee satisfaction and retention rates. Therefore, investing in superior digital experiences and tools is a strategic move that enhances operational efficiency and ensures a favorable total cost of ownership (TCO). Wipro discovered in its 2024 Mac@Work in the Enterprise survey1 that: Direct Quantified Cost Impacts Mac has been shown to reduce device support and management costs by nearly one-third compared to

other devices. The efficiencies stem from cheaper maintenance, fewer security incidents, and a notable reduction in support tickets—about 60% fewer tickets are filed annually, with faster and more affordable resolution costs per ticket. IT organizations also benefit by being able to manage twice as many devices per employee, again leading to substantial savings. For example, an organization with 13,125 Mac devices saved an estimated $7.3 million in support and management costs over five years. Additionally, using Mac devices avoids considerable hardware, software, and energy costs. Mac reduces the need to purchase OS license upgrades and additional security applications because of the built-in, high-level security features. Mac is also energy-efficient, consuming 56% less energy than PCs. These factors collectively contribute to ongoing financial benefits while ensuring robust operational performance. The innate security features of macOS, including System Integrity Protection, Gatekeeper, XProtect, encryption and regular updates, reduce the vulnerability to data breaches by up to 90%. This improvement can translate into an average savings of $530,000 in reduced risk of data breaches over five years. The increased reliability, faster processing, and reduced downtime of Mac can boost employee productivity, equating to an estimated average of $46.4 million over a five year period. Mac retains a much higher residual value—as high as 30% after four years compared to 15% for PCs. "Support, operational, and longevity cost savings of [Mac] compared to [PC] devices are far greater. And when it comes to ease of use, it's a more flexible and secure platform than our [PC] platform today". Director of Mobile Product and Innovation, Financial Services Indirect Unquantified Benefits Through its unmatched build quality, durability, and sustained performance, Mac offers an extended device lifecycle. Survey respondents claim their organization extended the lifespan of their Mac by an additional 13 months over other devices, enhancing the ROI and reducing the need for frequent device replacements. Using Mac strengthens an enterprise's reputation among users and benefits employee acquisition and retention. Employees generally find Mac more user-friendly, reliable, and efficient, translating to a better workplace experience. This improved employee satisfaction can help attract top talent and reduce turnover. Wipro's virtualization services allow organizations with legacy enterprise applications to run on the Mac. Wipro's in-depth industry knowledge and wide-ranging experience in delivering infrastructure solutions provide a solid virtualization offering that is secure, scalable, and flexible. Additionally, the environmental benefits of Mac—such as consuming less than half the electricity of equivalent PC devices—support environmental, social, and governance (ESG) goals by reducing emissions and contributing less to carbon dioxide levels. "Macs have proven to be more cost-effective from a management and support [perspective], for user experience, and [provide] a longer life cycle." Lead Systems Analyst, Food and Beverage Artificial Intelligence (AI) Mac helps enterprises better leverage AI development and deployment via cutting-edge hardware, especially the most current Mac lineup featuring the powerful Apple silicon chip with a dedicated Neural Engine. Apple silicon's high performance and energy efficiency offer long-term cost savings, making Mac a compelling choice for enterprises focusing on AI workloads. By collaborating with Wipro to implement Apple device solutions, enterprises can align their DEX goals to maximize the work environment, strengthen competitive advantage, promote sustainability, and ultimately strengthen TCO. Conclusion While

renowned for its design elegance, intuitive operating system, and user-friendly interface, the Wipro "Mac@Work in the Enterprise" survey confirms that Mac is a powerful enterprise-ready device. The survey provides compelling evidence from business executives that Mac better meets the needs of the enterprise workforce, proving indispensable for professionals in all parts of an organization. By promoting increased collaboration, greater integration, high compatibility, enhanced productivity, and notable cost-efficiency, Mac has established a solid position across all sectors. From a financial perspective, the benefits are undeniable. The ROI stands at an impressive 186%, with businesses seeing a payback period of less than six months. The most significant cost savings, $121.2 million, come from reduced and avoided hardware, software, and energy expenses. This compelling financial rationale underscores why Mac offers both short-term and long-term value. Mac makes a wise investment for any enterprise looking to evolve and optimize its technology infrastructure. These strengths make Mac a compelling choice for any business looking to maximize its technology ROI. Mac is future-ready and evolves to meet business needs. With Wipro's guidance, enterprises can confidently adapt to the future world of work, driven by the exceptional capabilities of the Mac. Additional Readings Total Economic Impact is a methodology developed by Forrester Research that enhances a company's technology decision-making processes and assists vendors in communicating the value proposition of their products and services to clients. Technical Support Services

We're always working for your workforce After your employees make their device choice, prove to them that they've made the right one. With our Mac Technical Support Services backed by AppleCare, our experts will provide you and your people with helpful, always-on, individual attention. Our self-service, remote, and onsite assistance options guarantee that you and your employees get the kind of help you want. Choose from our selection of seamless support experiences. We've got you covered with AppleCare for Enterprise Contact the Wipro Apple Experts to find the right solution for your enterprise =====================

Case Studies

Mac@Wipro: Giving Wipro Employees the Power of Choice

Ambition Back in February of 2022, the Wipro executive board was discussing ways to attract and retain top talent, when a member of the board mentioned that a younger relative recently had to decide between two competitive job offers. What sealed the deal, they said, was that one company offered employees Mac devices to use while the other did not. Apple has a reputation for making devices that are easy to use and troubleshoot, with processors that are more energy efficient than competitors out of the box. Wipro's executive committee agreed that expanding the use of Mac devices throughout the company would likely help Wipro achieve many of its business ambitions, including attracting top talent, saving time for IT staff, and prioritizing energy efficiency. The committee made this focus part Wipro's digital transformation, being led by Wipro CIO Anup Purohit, who was searching for opportunities to enhance the various tools, systems, and processes that make up Wipro's IT. Action Wipro recognized that a comprehensive Mac adoption program would require engagement with various stakeholders throughout the organization to understand their needs and devise a strategy that would address them completely. The CISO team wanted to be sure that all threat vectors would be addressed, while the CFO team needed proof that switching to Apple devices made economic sense, increasing efficiency and reducing costs. Wipro worked closely with Apple throughout the

transition to offer clear solutions to stakeholder concerns and develop a strategy that aligned with the various needs of the business. Wipro's Apple Practice and Apple security specialists, for example, took time to demonstrate how the native security tools of macOS compared to Windows, and outline best practices for integration to ensure Wipro achieves the highest quality security. Apple also helped address other concerns throughout the transition such as validating technical configurations, communicating with executives and mapping logistics for device distribution. Ambitions Realized Increased employee engagement, satisfaction, and retention The Mac@Wipro program provided new hires with state-of-the-art Mac laptops and paved the way for other employees to choose their own devices. New hires responded well to seeing Mac devices in their welcome kits, posting unboxing videos to social media to share the excitement. The Mac devices are easy to set up, making onboarding a breeze. They also tend to have fewer technical issues because the hardware and software are built together. When issues do arise, Wipro's dedicated Mac@Wipro support team makes it easier for new hires to resolve those issues quickly. The Mac@Wipro team reported fewer support calls relating to Mac devices — about one fifth the number relating to Windows devices — and greater overall satisfaction from employees using Mac. Reduced energy consumption The initiative also aligned with Wipro's environmental ambitions by working to reduce energy consumption, lower electricity bills, and create a more environmentally friendly office. Apple's latest processors are designed with energy efficiency in mind, consuming less power during operation due to smart power-management features. Wipro's previous standard Windows laptop produced an average of 365 kgs of CO_2 emissions per year. An Apple MacBook Air M1 produces an average of 161 kgs of CO_2 emissions per year. That 204 kg difference applied across the thousands of devices Wipro switched to Mac eliminates 27,865,890 kg of CO_2 emissions per year — about the same as reducing 3.1 million gallons of gasoline CO_2 emissions . "Wipro has pledged to reduce its emissions by 55% by 2030 and reach net zero by 2040," Anup Purohit said. "The M1 chip in Mac helps us in reaching our goals by greatly reducing our energy consumption." Reduced deployment costs With Apple's ecosystem, Wipro simplified and centralized its approach to provisioning, configuring, and maintaining devices. Apple Business Manager (ABM) and Mobile Device Management (MDM) solutions allowed Mac@Wipro to automate device setup, configuration, and software deployment. This streamlined process reduced the time and effort required, resulting in a reduction of over 75,000 hours for the IT staff.

Simplify Private Cloud Deployments with Wipro FullStride Cloud and Pure Storage

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/pure-storage/simplify-private-cloud-deployments-with-wipro-fullstride-cloud-and-pure-storage/ ----- Contact Wipro Please fill the required details to access the content Weak cloud adoption often has more to do with enterprise challenges than with technology limitations. Implementing cloud solutions requires executive buy-in, close collaboration between technology and business units, and a focus on measured business outcomes. With the emergence of complex requirements in the hybrid cloud world, solutions must simplify outcomes. In "Creating Simple Private Cloud Deployments with Pure Storage and Wipro FullStride Cloud," ISG digs into the best model for cloud delivery, explaining how AI and data analytics can be used to increase resiliency, performance, and build a more successful cloud-driven enterprise. The white paper looks at several examples of how joint solutions from Wipro FullStride Cloud and Pure Storage are helping organizations utilize these tools more effectively to simplify cloud deployment. Wipro and Pure Storage: Meeting the Requirements of Modern Technology Architecture Wipro's strategic partnership with Pure Storage has yielded significant results since 2016, bringing to market the joint solution Autonomous Storage Operations (AISOP) and frameworks for container-based platform services. "The strength of the Wipro-Pure Storage solution," ISG writes, "is that each provider (and other third parties) can play and align to their strengths and capabilities to provide end users, typically everyday employees, with a seamless and invisible solution." Download the white paper to get ISG's full perspective on simplifying cloud deployment, and how the joint solutions of Wipro FullStride Cloud and Pure Storage can help. IoT empowered Smart Buildings elevate the user experience and bring excellence in operations, transforming business performance and enhance sustainability A Wipro and Intel perspective An Intel - Wipro whitepaper =====================

Internet of Things (IoT) empowered Smart Buildings

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/intel/internet-of-things-empowered-smart-buildings/ ----- Contact Wipro Please fill the required details to access the content Internet of Things (IoT) empowered Smart Buildings Transform user experience and excel in operations IoT empowered Smart Buildings elevate the user experience and bring excellence in operations, transforming business performance and enhance sustainability IoT is playing a critical role in the management of buildings and its infrastructure, providing real-time actionable insights. Data from IoT devices are being leveraged to provide users and stakeholders with sharper insight and granular control over multiple areas of operations and user experience, creating a safe and healthy environment. IoT-based systems help to simplify maintenance, reduce operational costs, derive high visibility to assets, thus providing higher return on investment (ROI). Wipro Smart Building is an Intel® IoT market-ready solution powered by Wipro's Intellectual property Wipro Smart i-Connect™ (WSiC), an enterprise IoT platform. WSiC acquires, interprets, routes, processes, and visualizes data from the IoT devices to make Smart Building a central component in facility control. Intel is enabling a more intelligent Internet of Things (IoT), supporting enterprises that are moving to the edge so they can capture more data, analyze it faster, and act on it sooner. The solution uses Intel® Distribution of OpenVINO™ toolkit to accelerate deep learning inference. The free, downloadable toolkit helps developers and data scientists fast-track development of high-performance computer vision and deep learning into vision applications. With the help of Intel® Distribution of OpenVINO™ toolkit, Wipro Smart i-Connect™ improves model's performance, optimized runtime and maximized application's throughput on Intel's hardware platforms. Wipro Smart Building solution monitors, analyzes and manages the operational systems in a building. It uses vendor-agnostic technology and open-source interfaces based on IT/OT standards that are extremely well-suited for controlling intelligent building systems. Working as a central component of a facility control center, it provides the centralized monitoring and management for HVAC, lighting, access control and other operation systems and network infrastructure. The IoT gateway at the edge based on Intel® Core™ processors aggregates data and events, analytics and AI functionalities at the edge. Intel® processors come in a range of options for compute performance and power consumption, bringing AI closer to the edge thereby reducing latency, improving reliability and performance. Smart Building solution provide many benefits: Click here to know more about Wipro's IoT offering. Contact us =====================

Enhancing Endpoint Security Protection: Advanced Solutions from Wipro and Intel

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/intel/articles/enhancing-endpoint-security-protection-advanced-solutions-from-wipro-and-intel/ ----- Contact Wipro Please fill the required details to access the content A look at how Wipro Live Workspace™ Secure360, powered by Intel solutions, is combining AI and zero-trust models to deliver superior endpoint security. Seeking increased resiliency and competitiveness, enterprises are adopting new technologies and new ways of working that may also be exposing them to new cybersecurity threats. Hybrid work has extended the areas businesses need to secure, and flexible operations like bring-your-own-device programs are creating more endpoints that need monitoring. To maintain a secure, efficient digital work environment, enterprises need a comprehensive security approach that can keep pace with ever-changing business demands and regulatory requirements. In "Endpoint Protection: Securing enterprise endpoints with comprehensive security technology," Wipro security experts describe how to effectively tackle the challenges associated with endpoint security and offers businesses a guide for building a comprehensive endpoint security framework. The report also shows how solutions like Wipro Live Workspace™ Secure360 — a zero-trust based security architecture powered by Intel's vPro Platform, Hardware Shield, Remote Secure Access and other security tools—leverage advanced technologies like AI and machine learning to help enterprises reinforce critical IT infrastructure to enhance digital security throughout the organization. Wipro and Intel are working together to develop robust security solutions that help today's enterprises keep pace with change while keeping their operations safe. Access the full report to learn more. =====================

Turning business ideas into reality at the edge

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/intel/turning-business-ideas-into-reality-at-the-edge/ ----- Contact Wipro Please fill the required details to access the content Turning business ideas into reality at the edge A Wipro and Intel perspective We are in an era where information takes center stage, characterized by robust connectivity and increased digitalization. Amid the rising demand for automation and intelligence across sectors, organizations are seeking the next wave of digital transformation, and edge computing. As demand for real-time AI solutions and decentralized data processing continues to grow, implementing AI at the edge is becoming critical. An edge computing strategy should also target specific business objectives related to cost, growth, quality, and experience. The way forward is to allow splintered

workloads to run in the places best suited for them. This could be at the edge, core, hosted cloud or public clouds, thus making the landscape of enterprises boundaryless. This white paper outlines how businesses can strategically utilize Intel's infrastructure innovation in conjunction with Wipro solutions to effectively deploy and manage edge computing. Download Whitepaper =====================

PTC

Contact Wipro Please fill the required details to access the content PTC Accelerate digital transformation with market-leading platform and IIoT tools Wipro and PTC alliance combines industry-whetted tools and skills to build future-ready industrial solutions revolutionizing the way businesses

operate Wipro has one of the longest tenured partnerships with PTC in the IoT space. This alliance combines PTC's rich product portfolio in IoT, PLM, ALM, SLM, CAD, and AR/VR and Wipro's System Integration (SI) services and resources to carve out a niche offering to customers on their digital transformation journey. Over the years, Wipro has made considerable investments in terms of partner managers, executive sponsors and co-innovation spaces and forums. Wipro is an influencer for PTC software positioning as part of a strong digital transformation business with focus on quality in project execution and delivering value to the customer. Wipro has a strategic partnership with PTC that entails 2 million license influence, over 650,000 IoT bookings and a dedicated workforce trained in PTC technologies. The partnership primarily focuses on joint go-to-market initiatives to respond to customer requirements across industry verticals and geographies. The partnership also focuses on developing state-of-the-art reference solutions and accelerators to help in the rapid prototyping and development of customer solutions. Under this agreement, Wipro and PTC work with customers both reactively and proactively to architect and build end-to-end or pointed solutions that have PTC's product suite embedded at their core. The following are some of the highlights of the partnership: In addition to the efforts and activities listed above, the partnership enables an exchange of information and early access to the developments on PTC's product roadmaps. This collaborative synergy helps in building right solutions for the right consumers. PTC provides the tools, licenses and training, while Wipro primarily provides the resource pool for system integration and consultancy on how to position PTC's products in the market. The partnership is also characterized by excellent governance where a core group draws up specific partnership goals and roadmap, and tracks them closely. =====================

HighRadius

HighRadius Integrated solutions for accounts receivable Optimize accounts receivable with intuitive models that unify business operations and streamline processes HighRadius is a financial technology company that uses artificial intelligence to help companies automate accounts receivable and treasury processes. The HighRadius® Integrated Receivables platform reduces cycle times in order-to-cash processes by automating receivables and payments processes – from credit, electronic billing, and payment processing, to cash applications, deductions, and collections. HighRadius® Treasury Management Applications help teams achieve touch-less cash management, accurate cash forecasting, and seamless bank reconciliation. Powered by the Rivana™ artificial intelligence engine, designed specifically for finance, and the Freeda™ Digital Assistant, HighRadius enables teams to harness machine learning to predict future outcomes and automate routine, labor-intensive tasks. The radiusOne B2B Collaboration Network allows suppliers to connect with buyers digitally, closing the loop from supplier-receivable processes to buyer-payable processes. HighRadius solutions have a proven track record of delivering increased operational efficiency through automation, accurate cash-flow forecasting, optimized cash management, lower days sales outstanding (DSO), and bad debt, to help companies achieve strong ROI in just a few months. ======================

Dataiku

Dataiku All-in-on data science & machine learning platform An industry-leading workbench for citizen data scientists, data analysts, and engineers to build and deploy machine-learning solutions at enterprise scale Dataiku is one of the world's leading AI and machine-learning platforms. Through collaborative, elastic, and responsive AI, Dataiku provides agility at enterprise scale. Hundreds of companies use Dataiku to underpin their essential business operations and ensure they stay relevant in a changing world, including adopting models to improve fraud detection, prevent customer churn, assist with predictive maintenance, optimize supply chains, and much more. By partnering with Dataiku, Wipro offers customers data-driven insights and intelligence amplification through self-service technologies, for greater innovation and faster realization of business goals. Supported by our platform and solutions teams, and a strong center of excellence, Wipro's AI practice provides efficient implementation of AI and cognitive solutions, while our consultancy and decision-science services ensure successful collaboration with other industry leaders in the data transformation space. ======================

Calypso

----- Our Solutions Contact Wipro Please fill the required details to access the content Calypso Capital market firms are constantly challenged on multiple fronts with complexities arising from regulatory changes, trading costs, and risk exposure from trading cross-asset class and derivatives. It is imperative for these firms to rapidly adopt state-of-art integrated capabilities and platforms, addressing changing regulatory landscape, time-to-market, and increase straight-through processing. This helps firms achieve reduced total cost of ownership and managed risk. Calypso Technology, Inc. is a leading global provider of cloud-enabled cross-asset front-to-back solutions and managed services for financial markets, with over 35,000 users in 60+ countries. Its award-winning software improves reliability, adaptability, and scalability across several verticals, including capital markets, investment management, central banking, clearing, treasury, liquidity, and collateral. Wipro's Banking and Financial Services Business Unit is its largest industry vertical, serving top global banks in transforming their business, operations, and IT. Wipro augments its deep professional services capability with an extensive partner ecosystem, including leading industry platforms such as Calypso. The Wipro-Calypso global partnership leverages Calypso's strong product offerings and Wipro's leading services capability within the banking and financial services to serve clients better.
=======================

Denodo

----- Contact Wipro Please fill the required details to access the content Denodo Unparalleled data access and agility Accelerating the journey to intelligent enterprise with data virtualization Organizations rely on disparate external and enterprise-wide data sources to make critical business decisions. Data virtualization connects these data sources, bridging data warehouses, data marts, and data lakes without the need to create a whole new integrated data platform. In partnership with Denodo, Wipro helps organizations around the globe accelerate their data and analytics transformations with our data virtualization solution: A modern, efficient method for integrating data in real time, providing a logical data catalog for business use. Rather than moving the data to a central repository, like a data warehouse, data virtualization provides integrated semantic views of data across a range of heterogeneous sources, premises, and cloud repositories. This enables companies to deliver data on demand through modern architectures such as logical data warehouses, logical data lakes, hybrid-cloud data catalogs, and single-view applications. These updates retain many of the characteristics of traditional data warehouses while drastically eliminating redundancies, reducing costs and time, and supporting modern data sources. "Our collaboration with Wipro has helped transform business processes for Fortune 500 companies," says Susan Eckenberger, Partner and

Channel Sales Director at Denodo. "As one of our top GSI partners globally, Wipro provides deep expertise in data virtualization and data-integration tools with more than 170 consultants trained on the Denodo platform. I expect the Wipro-Denodo partnership to grow exponentially in the near future, establishing Wipro as a preferred partner for data management, leveraging the Denodo platform." =======================

Wipro-Cohesity Partnership

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/cohesity/ ----- News & Insights Form Title Form Title Form Title Our Services Contact Wipro Please fill the required details to access the content Cohesity Simplifying Data Management to Drive Business Value Accelerating the enterprise digital transformation journey by enabling customers to deploy applications and manage their data where it makes most sense — on premises or hybrid cloud Cohesity and Wipro have teamed up to help organizations unlock value from data by removing complexities in data management. We jointly bring to market solutions and services that combine innovative Cohesity data management software with Wipro's strategic IT services expertise, proven frameworks and global reach to help you simplify your operations, build and grow your cloud services, and unlock valuable insights from your data. We do this by eliminating mass data fragmentation and consolidating data silos onto a single, easy-to-manage software-defined platform. The platform hosts enterprise-class services including backup and recovery, file shares, object stores, disaster recovery, dev/test, and analytics -- all managed through a simple, intuitive user interface. This unique and comprehensive approach lowers TCO and radically simplifies the way businesses back up, manage, protect, and extract value from their data—in the data center, at the edge, and in the cloud. The joint offerings address two marquee Wipro services — Boundary Less Data Management and Enterprise Recovery Vault Services. Cohesity Helios — Cohesity's consolidated data management platform — and its associated services are coupled with the underlying infrastructure and integrated with Fluid IT – Wipro's state-of-the-art enterprise-scale platform enabling software-defined intelligence-driven agile operations. FluidIT propels both adaptive and incremental transformation and frictionless day-to-day business-as-usual operations through human-centric automation. Wipro has been honored as the 2022 Global Innovation Partner of the Year by Cohesity, a renowned provider of data management and cyber resiliency solutions. If there is one thing that keeps most IT practitioners up at night, it is the threat of ransomware. Ransomware and other cybercrimes are an increasing concern among enterprises. Cyber resiliency and cyber recovery have quickly become vital components of most organizations Delivering Enterprise-Class Data Protection & Management as a Service

Wipro & Gorilla: Cutting-Edge Utility Solutions

Gorilla Merging deep industry experience and unparalleled performance, Wipro and Gorilla's new platform is empowering businesses and customers across the utilities sector. Around the world, energy demands are shifting. Consumers are embracing low-carbon lifestyles. Businesses are switching to planet-friendly fuels. To keep pace with these changes, the utilities industry needs to evolve. Technology is helping the industry adapt. From microgrids and at-scale energy storage, to DER orchestration and data capabilities, digital innovations are enabling energy and water companies to reinvent themselves while delivering superior performance and customer service. For more than twenty years, Wipro has helped global utility leaders successfully navigate even the most ambitious transformations. Today, Wipro's strategic partnership with Gorilla empowers utility companies to deploy best-in-class solutions for critical elements of their value chains, and strengthen their engagements with customers around the world. Gorilla is a cutting-edge cloud platform offering solutions for energy pricing, forecasting, and reporting. Gorilla also automates data collection, transformation, processing, and analysis for large energy retailers. Gorilla's data-driven approach unlocks deep insights to provide greater control over margins, risks, and costs throughout the entire utility customer lifecycle. By combining Wipro's consulting, system integration, and services capabilities with Gorilla's cutting-edge technology platform, utility companies can reimagine their business models and elevate their customer experience.

Wipro expands cloud security portfolio with Colortokens to offer zero trust-based security

content Colortokens Wipro and ColorTokens collaborate to deliver zero trust and risk quantification solutions Wipro's clients include some of the world's most advanced enterprises that deem their digital assets as their core intellectual property and competitive advantage. Protecting these assets from modern day cyber-attacks requires enterprises to take a fresh approach to security. Wipro is excited to collaborate with ColorTokens to deliver a modern, proactive security platform based on the core principle of zero trust, which translates into, "never trust, always verify". ColorTokens' Xtended Zero Trust platform delivers unparalleled protection to enterprises from sophisticated ransomware, unauthorized lateral movement, and zero-

day attacks, while drastically simplifying their security operations. This unified platform provides data, endpoint, and application protection across data centers, clouds, corporate, and edge while seamlessly integrating with existing security tools. This partnership significantly expands Wipro's cloud security portfolio, enabling it to meet the ever-increasing demand for zero trust based security for enterprise workloads, users, and endpoints. The augmented capabilities will help organizations gain business agility by enabling rapid delivery of services to their customers, partners, and employees while maintaining uncompromised security and compliance.

Numocity

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/numocity/ ----- Contact Wipro Please fill the required details to access the content Numocity Smart Energy Delivery Ecosystem for Electric Mobility Energizing the future of transportation, building the foundation for a cleaner greener transformation of mobility worldwide. Globally the awareness and call for action to manage climate change is growing. As part of this, countries are reviewing how to limit the environmental impact from the transport sector. From adopting stricter emission standards to banning the use of fossil fuel vehicles to incentivize introduction of new energy vehicles setting the stage for mass-scale adoption of EVs. Falling Battery prices and continued (short-term) government incentives on EVs are driving EV demand. EVs (on an unsubsidized basis) are expected to be price competitive by 2025. Lack of EV charging infrastructure can become an impediment for EV Adoption, impacting de-carbonization/reduction in GHG. EVs will amount to 5% of the global projected power consumption by 2040. Numocity is a Bangalore-based award-winning start-up with rich experience in delivering solutions in the eMobility market globally. Their digital technology platform is designed and built for scale and flexibility in the emerging eMobility industry. Wipro and Numocity are collaborating to catalyze and accelerate response to this challenge through a collaborative spirit of innovative and transformational solutions across the value chain. Employing industry-leading expertise to assess, design, plan and deploy process and technology improvements

Pega

Guest experience transformation drives brand value and revenue Remote Services – Pickup Delivery Experience Transformation – Test drive scheduling Driving operations through AI predictions & insights National Water Management System End to end support for Pega applications AI driven business systems support B2B Next Best Offer Platform Digital Experience Platform (DXP) Service Network Deployment Tools | Automated Network Deployment Robotic Process Automation (RPA) | Wipro Intelligent Process Automation Solutions Business Process Management System | Business Rules Management System Cognitive Platform | Cognitive Claims Automation Please fill the required details to access the content Overview Pega provides a powerful low-code platform that empowers the world's leading enterprises to Build for Change®. Clients use Pega AI-powered decisioning and workflow automation to solve their most pressing business challenges – from personalizing engagement to automating service to streamlining operations.   Wipro has more than 12 years of strong partnership with Pega. Wipro is a Specialized – Intelligent Automation (Americas, Asia Pacific), Robotic Automation (Americas), Manufacturing (Americas, EMEA), Government (Asia Pacific, EMEA), Financial Services (Americas, EMEA), and Globally Authorized Partner (Authorized regions – Americas, Asia Pacific, EMEA, India). Value Proposition for Clients Wipro provides end-to-end services, including Advisory Consulting, Implementation, and Managed Services for all Pega's products, including Customer Service, Intelligent Automation, and 1-1 hyper personalization using Customer Decision Hub across verticals and

geographies. Awards and Accreditations Wipro is awarded the "Client Innovation Award for Customer Service" in 2023. This recognition holds immense value as it aligns with one of Pega's three GTM engagement strategies, and Wipro is the only recipient of this recognition for Customer Service this year. PEGA's Trust "At Pega, we could not be prouder of our partnership with Corrections Victoria and WIPRO. This is a transformational project and persistence, and patience have resulted in one of the best-Case Management solutions I have ever seen." Luke McCormack former Regional Vice President - Pega APAC" Analyst's Rating Wipro Digital is a leader in Digital business services, and our strategy is to realize the digital-first approach through the pillars of business transformation, modernization, connected intelligence, and trust underpinned by a design-led human-centric approach to transformation, talent strategy, high-performance engineering, and IP/Platforms/Open innovations. Wipro brings a unique blend of Experience Led (through our subsidiary firms – DesignIt and Cooper), Domain Led (through Wipro's proven deep domain expertise in various verticals), and Technology Led (through Pega's technology capabilities, Wipro's proven expertise using Pega and our long-standing strategic partnership) digital transformation for our clients at Global Scale. Our Solutions: Experience of the future Everything stats with experience - Connected, intelligent, and seamless experience Leverage Wipro Ips to provide the future multichannel experiences which allows the customers to interact with the brand in the medium of their choice (physical, digital, and virtual) and the brand to respond contextually at the moment with immersive experience design, multi-experience and conversational AI. With offerings such as AI powered workflow automation, streamlined work aggregation, and production-centric UX layer, it allows the employees to interact with the applications from a single pane to respond faster, with ML models and AI helping to analyze processes, providing actionable insights on how processes can be automated. Digital Prescriptive Maintenance IoT-based predictive maintenance solution to improve customer experience while increasing cross-sell and upsell with personalized offers to customers Wipro's Digital Prescriptive Maintenance solution integrates analytics and data from real-time asset-monitoring and remote-management solutions with Pega's industry-leading Dynamic Case Management, CRM, and Decision Hub capabilities. This combined resource recommends the proper actions for asset maintenance, enabling improved asset management and collaboration and leveraging real-time asset health and performance data from an advanced IoT platform. Using this system, clients gain assistance in the periodic refresh of recommendations and can proactively prescribe the following best action for asset maintenance. Cognitive Claims Automation Expedite claim settlements with Wipro's cognitive platforms and Pega This automated solution combines Wipro's cognitive platform with Pega for an enhanced customer experience, reduced leakage, and improved claim-settlement times. It leverages state-of-the-art Pega process orchestration and Wipro's industry-leading AI, analytics, IoT, and Blockchain solutions, driving significant cost savings and slashing processing time. Parole Decision Management Intelligent parole helps authorities make the proper decisions for a safer community This fully automated digital solution leverages a re-imagined process to eliminate the risk of incorrect parole decisions and provides a robust auditing capability with a 360-degree view of offenders. Structured automated checklists and intelligent forms further

streamline the process to help improve the accuracy and efficiency of parole decisions and related operations. Wipro Integrated Parole Management System Improves Parole Operations Efficiency Case Studies Like most Detroit automakers, our customer had traditionally let dealers manage the end-user experience. Customers of this Detroit automaker had trouble visiting dealers for minor repairs, so brand loyalty and customer satisfaction were low. This US automaker needed a system to let potential customers in Europe book a test drive, but their dealer experiences were disjointed, which led to inconsistent customer experiences. This customer is a government entity charged with administering and maintaining infrastructure and roads for every city, town, and village in a Middle Eastern country. Our customer was a government-owned corporation responsible for meeting the water needs of an entire province, operating its river systems and dams, and supplying bulk water to a city of over 5 million people. This customer, a global managed healthcare and insurance company, needed global 24/7 support and maintenance for four critical applications on Pega. Our customer is one of the world's largest offshore drilling companies. It has diverse rig fleets that meet a range of customer needs, but it lacked a way to track and monitor tickets and cases across its lines of business. HR needed to enable tracking and monitoring for tickets raised by employees. Our customer, a huge US mobile services provider, achieve revenue and profitability goals so it adopted a strategy of improving the experience that they offer business customers. Solutions Contact Us
======================

Automated claims transformation and the future of customer service right now it's manual intervention

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/pega/automated-claims-transformation-and-the-future-of-customer-service-right-now-its-manual-intervention/ ----- Contact Wipro Please fill the required details to access the content Automated claims transformation and the future of customer service right now it's manual intervention Ambition This European home insurance company wanted to be recognised as the #1 home insurer in the country for their outstanding customer experience while getting customers back to normal. To do that, they needed to handle the bulk of simple claims with a digitally enabled operational backbone and handle more complex cases by balancing expert human judgement with straight through processing that was enabled by analytics. But fewer than 5% of their customer interactions were digital, they lacked basic digital customer service capabilities, and using paper documents cost them more than €2 million annually—if those documents were ever delivered. Even worse, making basic changes in coverage and payments required human touch, while over 70% of their competitors let customers change their policies online. Actions Consultants from Wipro and Pega reviewed existing processes and identified design principles and concepts that could improve the customer experience. Then we delivered key features and screens to

enable an enhanced experience, more intuitive transparency, and greater self-service ability. Wipro and the business teams arrived at a reference architecture that leveraged Pega CS and AIML, RPA components, and UX and UI design. We focused on customer research to enable humanized customer centricity beyond a functional idea. Now simple claims are quickly handled by AI-enabled decision engines while complex claims are routed to expert employees for quick and accurate processing. Ambitions Realized This digital solution enables a new way of working for employees and roughly 2 million customers. More cohesive customer self-service experiences streamline grievance management, reduce manual intervention, and lower operational costs. =====================

Remote Services – Pickup Delivery

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/pega/remote-services-pickup-delivery/ ----- Contact Wipro Please fill the required details to access the content Remote Services – Pickup Delivery Challenge Customers of this Detroit automaker had trouble visiting dealers for minor repairs, so brand loyalty and customer satisfaction were low. Customers wanted more personalized service options, so the automaker decided to simplify every customer interaction in every channel and to make them simpler and more consistent. They decided to offer every customer complimentary services that include mobile service appointments and pickup and delivery of their vehicles for all types of service from simple oil changes to recall repairs. Approach and Solution Wipro collaborated with the automaker, its IT team, and its providers to understand the pain points. Results Now the customer's preferred dealer will come to their home or place of business, pick up their vehicle, make the repair or service, and return it after the repair is done. For routine maintenance and light repairs, dealers can dispatch a Mobile Service van with a trained technician to an eligible location. Participating dealers can set their own service and mileage limits for each type of remote experience. Significant benefits driven by this program =====================

End to end support for Pega applications

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/pega/end-to-end-support-for-pega-applications/ ----- Contact Wipro Please fill the required details to access the content End to end support for Pega applications Situation This customer, a global managed healthcare and insurance company, needed global 24/7 support and maintenance for four critical applications on Pega. Approach & Solution Wipro created a team to handle the entire operation in an onshore-offshore model with SLA targets. We do the Review and Analysis for existing performance issues with fix recommendations, and we Results This team has enabled automation,

proactive problem management, and service improvement to reduce effort.
======================

National Water Management System

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/pega/national-water-management-system/ ----- Contact Wipro Please fill the required details to access the content National Water Management System Ambition Our customer was a government-owned corporation responsible for meeting the water needs of an entire province, operating its river systems and dams, and supplying bulk water to a city of over 5 million people. Their legacy application had trouble pinpointing work locations, which caused delays and increased the number of interactions between customers and assessment officers required to complete work. Application and assessment processes were paper-based and relied on a third-party app, which delayed the application life cycle even more. Finally, it offered no self-service options for customers. Action Wipro executed this program in a co-creation model with business and IT teams to radically change how they operate. We began with a consulting assignment to identify needs, create a roadmap, and evaluate tech process automation platforms. We took the journey centric approach, initiating the program by employing design thinking and customer-centric experience as the core teams to help our client visualize their vision. They chose Pega to deliver a customer engagement platform to support multiple government departments supporting multiple personas on complex journeys. Digital Adoption platform implementation using Whatfix for faster and easier adoption by users. Ambitions realized Our solution is the first to integrate Pega Govt Platform (PGP) and Customer Service (CS) applications. It has streamlined how this customer interacts with adjacent government agencies. It also enables customer digital self-service, plus employees can track tickets more accurately and they have a 360-degree view of customer data. Significant benefits include: ======================

Guest experience transformation drives brand value and revenue

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/pega/guest-experience-transformation-drives-brand-value-and-revenue/ ----- Contact Wipro Please fill the required details to access the content Guest experience transformation drives brand value and revenue Ambition Like most Detroit automakers, our customer had traditionally let dealers manage the end-user experience. These experiences had become disjointed and inconsistent over the decades, and 21st century customers expected more input from the automaker itself. Dealers scheduled over 18 million annual service appointments, only 10% of them online. Some dealers offered online solutions, but the experience varied by dealer, which tended to inhibit their

use. None of the dealer solutions supported portable or mobile devices for booking and managing appointments. Dealers also didn't use proactive communications and notifications, so customers missed appointments or dealers scheduled customers on top of each other. Our customer needed to gain control over the process and outcomes of this experience, using digital solutions to make everything simpler and more convenient for both dealers and customers. Action Wipro collaborated with our customer, their IT team, and their providers to understand the current model and pain points. Then we designed and built an integrated experience platform so dealers have a single integrated tool to drive holistic experiences, improve operations, and make the lives of their guests simpler. This tool also Ambitions realized Now over 3,000 North American dealers use this tool, and the automaker has made its use mandatory for its new flagship electric vehicles and all newer models. =====================

AI driven business systems support

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/pega/ai-driven-business-systems-support/ ----- Contact Wipro Please fill the required details to access the content AI driven business systems support Challenge Our customer is one of the world's largest offshore drilling companies. It has diverse rig fleets that meet a range of customer needs, but it lacked a way to track and monitor tickets and cases across its lines of business. HR needed to enable tracking and monitoring for tickets raised by employees. Supply Chain managers needed to handle bid and spend analysis, and Finance needed to track and monitor payables, receivables, report to record, and other functions. Processing tickets through email created endless bottlenecks and provided zero visibility for tracking. Our customer needed Pega support and maintenance in addition to an application that would provide complete visibility across service requests and other cases, and integration with PeopleSoft. Approach & Solution Wipro set up a team to handle the entire operation from India, using Pega 8.1.4 to monitor ticket movement from date of creation to status to stakeholder details. We also support weekly and monthly report preparation, SLA target achievement, change management, and problem management. We manage six rig servers and one main server, and we also provide: Results Now the customer has visibility across HRMS, SCM, and Finance modules. =====================

Experience Transformation – Test drive scheduling

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/pega/experience-transformation-test-drive-scheduling/ ----- Contact Wipro Please fill the required details to access the content Experience Transformation – Test drive scheduling Challenge This US automaker needed a system to let

potential customers in Europe book a test drive, but their dealer experiences were disjointed, which led to inconsistent customer experiences. Since the dealer scheduled test drives, the manufacturer couldn't control or track the availability of vehicles and sales personnel. It also had no insights into customer profiles and conversion rate. Approach and Solution Wipro collaborated with the automaker's business teams, IT team, and IT providers to understand the test drive process and pain points for customers and the company. Then we designed and built a unified experience platform that provides over 5,000 dealerships in 19 European countries with a single integrated tool to ensure that customers will have a simple and easy way to book a test drive for their vehicle of choice irrespective of dealer and location. Major features include: Results Significant benefits driven by this program include: ======================

Driving operations through AI predictions & insights

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/pega/driving-operations-through-ai-predictions-and-insights/ ----- Contact Wipro Please fill the required details to access the content Driving operations through AI predictions & insights Ambition This customer is a government entity charged with administering and maintaining infrastructure and roads for every city, town, and village in a Middle Eastern country. It needed to schedule inspections, and inspectors needed to gather huge amounts of information, images, and other data to document work on projects. But it couldn't prioritize inspections based on risk, length, and severity of incidents, or the number of people and businesses an incident might affect. It also couldn't track the compliance history of businesses or business areas, and there was no way to track unlicensed business activity. The ministry also couldn't predict workloads, so it couldn't plan for workforce needs. Action The ministry launched an ambitious program to enhance the services it provides to citizens, and hired Wipro to help transform how its inspectors work and make smarter decisions. We began with a design consulting assignment to identify issues in case processing and reduce the risk to citizens. Our AI OPS service collaborated with the Customer IT team to design a framework for ingesting data and creating the engines that can be used in AI models. Then we developed a solution that leverages AI/ML models to prioritized cases within risk models based on prior history, business areas, location of incident etc. Ambitions realized Now the ministry has an AI-enabled solution that increases the safety of their citizens by providing forecasting and capacity planning for their workforce. Other significant benefits include: ======================

B2B Next Best Offer Platform

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/pega/b2b-next-best-offer-platform/ ----- Contact Wipro Please fill the required details to access the content B2B Next Best Offer Platform Challenge Our customer, a

huge US mobile services provider, achieve revenue and profitability goals so it adopted a strategy of improving the experience that they offer business customers. The tactics they chose were to provide new capabilities that would retain business customer prospects, provide new personalized offers to attract customers online, and enrich existing offers with new features. And they needed to do all of this across ACSS, MyBiz, TELESALES, and Account Inquiry channels in real time. Approach & Solution Wipro implemented a B2B offers platform using Pega's decision engine. Our initial scope was to deliver programs for retention and upsell on their online portal. We leveraged a headless design where APIs are exposed to the online channels to retrieve the best offer for each customer. We integrated it with the customer's CDP platform and other backend systems to enrich customer profiles, offer details, inventory checks, etc. And interaction details collected are sent to downstream systems to Kibana using Kafka for further analysis. Results Our work has greatly improved customer satisfaction and has driven significant ROI. Prior call volumes averaged 2,500 – 3,000 per day which were expected to be redirected to the new platform. ======================

Seamless Sales Order Intake for a Leading footwear and apparel in the world

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/pega/seamless-sales-order-intake-for-a-leading-footwear-and-apparel-in-the-world/ ----- Contact Wipro Please fill the required details to access the content Seamless Sales Order Intake for a Leading footwear and apparel in the world Ambition Customer is looking for efficient ways to improve the Order intake process keeping up with the pace of growth. They are unable to keep up with the growing demand and process the orders. The customer challenges included a fragmented order management system involving a lot of manual work. The Order Processing team validated the incoming order and once approved it needed to be keyed-in to SAP. The SAP manual entry process was cumbersome and involved lot of data entry errors which reversed order back. The changes to orders was a cumbersome and error prone process. Since those were B2B orders involving multimillion booking value, the financial and satisfaction impact was very high. There were around 2500 orders/day and hence up to 60,000 line items to be processed daily. Action Wipro was engaged as a strategic partner to optimize and automate order processing, in-transit order management and intelligent routing of shipment of customer's products. The salient features of the solution are: Ambitions realized Our Pega orchestrated Integrated solution provided the client with a seamless order processing capability with the following benefits: ======================

SeaLights

SeaLights Wipro Digital and SeaLights provide dynamic code quality focused Quality Engineering solutions which help 'democratize' quality. Together, we accelerate our clients digital journeys towards being adaptive DevSecOps enterprises. SeaLights brings to the table a radically new and capable approach known as Software Quality Governance (SQG). Powered by AI/ML, Software Quality Governance helps enterprises in automated identification, management and control of every perceivable Quality Risk (critical Line of Code) across the end-to-end release pipeline (beyond the development box), for every single application code change within an enterprise. Unlike traditional Quality Management processes, Software Quality Governance is ideal for Agile and DevSecOps ways of working, enabling organizations to achieve Quality@ speed. SeaLights' offerings include: SeaLights combines with Wipro's intelliassure intelligent quality platform powered by Wipro Holmes to form an Intelligent Quality Eco- system enabling clients to improve true coverage of their business processes, optimize code compliance and risk management efforts at an enterprise level. Working with Wipro and SeaLights, our clients can improve code-release velocity by reducing the length of test-execution cycles 70-80%, improve their quality 25-35% by reducing the number of defects that slip into production, and optimize their efforts by 30-40% for release quality assurance. For more information, contact us or visit the SeaLights website.

Yugabyte

Yugabyte Yugabyte is an early-stage startup in the distributed database segment that aims to make applications agile like never before. Yugabyte's unique technology provides APIs for both PostgreSQL and Cassandra applications. The core YugabyteDB solution is available as an open-source and on-premise offering, as well as a cloud-based service. Yugabyte Cloud, which can be deployed in any virtual private or public cloud, is a fully managed Database-as-a-Service product and is suitable for SMBs and large enterprises alike. Backed by Wipro Ventures, Lightspeed Venture Partners and Dell Technologies Capital, Yugabyte is led by a team with rich experience developing business-critical databases for some of the Technology sector's most-respected and future-looking companies. Yugabyte, headquartered in Sunnyvale, CA, is powered by a high-performance, globally distributed document store inspired by Google Spanner. ======================

ENSEK

Contact Wipro Please fill the required details to access the content ENSEK Wipro partners with ENSEK to accelerate the digital and cloud journey for utility companies across the world The winning combination of ENSEK's pioneering end-to-end SaaS solution and Wipro's wealth of industry experience provides utility companies with unmatched solutions for navigating today's tech challenges. The utilities industry is at a strategic crossroads. Energy providers across the world are focused on delivering seamless customer experiences and next-generation products and services to meet evolving consumer expectations. As utilities transition from legacy technologies, leveraging cloud-native and SaaS platforms is key to staying competitive and attaining new business efficiencies. ENSEK's core product provides an end-to-end SaaS platform for energy suppliers, covering the entire customer life cycle from quote and signup to billing, collections, and revenue assurance. The platform's cloud-based capabilities are powered by microservices and RESTful APIs to fully integrate data and drive new product innovations. Wipro has more than 20 years of expertise and deep industry knowledge working with utility companies across the world. Our strategies and solutions have enabled them to reinvent themselves and deliver superior business performance along with exceptional customer satisfaction. Our partnership allows Wipro and ENSEK to combine forces to help utilities companies radically enhance their customer experiences using agile, digital solutions at scale while significantly reducing cost to serve and cost to acquire. ======================

ESG Showcase: Intelligent Ransomware Recovery with Wipro's Enterprise Vault Powered by Cohesity

Contact Wipro Please fill the required details to access the content ESG Showcase: Intelligent Ransomware Recovery with Wipro's Enterprise Vault Powered by Cohesity A state-of-the-art solution to combat ransomware from Wipro and Cohesity Cyber resiliency and cyber recovery have quickly become vital components of most organizations' overall data protection and security practices. According to the FBI, organizations paid $4.1 billion to criminals to retrieve their data in 2020, which is a new record. Implementing a good cyber recovery solution is becoming more important as cyber-criminals become increasingly sophisticated, targeting not only production data and applications, but also the backup data that organizations rely on to recover their environments

from exactly such an event. The exclusive report by ESG highlights the core tenets of ransomware protection covered by Wipro and Cohesity. Aligned with the NIST Cybersecurity Framework 1.1, Wipro's Enterprise Recovery Vault Powered by Cohesity is an immutable backup and recovery solution that helps identify cyber vulnerabilities and protects the backup data and the whole platform with a multi-layered approach. Partnership with Aruba, a Hewlett Packard Enterprise company

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aruba/ ----- Solutions Contact Wipro Please fill the required details to access the content Partnership with Aruba, a Hewlett Packard Enterprise company Over 10 years of strong strategic partnership Wipro and Aruba: Leading the journey to transformation With over 10 years of strategic partnership, Wipro and Aruba (an HPE company) have been jointly delivering value to customers through differentiated offerings and next-gen engagement models. Wipro is a key certified Aruba GSI partner. This partnership combines Wipro's global system integration, IT consulting and industry domain expertise across sectors with Aruba's industry leading networking technology products, platforms and services. Our primary areas of focus include: Network Management & Transformation, SD-WAN, Edge Services Platforms, Network Security, 5G, Campus and Wi-Fi solutions. With global delivery centers and joint innovation labs, we aspire to become end-to-end solution partners of choice for clients across geographies in their digital network transformation journey. Aruba has been at the forefront of innovation since the beginning, and has continued to make significant investments to deliver Aruba ESP (Edge Services Platform), the first platform that goes well beyond conventional network management to provide AI-powered operations, provisioning, orchestration, security, and location services. Aruba gives network operators the ability to balance both security and access requirements for users, devices, and applications—no matter where or how connectivity is delivered. Bundling these benefits with Wipro's industry leading services, our joint customers can consume the network as a service (NaaS) enabling faster deployment of new features and services, ensuring optimal performance and facilitating delivery of business outcomes. Holistic WAN optimization solution for streamlining network operations with centralized management based on app-centric policies across locations ======================

Rubrik

BoundaryLess Data Management (BLDM)

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/rubrik/boundaryless-data-management/ ----- Contact Wipro Please fill the required details to access the content A data protection and management solution powered by Rubrik Security Cloud to support a multi-cloud strategy Use a single pane of glass to connect, secure, backup, recover, manage and control enterprise-wide data in the cloud. Enterprises are adopting a hybrid and multi-cloud strategy to avoid vendor lock-ins, conveniently access sophisticated services, meet data residency requirements, and optimize the user experience. However, to leverage these advantages, they need to re-platform their applications and use cloud-native solutions to mobilize data to the cloud of their choice. Wipro's BoundaryLess Data Management (BLDM) solution, powered by Rubrik Security Cloud, provides a holistic, cloud-agnostic framework that supports multi-cloud environments. The solution includes end-to-end data protection and management services with a single pane of glass management to connect, secure, backup, recover, manage, and control enterprise-wide data. The solution uses Open API-based integration with automation tools like vRA, Chef, Puppet, and ServiceNow to optimize the resources required to manage and run environments. Clients using BLDM increase their operational efficiency and ensure consistency across on-premises and public clouds. =====================

BoundaryLess Data Protection as a Service

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/rubrik/boundaryless-data-protection-as-a-service/ ----- Contact Wipro Please fill the required details to access the content BoundaryLess Data Protection as a

Service Safeguard data and ensure data recovery Identify and remediate security incidents to ensure business continuity   Data backup is a complex but essential process. Enterprises invest in innumerable data backup tasks across hybrid and multi-cloud environments. These tasks can be automated and simplified with just a few policies. Wipro's BoundaryLess Data Protection as a Service, powered by Rubrik Security Cloud, replaces thousands of backup tasks. The service is designed to identify, protect, detect, analyze, respond, and recover from a cybersecurity incident (i.e., breach, compromise, theft, ransom, or destruction). It provides secure data observability, enabling detection and remediation from cyber threats to make enterprises cyber resilient. The service is based on the guiding principles of the NIST framework and uses ML-based anomaly/ encryption detection. Clients using the service enable rapid, automated remediation across all their important business and support systems.

Nexthink

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/nexthink/ ----- Contact Wipro Please fill the required details to access the content Nexthink Wipro joins forces with Nexthink for an improved digital workplace service offering Wipro and Nexthink's strategic partnership spans 7 years, servicing several leading global companies together. With Nexthink, Wipro is turning data analytics inwards with a revolutionary real-time analytics technology to forever change the enterprise IT services market — transforming the IT department from a cost center into a true enabler for the business. Wipro's infrastructure services deliver innovative ways for organizations to effectively manage complexity and drive higher efficiency. Nexthink's Digital Employee Experience Management platform is one of the core components of Wipro's experience monitoring and management offering. The capabilities of Nexthink are leveraged as a part of multiple offerings within the Digital Workplace catalog like ExperienceNXT, myHubStyle, etc. Nexthink helps organizations measure, manage, and improve digital employee experience every moment. By correlating technical performance and employee sentiment, organizations have a view of the true employee experience for the first time. Flexible dashboards provide key insights and event visibility, while visualizations enable rapid problem solving, so that issues can be instantly remediated through our automation technology. Nexthink becomes the central experience hub with real-time, actionable insights into every employee – across devices, operating systems, locations, and organizational units.   ======================

BlackLine

Wipro and Databricks Partner to Build Williams Energy's First-Certified Gas Marketplace

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/databricks/success-stories/wipro-and-databricks-partner-to-build-williams-energys-first-certified-gas-marketplace/ ----- Contact Wipro Please fill the required details to access the content Wipro and Databricks Partner to Build Williams Energy's First-Certified Gas Marketplace Ambition Williams Energy, a 116-year-old leader in energy infrastructure based in Tulsa, Oklahoma, United States, handles one-third of the natural gas used daily for cooking, heating homes, and generating electricity. Their legacy is etched in pipelines that crisscross the nation, fuelling progress and prosperity. Williams sought to disrupt the energy Industry by creating the first certified gas marketplace with a gas certification process to encompass the end-to-

end supply chain: from production through transmission and delivery. Participants share emissions data throughout the value chain with the certification agency, Context Labs. The Decarbonization-as-a-Service™ platform will enable Context Labs' partners in upstream, midstream and downstream firms to track and quantify emissions associated with natural gas procurement, transmission, and delivery down to the individual molecule. Achieving this ambitious goal involves ingesting and analyzing vast amount of complex time series data from proprietary systems like FlowCal, Maximo, and Pi which house critical data of transmission, emissions etc. Action Wipro collaborated with Williams to design and implement the solution using capabilities of the Databricks Data Intelligence Platform. The design followed the industry standard Databricks Medallion Architecture for Data refinement, which was sourced from various systems, including PI. The data was stored in Delta format. While Wipro ensured governance and security of the data through Unity Catalog, the data pipeline orchestration was implemented through Azure Data Factory. Wipro successfully tackled complex data engineering challenges by developing a PI Asset Framework (AF) for the NextGen use case, enabling seamless querying of data through PI AF using a linked server. Wipro leveraged Delta Share from Databricks for delivering data to Context Labs, while also provides necessary access tokens to the third party, in less than 48 hours which was a significant achievement. From complex data engineering to pioneering Delta Share and AI-driven tag consistency, Wipro's solutions paved the way for NextGen Gas. Ambitions Realized The collaboration between Wipro and Williams Energy has yielded remarkable achievements, particularly in sustainability and commercial success. Williams Energy has realized an impressive $6M increase in margin from additional volume and secured new next-gen gas contracts in 2023. Contact Us

Wipro and Acceldata

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/acceldata/ ----- Our Acceldata Alliance Benefits Services Contact Wipro Data Observability for Effective Data Management Reductions in Application Maintenance Costs Strengthening Data Operations Hadoop-based Platform Support Data Reliability and Predictive Data Quality Usage and Spend Intelligence of Cloud Data Warehouses Please fill the required details to access the content Enhancing data health and visibility through our combined expertise Analyzing massive volumes of data to gain valuable customer insights and accelerate business decisions is a common task in most industries. As data rates increase and markets become more competitive, a crucial component in business operations is data observability: an enterprise's ability to track the health of its data and data systems. With this visibility, an organization has an effective way to identify, troubleshoot, and fix data issues, helping ensure data is relevant and secure. According to Gartner research, data observability is now essential to supporting and augmenting data management architectures. Wipro and Acceldata's partnership enables us to deliver customized strategies for simplifying data management with multidimensional observability across

compute processes and pipelines based on the Acceldata platform. Effective data management is key to staying competitive, and the Wipro and Acceldata partnership enables enterprises to derive higher value from their data assets while improving team productivity, issue-detection capabilities, and overall data health. =====================

Bentley Systems

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/bentley/ ----- Contact Wipro Please fill the required details to access the content Bentley Systems Transforming traditional buildings into Smart Spaces To create agile and adaptable buildings, organizations and building owners must weigh various factors, including occupant health and safety, space utilization, and equipment performance, while also addressing environmental and sustainability concerns. Building owners, operators, and tenants expect these needs to be addressed in a seamless and cost-effective way. Being a global technology company, Wipro has been developing solutions that enable infrastructure owners and operators to propel digital transformation by turning traditional buildings and campuses into Smart Spaces. Bringing together an experience of over 15 years in automation, access control, and business intelligence, Wipro delivers solutions that are engineered to address the dynamic digital transformation demands. Wipro and Bentley, the Digital Twin partners Wipro collaborated with Bentley to drive awareness, adoption, interoperability, and development of Digital Twin technology and embed it into the solutions. Leveraged Bentley's iTwin® platform, Wipro catalyzes the integration and overlaying of IoT data onto interactive 3D models of buildings. This also allows the Wipro Smart i-Building app to trigger workflows in the event of anomalies, detected by IoT sensors and other equipment. Wipro has built a Smart i-Building solution, powered by Wipro Smart i-Connect™, which focuses on real-time monitoring, alerts, and incident management for large buildings and campuses across the world. Bentley iTwin® The vision forward At Wipro, we are poised to take the Smart i-Building app to the building automation organizations that are associated with us, helping them realize that there is an untapped opportunity in developing infrastructure-centric solutions on a Digital Twin foundation. Wipro and Bentley, together, are extending the solution framework with Digital Twin solutions to cater to utility management, city management, transportation, telecom infrastructure, and more. =====================

Value to enterprises and their global supply chain leaders Contact Wipro Please fill the required details to access the content Making international logistics seamless Consumers in today's globalized and interconnected era have dynamic demands. They demand products and solutions that are readily available, anywhere. This is where a resilient global supply chain plays a pivotal role. The reliability, agility, and resiliency of global supply chains are determined by international logistics; however, existing international logistics technology may become inadequate at times, adversely impacting the global supply chains. Bridging the gap with synergized solutions At Wipro and e2log, we enable enterprises and their global supply chain leaders to accelerate international logistics operations

with unprecedented visibility and control. Wipro's extensive supply chain transformation & operational capabilities integrated with e2log's powerful cloud-based logistics orchestration platform help enterprises with data-driven insights and strategic roadmap to elevate international logistics processes. Together, we are empowering international logisticians to reduce their reliance on time-consuming manual work across fragmented systems. Streamline shipping of complex international cargo. Increase operational efficiency with an integrated freight booking engine, a global TMS, and digital control towers. Get a holistic view of international shipments across different activities. Analyse and improve service performance by moving to an orchestration model. Enhance customer, stakeholder & logistician experience. Make better decisions driven by data insights. Plan, execute, and deliver complex projects on time. Avail intuitive dashboards built on reliable data. Track scope 3 emissions globally.

A partnership with BT that simplifies hybrid cloud adoption

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/bt/ ----- Contact Wipro Please fill the required details to access the content BT Accelerate your digital transformation journey with our world-class capabilities and proven track record. Hybrid cloud is central to digital transformation. To accelerate their journey, clients leverage our long-standing strategic partnership with BT to address the complexities of adopting hybrid cloud. Our clients choose the Wipro-BT alliance because it brings a number of benefits. Global Reach and Scale: BT serves customers in over 180 countries, satisfying data and application requirements from a performance, security, and regulatory perspective around the world. BT offers connectivity options, partnerships with 250+ ISPs, and global and regional aggregators for enhanced geographic coverage and connectivity. Multi-Cloud Experience: The partnership with BT provides cross-platform expertise in cloud, hybrid cloud, data center co-location services, network modernization, SD-WAN, and security services - all enhanced by a flexible and agile engineering and support model. World-class Security: Over 3,000 dedicated BT security experts handle operations centers worldwide, providing visibility into global threats. Leading Technology: Clients have access to the best technology and operational capabilities from global leaders like VMware, AWS, Microsoft, Google, and Rackspace Technology. Integration Expertise: The Wipro-BT partnership combines experience and expertise to securely integrate infrastructure, networking services, application platforms, and multi-cloud services to bridge the gap between public and private clouds. Our clients prefer the services under our joint partnership for its proven track record of migrating clients to the cloud, implementing hybrid working, ensuring regulatory compliance, and integration to deliver agile, reliable, and secure infrastructure.

Wipro and AT&T Business

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/att/ ----- What We Think Form Title Delve deeper into the synergized solutions Contact Wipro Please fill the required details to access the content Wipro and AT&T Delivering advanced networking solutions Building a robust management platform, together Wipro, a global leader in system integration, has partnered with AT&T Business to enable enterprises with cutting-edge technology and security management platform. With a focus on delivering speed, reliability, and flexibility, Wipro leverages AT&T Business's extensive global network connectivity options to provide robust and secure solutions, setting them apart from the competition. This partnership meets the growing market demands for advanced networking technology and sets Wipro apart as a leader in delivering industry-leading technology solutions. Enabling enterprises with infrastructure modernization Many enterprises find it challenging to scale with their existing infrastructure strategy, as it limits availability, speed, and geography. With an integrated approach, Wipro equips enterprises with innovative technologies to deploy and manage their infrastructure and business units across different geos. Deployment of the new capability helps enterprises minimize or eliminate infrastructure silos and gaps – leveraging both fixed and wireless connectivity solutions for almost any company asset. Partnering for success Wipro and AT&T Business have partnered to deliver and support over 100 enterprises with Wipro platform management and support services combined with AT&T Business networking capabilities. Enterprises across retail, manufacturing, finance and utility have relied on joint solutions to accelerate business and tap into new revenue opportunities. To harness the full potential of connected devices, enterprises need comprehensive IoT solutions that empower the business. Contact Us =====================

Enhancing operational efficiency with comprehensive IoT solutions

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/att/enhancing-operational-efficiency-with-comprehensive-iot-solutions/ ----- Drive value with a powerful partnership Contact Wipro Increased Visibility Accelerate Product Development Cycle Flexible and Agile Manufacturing Increased Profitability Please fill the required details to access the content Enhancing operational efficiency with comprehensive IoT solutions The rise in IoT applications and the increase in IoT connections are leading to a massive generation of data streams. This implies that enterprises need an effective solution that enhances the data processing capabilities where valuable insights can be driven from the data in real-time. AT&T and Wipro, bringing in the best of two worlds The synergy between AT&T and Wipro expanded in 2022 with the integration of Wipro Smart i-Connect™ (WSiC) and AT&T Control Centre (ACC). The joint objective was to enable enterprises with end-to-end IoT solutions to drive optimum business value in

today's connected business landscape. WSiC and ACC bring forth global connectivity and control over business assets helping enterprises with operational efficiency and reliability. Together, we are helping enterprises leverage i4.0 technologies, such as predictive maintenance, autonomous robotics, connected supplier ecosystems, digital twin, supply chain management, and more - powered by the world's most reliable and secure network. How can enterprises benefit? =====================

Wipro achieves the AWS Manufacturing and Industrial Competency

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/wipro-achieves-the-aws-manufacturing-industrial-competency/ ----- Contact Wipro Please fill the required details to access the content Wipro achieves the AWS Manufacturing and Industrial Competency How Wipro is driving cloud innovations for manufacturers with AWS The manufacturing industry has been a step ahead of other sectors when it comes to cloud adoption, according to Wipro FullStride Cloud research, and through our industry-specific insights and business strategies, we're helping manufacturing enterprises transform their businesses with AWS. As an AWS manufacturing partner, we've expanded our industry expertise by achieving the Manufacturing and Industrial Competency, positioning our organization as a leading provider of cloud modernizations that drive agility and innovation. "Wipro is proud to achieve the AWS Manufacturing and Industrial Competency," says Ashish Saxena, Senior Vice President, Manufacturing and Hi-Tech. "Wipro continually invests in cloud capabilities to capitalize on the power of cloud transformation in serving our clients. We are partnering with many top manufacturing and high-tech firms to deliver digital transformation. Our teams are dedicated to helping companies achieve their business transformation goals by leveraging the agility, breadth of services, and pace of innovation that AWS provides. We are engaged with top enterprises to enable them to become 'factories of the future' through smart manufacturing, supply-chain transformation, sustainability, connected products, automation, and advanced technologies involving IT/OT, 5G/Edge, AI, and analytics." In response to supply chain

disruptions, security challenges, and tech advancements, cloud transformations remain an essential and ongoing priority for the manufacturing industry. From the outset of the pandemic, manufacturing was one of the hardest-hit sectors, and since then enterprises have been seeking not only innovative solutions, but effective strategies for implementing them. The Industry 5.0 era that's taking shape will center around the benefits that cloud technologies are putting in reach for streamlining supply chains, enhancing analytics operations, and accelerating time to market. The Impact of our AWS Expertise Through our AWS-driven transformations, manufacturers around the world are evolving their infrastructures and realizing greater business value. Our industry-specific IoT and AI solutions enable improved agility and efficiencies through a series of benefits: In a recent strategic engagement, Wipro helped an organization transform the real-time visibility of its production operations and strengthen how it tracks its order fulfillment data. Utilizing AWS IOT analytics in conjunction with a series of production-monitoring dashboards, departments across the organization gained a 360 view of their available-to-promise inventory and transparency into the production process of every active work order. The business now operates with real-time information on stock availability, price, and delivery dates, accelerating its ability to respond to customer demand and reimagine its shipment operations. When a leading steel manufacturer needed to solve its production line challenges and prevent downtime, Wipro partnered with the company to provide end-to-end visibility of inventory from its business partners. By implementing IoT-based sensors, the organization could easily track arrived inventory, and the greater transparency resulted in optimized production schedules and enhanced work-in-progress decision-making. These AWS-based innovations reduced the company's downtime challenges by 80% and drove more efficient production schedules with inventory accuracy performance reaching 99%. What the Pathway Forward Looks Like New transformational approaches such as the engagements above are allowing major industrial players to update their products, supply chains, development processes, and go-to-market strategies. Using data and insights gained from their team members, businesses have been able to automate their sales processes and gain greater visibility into their opportunities for growth. Companies in the energy sector are getting prepared for the growing demand for alternative power in manufacturing and other verticals. Managing data effectively is also an essential goal of a digital transformation. The growing number of connected devices in factories and manufacturing facilities has led to a significant increase in the amount of data companies are able to capture and utilize. But data alone isn't necessarily useful. To make the most of it, companies must have both the right fundamentals in place as well as a nuanced understanding of their unique business goals. The Three Fundamentals of AWS Cloud Transformations The adoption of emerging technologies — industrial IoT, artificial intelligence, and machine learning among them — will only increase in the coming years. To get the most out of these tools and avoid a customer experience gap, manufacturing companies must make greater investments in digital integration solutions. An effective approach to guiding infrastructure updates should be anchored by three principles: Empower your teams It pays to put people first. The key to reshaping an organization is team empowerment, and that means giving teams a full understanding of how an AWS transformation will help them

reach new achievements and greater productivity. A plan of this kind is more than technological. Employees will need to know why the change is needed, how they'll benefit, and what the overall goals are. When people are aware of the accomplishments and efficiencies to shoot for, they'll be motivated to adopt new standards that replace outdated methods and work to better serve their customers. Assess, integrate, and collaborate An AWS transformation plan should be based on a thorough assessment of a company's infrastructure, looking for weaknesses to improve and strengths to enhance. The goal should be to find where data silos exist and implement a solution for integrating them into a centralized system. By creating a more unified system, teams can have new avenues for sharing data, collaborating, and learning what's driving company success. When an organization can gain insights on what customers are responding to, it can continue the success and help build brand loyalty. Think long term As an AWS transformation is planned and new goals are set, scalability should be a serious consideration. A company's growth shouldn't be hindered by a legacy system that can't grow along with it. As a business takes on new markets and expands its workforce, its infrastructure should be able to easily handle such changes. Today ongoing digital transformations are necessary and inevitable, so be sure to consider the big picture and don't be limited by the monthly or quarterly perspective. Transforming Operations, Performance, and Outcomes Cloud-driven transformations don't occur in a vacuum, and they don't end with the adoption of any one technology. They're an ongoing process that requires careful planning and the ability to understand how existing solutions can be integrated with the latest technologies. Based on our combined tech and consulting expertise, the Wipro FullStride Cloud team is ensuring that enterprises can benefit from AWS-based solutions to achieve new levels of productivity and long-term growth through a range of advantages: Wipro FullStride Cloud has also provided thought leadership content to the manufacturing industry with our recent cloud report, which outlines the effective tactics for developing further cloud maturity. To learn more about how to develop an effective strategy for adopting cloud innovations, download the Wipro FullStride Cloud Services report. ======================

Tapestry Strengthens Its Cybersecurity Posture

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/tapestry-moves-to-cloud-for-better-ux-improved-security-posture-reduced-costs/ ----- Contact Wipro Please fill the required details to access the content Tapestry Strengthens Its Cybersecurity Posture Tapestry initiated a large-scale digital transformation that involved migrating the company's existing systems to the cloud and completely modernizing the user experience. Ambition Tapestry, Inc. is an American multinational luxury fashion holding company. It is based in New York City and is the parent company of three major brands: Coach New York, Kate Spade New York and Stuart Weitzman. Every year, Tapestry hosts its annual sample sale, offering products at discounted prices to its employees and contractors. This event

has been increasingly popular among employees over the years, but recent numbers have shown a consistent decline in sales. Tapestry attributed this decline to technical issues with the Employee Sample Sale Registration System, the application used to register for the event, and poor user experience. Upon further analysis, Tapestry traced the issue back to legacy architecture in the application that limited performance and scalability. Tapestry also discovered it was incurring high licensing and maintenance costs despite only using the system for a limited time each year. Action Tapestry initiated a large-scale digital transformation that involved migrating the company's existing systems to the cloud and completely modernizing the user experience to revitalize this once-popular employee event. The primary goals of this transformation were to reduce the system maintenance costs, enhance the overall security posture and increase sales by returning the event to its former status. Tapestry partnered with Wipro to help strategize and execute this transformation. Tapestry wanted to use the cloud to leverage the scalability and elasticity of the infrastructure, including microservices (based on demand) to optimize resource utilization and cost efficiency. In alignment with their vision, Wipro proposed an application modernization solution on AWS cloud that uses cloud-native, serverless microservices-based architecture for faster development cycles and easier maintenance, even for complex user interfaces. Switching to the AWS pay-as-you-go pricing model would help reduce administrative overhead and AWS managed services would provide strong, round-the-clock technical support. Other solution details include: Ambitions Realized In moving its Employee Sample Sale Registration System to the cloud, Tapestry included valuable upgrades to ensure the application can meet the changing needs of the business and its employees. By enabling OAuth 2.0, Single Sign-On (SSO) with Azure AD and Cognito integration (allows user authentication from different devices, including mobile) Tapestry significantly enhanced its security posture and streamlined the user experience, making it more intuitive. The results were impactful, resulting in nearly two times more registrations. Tapestry embraced managed services to reduce operating costs by approximately 30% and increased the efficiency of these operations by outsourcing them to a qualified team capable of constant monitoring. ======================

Dealer Management in the Cloud: An Automotive Case Study

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/dealer-management-in-the-cloud-an-automotive-case-study/ ----- Contact Wipro Please fill the required details to access the content Dealer Management in the Cloud: An Automotive Case Study Ambition A leading multinational automotive manufacturer headquartered in India was using a centralized, monolithic dealer management system (DMS 1.0) to manage its dealerships across over 2,000 locations. A DMS is a dealers' enterprise resource planning (ERP), enabling dealerships to perform their day-to-day operations by connecting OEMs, distributors, dealers, and customers. Implemented over a decade ago, the system had been

instrumental to the company's growth, but lately high licensing and maintenance costs and limited functionalities (including an outdated user interface and software stack) were preventing the legacy system from keeping up with the company's ambitions. The system's suboptimal scalability, performance and storage were hampering important go-to-market (GTM) efforts. There was also a significant security concerns due to the system's security upgrades, patching, and infrastructure upkeep being highly manual processes. The client sought to modernize DMS 1.0 and partnered with Wipro to build a highly scalable multi-channel solution on AWS that would reduce the maintenance cost of the system, enhance its features (e.g., seamless connectivity, API for business continuum, AI-based analytics) and security posture while allowing dealers to manage their entire business from a single platform. The Solution Wipro was the strategic partner for this engagement. The client chose to work with Wipro due to Wipro's decades of experience managing large-scale automotive industry transformations and coordinating complex interactions between technology and business teams. Wipro and the Wipro FullStride Cloud Studio worked with the client to outline the attributes of the current system, expectations for the new one, and develop a blueprint for the transformation. The blueprint included critical system and architectural requirements but balanced those technical concerns with user experience considerations to ensure that the new cloud-based interface would more than meet the needs of dealerships. The project required rewriting the client's existing system and completely modernizing the user experience. The client chose AWS cloud for its flexibility and elasticity to scale individual micro-services up or down based on user demand, thereby optimizing resource utilization and cost efficiency. Wipro worked with the client to redesign more than 85 business processes across 8 different modules including sales, customer support, service, and parts. The new solution was built on AWS cloud using a plug-and-play model, employing various AWS managed services to reduce costs while increasing the scalability, security, and performance of services like data ingestion, exchange and sync, core services, insights and persistence, orchestration, APIs, encryption and logging, DevOps, and automation. By breaking the transformation down into manageable microservices, the client was able to accelerate its transition and quickly generate concrete business value through the enhancements. Ambition Realized The new dealer management system harnesses the power of the cloud and managed services through AWS to enhance performance and user experience. Cloud Platform as a Service (PaaS) components, for example, have reduced operational costs through embedded licenses, eliminating the need for separate license procurement. PaaS components have also increased horizontal and vertical scalability. A data warehouse and auto-archival mechanism now help the client optimize transactional data size based on business requirements, while the managed database (RDS) and object storage (S3) enhance data storage and management. AWS services like load balancer and EKS Fargate, along with automated backup and recovery services, reduce load-related issues and safeguard data in case of disruptions. The solution's automation and DevOps capabilities have improved agility and GTM speed by automating repetitive tasks such as patching and code rebuilds. The new system also provides enhanced security measures through single sign on (SSO) and identity access management (IAM). The new system provides a seamless omnichannel

experience — including end-to-end visibility of KPIs, services, and sales across dealerships — and supports greater collaboration across departments. Dealerships are now able to access better inventory records in less time, leading to quicker decision-making and improved customer service. By leveraging the speed, agility, and cost efficiency of cloud, the client has reshaped its relationship with its dealers and is now reaping the benefits. =====================

GenAI-Powered Marketing for a Fortune 500 Leader

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/gen-ai-powered-marketing-for-a-fortune-500-leader/ ----- Contact Wipro Please fill the required details to access the content GenAI-Powered Marketing for a Fortune 500 Leader A leading investment firm leverages GenAI for efficient, personalized digital marketing. Ambition In the fast-paced realm of digital marketing, email campaigns remain a cornerstone for engaging customers and driving conversions. A Fortune 500 investment and insurance company sought to advance dual imperatives: reduce time-to-market while boosting conversion rates. The company recognized that incorporating GenAI into its digital marketing workflows would streamline operations and empower teams to quickly create compelling, hyper-personalized content. At the same time, the company wanted the flexibility to integrate new large language models (LLM) to keep pace with technology advancements and changing business needs. Action Wipro proposed a GenAI solution that can quickly gather insights from various trusted sources and distil that information into clear, compelling email content that engages customers and empowers them to make stronger investment decisions. Because security is paramount when handling customer data, the solution incorporates top-tier security features from AWS. Wipro used VPC private link between SageMaker and S3 to ensure that information transferred between different AWS services is secure and that the data used to train the GenAI models stays private within the client's network. To meet the client's flexibility requirements, Wipro used AWS SageMaker Jumpstart. These tools from AWS offer a range of large language models that can be adjusted to fit specific tasks. Combining AWS SageMaker Jumpstart, Transit Gateway,S3, KMS, and IAM functions, Wipro created a solution that was both smart and secure. Ambition Realized Implementing the GenAI application enabled the marketing team to automate more than 30% of its email generation processes within the first week. This leap in automation led to a 40% increase in overall process efficiency and significantly enhanced customer engagement. By harnessing the power of GenAI, the client can now ensure that every marketing email is a vessel for delivering personalized insights gathered from a variety of reputable sources, directly addressing the needs and interests of each target customer. =====================

GenAI Expedites Competency Assessment for a Global Enterprise

Contact Wipro Please fill the required details to access the content GenAI Expedites Competency Assessment for a Global Enterprise By automating competency assessments, a global IT services provider is streamlining talent development for cost-effective service delivery. Ambition A prominent IT service provider with operations in more than 50 countries boasted a large workforce with a wide array of skills. But nurturing career growth and upskilling for such a large workforce can be challenging. In particular, the company's manual competency assessments were proving to be cumbersome, time-consuming, and prone to errors. To address this issue, the business sought to automate key aspects of its competency assessments, paving the way for more efficient processes, lower costs, and increased employee satisfaction. Action Wipro developed an Enterprise RAG (retrieval augmented generation) solution built on GenAI to expedite the creation of training materials. This solution supports a platform that allows employees to earn skill proficiency badges through short online assessments. By leveraging organizational guidelines and training materials as well as externally sourced information, the GenAI solution (built on AWS Sagemaker using advanced GenAI models like Claude 2.0 and Llama 2.0) generates design, troubleshooting, and coding questions tailored to various proficiency. For addressing security and high availability requirements solution leveraged AWS SageMaker Jumpstart, Amazon ECS (Fargate), Amazon Load Balancer, Amazon Bedrock, Amazon Simple Storage Service (S3), Amazon OpenSearch, and Amazon RDS. The solution combines retrieval and generative models to generate high-quality, relevant responses, with only 10% of the generated material needing to be adjusted by a human. Ambition Realized Within just a week of implementing the GenAI solution, the client achieved remarkable results, completing over 5,600 online assessments across key technical areas such as Java/J2EE, Springboot, MicroServices, AngularJS, ReactJS, Selenium, and CoreJava. This agile new method of competency assessment has enabled the client to pinpoint areas for improvement and further bolster skill development. Upcoming additions to the assessment tool — including Mainframe, Microsoft, and CIS skills — will bring even greater coverage and efficacy, enabling the client to hone the capabilities of its global workforce, leading to enhanced productivity, proficiency, and cost-effective client delivery.
======================

A Global Energy Leader Advances Cloud Efficiency with GenAI

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/a-global-energy-leader-advances-cloud-efficiency-with-genai/ ----- Contact Wipro Please fill the required details to access the content A Global Energy Leader Advances Cloud Efficiency with GenAI GenAI streamlined the maintenance and upgrade process for serverless functions, cutting cloud costs by $1 million per year. Ambition An international leader in the energy and petrochemical sector sought to optimize the maintenance and upgrade process for its serverless functions on AWS. The business had developed hundreds of serverless functions over the years using Python and found the process of upgrading these functions challenging. Each upgrade required manual adjustments that risked system downtime, diminished customer satisfaction, and invited revenue loss if not executed perfectly. Delayed upgrades posed additional risks including data loss, security vulnerabilities, and damage to the organization's reputation. Furthermore, the absence of comprehensive documentation for many functions also led to inefficient utilization of cloud resources and elevated operational costs. Action To address the client's maintenance and upgrade challenges, Wipro built a user-friendly GenAI-based application using Anthropic's Claude 2.0 large language model (LLM) in AWS Bedrock . Leveraging React for the front-end and Python for backend scripts, this application automates impact analysis and upgrades for hundreds of AWS Lambda functions across various AWS subscriptions. The process encompasses securing permissions, managing source code, analyzing and upgrading Lambda functions, followed by testing, validation, and performance optimization through AWS services. Ambition Realized By automating upgrades analysis, the client reduced analysis time by approximately 75%, enabling the development team to focus more time on tending critical backlog items. The automations also reduced overall deployment time by nearly 50%, streamlining processes such as development and testing, and increased developer productivity by almost 25%. Leveraging large language models (LLMs), the client executed its Lambda upgrades seamlessly and efficiently, well before the software's end -of -lifecycle (EOL) support, ensuring uninterrupted system operations. Most notably, the client reaped substantial cost savings, amounting to $1 million per year, approximately 10% of its overall cloud expenditure. ======================

Wipro and AWS: Empowering Businesses with Microsoft Technology

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/wipro-and-aws-empowering-businesses-with-microsoft-technology/ ----- Contact Wipro Tapestry moves to the cloud for better user

Wipro and AWS have collaborated to deliver a potent blend of Microsoft technologies on the cloud, enabling businesses to modernize their infrastructure and applications. At the core of this collaboration lies the seamless integration of the Microsoft technology stack with AWS cloud services. At the heart of this synergy lies the seamless integration of the Microsoft technology stack with the expansive AWS cloud services. Wipro's extensive expertise in Microsoft tools and technologies seamlessly integrates with AWS's scalable and flexible cloud ecosystem. This integration delivers the effortless deployment of .NET applications on AWS infrastructure, empowering businesses to embark on a trajectory of infrastructure modernization. This collaborative effort not only streamlines operational processes but also dynamic scalability, mitigates operational overhead, and optimizes resource utilization. A pivotal aspect of this collaboration is accelerated migration to the cloud, supported by the robust tools provided by AWS. This ensures a smooth transition, empowering businesses to capitalize on the benefits of a cloud-based infrastructure seamlessly. Wipro's proficiency in SQL, coupled with AWS's comprehensive database services, results in the delivery of efficient, data-driven applications. Simultaneously, the collaboration meticulously addresses security and compliance concerns, leveraging Wipro's commitment to robust cybersecurity practices and the advanced features inherent in AWS. This blend of Wipro and AWS within the Microsoft technology stack offer, growth, innovation, and efficiency, guiding businesses toward a cloud-powered future. Case Studies What we Think Contact Us

AI and Automation-driven Contact Center Transformation by Wipro FullStride Cloud and AWS

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/ai-and-automation-driven-contact-center-transformation-by-wipro-fullstride-cloud-and-aws/ ----- eBook: Considerations in using Ai for Cloud-based Contact Centers Contact Wipro Discover the Transformative Journey of Contact Centers in the Era of Generative AI Wipro Achieves AWS Machine Learning Partner Competency Please fill the required details to access the content AI and Automation-driven Contact Center Transformation by Wipro FullStride Cloud and AWS Navigating Challenges, Maximizing

Efficiency, and Ensuring Long-Term Success in Customer Engagement. In today's dynamic customer engagement landscape, contact centers grapple with challenges ranging from scalability to ensuring a seamless experience for agents and customers. To meet evolving demands, many are turning to AI/ML and automation, yet face obstacles relating to integration and privacy. Cloud-based solutions can help, providing the scalability, agility, and industry-specific tools contact centers need to maximize value and long-term ROI. With more than 20 years of experience working in contact centers, Wipro has identified three key barriers to cloud and AI adoption, and three strategic shifts to overcome these barriers: Wipro helps contact centers adopt these strategies for long-term success, drawing on its expertise to implement Amazon Connect, address TCO concerns, identify revenue-generating capabilities, and design efficient systems. Wipro's focus extends beyond immediate problem-solving to establishing resilient systems that proactively prevent recurring issues, ensuring long-term success in the rapidly evolving contact center environment. Wipro FullStride Cloud harnesses interactive AI extensively to revolutionize and automate contact centers, paving the way for future-ready solutions. Jo Debeker, Global Head of FullStride Cloud at Wipro, predicts in his Forbes article, "Interactive AI will lead a revolution in customer service with zero-touch call centers. By year-end, businesses are likely to unveil the world's first zero-touch call centers, a testament to the advancements in Generative AI." Featured Resources Wipro and AWS detail solutions and strategies to help contact centers overcome key challenges relating to cloud and AI. Guide to Using AI for Cloud-based Contact Centers

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/guide-to-using-ai-for-cloud-based-contact-centers/ ----- Contact Wipro Please fill the required details to access the content Guide to Using AI for Cloud-based Contact Centers Wipro and AWS detail solutions and strategies to help contact centers overcome key challenges relating to cloud and AI. When engaging with brands, consumers today want personalized, reliable, interconnected service. These expectations are putting new pressure on contact centers, forcing them to become more adaptive and tech-driven. To meet these needs, businesses are turning to the cloud and exploring advanced technologies like artificial intelligence (AI), machine learning (ML) and automation. But integrating new technologies comes with its own set of hurdles, including telephony integration, budget constraints, compliance with privacy regulations and the need for comprehensive training. Moving to the cloud has proven to be foundational to AI/ML and automation in a way that drives efficiency and long-term return on investment (ROI). To realize these benefits, businesses first need to address the barriers to entry. This eBook details how contact centers can overcome key challenges relating to cloud and AI to achieve business goals with the support of Wipro's Intelligent Contact Center for Amazon Web Services (AWS). As a Premier Consulting Partner, Wipro

leverages its extensive AWS experience to customize solutions such as Amazon Connect, a cloud contact center that facilitates the seamless adoption of AI. Explore how these strategies and solutions can empower your contact center operations, driving efficiency and success in the realm of customer service. Read The Report =====================

Mainframe Modernization with Wipro and AWS

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/mainframe-modernization-with-wipro-and-aws/ ----- Contact Wipro Please fill the required details to access the content Mainframe Modernization with Wipro and AWS Learn how Wipro and AWS are empowering businesses and simplifying mainframe modernization through joint solutions like Mainframe A to Z. In today's dynamic business landscape, change is not just inevitable; it's a constant that demands swift adaptation. The pressure to keep pace has never been higher, leaving companies that still rely on legacy mainframes rather than modernized IT systems at a disadvantage. The traditional mainframe release cycle, which often takes weeks or months, simply cannot compete with the agility demonstrated by organizations that make changes daily or multiple times a day. Why, then, are so many companies still using legacy mainframes? Although many businesses today recognize the value of mainframe modernization, 75% of respondents in a recent survey claimed that fear of change and funding constraints were preventing their company from completing its modernization program. Mainframe modernization can be a complex process impacting every aspect of an organization, from business and technology to people and processes. Success requires careful consideration of different approaches such as whether to rewrite, rehost, refactor or replace. Businesses need to also consider change management, governance, production and rollout. Orchestrating all this requires a comprehensive strategy, technical knowledge and industry experience. This eBook highlights how Wipro, as a global system integrator and AWS Premier Consulting Partner, helps enterprises address these challenges with end-to-end support including next-gen application services, deep domain expertise, integration and testing proficiency, data migration capabilities, and extensive program execution experience. The eBook also showcases Mainframe A to Z, a joint solution from Wipro and Amazon designed to be a one-stop-shop for all mainframe modernization needs. Download the eBook =====================

Unlocking the Power of Your Data: Embrace Modernization for Enhanced Efficiency

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/unlocking-the-power-of-your-data-embrace-modernization-for-enhanced-efficiency/ ----- Contact Wipro Please fill the required details to access the content Unlocking the Power of Your Data: Embrace Modernization for Enhanced Efficiency Discover the path to data-driven excellence with Wipro and AWS. In today's data-driven landscape, organizations thrive on the wealth of insights their data can offer. Yet many enterprises are hindered by outdated data systems that impede progress. Legacy data estates contribute to siloed information and inefficiencies, complicating decision-making processes and obstructing innovation. Embracing modernization unlocks the full potential of enterprise data, paving the way for truly intelligent enterprise operations. Why Modernize? Efficiency Boost Outdated data systems slow down operations. Modernization streamlines processes, enabling businesses to work faster and smarter. Actionable Insights Raw data alone has limited value. Modernization tools such as advanced analytics and machine learning transform data into actionable intelligence. Security Matters Compliance is

essential, especially when dealing with confidential information. Protect sensitive data with a secure, scalable infrastructure. Wipro's Expertise: Your Path to Success As an AWS Premier Consulting Partner, Wipro offers comprehensive solutions to modernize legacy data estates, with a track record of successful customer engagements. Here's what Wipro brings to the table: Download the eBook Transforming Legacy Data Estates into Intelligent Enterprises This eBook is a comprehensive guide to understanding the What, Why, and How of transforming your legacy data estates into agile, intelligent enterprises. Experts from Wipro and AWS share actionable insights and strategies for how to navigate the complexities of modernization, ensuring your organization is not just a participant but a leader in today's data-driven world. Download the eBook to learn how Wipro's partnership with AWS can accelerate your journey towards an intelligent enterprise. =====================

Transforming Compliance in BFSI: Harnessing AI and Cloud for Growth

----- Arccticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/reports/transforming-compliance-in-bfsi-harnessing-ai-and-cloud-for-growth/ ----- Contact Wipro Please fill the required details to access the content Transforming Compliance in BFSI: Harnessing AI and Cloud for Growth Streamlining compliance for resilience and innovation in BFSI industries powered by AI AI-powered compliance is transforming the banking, financial services, and insurance (BFSI) industries by helping institutions navigate complex regulatory environments. With rising fines and increasing cyber threats, non-compliance can lead to billions in losses and reputational damage. AI and cloud technologies offer enhanced security, risk

management, and automation, making compliance more efficient and scalable. However, these technologies bring new challenges, such as data sovereignty and the need for explainability in AI decisions. Financial institutions must carefully adopt AI to ensure transparency and accountability while using cloud solutions to remain agile in adapting to evolving regulations. By integrating AI-driven compliance frameworks, BFSI organizations can automate regulatory processes, mitigate cybersecurity risks, and streamline operations. Strategic partnerships with cloud providers ensure data residency compliance and adopting explainable AI (XAI) fosters trust by clarifying decision-making processes. These innovations allow financial institutions to transform compliance challenges into opportunities for growth and resilience in a rapidly changing regulatory landscape. Download the PDF to explore how AI and cloud technologies are transforming compliance in banking, finance, and insurance, helping firms overcome regulatory hurdles and stay ahead of evolving risks. Download the ebook =====================

Navigating Regulatory Complexity in Retail and CPG with AI and Cloud

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/reports/navigating-regulatory-complexity-in-retail-and-cpg-with-ai-and-cloud/ ----- Contact Wipro Please fill the required details to access the content Navigating Regulatory Complexity in Retail and CPG with AI and Cloud Leverage AI and cloud tech to streamline compliance, secure data, and enhance sustainability Retail and consumer packaged goods (CPG) companies face an increasingly intricate regulatory environment, with new regulations, compliance mandates, and security standards emerging rapidly. This evolving landscape demands constant vigilance and adaptability, particularly concerning updates to food safety, data privacy laws, and sustainability requirements. For global companies, managing compliance across diverse markets adds complexity, risking fines, recalls, and reputational damage if not handled correctly. Data protection is crucial, especially with regulations like GDPR and CCPA, necessitating secure consumer data management. Product integrity, involving safety and accurate labelling is equally important for maintaining consumer trust. Environmental responsibility is another growing focus, with regulations requiring sustainable practices and materials. By leveraging AI and cloud technologies, businesses can streamline compliance processes, ensure data protection, and adopt sustainable practices. Download the PDF to explore how cloud compliance is revolutionizing the Retail and CPG industries. Download the ebook =====================

Revolutionizing Compliance in Healthcare and Life Sciences with AI and Cloud

The Rising Importance of Cloud Compliance in a Multi-Cloud World

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/aws-business-group/reports/the-rising-importance-of-cloud-compliance-in-a-multi-cloud-world/ ----- Contact Wipro Please fill the required details to access the content The Rising Importance of Cloud Compliance in a Multi-Cloud World Navigating Security Risks and Regulatory Challenges with Continuous Compliance Solutions Cloud compliance has become critical as incidents of data breaches and regulatory violations rise. In June 2023, the Italian Data Protection Authority fined a global internet company €900 million for GDPR violations related to data transfers. A financial firm faced an $80 million fine for a misconfigured cloud firewall affecting 100 million customers, and third-party credential breaches exposed 41 million payment card accounts. As companies increasingly operate across hybrid and multi-cloud environments, cloud adoption brings agility and cost efficiency, but also raises risks of security vulnerabilities. The global nature of cloud operations adds complexity to compliance, pushing governments to enhance data protection regulations. The solution lies in continuous compliance, integrating real-time analytics, automation, and AI to monitor and secure cloud infrastructures.

This approach ensures businesses stay ahead of evolving regulations and security risks, transforming compliance into a competitive advantage. Download our comprehensive guide to learn how to streamline your cloud compliance strategy, secure your operations, and stay competitive in the digital economy. How to Choose the Right Order Management System

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/kibo/how-to-choose-the-right-order-management-system/ ----- Contact Wipro Please fill the required details to access the content How to Choose the Right Order Management System Consumers are becoming less and less loyal to brands and retailers. In order to delight customers and boost loyalty, it is essential to deliver seamless omnichannel experiences from browsing to order capture to fulfilment. As retailers manage a complicated balance of in-store, online and omni-channel initiatives (such as Buy Online Pickup In Store, curbside pickup, etc.), they need a powerful order management system (OMS) that can keep up with the pace of change. Advanced order management, in other words, is now a key component of a positive customer experience. Poor and outdated order management, on the other hand, will lead directly to customer attrition – especially if inventory data is inaccurate, extending false promises and incorrect ETAs to customers. In this new environment, choosing an order management system is a profoundly strategic decision. Yet with so many options available on the market, selecting the best OMS can be a daunting task. In response, Wipro and Kibo have teamed up to clarify the OMS landscape. Download our comprehensive guide to learn how you can identify the right OMS for your own enterprise. Download the guide =====================

Xceptor

Mitigate ransomware threats with cyber recovery

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/dell/mitigate-ransomware-threats-with-cyber-recovery/ ----- Contact Wipro Please fill the required details to access the content An IDC Whitepaper Powered by Dell Technologies and Wipro The rapid adoption of innovative and connected technologies is increasing the surface for sophisticated cyberattacks. This is a growing concern for enterprises across industries. $590 million ransomware-related suspicious activity reports (SARs) were identified in the first six months of 2021, which is a 42% increase over the previous year. Source: Financial Crimes Enforcement Network (FinCEN) The imperative right now is for enterprises to realize how they can strategize an effective cyber recovery roadmap that delivers a prescriptive, practiced, and proven option for surviving cyberattacks. The Technology Spotlight Whitepaper by IDC, sponsored by Dell Technologies and Wipro, elaborates on the best practices that enterprises can adopt to build an effective cyber recovery

strategy. A glimpse of the best practices elucidated in the whitepaper Wipro Enterprise Resiliency Solution powered by Dell Technologies In partnership with Dell Technologies, Wipro enables enterprises to bridge cybersecurity gaps by establishing a robust cyber recovery plan. The solution combines the systematic recovery capabilities of Wipro's services with the hardware and software expertise of Dell Technologies.   Download the white paper to discover how you can enhance your enterprise's cyber recovery capabilities. Download Whitepaper =====================

Wipro Digital Database Platform Services

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/dell/wipro-digital-database-platform-services/ ----- What we Do Contact Wipro Please fill the required details to access the content Confidently fix database sprawl with a Dell-validated cloud-based platform Consolidate and consume data with the click of a button using a solution running on PowerFlex, VxRail, or PowerStore from Dell Technologies A typical enterprise runs hundreds of applications to meet growing business needs. Over time, these applications use different databases (SQL and NoSQL) to assemble, retrieve, and share data to meet their unique needs. While convenient, the resulting database sprawl hinders flexibility, availability, scalability, security, and management. It also creates latency issues and makes just-in-time provisioning a challenge. It, therefore, becomes necessary to develop an optimal mix of SQL and NoSQL and use a DBaaS platform to overcome these challenges. Wipro's Digital Platform Services 2.0, powered by Dell, specializes in providing database management systems as a cloud service. We use Dell's state-of-the-art infrastructure to provide: Using our database-as-a-service offering on a Dell-validated platform running on PowerFlex, VxRail, or PowerStore, clients can consume their databases on a reliable cloud infrastructure. When security and performance issues demand it, the service can migrate databases back from hyperscalers to on-prem. Wipro's Digital Platform Services 2.0 delivers convenience and easy manageability through the complete automation of processes. Equally important is the fact that it also creates business value by consolidating databases and infrastructure for cost optimization, license rationalization, and innovative pricing. =====================

Wipro's DDPS 2.0, powered by Dell,
for faster and simpler database management

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/dell/wipros-ddps-2-0-powered-by-dell-for-faster-and-simpler-database-

management/ ----- Contact Wipro Please fill the required details to access the content Wipro's DDPS 2.0: A straightforward database management solution, enabled through a single control pane to scale all types of databases in a non-disruptive manner Databases are configured on a range of technologies, often leading to fragmentation and complex operations. Wipro's DDPS 2.0 simplifies database management through automation, one-click operations, and time-streaming to any point in time up to the last transaction. The solution helps customers resolve practical challenges seen during Day Zero, One and Two and delivers tangible results. Wipro's DDPS 2.0 helps customers transform the database ecosystem from complex to mature, with capabilities to disburse database as a service. It also seamlessly enables single touch provisioning of new databases and DB servers across open source and commercial database engines like MySQL, PostgreSQL, Redis and Mongo. Reduce your database footprint with consolidation and lower OpEx, delivering an enhanced experience. To learn more about Wipro's DDPS 2.0 solution, download the flyer here. =====================

Wipro's DDPS 2.0 for faster and cost-efficient database management

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/dell/wipros-ddps-2-0-for-faster-and-cost-efficient-database-management/ ----- Contact Wipro Please fill the required details to access the content Wipro's DDPS 2.0: A robust solution underpinned by automation and standardization to simplify database deployment, management, and operations Wipro's Digital Database Platform Services 2.0 (DDPS 2.0), powered by Dell, provides lifecycle management and operation support of database services. As global organizations grapple with managing databases to support multiple applications, they need to ensure performance, availability, security, flexibility, and scalability; all while ensuring costs are under control. Wipro's DDPS 2.0 helps customers to consolidate their relational & non-relational database workloads, manage database sprawl and allows users to provision and manage databases just in time. Application releases are accelerated as it does not require prior knowledge of hardware, database software and associated configurations. Customers can utilize and apply rich content catalogs and automation capabilities to accelerate service delivery and adoption of containers for microservice based deployments. If automation to reduce CapEx and OpEx, service delivery acceleration, and a performance driven experience are your goals, then click here to download Wipro's DDPS 2.0 brochure and learn more =====================

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/transforming-procurement-with-wipro-and-raindrop-partnership/ ----- Contact Wipro Please fill the required details to access the content Transforming Procurement with Wipro and Raindrop Partnership Empowering Businesses with Seamless Source-to-Pay Solutions Wipro and Raindrop have joined forces to revolutionize procurement with a comprehensive Source-to-Pay suite. This collaboration aims to deliver rapid "Time to Value" for customers seeking a complete platform encompassing Spend Visibility, Strategic Sourcing, Contract & Supplier Management, and transactional Procure-to-Pay. The powerful Sourcing module, designed by Procurement practitioners for Procurement practitioners, seamlessly connects the entire Procurement lifecycle from spend planning to contract renewal. This approach simultaneously reduces spend leakage and ensures compliance, marking a significant shift in the industry. Raindrop, an industry-disruptive digital

spend management platform, serves as the central hub for managing all outflow of funds from a customer's company. Founded by highly experienced procurement practitioners, technologists, and operational experts, Raindrop brings a fresh user experience to a mature industry in need of change. It is designed for ease of use and speed to value attainment. The partnership's primary focus is on streamlining procurement for organizations by enabling more efficient spend management, enhancing risk and compliance mechanisms, reducing the cost of ownership, and enhancing savings by identifying and resolving spend leakages. =====================

Wipro UnitedLayer partnership

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/united-layer/ ----- Know Why Your Businesses Need Remote Hands Services Contact Wipro G3 Private Cloud/Hybrid Cloud United Connect United Secure United Edge UnityOne.AI Managed Services Data center infrastructure management (DCIM) Unified hybrid cloud management platform (HCMP) with network interconnections On-demand cloud migration Container management Managed backup and disaster recovery (DR) Cost management AIOps-led operations Key Considerations For Data Center Sustainability Practices Managed Colocation Services By UnitedLayer: Empowering Business With Resiliency And Reliability Disaster Recovery: A Way To Enhance Business Resiliency Please fill the required details to access the content UnitedLayer and Wipro A Unified Vision for Cloud Excellence Wipro and UnitedLayer have partnered to enhance cloud transformations and managed services across private, hybrid, and multicloud platforms. With more than 25 data centers and over 150 edge data centers, UnitedLayer extends Wipro's network capabilities, connecting more clients across five continents to industry-leading cloud support. Wipro commitment to the UnityOne Certified Professional (UCP) program showcases our industry leading capabilities and expertise in UnitedLayer technologies. This collaboration is dedicated to delivering future-ready B2B and B2C cloud services and managed services that are both innovative and customer-centric, ensuring businesses are equipped with the tools they need to succeed in the cloud. Next-gen G3 private cloud capabilities enable clients to deploy critical application workloads like SAP, Oracle and Citrix VDI on secure, high-performing G3 IaaS infrastructure. Carbon footprint analysis for hybrid/multicloud operations provides valuable insights and offer recommendations based on sustainability goals. Wipro and UnitedLayer are committed to providing hybrid cloud solutions that meet today's needs and anticipate future challenges. Services span consulting, migration and transformation, all aimed at accelerating cloud-centric business strategies. Partner Status Gold level partner Approach ROI-Focused Cloud Innovation Cloud Platforms Private, Hybrid and Multicloud, Managed Services Our Services IaaS and DC management with 100+ services and global multicloud operations. On-demand connectivity among global data centers, private and public clouds Physical and virtual protection for infrastructure, data, apps and endpoints. 150+ edge locations to process, store, and deliver data fast, with high availability. SaaS platform manages DCIM, AIOps, CMP, costs, sustainability across clouds. Fully managed services for improved

security, operations, and compliance. Our Offerings Featured Resources Data centers are at the heart of the digital transformation movement. Contact Us =====================

Informatica Alliance

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/informatica-alliance/ ----- Contact Wipro Cloud led Data metamorphosis MDM Modernization Digital Data Trust Propelling to SAP S/4 HANA with IDMC Microsoft Fabric + IDMC Informatica GPTS Partner Award 2023 for Top Enablement Recognized as a leader in the 2022 Gartner Magic Quadrant for Data and Analytics Service Providers 2021 Regional CIO Award for MFI implementation Please fill the required details to access the content Informatica Alliance Pioneering Data Modernization for AI-Ready Enterprises As a premier Global Systems Integrator partner for Informatica, Wipro — a titan in data and AI-driven technology solutions — leverages its vast cross-industry acumen alongside Informatica's Intelligent Data Management Cloud. This powerful synergy is dedicated to propelling customers into the future by modernizing their entire data management systems and forging sophisticated data analytics capabilities enriched with AI-powered insights. Wipro's Informatica Centre of Excellence is an innovation hub, where seasoned experts collaborate with clients to architect, implement, and refine data management solutions that resonate with their strategic goals. Wipro's comprehensive approach ensures that each segment of the data lifecycle is meticulously fine-tuned for peak performance and efficiency. In unison, Wipro and Informatica are revolutionizing the data landscape, enabling organizations to liberate their data assets and thrive in the ever-evolving global market. 1000+ Implementations 3000+ Certified professionals 150+ Customers served Differentiator Approach Recognition Narayan Kamat, Global Head of Partnership, Data and AI, Wipro discusses Wipro's strategies for future-proofing enterprises with data and AI initiatives. Wipro's MDM Modernization Framework

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/informatica-alliance/wipro-mdm-modernization-framework/ ----- Contact Wipro Please fill the required details to access the content Shaping the future of enterprise MDM Scaling and modernizing on-premise Master Data management (MDM) has been a formidable business challenge. Migration to cloud-based MDM has gained traction, enabling enterprise to spearhead

data modernization initiatives. The cloud-based MDM landscape aims at simplifying operations and reducing infrastructure costs by leveraging native AI capabilities. Wipro's MDM modernization framework integrates and enhances AI and ML capabilities, marking the advent of an era of automated data quality management and informed decision-making. Wipro enables the MDM modernization journey, beginning with legacy discovery and migration automation, while preserving the core MDM. The Wipro Data Intelligence Suite (WDIS) expedites the migration to Cloud MDM and strengthens the MDM Strategy with AI, resulting in increased efficiency, accuracy and improved time-to-market. MDM modernization elevates businesses with data-driven intelligence, driving strategic decisions and fueling innovations. Accelerated discovery 50% automatic discovery of legacy MDM systems and configurations Automated data generation 40% automatically generated target MDM metadata Accurate migration Error-free migration of configurations from legacy to modern MDM solution Contact Us =====================

Strengthening Data Foundations for Supply Chain Control Tower

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/informatica-alliance/strengthening-data-foundations-for-supply-chain-tower/ ----- Contact Wipro Please fill the required details to access the content Strengthening Data Foundations for Supply Chain Tower Accelerators powered by Informatica IDMC to augment data-driven processes Wipro's Approach and Solutions – At Wipro, we follow a business imperative-led approach that provides an end-to-end process view and user-centric transformation for diverse industry use cases. Our Data-Driven Supply Chain Management solution is a key part of this approach, enabling enterprises to create visibility on potential supply chain disruptions and proactively intervene to outperform challenges arising from market dynamics, inventory logistics, and customer demands. Role of Informatica's Intelligent Data Management Cloud (IDMC) - Informatica's (IDMC) lays the foundation for a business value-driven data governance framework. With IDMC, we connect, unify, and democratize organization data, advancing outcomes such as reduced costs, improved efficiency, and augmented customer experiences. Integration and Tangible Outcomes - For Wipro's supply chain tower, IDMC plays a critical role in democratizing data at scale and speed, integrating a hybrid cloud layout with ML-driven data discovery, delivering tangible outcomes. Our focus is on business value realization and prioritizing processes to sustain growth momentum for enterprises. 20-40% Inventory reduction across the value chain 10-40% Reduction in supply chain costs 10-20% Reduction in obsolescence cost Contact Us =====================

Redefining Protection from Edge to Cloud

----- Arcticle source ----- https://www.wipro.com/partner-ecosystem/ redefining-protection-from-edge-to-cloud/ ----- Contact Wipro IDC Spotlight on Cloud Security: Multi-Cloud Mastery Unveiled Accelerating Digital Transformation with SASE to Securely Move from Edge to Cloud Three modern cybersecurity strategies to navigate today's complex threat landscape Please fill the required details to access the content Wipro + Palo Alto Networks deliver cost-optimized multi-cloud security and compliance Wipro and Palo Alto Networks form a strong partnership that enables and secures enterprise digital transformation. We employ a holistic security approach built on integrated architecture and automation using cost-optimization methodologies. Wipro's industry-leading strategic advisory, customized integrations, and comprehensive managed security services are supported by Palo Alto Networks' next-generation security platform. We provide transformational security services for protecting mission-critical assets across hybrid/multi-cloud environments – ensuring meaningful wins in risk governance, compliance, situational awareness and threat remediation. Wipro Cybersecurists help you transform security operations by consolidating and integrating toolsets, accelerating incident resolution with AI-managed detection and response (AI-MDR), automating actions using playbooks and ensuring consistent cloud security and compliance. Next-Gen Security Protecting against intensifying threats with AI-managed detection and response Cost Optimization Reducing security complexity and solutions sprawl for most cost-efficient operations Cyber Talent Accessing a vast pool of skilled and experienced cybersecurity professionals Our Solutions Converging networking and security services into a unified, cloud-delivered solution based on Zero Trust principles Covering the lifecycle of cloud security — from planning, application modernization, migration and post-migration Providing SOC transformation for security monitoring and management through automation and orchestration Fortify your cloud security strategy with platform-driven solutions Gain a deeper understanding of SASE implementation challenges and solutions Learn how to protect your company's cyber transformation through integrated, accessible solutions that utilize best-in-breed technology for reduced complexity, a smaller attack surface Everest Group's latest research provides a comprehensive understanding of next generation security solutions that address the increasing cyber threats and risks experienced by businesses across all industries.
